1. INTRODUCTION

This Predesign Investigation Work Plan (PDIWP) has been developed for the Operable Unit 1/Operable Unit 2 (OU-1/OU-2) portion of the Anniston PCB Site (the Site; Figure 1-1). The PDIWP is a deliverable under the OU-1/OU-2 Remedial Design/Remedial Action (RD/RA) Consent Decree (CD: United States Environmental Protection Agency [USEPA] 2021a) and was developed on behalf of Pharmacia LLC/Solutia Inc. (P/S). This PDIWP presents the field, laboratory, and desktop support activities that will be conducted to support the remedial design (RD) for the OU-1/OU-2 remedies identified in the CD and is consistent with the respective components of the OU-1/OU-2 Record of Decision (ROD; USEPA 2017).

This PDIWP is available as an electronic deliverable at PDIWP. Other publicly available technical documents for OU-1/OU-2 and the Site are available at Anniston PCB Site File Exchange.

1.1 Purpose of this Predesign Investigation Work Plan

As described in the OU-1/OU-2 Remedial Design Work Plan (OU-1/OU-2 RDWP; P/S 2021a), this PDIWP provides an evaluation and summary of existing data and a description of data gaps to be addressed as the second technical deliverable under the CD. Additionally, the means and methods of sampling and collecting other data (e.g., topographic surveys) to address identified data gaps as part of implementing the PDIWP are included. The PDIWP is based on technical requirements identified in the CD, including Section 3.3(a) of the Statement of Work (SOW), Appendix B to the CD.

1.2 Remedial Action Summary

The remedy USEPA selected for OU-1/OU-2 includes multiple components for soil, groundwater, and sediment. The ROD identified eight categories or types of remedies based on the range of remedial alternatives presented in the *OU-1/OU-2 Feasibility Study Report, Anniston PCB Site* (OU-1/OU-2 FS; Ramboll Environ 2016), and P/S and USEPA agreed that P/S would implement the selected remedy for seven of these categories. The seven categories of remedial alternatives for OU-1/OU-2 identified in the CD and the selected remedy for each category are as follows:

- **Residential soil:** The selected remedy for residential soil is removal and on-site or off-site disposal of surface soil (i.e., soil from ground surface to 12 inches below ground surface [bgs]) with polychlorinated biphenyl (PCB) concentrations greater than or equal to 1 milligram per kilogram (mg/kg) but less than 10 mg/kg and removal and off-site disposal of surface and subsurface soil (i.e., soil deeper than 12 inches bgs) with PCB concentrations greater than or equal to 10 mg/kg. The selected remedy also includes long-term soil management for (1) properties with residual PCBs greater than or equal to 1 mg/kg, (2) properties with PCB concentrations in soil greater than or equal to 1 mg/kg that have been designated as "unsuitable for removal," and (3) properties that potentially have residual PCBs beneath a structure (i.e., a building, shed, or paved area) that limits exposure.

- **Special use properties:** For high-activity special use properties, the selected remedy includes removal and on-site or off-site disposal of surface soil with PCB concentrations greater than or equal to 1 mg/kg but less than 10 mg/kg and removal and off-site disposal of subsurface soil with PCB concentrations greater than or equal to 10 mg/kg. For low-activity special use properties, the selected remedy includes removal and on-site or off-site disposal of surface soil with PCB concentrations greater than or equal to 1 mg/kg but less than 10 mg/kg and removal and off-site disposal of surface soil with PCB concentrations greater than or equal to 10 mg/kg and subsurface soil with PCB concentrations greater than or equal to 97 mg/kg. The selected remedy also includes long-term soil management for (1) properties where residual PCBs are at concentrations greater than or equal to 1 mg/kg, (2) properties with PCB concentrations in soil greater than or equal to 1 mg/kg that have been designated as "unsuitable for removal," and (3) properties that potentially have residual PCBs beneath a structure (i.e., a building, shed, or paved area) that limits exposure.
- **Interim measure (IM) areas:** The IM component of the OU-1/OU-2 remedy includes maintaining the existing IMs and excavating soil around the Northside Area, Eastside Area, and the Eastside Drainageway (including the drainage ditch to the north and PB-RR-37 area) IMs to meet the surface soil remedial goal for PCBs of 21 mg/kg and subsurface soil remedial goal for PCBs of 97 mg/kg. Excavated soil will be disposed of off-site. The OU-1/OU-2 remedy also includes assessing the potential for principal threat waste (PTW) to be present in the portion of OU-1/OU-2 that is located just east of OU-3. The presence of PTW will be characterized by groundwater with PCBs at concentrations greater than the State maximum contaminant level and the Federal Safe Drinking Water Act maximum contaminant level. If PTW is found to be present, the specific approach to address the PTW material will be developed in coordination with USEPA during the RD.
- **Dredge spoil piles:** The remedy includes removal and off-site disposal of four dredge spoil piles located near or adjacent to Snow Creek. The CD includes predesign investigation (PDI) sampling for dredge spoil pile SC-2, which was not characterized during the remedial investigation (RI) to assess whether PCB concentrations are greater than or equal to the threshold concentration of 3 mg/kg for dredge spoil pile removal in OU-1/OU-2 under the selected remedy. The surface soil located directly beneath the dredge spoil piles will also be evaluated for conformance with the surface soil remedial goal of 21 mg/kg. The subsurface soil will be evaluated using the remedial goal of 97 mg/kg. Long-term soil management for areas underlying dredge spoil piles with residual PCBs greater than or equal to 1 mg/kg is also part of the remedy.
- **Nonresidential soil:** For nonresidential soil, the remedy includes removal and off-site disposal of surface soil with PCB concentrations greater than or equal to 21 mg/kg, removal and off-site disposal for subsurface soil with PCB concentrations greater than or equal to 97 mg/kg, and long-term soil management for residual soil with PCB concentrations greater than or equal to 1 mg/kg. The remedy also includes the removal and off-site disposal of nonresidential soil from several small areas where non-PCB

constituents are present at concentrations greater than their respective remedial goals from the OU-1/OU-2 ROD.

- **Soil and groundwater at T-11:** For the T-11 area, the remedy includes removal and off-site disposal of soil from the upper 18-inch horizon across the broader T-11 area and the removal and off-site disposal of soil at depth directly surrounding groundwater well T-11; placement of a low-permeability cap over the broader T-11 area; the extraction, treatment, and discharge of groundwater from new groundwater wells installed in the T-11 area; and land use controls (e.g., deed restrictions or environmental covenant) that prohibit future groundwater use.
- **Sediment and creek bank soil:** For sediment and creek bank soil, the remedy includes stabilization of select creek bank areas and the removal and off-site disposal of sediment with PCB concentrations greater than or equal to 3 mg/kg. The remedy also includes the removal and off-site disposal of several sediment deposits containing non-PCB constituents at concentrations greater than their respective remedial goals from the OU-1/OU-2 ROD. The remedy for creek bank areas along Snow Creek includes stabilization of the specific reaches of the creek identified in the OU-1/OU-2 ROD.

Additional details for the remedy selected for each of the categories identified above are provided in Section 2.2 of the OU-1/OU-2 RDWP (P/S 2021a).

1.3 Predesign Investigation Objectives

The objectives of this PDIWP include collecting data that, in combination with existing data collected for OU-1/OU-2, will be used to develop the RD for implementing the OU-1/OU-2 remedy. These PDI objectives are consistent with the requirements of the supporting documents in Section 6.7 of the SOW and include the following:

- Presentation and evaluation of existing data and the identification of data gaps
- Field sampling plan, including the media to be sampled; number of samples to be collected, including locations, aerial extent, and depths; and contaminants to be analyzed
- Applicable cross references between the planned sampling activities and the Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP)

1.4 Organization of the PDIWP

This PDIWP includes nine sections, including this introduction, and five appendices:

- Section 2 presents existing data and identifies data gaps for OU-1/OU-2 floodplain and creek bank soil, groundwater, and Snow Creek sediment.
- Sections 3 and 4 describe the field and laboratory activities that will be conducted as part of the PDI to support OU-1/OU-2 RD development.
- Section 5 presents an overview of the access process and a summary of properties where access is needed to implement the PDI.

- Section 6 describes the health and safety plan (HASP).
- Section 7 describes the UFP-QAPP.
- Section 8 presents what will be included in the PDI evaluation report and the PDI schedule.
- Section 9 includes the references for documents cited in this PDIWP.
- Appendix A to this PDIWP is the UFP-QAPP.
- Appendices B and C provide the details of the treatability studies (TSs) for groundwater and sediment, respectively.
- Appendices D and E provide the details of the confined space entry plans for the Highway 202 culverts and the Quintard Mall culvert, respectively.

To document compliance with the SOW, Table 1-1 presents the SOW requirements and identifies the location in this PDIWP where the associated information is presented.

2. SUMMARY OF EXISTING DATA, DATA NEEDS, AND DATA GAPS

PDIWP development included reviewing existing data from the OU-1/OU-2 RI and FS and other historical reports and conducting a data gap analysis to identify the additional information needed to complete the OU-1/OU-2 RD as defined in the ROD. The PDI has been designed to collect the necessary and relevant information needed to successfully complete the OU-1/OU-2 RD. For each of the major components of the OU-1/OU-2 RD (i.e., floodplain and creek bank soil, groundwater, and Snow Creek sediment), this section presents a description of the existing data, data needs, and data gaps the PDI addresses. The associated scope of work and investigative methods for these data gaps are provided in Section 3.

2.1 Summary of Existing Data

The OU-1/OU-2 portion of the Site has been extensively sampled over the past 20-plus years, and the results of these investigations are presented in a collection of reports, including the OU-1/OU-2 RI (Environ 2015). Summaries of the existing data for floodplain and creek bank soil, groundwater, sediment, and surface water are provided in Sections 2.1.1 through 2.1.4, respectively.

2.1.1 Floodplain and Creek Bank Soil

The multiple categories of floodplain and creek bank soil identified in the OU-1/OU-2 ROD that have been part of the sampling that has been conducted over the past 20-plus years are presented in the OU-1/OU-2 RI and the *NTC Removal Action Completion Report for Residential Properties in OU-1/OU-2* (Completion Report; Golder 2015) and its associated annual addenda. The individual data for the residential properties and high-activity special use properties are not presented in this PDIWP due to their voluminous nature and because they have been presented in previous documents (OU-1/OU-2 RI and Completion Report). Additionally, all required removals have already been completed for the residential properties and high-activity special use areas where access is available and the properties are suitable for removal.

Summaries for the existing data for the other categories of floodplain soil are provided below, including low-activity special use areas, IM areas, dredge spoil piles, the low-permeability cover for the T-11 area, and select creek banks with stability-related concerns.

2.1.1.1 Low-Activity Special Use Areas

A significant amount of sampling was conducted for the low-activity special use areas under the *Stipulation of the Parties Clarifying Partial Consent Decree between USEPA, Solutia Inc., and Pharmacia Corporation* (Stipulation; USEPA 2006), and the results are reported in the Completion Report (Golder 2015). Soil sampling results for the low-activity portions of the special use properties are presented on Figures 2-1a through 2-1l of this PDIWP, and low-activity use areas targeted for remediation are identified on these figures. The low-activity area located in the southeast corner of exposure unit 14 (EU14) North (Figure 2-1j) no longer requires remediation because an electric utility company (Alabama Power Corporation [APCO]) has constructed a transformer facility on this property since the OU-1/OU-2 ROD was issued. The work conducted for the property was described in a construction support work plan (P/S 2021b), and additional clarification regarding transition of the property from a low-activity special use property to a

nonresidential industrial use property was provided by P/S in response (P/S 2021c) to comments from USEPA on the construction support work plan (USEPA 2021b). This land use condition transition will be confirmed during the PDI.

2.1.1.2 Interim Measure Areas

Each OU-1/OU-2 IM (Figure 2-2) was evaluated for effectiveness in the OU-1/OU-2 FS (Ramboll Environ 2016) and the OU-1/OU-2 ROD (USEPA 2017). Most of the IMs were deemed as being effective, with small areas identified where additional remedial efforts are needed to ensure long-term effectiveness. These remedial areas were identified in the OU-1/OU-2 ROD for portions of several IMs (Figures 2-3a through 2-3f). The remedial areas include portions of the Northside Properties (Figure 2-3a), portions of the Eastside Properties (Figures 2-3b through 2-3d), and portions of the Eastside Drainage Way (Figure 2-3e). An overview of the Hall Street IM is shown on Figure 2-3f. The sampling results for each of the IMs identified on Figure 2-2 and the construction-related reporting details are included in Appendix A of the OU-1/OU-2 RI (Environ 2016).

Surface soil remediation has already been conducted for one of the IM areas in the Northside Properties located along the western side of Clydesdale Ave just north of the railroad tracks (Figure 2-3a). The subsurface soil PCB concentrations will be evaluated for this IM as part of the PDI.

Results from a recent inspection of the Hall Street IM indicated that portions of the surface soil cover were disturbed. The soil disturbance occurred through the staging of construction equipment on the surface of the IM by a utility construction contractor. While the overall IM appears intact, P/S are working with the landowner (Oxford Water and Sewer Board) to inspect the IM as part of the PDI. This inspection will evaluate whether portions of the Hall Street IM cover soils require augmentation to meet the IM design requirements. The OU-1/OU-2 RD will identify physical controls to limit future unauthorized vehicle access to the Hall Street IM area.

2.1.1.3 Dredge Spoil Piles

Dredging that was previously conducted in Snow Creek by the City of Anniston resulted in a series of dredge spoil areas placed along the nearby banks of the creek. Information regarding these dredge spoil piles was presented in the OU-1/OU-2 RI (Environ 2015). Several of the dredge spoil piles were previously removed while four remain (Figure 2-4). The available analytical testing results for these dredge spoil piles are shown on Figure 2-5a for dredge spoil pile SC-1 and on Figure 2-5b for dredge spoil piles SC-7 and SC-8.

2.1.1.4 Nonresidential Soil Areas

A significant number of nonresidential soil samples have been collected for OU-1/OU-2 over the past 20-plus years. PCB results for the surface samples are shown on Figure 2-6, and the subsurface PCB results are shown on Figure 2-7. The results of this sampling were evaluated on an EU basis, and these EUs are shown on Figure 2-8. Summary-level statistics for PCBs in surface soil from the OU-1/OU-2 RI and FS are presented in Table 2-1 on an EU basis and include the number of samples collected, the mean of the detected samples, the percentage of the EU that is nonresidential versus residential or special use properties, and the spatially weighted mean PCB concentration

that accounts for exposure potentially occurring in residential/special use portions of the EU. The subsurface PCB results from the OU-1/OU-2 RI are presented in Table 2-2.

In addition to PCBs, the OU-1/OU-2 ROD identified the need for remediation at specific locations for three non-PCB constituents:

- Polycyclic aromatic hydrocarbons (PAHs) as benzo(a)pyrene equivalents
- Chromium
- Polychlorinated dibenzo-p-dioxin and dibenzofurans (PCDD/DFs, as 2,3,7,8-tetrachlorodibenzo-p-dioxin equivalent [toxic equivalent or TEQ])

The results of soil sampling conducted for these three constituents are presented on Figures 2-9, 2-10, and 2-11, respectively.

2.1.1.5 T-11 Area Soil

The T-11 area is located adjacent to Snow Creek and just downstream of its confluence with the 11th Street Ditch. This area is highlighted in dark-blue shading on Figure 2-12, and the figure includes PCB concentrations for surface and subsurface soil. A low-permeability cover will be placed over this footprint following removal of an 18-inch layer of soil over the T-11 area and the deeper excavation of soil potentially acting as PTW directly surrounding groundwater well T-11.

2.1.1.6 PB-RR-37 Area

PCB concentrations in surface soil within the PB-RR-37 area are characterized by two soil samples (PB-RR-37 and PB-RR-40) that USEPA collected in March 2000 (Figure 2-3e). The samples have identical location coordinates and were reported to have been collected from the interval of 0 to 3 inches below ground surface (bgs). Sample PB-RR-37 had a reported total PCB concentration of 3,700 mg/kg, and PB-RR-40 had a total PCB concentration of 2.3 mg/kg. Because the reported concentrations of these co-located samples varied by more than 3 orders of magnitude, additional soil sampling in this area is proposed to evaluate the representative PCB concentrations in surface soil and subsurface soil relative to the respective remedial goals of 21 mg/kg and 97 mg/kg. Subsurface soil sampling at PB-RR-37 will also be conducted to the elevation of the groundwater table and if PCBs are detected in soil at the groundwater interface, the potential installation of a groundwater well at this location will be discussed with USEPA.

2.1.1.7 Select Creek Bank Areas with Stability Concerns

Creek banks along Snow Creek were inventoried and assessed in the OU-1/OU-2 RI and further evaluated in the OU-1/OU-2 FS. The results of the evaluation indicated that long stretches of Snow Creek were bordered by hardened structures such as concrete sidewalls or riprap. The other creek bank areas were inspected during the OU-1/OU-2 RI, and three general locations were identified in the OU-1/OU-2 FS as having concerns for creek bank stability based on a combination of bank conditions and elevated PCB concentrations in floodplain soil proximate to the creek banks. Two of the locations are in the EU5 portion of Snow Creek, including just downstream of the confluence of Snow Creek and the 11th Street Ditch and at the downstream end where EU5 intersects EU10

(Figure 2-13a). The third creek bank stability area is located downstream of Highway 202 (Figure 2-13b).

2.1.2 Groundwater

Groundwater investigations were conducted in OU-1/OU-2 prior to the RI as part of previous activities conducted at and adjacent to OU-3 and under the non-time-critical (NTC) residential removal program. Groundwater was also investigated as part of the RI. Details of investigations and their results relevant to the groundwater RD for the Eastside Properties and T-11 area are provided in the following subsections. Section 2.1.1.6 above discussed existing data for the PB-RR-37 area, where the need for groundwater RD activities will be determined based on findings of the PDI.

2.1.2.1 Eastside Properties

As discussed in the OU-1/OU-2 ROD, PCB concentrations in soil in portions of the Eastside Properties have been detected at concentrations over 500 mg/kg, indicating the potential presence of PTW. Between 1997 and 2012, IMs were implemented to reduce potential exposure to and migration of PCB-impacted soil. The IMs generally included soil caps where total PCB concentrations were less than 500 mg/kg and geomembrane caps where PCB concentrations were over 500 mg/kg. Existing soil characterization data for the Eastside Properties shown on Figures 2-14a through 2-14c were used to evaluate potential locations for a new groundwater monitoring well that met the following criteria: (1) an area with low or no PCB impacts in shallow soil to minimize potential drag-down of PCBs from soil to groundwater during well installation and (2) an area close to and downgradient of areas within the Eastside Properties with high PCB concentrations in soil.

2.1.2.2 T-11 Area

Groundwater samples collected from monitoring well T-11 (Figure 2-12) as part of the OU-1/OU-2 RI in 2008 exhibited total PCB concentrations in unfiltered samples ranging from 3.3 micrograms per liter (µg/L) (Aroclors) to 17.3 µg/L (homologs), with a nondetect result (Aroclors) and a concentration of 10.4 µg/L (homologs) reported following redevelopment of the monitoring well that was completed due to high turbidity noted in the initial samples (Environ 2015). Additional samples collected from T-11 in 2012 exhibited total PCB concentrations in the unfiltered sample between 12 µg/L based on Aroclors and 30 µg/L based on the sum of PCB homologs (Environ 2015). As noted in the ROD, the distribution of PCBs in the floodplain area surrounding T-11 appeared to be unique for the Site, characterized by the presence of the lower-chlorinated PCB compounds (e.g., Aroclor 1221 and monochlorobiphenyl and dichlorobiphenyl homolog groups).

Existing hydrogeologic data related to T-11 groundwater includes information on the dominant soil type observed during well installation, groundwater elevation data over time, and aquifer slug testing data. The soils encountered at T-11 consisted of an “orange to red, stiff to soft clay” that were present from ground surface to the termination depth of 21 feet bgs (Environ 2015). Based on the proximity of T-11 to the surface water of Snow Creek, the well was installed to monitor an interval of “minor moisture” observed from 6 to 10 feet bgs. The well is constructed with a 5-foot screen placed from 8.5 to 13.5 feet bgs. The water table at T-11 was observed at approximately 7 feet bgs following installation. Recent depth-to-water measurements have been consistent with

the initial observation, corresponding to a static water elevation of approximately 687.7 feet above mean sea level. The hydraulic conductivity reported for T-11 based on slug testing was 5.93 feet per day, corresponding to 2 x 10^{-3} centimeters per second (Environ 2015).

2.1.3 Snow Creek Sediment

Multiple sediment sampling programs provided data that were presented in the OU-1/OU-2 RI and used in the OU-1/OU-2 FS to evaluate sediment conditions in the OU-1/OU-2 portion of Snow Creek. Sediment samples were collected during the following sampling programs from locations shown on Figure 2-15:

- The Off-Site Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) Program (Blasland, Bouck & Lee, Inc., [BBL] 1999)
- The Field Sampling Plan for Non-Residential Properties of the Operable Unit 1/Operable Unit 2 Area of the Anniston PCB Site (BBL 2004) and associated addenda (BBL 2005 and 2006)
- The USEPA-led sediment sampling in 2000 (these data were provided to P/S via electronic data transfer [i.e., sediment samples collected at seven locations])
- West 9th Street Creek sediment sampling data that provides background results for locations upstream of the OU-1/OU-2 portion of Snow Creek (Solutia 2003)

Sediment data generated during these investigations served as the basis for evaluating the remedial alternatives presented in the OU-1/OU-2 FS. Most of the sediment samples and geomorphological information for Snow Creek were collected in 1999 as part of the Off-Site RFI program. The initial steps for this program included a detailed geomorphological mapping of the creek to identify the sediment deposits in the creek bed. The geomorphological information included mapping the sediment deposit locations, dimensions, and material types based on visual observations and geomorphological characterization (e.g., channel deposit, aggrading bar, bank deposit, terrace deposit, sand bar). The creek mapping results, which showed that some portions of the creek bed had no sediment due to localized high surface water velocity conditions, were used to develop the sampling strategy to characterize the Snow Creek sediment deposits for the Off-Site RFI. The data for that sampling program were reported in the *Off-Site RCRA Facility Investigation Report* (BBL 2000). The RFI investigation for Snow Creek included collecting 73 sediment samples from 34 individual locations within the OU-1/OU-2 portion of Snow Creek downstream of the creek's confluence with the 11th Street Ditch. Each sample was analyzed for PCBs, total organic carbon (TOC), and grain-size distribution. At the request of the Alabama Department of Environmental Management, approximately 10% of the samples with a bias toward the fine-grained sediment were analyzed for the following metals: arsenic, barium, beryllium, cadmium, chromium, cobalt, lead, manganese, mercury, nickel, and vanadium. An additional round of sediment sampling in the OU-1/OU-2 portion of Snow Creek was conducted under the Nonresidential Properties field sampling plan and associated addenda (BBL 2005, 2006). During this program, three sediment samples were collected from locations chosen to reflect low, medium, and high PCB concentrations. The primary goal of this sampling program was to generate data to evaluate, in addition to PCBs and TOC, the wider list of constituents over the range of PCB concentrations

typically present in Snow Creek. Data from this sampling program were reported in the OU-1/OU-2 RI (Environ 2015).

The primary constituent of concern in sediment is PCB (Ramboll Environ 2016). PCB concentrations in sediment are shown on Figure 2-16 based on the downstream distance (in miles) between the sample collection location and the confluence of Choccolocco Creek (i.e., the downstream end of OU-4) and Lake Logan Martin. Figure 2-16 also presents PCB results for samples that were collected upstream of the OU-1/OU-2 portion of Snow Creek to provide background context. Results for non-PCB constituents in sediment are respectively shown on Figures 2-17 through 2-24 for barium, chromium, cobalt, lead, manganese, mercury, nickel, and vanadium.

The existing sediment sampling data indicate that the highest total PCB concentrations (60 mg/kg) in Snow Creek sediment are generally found in the upstream portions of the creek between the 11th Street Ditch and Highway 202, including the culverts that convey flow under the highway. The data also indicate that sediment deposits in a small portion of Snow Creek near a railroad bridge located just downstream of Highway 202 have a mean sediment PCB concentration of 12 mg/kg. The sediment in the portion of Snow Creek between the railroad bridge and Highway 78 had an average PCB concentration of approximately 1.9 mg/kg. None of the prior sampling efforts included sediment sampling within the culvert beneath Quintard Mall, which is immediately upstream of Highway 78 (construction of Quintard Mall and the associated culvert was underway during the 1999 RFI). The culvert beneath Quintard Mall will be probed and sampled as part of the PDI (Section 3.3.2).

The OU-1/OU-2 FS identified two other sediment deposits as candidate remedial areas. These two areas had non-PCB constituents at concentrations above the remedial goals and PCB concentrations below the remedial goals. These sediment deposits were in the downstream portion of Snow Creek (i.e., in the vicinity of Snow Creek railroad crossing along South Noble Street [Figures 2-16 through 2-24]). One sediment deposit contained manganese above the remedial goal, and the other contained chromium, lead, manganese, and nickel above the remedial goals.

The existing investigation data indicated that Snow Creek sediments were predominantly coarse grained; only 26% of the deposits were characterized as containing more than trace amounts of silt and clay.

Snow Creek is a high-gradient stream, with a typical slope of 20 to 30 feet per mile, flowing through an urbanized corridor of Anniston and Oxford. The mean flow within Snow Creek increases from approximately 5 cubic feet per second at the confluence with the 11th Street Ditch to 28 cubic feet per second at the confluence with Choccolocco Creek. The steep basin terrain produces sharp peak flows. The estimated 10-year and 100-year recurrence interval floods for Snow Creek at the point it discharges to Choccolocco Creek are 4,030 and 6,900 cubic feet per second, respectively (Federal Emergency Management Agency [FEMA] 1993), with in-channel velocities frequently more than 5 feet per second during these large storm events.

There are no surface water gauging stations on Snow Creek, so a localized determination of the frequency of flood events cannot be calculated directly from Snow Creek data. There are two

gauging stations maintained by the United States Geological Survey (USGS) on Choccolocco Creek—one near Boiling Spring, Alabama (Station Number 04203310), and one approximately 30 miles downstream at Jackson Shoal near Lincoln, Alabama (Station Number 0240440). Data from these gauging stations were used to evaluate regional flood frequency. The USGS data from 1961 to 2019 at Jackson Shoal were used to calculate the 2-year storm flow of 11,500 cubic feet per second at Jackson Shoals near the downstream end of OU-4. The station near Boiling Spring was operational later, and data from 2003 to 2019 were used to calculate a 2-year storm flow of 3,350 cubic feet per second. The 2-year storm flow was exceeded 11 times at Jackson Shoals over the past 20 years. At Boiling Springs, the 2-year storm flow was exceeded 14 times over the period of record. These data indicate that storm flows that have occurred in the region appear to be in line with typical conditions over the period since the RFI sediment sampling program was conducted.

2.1.4 Snow Creek Surface Water

Surface water samples were collected during two sampling programs that provided data that were presented in the OU-1/OU-2 RI and used in the OU-1/OU-2 FS to evaluate surface water conditions in the OU-1/OU-2 portion of Snow Creek. The first sampling was conducted as part of the RCRA Program, and the second was conducted under the Nonresidential Properties FSP and associated addenda. Under the RCRA program, samples were collected from four locations that were selected to reflect the potential downstream movement of PCBs and sediment particulates from Snow Creek (OU- 1/OU-2) to Choccolocco Creek (OU-4). Two of the sampling stations were located approximately 2,000 feet (14th Street) and 3,000 feet (16th Street) upstream of the 11th Street Ditch–Snow Creek confluence. The other sampling stations were located downstream of OU-1/OU-2 at Snow Street and Oxford Lake Park. A total of 6 base-flow and 19 high-flow events were sampled at the downstream sampling stations. A single round of base-flow samples was collected at each of the upstream locations.

The second surface water sampling program was conducted under the Nonresidential Properties FSP and associated addenda in 2007. This program included collecting four whole-water samples during three different high-flow events. The samples were collected using an automated in-water ISCO sampler that was triggered by a flow gauge mounted on the bank near the sampling location. The sampling station was in the downstream area of Snow Creek (Oxford Lake Park). This location is just downstream of OU-1/OU-2 and was chosen to be representative of conditions at the downstream end of the OUs.

The surface water data for Snow Creek indicate that during base-flow conditions the downstream PCB contributions from Snow Creek to OU-4 are small and that total suspended solids and PCB transport in Snow Creek are extremely responsive to high-flow events. Most annual sediment transport occurs infrequently and over short periods during high-flow events. Given the low concentration of solids generally present in the creek during periods of low flow, the surface water PCB concentrations are expected to be quite low. This is important as base-flow conditions for the creek occur approximately 90% of the time.

2.2 Identification of Data Needs and Data Gaps

During the review of existing data from the OU-1/OU-2 RI, the OU-1/OU-2 FS, and other historical reports, data needs and data gaps were identified for floodplain and creek bank soil, groundwater, Snow Creek sediment, and site-wide evaluations for utilities, structures, and topo-bathymetry that need to be addressed to complete the OU-1/OU-2 RD as defined in the ROD. Descriptions of these data needs and data gaps are provided in the following subsections.

2.2.1 Floodplain and Creek Bank Soil

The existing floodplain soil and creek bank data were reviewed relative to the data needed to prepare an RD that meets the requirements of the OU-1/OU-2 ROD to identify data gaps. Data gaps were not identified for residential soil because all removal actions have been conducted for residential properties in OU-1/OU-2 where access has been granted and the properties have been identified as suitable for removal. No data gaps were identified for the high-activity special use areas because these areas have been sampled and removal actions completed where required under the Non-Time-Critical Removal Action (NTCRA) Agreement.

Comparing the data needed to complete the RD with the existing data did reveal data gaps for several other categories of floodplain soil and the creek bank areas identified in the OU-1/OU-2 ROD. The results of this comparison are presented below for the low-activity special use areas, IM areas, dredge spoil piles, nonresidential soils, and creek bank areas.

- **Low-activity special use areas:** PCB concentration data for subsurface soil in the low-activity special use area are needed to compare with the remedial goal of 97 mg/kg. While these data could be collected as confirmation samples during remedial action (RA) construction, most of these low-activity areas are easy to access, and the data can be efficiently collected during the PDI and used to scope the required excavation depths as part of the OU-1/OU-2 RD. Land use conditions at the low-activity special use areas will be reviewed during the PDI prior to completing sampling to confirm they are consistent with the Stipulation's definition of a low-activity special use area and are suitable for removal (e.g., are not heavily vegetated or wooded; like low-activity special use area with property identification number [PPIN] 20717). Documentation of current land use will be collected for all low-activity special use areas identified in the OU-1/OU-2 ROD. This information will be used to confirm that the land uses initially identified as part of the investigations conducted under the Stipulation have not changed. For example, if a low-activity area has transitioned to industrial use, relevant information (ownership, zoning, the removal or addition of built-structures, etc.) will be gathered to document this change in land use. If no changes to the properties have taken place since the initial surveys were conducted under the Stipulation, the plan is to conduct the sampling as described in Section 3.1.2.1. Any changes in land use will be discussed with USEPA and may result in modifying the sampling program. Consistent with the OU-1/OU-2 ROD, subsurface soil sampling will be conducted only for low-activity special use areas that are suitable for removal. For example, overgrown and paved areas will not be sampled.

- **IM areas:** PCB concentrations in subsurface soil for the specific IM areas identified in the OU-1/OU-2 ROD are needed to compare with the remedial goal of 97 mg/kg. These IM areas are accessible, and the data can be efficiently collected as part of the PDI. The Hall Street IM area is also accessible for conducting physical inspections of the cover integrity as part of the PDI. PCB concentrations in surface and subsurface soil for the drainage ditch located west and east of the PB-RR-37 location will be collected for comparison with the surface remedial goals for surface and subsurface soil of 21 mg/kg and 97 mg/kg, respectively. Surface soil at the downstream end of the eastern portion of this ditch that have the potential to erode and migrate to Snow Creek will also be compared to the remedial goal for sediment of 3 mg/kg.
- **Dredge spoil piles:** PCB concentration data are needed to assess whether remediation of dredge spoil pile SC-2 is required. Dredge spoil SC-1 and dredge spoil pile SC-2 are located sufficiently away from Snow Creek that soils located at the outside edge of the piles are not potential sources to Snow Creek. Soil PCB concentrations beneath the dredge spoil piles required to be removed will be assessed through analysis of post-removal samples collected during the RA construction phase of the project. The dredge spoil piles are in remote areas with difficult physical access. Collecting samples beneath the piles during RA construction will limit the disturbance of existing vegetation because the equipment needed to sample beneath these piles is like the equipment that will be used for their excavation. Since dredge spoil pile SC-8 is located adjacent to and within the borders of Snow Creek, this dredge spoil pile is being addressed as part of the Snow Creek sediment RD.
- **Nonresidential soil:** PCB concentrations in subsurface soil for the nonresidential soil areas identified in the OU-1/OU-2 ROD as candidate removal areas are needed to compare with the remedial goal of 97 mg/kg. For the PB-RR-37 area, surface soil PCB concentrations will be confirmed as an initial activity and, pending the results, the subsurface soil may be analyzed. Additionally, PCB concentrations at PB-RR-37 will be profiled from the ground surface to the groundwater table to evaluate the potential of PCBs to be leaching groundwater. Surface and subsurface soil from the ditch upstream and downstream of PB-RR-37 will also be evaluated relative to the applicable remedial goals. The surface soil PCB results from samples collected from the portion of the ditch closest to Snow Creek will also be assessed relative to potential erosion into Snow Creek. Geotechnical data are also needed to design the excavation of PTW soil at the T-11 area and for the broader T-11 area that will be capped with clean backfill and a low-permeability cover. These data will assist in assessing the potential for differential settlement of the post-cap surface if groundwater treatment equipment is constructed on the T-11 side of Snow Creek. Geotechnical data are also needed to design long-term access to the T-11 area that may include a bridge or pipe bridge.
- **Creek bank areas:** Geotechnical data are needed to assess creek bank stabilization options along Snow Creek at and immediately downstream of its confluence with the 11th Street Ditch.

The PDI field sampling procedures to address these data gaps are included in Section 3.1.

2.2.2 Groundwater

The review of existing groundwater data (Section 2.1.2) revealed several data needs and data gaps relevant to designing the groundwater-related components of the OU-1/OU-2 RD. The following subsections describe these data needs and the data gaps that need to be addressed to assess the potential for PCBs to leach from soil to groundwater at the Eastside Properties and design a treatment remedy for the T-11 area.

At the PB-RR-37 area, soil sampling will first be conducted to evaluate the potential for PCB-leaching from soil to groundwater as discussed in Section 3.1.2.1. Following receipt of soil sampling results, P/S will consult with USEPA on the need for groundwater investigation at the PB-RR-37 area. Depending on laboratory testing results, possible outcomes for this area may include no further investigation or installation of a groundwater monitoring well.

2.2.2.1 Eastside Properties

The data gap at the Eastside Properties to be addressed by the PDI is evaluating whether PCBs have leached from soil into groundwater at concentrations exceeding the remedial goal of 0.5 µg/L. PDI activities to address this data gap will include installing two new groundwater piezometers and installing and sampling two new groundwater monitoring wells (Section 3.2.2.1). Following receipt of groundwater monitoring results and interpretation, P/S will consult with USEPA on the need for and extent of additional PDI activities. Depending on laboratory testing results, possible outcomes may include no further investigation, confirmation resampling, or additional investigation to support the OU-1/OU-2 RD.

2.2.2.2 T-11 Area

Data gaps related to groundwater extraction and treatment at the T-11 area include current concentrations of total and dissolved PCBs as well as geochemical parameters, hydraulic properties of the groundwater-bearing unit (i.e., local gradient, hydraulic conductivity, well yield), the extent of aquifer response to pumping, and performance of carbon adsorption for removal of PCBs from groundwater. A range of PDI activities and a TS are planned to address these data gaps as discussed in Sections 3.2 and 4.1, respectively. Additional information on the groundwater TS is provided in Appendix B.

2.2.3 Snow Creek Sediment

Most of the existing sediment data for the OU-1/OU-2 portion of Snow Creek were generated as part of the 1999 RFI investigation. Due to the dynamic nature of the creek system, there is the potential for sediment deposits to have moved or for new sediment deposits to have formed over the past 20-plus years. In addition, the culvert beneath Quintard Mall and other portions of Snow Creek where property access was not granted were not characterized during the 1999 RFI. The culvert beneath Quintard Mall will be probed and sampled as part of the PDI as described in Section 3.3.2.

The sediment PDI will be conducted to address the following data gaps:

- Additional chemical and physical data are needed to provide updated information to refine the sediment remedial extents and volumes and to establish off-site disposal requirements.
- Treatability testing is needed to evaluate potential options for dewatering sediment that will be removed from the creek.

The PDI field sampling procedures and TS bench-scale testing procedures to address these data gaps are included in Section 3.3 and Section 4.2, respectively. Additional information on the sediment TS is provided in Appendix C.

2.2.4 OU-1/OU-2-Wide Evaluations

Data needs and data gaps were identified for floodplain and creek bank soil, groundwater, and Snow Creek sediment, as well as site-wide evaluations for utilities, structures, and topo-bathymetry that need to be addressed to complete the OU-1/OU-2 RD as defined in the ROD. Descriptions of these data needs and data gaps are provided in the following subsections.

As part of the OU-1/OU-2 RD process, existing conditions of utilities, structures (e.g., bridges, roadways, outfalls, and culverts), surface elevations, and the presence of cultural and archeological resources need to be evaluated for inclusion on design drawings and for any preventative measures that need to be implemented to protect the integrity of the utilities and structures.

The PDI will be conducted to address the following data gaps:

- Information is needed regarding structures immediately adjacent to target remedial areas to confirm that the remediation work will not affect the integrity of the structures.
- Current project base mapping is needed to support the development of the RD and contract drawings.
- Updated topography and bathymetry data are needed to support the design for the soil and sediment remediation and for use in hydraulic modeling of potential flooding impacts associated with potential remediation within and near the creek and the Highway 202 culvert area.

The PDI field sampling procedures to address these data gaps are included in Section 3.4.

2.2.5 Snow Creek Surface Water

The USEPA-selected remedy includes monitoring surface water at the upstream and downstream ends of OU-1/OU-2. Surface water sampling will be conducted as part of the PDI to establish a baseline for comparing post-remedy conditions. Since the ROD specified remedial goals for surface water based on the USEPA's chronic aquatic life freshwater ambient water quality criteria (AWQC), the monitoring will be conducted during base-flow conditions that are present 90% of the time.

As described in Section 3.5.2, the baseline surface water sampling program will include collecting up to 8 grab samples (1 sample quarterly for 2 years) from 1 upstream and 1 downstream location. Each grab sample will include collecting samples to measure total (unfiltered) and dissolved (filtered) concentrations in surface water. In addition, the baseline surface water sampling program will include collecting up to 4 passive samples (twice per year for 2 years) from each upstream and downstream location. Details for the baseline PDI surface water sampling are described in Section 3.5.

3. PREDESIGN INVESTIGATIONS FIELD SAMPLING PLAN

The PDI has been designed to collect necessary and relevant information to successfully complete the OU-1/OU-2 RD as defined in the ROD. Descriptions of the rationale and objectives for all PDI activities are included below, and the field sampling procedures to be followed to complete the PDI are described in the following sections. All PDI field work will be conducted in accordance with the UFP-QAPP (Appendix A).

3.1 Floodplain and Creek Bank Soil

PDI activities related to the soil RD will include floodplain subsurface soil sampling for the low-activity special use areas, the IM areas, and the nonresidential floodplain soil identified in the OU-1/OU-2 ROD. The PDI will also include sampling dredge spoil pile SC-2. Geotechnical sampling will also be conducted in the T-11 area. The following subsections present the investigation rationale and objectives and the scope of work and investigative methods to be employed.

3.1.1 Rationale and Objectives

The PDI field work for soil includes sampling and analyzing soil for dredge spoil pile SC-2, low-activity special use areas, IM areas, and nonresidential floodplain areas. The field work will also include geotechnical testing of soil borings from the T-11 area and in creek bank areas. Sampling residential or high-activity special use areas is not included in this PDIWP because these areas were sufficiently characterized during the OU-1/OU-2 RI and remediated where necessary based on the NTCRA requirements. The assessment of soil relative to PTW potentially being present at PB-RR-37 and the Eastside Properties is discussed in Section 3.2.2 of this PDIWP.

PDI efforts are focused on the following:

- For the dredge spoil piles, sampling will be focused on SC-2 to evaluate PCB concentrations relative to the remedial goal of 3 mg/kg.
- For confirmed low-activity special use areas, subsurface soil will be sampled at the same surface soil locations associated with the Stipulation (USEPA 2006) for comparison to the OU-1/OU-2 ROD requirement of 97 mg/kg. Sample locations will only include locations where surface soil concentrations were found to be greater than or equal to 1 mg/kg.
- For IM areas (excluding the Hall Street IM area and the Former Miller property), subsurface soil will be sampled relative to the subsurface remedial goal of 97 mg/kg. For the Hall Street IM area, a visual inspection of this area will be completed to evaluate whether portions of the IM cover soils require augmentation to meet the IM design requirements. The remedy of the Former Miller property portion of the Eastside Drainageway area includes removing the upper foot of soil in the identified areas, placing a 1-foot layer of clean backfill, and stabilizing the area with vegetation. Subsurface soil sampling will not be conducted for this IM area because PCB-containing soil is isolated at depth by design.

- For the nonresidential areas, subsurface soil will be sampled for the target remedial footprints identified in the OU-1/OU-2 ROD for comparison to the subsurface remedial goal of 97 mg/kg.
- For the PB-RR-37 area, historical results of co-located soil samples (PB-RR-37 and PB-RR-40) exhibited PCB concentrations differing by more than 3 orders of magnitude (3,700 mg/kg and 2.3 mg/kg, respectively). These variable concentrations suggest the potential for heterogeneity in surface soil PCB concentrations. Surface soil confirmation sampling will be conducted to assess PCB concentrations relative to the OU-1/OU-2 ROD requirement of 21 mg/kg. If PCB concentrations in surface soil are greater than or equal to 21 mg/kg, then the subsurface soil samples collected for this area will be analyzed and compared with the remedial goal of 97 mg/kg. In addition to the samples collected for the PB-RR-37 area, a discrete soil boring will be conducted at the PB-RR-37 location to develop a vertical profile of PCB concentrations from ground the surface to the elevation of the groundwater table. If PCBs are detected in soil at the groundwater interface, the potential installation of a groundwater well at this location will be discussed with USEPA. Additionally, soil sampling will be conducted to evaluate PCB concentrations in surface and subsurface soils within the drainage ditch upstream and downstream of the PB-RR-37 area.
- For the T-11 area, a geotechnical characterization will be completed to support the development of the RD for excavation and low-permeability capping in this area. The geotechnical investigation will also be used to evaluate potential bridge or pipe bridge options to access the T-11 area during and following engineering design aspects of the low-permeability cap, the groundwater treatment plant, and bridge foundations. Results of the geotechnical investigations along the banks of Snow Creek in the T-11 area will also be used, along with physical inspection results, to develop the RD for the select creek bank areas identified in the OU-1/OU-2 ROD.

The following are specific data quality objectives (DQOs) for the OU-1/OU-2 PDI for soil:

- SO-DQO 1: Refine the current understanding of PCBs for dredge spoil pile SC-2 to evaluate whether PCB concentrations exceed the remedial goal of 3 mg/kg. Once the dredge spoil piles identified for remediation are removed, surface soil and subsurface soil beneath the dredge spoil piles will be sampled and assessed for PCBs based on the ROD requirements of 21 mg/kg for surface soil and 97 mg/kg for subsurface soil.
- SO-DQO 2: Refine the current understanding of subsurface soil PCB concentrations in floodplain soil areas, including confirmed low-activity special use areas, certain IM areas, and the nonresidential areas, for comparison with the OU-1/OU-2 ROD remedial goal of 97 mg/kg.
- SO-DQO 3: Gather geotechnical characterization data from the T-11 area to support the detailed design of a low-permeability cap and creek bank stabilization measures.
- SO-DQO 4: Evaluate whether representative soil PCB concentrations at the PB-RR-37 area, including soil along the drainage ditch upstream and downstream of this area, are above the ROD requirements of 21 mg/kg for surface soil and 97 mg/kg for subsurface

soil. For locations adjacent to Snow Creek, concentrations will be compared to the OU-1/OU-2 ROD remedial goal of 3 mg/kg and evaluated relative to their ability to erode and migrate into Snow Creek. If PCBs are detected in subsurface soil proximate to the groundwater table in the PB-RR-37, discussions will be held with USEPA relative to the potential installation of a groundwater monitoring well to assess if groundwater PCB concentrations in this area exceed the remedial goal of 0.5 µg/L.

- SO-DQO 5: Evaluate whether portions of the Hall Street IM cover soils require augmentation to meet the IM design requirements.

Details of the proposed PDI activities to achieve SO-DQO 1 through SO-DQO 5 are provided in Section 3.1.2.

3.1.2 Scope of Work and Investigative Methods

Soil sampling and geotechnical borings will be completed as part of the PDI of floodplain and creek bank soil. The scope of work and field sampling procedures to be used to address data needs and data gaps identified in Section 2.2.1 are described below.

3.1.2.1 Soil Sampling

Composite soil sampling procedures will be used to sample dredge soil pile SC-2 and low-activity special use areas. A combination of composite sampling and Incremental Sampling Methodology (ISM) will be used to sample subsurface soil for the IM and nonresidential areas. The locations sampled in the low-activity special use areas will be reoccupied for the PDI, and composite subsurface samples will be collected using the NTCRA approach. The general procedures are outlined below, and additional details can be found in Attachment A-5 (Surface and Subsurface Soil Sampling), Attachment A-9 (Procedures for Compositing or Homogenizing Soil or Sediment Samples), and Attachment A-12 (Incremental Sampling Methodology Procedures) of the UFP-QAPP (Appendix A).

Dredge Spoil Pile SC-2

A single 5-point composite soil sample will be collected from dredge spoil pile SC-2 (Figure 3-1). The five sample points will be evenly distributed over the surface of the dredge spoil pile and collected from the 0–1-foot horizon.

Soil samples will be collected in accordance with Attachment A-5 (Surface and Subsurface Soil Sampling) of the UFP-QAPP (Appendix A). These general procedures will be followed for collecting the soil borings:

1. The sample location will be located, identified, and marked with a stake, flag, or similar marker.
2. Any debris or vegetation present will be cleared from the boring location to expose the ground surface.
3. Borings will be advanced using a hand auger (or equivalent method) to a depth of 1 foot.

4. The material collected from the five locations will be combined and homogenized into a bucket with a Teflon® liner or a stainless steel bowl or equivalent to form the composite sample for each dredge spoil pile in accordance with Attachment A-9 (Procedures for Compositing or Homogenizing Soil or Sediment Samples) of the UFP-QAPP. Quality assurance/quality control (QA/QC) samples will be collected and submitted to the laboratory in accordance with the UFP-QAPP. Sample container sizes, holding times, preservation requirements, and other information regarding the analytical program, specific methods, and QA/QC procedures are provided in the UFP-QAPP.
5. Composited material will be transferred into laboratory-supplied bottleware for shipment to the analytical laboratory. The bottleware will be labeled and temporarily stored on ice (4 ± 2 degrees Celsius [°C]) to await transport or preparation for shipment to the laboratory as directed in the UFP-QAPP. A minimum of 100 grams of material will be submitted to the analytical laboratory for analysis; sample mass requirements for PCB Aroclors by USEPA SW-846 8082 are listed in the UFP-QAPP.
6. Nondedicated sampling equipment, if used, will be decontaminated following completion of sampling of dredge spoil pile SC-2.

Low-Activity Special Use Areas

Land use conditions at the low-activity special use areas will be reviewed during the PDI prior to completing sampling activities to confirm they are consistent with the Stipulation's definition of a low-activity special use area and are suitable for removal (e.g., are not overgrown). Documentation of current land use will be collected for all low-activity special use areas, and the findings and any revisions to the proposed sampling plan will be discussed with USEPA. Subsurface soil sampling will be conducted only for confirmed low-activity special use areas that are suitable for removal.

Five-point composite subsurface soil samples will be collected in confirmed low-activity special use areas from the same locations that were used for surface soil sampling under the Stipulation where surface soil concentrations were found to be greater than or equal to 1 mg/kg (Figures 3-2a-l). Composite samples will be collected from three soil depth intervals of 1–2 feet bgs, 2–3 feet bgs, and 3–4 feet bgs. Composite samples collected from the soil depths of 2–3 feet bgs and 3–4 feet bgs will be archived at the analytical laboratory pending analysis of the composite sample collected from 1–2 feet bgs. The subsequent depth interval sample will be analyzed if PCB concentrations detected in the analyzed interval are above the PCB remedial goal for subsurface soils (97 mg/kg). For example, if PCB concentrations in the 1–2-foot-bgs composite sample interval are detected above the remedial goal for subsurface soil (97 mg/kg), the composite sample collected from the 2–3-foot depth interval will be analyzed.

The low-activity areas that will be sampled, pending confirmation of land use condition, are presented on Figures 3-2a through 3-2l except for the low-activity area located in the southeast corner of EU14 North that has been developed for industrial purposes after the OU-1/OU-2 ROD was issued. Soil samples will be collected in accordance with Attachment A-5 (Surface and Subsurface Soil Sampling) of the UFP-QAPP (Appendix A).

These general procedures will be followed for collecting the soil borings:

1. The sample location will be located, identified, and marked with a stake, flag, or similar marker.
2. Any debris or vegetation present will be cleared from the boring location to expose the ground surface.
3. Borings will be advanced using a hand auger, Geoprobe®, or equivalent method to depths of 1–2 feet, 2–3 feet, and 3–4 feet bgs.
4. For each depth, the material collected from the five locations will be combined and homogenized into a bucket with a Teflon® liner or a stainless steel bowl or equivalent to form the composite sample for each low-activity special use area in accordance with Attachment A-9 (Procedures for Compositing or Homogenizing Soil or Sediment Samples) of the UFP-QAPP. QA/QC samples will be collected and submitted in accordance with the UFP-QAPP. Sample container sizes, holding times, preservation requirements, and other information regarding the analytical program, specific methods, and QA/QC procedures are provided in the UFP-QAPP (Appendix A).
5. Composited material will be transferred into laboratory-supplied bottleware or zip-top bags for shipment to the analytical laboratory. The bottleware or zip-top bags will be labeled and temporarily stored on ice (4 ± 2°C) to await transport or preparation for shipment to the laboratory as directed in the UFP-QAPP. A minimum of 100 grams of material will be submitted to the analytical laboratory for analysis; sample mass requirements for PCB Aroclors by USEPA SW-846 8082A and PCB homologs by USEPA Method 680 are listed in the UFP-QAPP.
6. Nondedicated sampling equipment, if used, will be decontaminated between sampling in the low-activity special use areas.

Interim Measures and Nonresidential Areas

Soil samples will be used to develop the remediation depths for the targeted IM and nonresidential areas relative to the PCB remedial goal for subsurface soils of 97 mg/kg. The IM areas identified for sampling, remediation, and assessment are shown on Figures 3-3a through 3-3f. Composite sampling will also be conducted for surface soils (0–1 foot) in the area surrounding location PB-RR-37/PB-RR-40 (Figure 3-3e) to assess whether PCB concentrations in that area are greater than or equal to 21 mg/kg. The subsurface soil sampling efforts also include the IM located along the western side of Clydesdale Avenue just north of the railroad tracks (Figure 3-3a) where surface soil remediation has already been completed. The physical integrity of the Hall Street IM (Figure 3-3f) will also be assessed as part of the PDI.

The nonresidential areas selected for remediation in the OU-1/OU-2 ROD and included in the SOW are shown on Figure 3-4a through 3-4h. The figures show the remediation footprints where the surface soil will be excavated and the associated basis (PCBs versus non-PCB constituents). The PDI will be conducted for the PCB remediation footprints to evaluate conditions compared to the subsurface soil remedial goal of 97 mg/kg. One of the nonresidential remediation footprints shown on Figure 3-4a no longer requires remediation because the property was remediated under the NTCRA program after the OU-1/OU-2 ROD was issued. This property is in EU7 along its

border with EU5 (Figure 3-4a), and remediation involved the removal of surface and subsurface soil.

Five-point composite subsurface soil samples will be collected in IM areas and nonresidential areas where the size of the contiguous area to be sampled is equal to or less than 0.5 acres. All of the IM areas evaluated under this PDI are less than 0.5 acres and will be sampled by collecting one 5-point composite per 0.25-acre area (Table 3-1). Composite samples will be collected as described above from three soil depth intervals of 1–2 feet bgs, 2–3 feet bgs, and 3–4 feet bgs. Composite samples collected from 2–3 feet bgs and 3–4 feet bgs will be archived at the analytical laboratory pending analysis of the composite sample collected from 1–2 feet bgs. The subsequent depth interval sample will be analyzed if PCB concentrations detected in the analyzed interval are above the PCB remedial goal for subsurface soil (97 mg/kg).

Proposed sample locations are shown on Figures 3-3a-f for IM areas and Figures 3-4a-h for nonresidential areas. This includes collecting 5-point composite soil samples from the drainage ditches located upstream and downstream of PB-RR-37 (Figure 3-3e). Composite samples will be collected as described above from four sample depths: 0–1 foot bgs, 1–2 feet bgs, 2–3 feet bgs, and 3–4 feet bgs. Additionally, during collection of the 5-point composite samples, individual split samples (aliquots) for the two locations closest to Snow Creek will be collected from 0–1 foot bgs and analyzed for comparison to 3 mg/kg. The composite PCB results for samples collected from this ditch will be compared to the nonresidential remedial goal of 21 mg/kg. Samples collected from the soil depths of 1–2 feet and below will be archived at the analytical laboratory pending analysis of samples collected from 0–1 feet bgs.

The subsurface soil in nonresidential areas that are larger than 0.5 acres will be sampled using ISM in accordance with the Interstate Technology Regulatory Council (ITRC) *Technical Guidance: Incremental Sampling Methodology Update (ISM-2)* guidance document (ITRC 2020) and Attachment A-12 (Incremental Sampling Methodology Procedures) of the UFP-QAPP (Appendix A). ISM is a probabilistic sampling method used to evaluate the representative concentration of a constituent in an area. It is designed to provide an unbiased and statistically valid estimate of the mean concentration of analyzed constituents within each sample area of the IM areas. ISM was developed to decrease the effect of soil sample variability due to heterogeneity and provides a reasonably unbiased estimate of mean concentration in a defined soil volume, referred to as a decision unit (DU) (ITRC 2020). Each IM and nonresidential area will be sampled as three DUs based on sample depth: 1–2 feet bgs, 2–3 feet bgs, and 3–4 feet bgs.

The following general procedures will be followed for collecting all ISM samples:

1. The horizontal boundaries of the nonresidential area will be located using a handheld global positioning system (GPS) unit. The footprint of the nonresidential areas will be subdivided into a stratified grid of 30 cells as listed in Table 3-1, and 1 increment will be collected within each grid cell. A total of 30 increments will be collected per DU and composited into an increment sample as described in Step 5 below. The locations of each increment will be recorded with a handheld GPS.

2. Surface debris (e.g., wood, paper, sod, gravel, grass, and trash) will be removed in the immediate vicinity of the increment location prior to sampling. The increment location will be clearly marked.
3. Soil cores will be collected using a direct-push drill rig operated by a licensed drilling subcontractor. Larger pieces of material (cobbles, larger rocks) will not be included in samples.
4. At the time of sample collection, soil increments will be described using visual-manual procedures of ASTM International (ASTM) Standard D2488, which is based on the Unified Soil Classification System (USCS). Color, moisture content, visual grain-size distribution, and other pertinent characteristics will be noted. Information in the field notebook will include location, date, time, personnel and equipment present, down time, materials used, samples collected, and other observations or information that is relevant to the data collection objectives.
5. A representative subsample of approximately equal mass (at least 30 grams) from each increment will be collected using the plug subsampling technique (i.e., soil material from each core will be collected using a plug-type sampler [e.g., TerraCore®] equally spaced from one another along the length of the core) in accordance with ITRC ISM-2 guidance, depending on field conditions. If challenges are observed in the field using the plug subsampling technique, one of the following collection techniques found to be most suitable for field conditions will be consistently implemented to the increments within any given DU:
    a. Core wedge subsampling: Each soil core will be split into one-third to one-half wedges along the length of the core.
    b. Core slice subsampling: A 4-inch perpendicular slice will be randomly selected from each individual core.

    The representative subsamples from the 30 increments will be combined and homogenized into a bucket with a Teflon® liner or a stainless steel bowl or equivalent to form the complete ISM sample for each DU. Approximately 900 grams of material will be submitted per ISM sample to the laboratory.
6. Field replicates: The ISM-2 guidance document recommends that field triplicate ISM samples (i.e., the original increment sample plus two replicate increment samples) be collected. Field triplicates will be collected as indicated in Table 3-1. The collection of these field replicates allows for the calculation of the relative standard deviation (RSD),[1] which measures the precision or reproducibility of the sampling method and the heterogeneity of the analyte distribution throughout the DUs. The greater the RSD the less confidence there is in the estimate of the mean analyte concentration for that DU.

[1] RSD is expressed as a percent and is obtained by multiplying the standard deviation of the triplicate ISM sample concentrations by 100 and dividing this product by the average concentration of the triplicate ISM samples.

a. Field replicates will be collected as described in Steps 3 through 5 above for the original ISM increment sample. Replicate increment locations are unique from the original increment locations and are accessed using a different sampling path in the DU used to access the original ISM increment sample locations. For example, if the original ISM increment sample was collected by following a path from north to south starting in the west and moving east to access each increment location, a replicate increment sample could be collected by following a path from south to north starting in the east and moving west to access each increment location.

b. The RSD of the field replicate ISM samples will be calculated and expressed as a percentage. If the calculated RSD for a DU exceeds 50% and the average concentration for a DU exceeds the subsurface soil remedial goal of 97 mg/kg then additional ISM sampling may be necessary, using a larger number of sample increments per DU to obtain a more representative measure of the analyte concentrations in the DU. If additional sampling is necessary, it will be addressed in a separate addendum to this PDIWP.

7. Field QA/QC samples: Duplicates and matrix spike/matrix spike duplicates will be collected at frequencies specified in the UFP-QAPP (Appendix A).
8. After samples are collected and homogenized, material will be transferred into zip-top bags to encapsulate the sample. The zip-top bags will be labeled and temporarily stored on ice (4 ± 2°C) to await transport or preparation for shipment to the laboratory as directed in the UFP-QAPP.
9. Nondedicated sampling equipment, if used, will be decontaminated between DUs.

In accordance with sample preparation methods required for ISM, upon receipt at the laboratory, the ISM soil samples for inorganic and nonvolatile analyses will be air dried, disaggregated and sieved to 2 millimeters using a disaggregator prior to passing material though a #10 mesh screen to eliminate coarser materials not considered part of the soil fraction, and subsampled using the two-dimensional slabcake subsampling technique as described in ITRC ISM-2 and standard operating procedures (SOPs) for soil processing (SOP NC-OP-44) and subsampling (SOP NC-OP-046) provided in Attachment B (Analytical Lab SOPs) of the UFP-QAPP (Appendix A).

Soil samples will be analyzed for PCB Aroclors by USEPA SW-846 8082. ISM samples collected from the soil depths of 2–3 feet bgs and 3–4 feet bgs will be archived at the analytical laboratory pending analysis of the ISM samples collected from 1–2 feet bgs. The subsequent depth interval DU will be analyzed if PCB concentrations detected in the analyzed interval are above the PCB remedial goal for surface soils (21 mg/kg; 0–1-foot-bgs DU only) or subsurface soils (97 mg/kg). For example, if PCB concentrations in ISM samples collected from the 1–2-foot-bgs DU are detected above the remedial goal for subsurface soils (97 mg/kg), the ISM samples collected from the 2–3-foot-bgs DU will be analyzed.

DU horizontal extents and grid spacing for ISM are shown on Figures 3-4a-h for nonresidential areas. The horizontal extents and grid spacing will be the same for all sampling depths.

Discrete Boring at PB-RR-37

Surface and subsurface soil samples will be collected from depth intervals from a discrete location proximate to PB-RR-37 (Figure 3-5). Samples will be collected at 1-foot depth intervals from ground surface until the soil–groundwater interface is reached based on field observations (approximately 15 to 25 feet bgs). The last depth interval will be located immediately above the observed groundwater level. If PCBs are detected in soil at the groundwater interface, the installation of a groundwater well at this location will be discussed with USEPA.

These general procedures will be followed for collecting the soil boring:

1. The sample location will be located, identified, and marked with a stake, flag, or similar marker.
2. Any debris or vegetation present will be cleared from the boring location to expose the ground surface.
3. Borings will be advanced using a Geoprobe® or equivalent method to depths of groundwater.
4. The material collected from each 1-foot depth interval will be homogenized into a bucket with a Teflon® liner or a stainless steel bowl or equivalent in accordance with Attachment A-9 (Procedures for Compositing or Homogenizing Soil or Sediment Samples). QA/QC samples will be collected and submitted in accordance with the UFP-QAPP. Sample container sizes, holding times, preservation requirements, and other information regarding the analytical program, specific methods, and QA/QC procedures are provided in the UFP-QAPP (Appendix A).
5. Homogenized material will be transferred into laboratory-supplied bottleware or zip-top bags for shipment to the analytical laboratory. The bottleware or zip-top bags will be labeled and temporarily stored on ice (4 ± 2 °C) to await transport or preparation for shipment to the laboratory as directed in the UFP-QAPP. A minimum of 100 grams of material will be submitted to the analytical laboratory for analysis; sample mass requirements for PCB Aroclors by USEPA SW-846 8082A and PCB homologs by USEPA Method 680 are listed in the UFP-QAPP.
6. Nondedicated sampling equipment, if used, will be decontaminated between sampling depth intervals.

3.1.2.2 Geotechnical Investigation

Four geotechnical borings will be advanced at locations shown on Figure 3-6 within the general areas where the RA excavation and bank stabilization will be completed. The geotechnical boring to be advanced closest to well T-11 will be installed at one of the piezometer locations (i.e., TPZ-1 through TPZ-3) proposed as part of the groundwater PDI (Section 3.2.2). Track-mounted drill rigs will be used to advance the geotechnical borings to collect standard penetration test (SPT) blow counts and split-spoon samples for analysis as discussed in the following subsections.

Access and Preclearing Geotechnical Borings
Track-mounted drill rigs will be used to advance the geotechnical borings. For borings advanced in vegetated areas, paths will be cleared of the vegetation and construction mats (e.g., MobiDeck™ portable rigid construction mats or equivalent) will be placed to construct access roadways to the boring locations.

Prior to advancing geotechnical borings or other intrusive subsurface work, locations will be hand-cleared or air-knifed by the drilling subcontractor to a depth of 5 feet as a precaution to avoid shallow utilities in addition to completion of other project health and safety requirements (e.g., calling Alabama 811 and other utility clearance provisions identified in the OU-1/OU-2 RD/RA HASP). If the geophysical survey or hand-clearing/air-knifing indicate the presence of a utility, subsurface work will be relocated to an area that is expected to be clear of utilities, and the new location will be manually cleared to a depth of 5 feet.

Geotechnical Borings
SPT blow counts and split-spoon sampling will be conducted in accordance with ASTM D1586 (Standard Test Method for Penetration Test and Split-Barrel Sampling of Soils) by the drilling subcontractor with oversight and sampling conducted by P/S representatives. Split-spoon samples will be collected continuously to boring termination at approximately 40 feet bgs or refusal, whichever is encountered first. Split-spoon samples from each boring will be collected from the geotechnical borings for the following geotechnical laboratory analyses:

- Natural Moisture Content (ASTM D2216)
- Particle-Size Analysis (ASTM D6913 and ASTM D7928)
- Atterberg Limits (ASTM D4318)
- Engineering Classification (ASTM D2487)

One thin-walled Shelby-tube sample from each of the borings will be collected from cohesive soil horizons encountered in the borings. Representative Shelby-tube samples will be submitted for the following geotechnical laboratory analyses:

- Unconsolidated Undrained Triaxial Compression Test (ASTM D2850)
- Consolidated Undrained Triaxial Compression Test (ASTM D4767)

SPT blow counts and split-spoon samples will be collected generally as follows:

1. The split-spoon samplers and other reusable tools will be decontaminated at each sample location in accordance with Attachment A-2 (Field Cleaning and Decontamination Procedures) of the UFP-QAPP (Appendix A).
2. At each boring location, a 2-inch-diameter split-barrel sampler will be advanced by hollow-stem auger, rotary drilling, or sonic drilling. If hollow-stem auger or rotary drilling methods are used, the split-barrel sampler will be advanced using a 2-inch-diameter roller bit while circulating a bentonite slurry to maintain sidewall stability and

remove drill cuttings. Borings will be advanced continuously in 2-foot intervals to boring termination at approximately 40 feet bgs or refusal whichever is encountered first in accordance with Attachment A-6 (Subsurface Drilling and Monitoring Well Installation Procedures) of the UFP-QAPP (Appendix A).

3. At each 2-foot sampling interval, the split-barrel sampler will first be seated 6 inches and then driven an additional 18 inches with blows from a 140-pound hammer and 30-inch drop height. The number of hammer blows (i.e., blow counts) required to drive the sampler each 6 inches will be recorded. The blow counts required to advance the sampler through the middle 12-inch interval represents the N-value, which, when properly interpreted, is an index of soil strength, relative density (for granular soils), and consistency (for fine-grained soils).
4. Each boring and split-barrel sample will be appropriately logged by the P/S representative at the time of investigation. Lithologic field logs will include a visual description of material encountered for each depth interval and denote the corresponding blow counts, corresponding N-values, and relevant observations made during the drilling process.
5. Representative portions of the soil samples obtained from the spilt-spoon samplers will be placed in sample bags, marked with the corresponding boring designation and depth interval, and retained for submittal for geotechnical laboratory analysis. Samples will be maintained under chain-of-custody protocol in accordance with Attachment A-1 (Field Sample Packing, Handling, Shipping, and Chain-of-Custody Procedures) of the UFP-QAPP (Appendix A).
6. Once drilling is complete, each borehole will be tremie grouted from the bottom of the borehole to surface. The grout mixture will consist of 5% bentonite powder and 95% Portland cement as described in Attachment A-6 (Subsurface Drilling and Monitoring Well Installation Procedures) of the UFP-QAPP (Appendix A).
7. Soil and liquid investigation-derived waste (IDW) generated during field activities will be containerized separately in new, 55-gallon, steel drums and managed as described in Section 3.1.2.3.

Thin-walled Shelby tube samples will be used to recover relatively undisturbed cohesive soil samples from cohesive soils of the clay layer observed underneath fill material generally as follows:

1. If cohesive soil is observed during borehole advancement, a Shelby tube will be lowered to the depth and slowly pressed 24 inches into the soil.
2. Before the Shelby tube is withdrawn from the borehole, the tube will be left in the borehole for 10 to 15 minutes to allow the sampled material to stabilize inside the tube.
3. An end cap will be placed at the bottom end of the Shelby tube immediately upon retrieval. Any cuttings or wash materials will be removed from the top of the Shelby tube, and recovery will be measured and recorded in field notes.

4. Shelby tubes will be sealed at the ends with wax caps and several wraps of electrical tape. The exterior of the Shelby tube will be cleaned and clearly labeled with the boring number, depth range of the Shelby tube, recovery in inches, and an arrow indicating the top of the Shelby tube.
5. Shelby tubes will be transported and shipped in a vertical orientation to the geotechnical laboratory under chain-of-custody protocol.
6. Soil and liquid IDW generated during field activities will be containerized separately in new, 55-gallon, steel drums and managed as described in Section 3.1.2.4.

3.1.2.3 Inspection of Hall Street IM Area Cover Soils

Results from a recent inspection of the Hall Street IM area indicated that portions of the surface soil isolation cover were disturbed. The soil disturbance occurred when a utility construction contractor staged construction equipment on the surface of the IM. The Hall Street IM will be inspected as part of the PDI. This inspection will evaluate whether portions of the IM cover require augmentation to meet the IM design requirements (i.e., presence of geotextile marker layer, 12-inch soil cover layer, and vegetative cover).

The PDI visual inspection of the condition of the cover soils will include the observations of the following to document the most recent conditions of the surface soil cover:

- Poor vegetation (e.g., bare or unvegetated areas)
- Whether mowing or seeding and fertilizing is required
- Differential settlement producing areas of ponding
- Significant surface erosion
- Exposure of underlying geosynthetic layers
- Significant surface soil cracking (approximately 1 inch or greater in width)
- Other disturbances such as fallen trees that may adversely affect cap performance

In areas of disturbance, small (less than 1-inch diameter) soil cores will be collected to confirm cover soil thickness around the perimeter and within the area of the observed disturbance. The number of soil cores collected will depend on the surface area of the observed disturbance. If the thickness of the cover soil is less than the design requirement, the area will be repaired during the RA by placing and compacting a layer of soil on top of the disturbed area.

3.1.2.4 Characterization and Management of Investigation-Derived Waste

Soil cuttings, decontamination fluids, personal protective equipment (PPE), and other disposable soil-collection materials (e.g., acetate liners) will be containerized in 55-gallon, open-top, steel drums for off-site disposal at an appropriate facility. Drums will be filled to approximately 75% of volume capacity.

IDW identified as potentially contaminated with hazardous materials will be collected at the point of generation and later stored in a designated and clearly marked IDW management area. Containers will also be clearly labeled to indicate the source of the IDW. The IDW storage area will be inspected to ensure that storage procedures are adequate to keep the IDW isolated and contained. Potentially contaminated IDW will be identified based on its origin and olfactory and visual evidence. The volume of waste will be minimized whenever applicable, and soil, sediment, liquid, and PPE IDW will be segregated and separately containerized. Laboratory testing may be required to determine the proper disposal requirements of IDW anticipated to be generated as part of the PDI activities described above:

- The PPE and plastic sheeting will be disposed of as nonhazardous waste unless it has been visibly contaminated. Spent decontamination liquids will be containerized in drums and tested to determine the proper disposal method.
- Excess sample material will require testing, and the handling of this material will depend on its origin and characteristics. Olfactory and visual observations, as well as field screening with a photoionization detector and/or a flame ionization detector will be used to determine if the soil contains potentially elevated levels of volatile contaminants and direct where confirmation samples will be collected for analysis of PCB Aroclors by USEPA SW-846 8082 and hazardous waste characterization (i.e., toxicity characteristic leaching procedure, ignitability via SW846 7.1.2 or USEPA Method 1020B, corrosivity via USEPA 9045D, and reactivity via USEPA 9014 and USEPA 9034) per the UFP-QAPP. Excess sample material will be collected at the point of generation and later composited (as dictated by field measurements) and stored in a designated and clearly marked IDW management area.

Field personnel will document IDW generation in a drum log. A nonhazardous, hazardous, or pending-analysis label will be filled out with the appropriate generator information (i.e., generator contact information and contents of drum) and affixed to the drum.

Additionally, drums will be labeled with the following information using a paint pen (or similar):

- Unique identification (ID)
- Generator/contact information
- Date of waste generation
- Contents of the drum (PPE, acetate liners, etc.)
- Origin of contents
- Site name and address
- Percent of drum filled

After the PDI is completed, the drums will be disposed of at a permitted, off-site facility depending on their waste characterization designation (i.e., hazardous or nonhazardous).

3.2 Groundwater

PDI activities related to the groundwater RD will be performed at the Eastside Properties and the T-11 area. The following subsections present the investigation rationale and objectives as well as the scope of work and investigative methods to be employed. The approach for investigating the potential presence of PTW at PB-RR-37 is also provided below.

3.2.1 Rationale and Objectives

At the Eastside Properties, an assessment will be conducted to evaluate whether PCBs in soil have leached into underlying groundwater resulting in dissolved-phase PCB concentrations exceeding the remedial goal of 0.5 µg/L. Groundwater conditions will be assessed by installing two groundwater monitoring wells and two piezometers, collecting soil samples at various depths down to the soil–groundwater interface in one of the monitoring wells, and submitting select samples for analysis of PCB Aroclors and homologs. Once the two monitoring wells and two piezometers have been developed to remove fine sediment, static water levels will be measured in the new monitoring wells, new piezometers, and existing nearby monitoring wells to determine the local hydraulic gradient. Unfiltered and filtered groundwater samples will be collected from the two new monitoring wells and submitted for analysis of PCB Aroclors and homologs.

At the PB-RR-37 area, representative PCB concentrations in soil will be measured as described in Section 3.1 to evaluate the presence of PCBs at depth. If subsurface soil sampling indicates the presence of PCBs at the soil–groundwater interface, the results will be discussed with USEPA regarding potential next steps. These next steps could include no further actions regarding groundwater at PB-RR-37 or the installation of a groundwater monitoring well. If a groundwater monitoring well is installed, it will be developed to remove fine sediment, and unfiltered and filtered groundwater samples will be collected and analyzed for PCB Aroclors and homologs.

PDI activities related to groundwater in the T-11 area will provide data to support the design of the groundwater extraction-and-treatment system. The investigation will include assessing groundwater chemistry, hydrogeologic properties of the groundwater-bearing unit, and granular activated carbon (GAC) treatment performance.

Specific DQOs for the OU-1/OU-2 groundwater PDI are as follows:

- GW-DQO 1: Evaluate whether representative groundwater PCB concentrations at the Eastside Properties (and potentially location PB-RR-37) exceed the remedial goal of 0.5 µg/L.
- GW-DQO 2: Gather hydrogeologic data at the T-11 area to support the detailed design of a groundwater extraction-and-treatment system.
- GW-DQO 3: Evaluate potentially efficient and cost-effective GAC media for PCB treatment.
- GW-DQO 4: Estimate the time for PCB breakthrough in a full-scale GAC system.

Details of the proposed PDI activities to achieve GW-DQO 1 and GW-DQO 2 are provided in Section 3.2.2, and TS activities to be completed as part of the groundwater PDI to achieve GW-DQO 3 and GW-DQO 4 are provided in Section 4.1.

3.2.2 Scope of Work and Investigative Methods

3.2.2.1 Eastside Properties Groundwater Assessment

The proposed locations of the two new groundwater monitoring wells and two new piezometers in the Eastside Properties area are shown on Figure 3-7. The locations of the groundwater wells and piezometers were selected considering two key criteria:

- Selecting locations with low or no known PCB impacts in shallow soil (i.e., soil sample locations with light blue symbols on Figure 3-7) to minimize the potential to drag down PCBs from soil to groundwater during well installation
- Selecting a location reasonably close to and downgradient of the area within the Eastside Properties where elevated soil PCB concentrations have been observed[2]

The proposed well locations were determined, in consultation with USEPA, by reviewing the groundwater flow direction and PCB soil data within the Eastside Properties to identify areas that are both downgradient of the area where elevated soil PCB concentrations in proximity to the groundwater table have been observed and have low or no known PCB impacts in shallow soil. The two proposed well locations are approximately 75 and 130 feet downgradient from the area of elevated PCB soil concentrations and are surrounded by soil showing little (≥1 to <10 mg/kg) or no (not detected to <1 mg/kg) PCB impacts. The locations are also within a reasonable groundwater travel distance from the area of elevated PCB soil concentrations as further discussed below.

Potentiometric surface elevations from May 2020, which are shown on Figure 3-8, indicate that groundwater within the Eastside Properties flows to the north-northwest (P/S 2021d) with a hydraulic gradient of approximately 0.04. The potentiometric surface shown on Figure 3-8 was developed using water levels from all shallow residuum wells across and near OU-3 of the Anniston PCB site. At the time, six wells existed within the Eastside Properties, but in 2021, wells OW-07 and OW-09 were plugged and abandoned, leaving wells OW-06A, T-03, T-20, and OWR-09S within the Eastside properties.

A falling-head slug test conducted in well OW-07, located within the Eastside Properties (Figure 3-8), indicated a hydraulic conductivity of 7.1 x 10^{-5} centimeters per second (0.2 feet per day;

[2] Multiple IMs were implemented to address PCB-containing soil within the Eastside Properties with a majority of the construction occurring in 1997 and 1998. The IMs at the Eastside Properties include multilayer soil covers (i.e., nonwoven geotextile marker layer, minimum of 12–14-inch-thick soil isolation cover, and vegetative cover), as well as a high-density polyethene (HDPE) membrane liner in select areas. The IMs implemented during 1997/1998 were approved by the Alabama Department of Environmental Management at that time. These IMs were subsequently included in the OU-1/OU-2 ROD as part of the selected remedy subject to additional investigation of groundwater to confirm that PTW is not present in the Eastside Properties area.

Solutia 2002). When an estimated effective porosity for the shallow residuum clay of approximately 0.2 is used, the seepage velocity is approximately 10 to 20 feet per year. The proposed monitoring well locations are approximately 75 and 130 feet north-northwest (downgradient) of sample location SED0420R5 with a total PCB concentration of 25,000 mg/kg, 95 and 150 feet north-northwest (downgradient) of sample location SED0400 with a total PCB concentration of 200,000 mg/kg, and approximately 30 feet northeast and 70 feet east-southeast of sample location MH-7 with a total PCB concentration of 6,200 mg/kg in the 0–6-inch depth interval.

The proposed well locations represent a groundwater travel time of less than 10 years from the area of elevated PCBs in soil. Soil sample SED0400, along with the immediately surrounding soil samples with elevated PCB concentrations, were collected nearly 27 years ago in early 1995, suggesting that the estimated travel time in the downgradient direction is reasonable to assess groundwater impacts at the Eastside Properties. The two proposed monitoring wells and two proposed groundwater piezometers will be drilled, installed, and developed following the procedures in Attachment A-9 (Subsurface Drilling and Monitoring Well Installation Procedures) of the UFP-QAPP (Appendix A). Sonic drilling with two temporary surface isolation casings is anticipated for installation of these wells. The use of dual telescoping temporary isolation casings is proposed to minimize the likelihood of PCB drag-down from surface soil. The outermost isolation casing (10-inch diameter) is proposed to be installed to a depth of 5 feet, and the inner isolation casing (8-inch diameter) is proposed to be installed to a depth of 10 feet.

In addition to the standard soil logging that is conducted during installation of all monitoring wells and piezometers (as specified in Section 2.0 of Attachment A-6, Subsurface Drilling and Monitoring Well Installation Procedures), soil samples for analysis of PCB Aroclors and homologs will be collected from one of the monitoring well boreholes at 1-foot depth intervals from the ground surface until the soil–groundwater interface is reached based on field observations (approximately 10–15 feet bgs), following a similar procedure to that specified in Section 3.1.2.1 for the collection of soil samples from the discrete boring at PB-RR-37. Collection of the soil samples from one of the monitoring well boreholes will follow these general procedures:

1. The material collected from each 1-foot depth interval will be homogenized into a bucket with a Teflon® liner or a stainless steel bowl or equivalent in accordance with Attachment A-9 (Procedures for Compositing or Homogenizing Soil or Sediment Samples). QA/QC samples will be collected and submitted in accordance with the UFP-QAPP. Sample container sizes, holding times, preservation requirements, and other information regarding the analytical program, specific methods, and QA/QC procedures are provided in the UFP-QAPP (Appendix A).
2. Homogenized material will be transferred into laboratory-supplied bottleware or zip-top bags for shipment to the analytical laboratory. The bottleware or zip-top bags will be labeled and temporarily stored on ice (4 ± 2 °C) to await transport or preparation for shipment to the laboratory as directed in the UFP-QAPP. A minimum of 100 grams of material will be submitted to the analytical laboratory for analysis; sample mass

requirements for PCB Aroclors by USEPA SW-846 8082A and PCB homologs by USEPA Method 680 are listed in the UFP-QAPP.

3. Nondedicated sampling equipment, if used, will be decontaminated in accordance with Attachment A-2 (Field Cleaning and Decontamination Procedures) between sampling depth intervals.
4. Once the static water level in the well borehole has been determined following well installation but prior to well development, the following soil samples will be collected and then submitted to the analytical laboratory: the sample from the 1-foot interval immediately above the static water level and a subset of the overlying samples (e.g., one sample for every 5 feet bgs down to the static water level).

Based on previously installed wells within and near the Eastside Properties, it is anticipated that these wells and piezometers will be approximately 35 to 40 feet deep. Well screen intervals of 10 feet are recommended for the two new monitoring wells and two new piezometers based on the nature of groundwater flow in the shallow residuum occurring within thin silt and sand seams interbedded in the clay matrix. A 10-foot well screen interval is also consistent with the other wells located within the Eastside Properties (i.e., OW-06A, OW-09S, T-3, and T-20).

After the two new monitoring wells and two new piezometers have been installed and developed, depth to water measurements will be collected until the water levels have returned to static conditions in each new well and piezometer. After the water level in each new well and piezometer have recovered to static conditions, a static water level survey of the two new monitoring wells, the two new piezometers, and the four existing Eastside Properties monitoring wells OW-06A, OW-09S, T-3, and T-20 will be conducted to determine the local hydraulic gradient. Top-of-casing elevation measurements will be collected at the new monitoring wells and piezometers by a professional land surveyor.

Once the static water level survey is completed, groundwater samples will be collected from the two new monitoring wells following the procedures in Attachment A-7 (Groundwater Sampling Procedure) of the UFP-QAPP (Appendix A). At each of the two monitoring wells, an unfiltered sample and a filtered sample will be collected using a 0.1-micron filter. In addition, QA/QC samples, including a duplicate sample and matrix spike/matrix spike duplicate samples, will be collected from one of the monitoring wells. All samples, including QA/QC samples, will be analyzed for PCB Aroclors and PCB homologs. Required sample volumes, preservation methods, analytical methods, reporting limits, and DQOs for analysis of PCB Aroclors and PCB homologs in groundwater samples are provided in the UFP-QAPP (Appendix A).

The data will be evaluated in consultation with USEPA to assess whether additional data collection is warranted. Once a determination is made through consultation with USEPA that no additional data are needed, the two piezometers and groundwater wells will be overdrilled, plugged, and abandoned following the procedures in Attachment A-8 (Monitoring Well/Borehole Abandonment Procedure) of the UFP-QAPP (Appendix A).

3.2.2.2 T-11 Area Hydrogeologic Assessment

The groundwater PDI at the T-11 area will use a three-phase approach to evaluate hydrogeologic conditions in the T-11 area. Each phase will be designed to gather specific data to address the GW-DQO for this area:

- Phase 1 will include redeveloping the T-11 well, sampling groundwater for laboratory analysis of PCBs and geochemical parameters to supplement existing characterization data, and confirming the hydraulic conductivity of the transmissive zone through aquifer slug testing.
- Phase 2 will involve installing groundwater observation wells to be used in subsequent aquifer pump testing and collecting soil samples for geotechnical analysis.
- Phase 3 will include conducting aquifer pump testing to assess aquifer response and well yield for designing the extraction wells. It is anticipated that a portion of the groundwater discharge from the aquifer pump tests will be collected for use in the groundwater TS described in Section 4.1 and Appendix B.

The PDI activities for each phase are described in the following subsections.

Phase 1: Well Redevelopment, Groundwater Sampling, and Slug Testing

For Phase 1 of the groundwater PDI at the T-11 area, well T-11 will be redeveloped, groundwater samples will be collected and sent for analysis of PCBs and geochemical parameters, and hydraulic conductivity of the groundwater-bearing unit will be confirmed through aquifer slug testing.

Well T-11 will be redeveloped to achieve two primary objectives: (1) ensure that samples collected from T-11 are representative of groundwater by minimizing the presence of very fine-grained soil particles in groundwater samples and (2) ensure that results obtained during subsequent aquifer testing are representative by maximizing the well yield. Historical sampling data indicate high turbidity (due to very fine-grained soil particles present in the groundwater) in samples collected from well T-11 (e.g., >1000 nephelometric turbidity units [NTUs] in samples collected in April 2008). The presence of such fine-grained soil may affect PCB concentrations in groundwater samples due to the potential for sorbed-phase PCBs to enter the well. Well redevelopment will follow the procedures specified in Section 12.0 of Attachment A-6 (Subsurface Drilling and Monitoring Well Installation Procedures) of the UFP-QAPP (Appendix A). Ideally, well redevelopment will continue until measured turbidity readings are less than 10 NTUs or have stabilized to within ±10% for values greater than 10 NTUs.

After the well has been developed and water level in the monitoring well has recovered to static conditions, groundwater samples will be collected following the specified procedures in Attachment A-7 (Groundwater Sampling Procedure) of the UFP-QAPP (Appendix A). An unfiltered sample, a filtered sample collected using a 0.1-micron filter, duplicate unfiltered and filtered samples, and matrix spike/matrix spike duplicate unfiltered and filtered samples will be collected in accordance with the UFP-QAPP (Appendix A). Filtered and unfiltered samples, including QA/QC samples, will be analyzed for the following:

- PCB Aroclors (USEPA SW-846 8082)
- PCB homologs (USEPA Method 680)
- TOC (or dissolved organic carbon for filtered sample; USEPA Method 9060A)
- Cations (calcium, magnesium, sodium, potassium, manganese, iron; USEPA Method 6010C)
- Anions (sulfate, chloride, nitrate; USEPA Method 300.0)
- Alkalinity (Standard Method 2320B)
- Hardness (Standard Method SM 2340B)
- Total suspended solids (or total dissolved solids for filtered sample; Standard Method 2540D and 2540C)

A filtered sample will be collected using a 0.1-micron filter to evaluate the dissolved fractions of organic carbon, cations, anions, and hardness. Required sample volumes, preservation methods, analytical methods, reporting limits, and laboratory DQOs for analysis of PCB Aroclors, PCB homologs, and the geochemical parameters specified above in groundwater samples are provided in the UFP-QAPP (Appendix A). Water quality parameters (i.e., pH, conductivity, temperature, dissolved oxygen, oxidation-reduction potential, and turbidity) will be recorded in the field notebook at the time of sampling. Additionally, dissolved iron (Fe^{2+}) will be measured using a field test kit (e.g., Hach Model IR-18C or equivalent) and recorded in the field notebook at the time of sampling.

Once the water level in the monitoring well has recovered to static conditions after well development, T-11 will be slug tested following the procedures in Attachment A-10 (Slug Test Procedure) of the UFP-QAPP (Appendix A). Slug testing at well T-11 will be performed to confirm the hydraulic conductivity for the well of 5.93 feet per day that was reported in the OU-1/OU-2 RI (Environ 2015). Once the field activities of Phase 1 are completed, the slug testing data will be analyzed using the AQTESOLV software to calculate the hydraulic conductivity for T-11.

Phase 2: Observation Well Installation

During Phase 2, three observations wells (also referred to as piezometers) will be installed around T-11 for use in Phase 3. The proposed locations of these three observation wells were established based on theoretical drawdown-versus-distance estimates developed using the reported hydraulic conductivity estimate of 5.93 feet per day (Environ 2015). The graphic below (Exhibit 1) shows the expected drawdown as calculated using the Theis equation as a function of distance from the extraction well at various time steps at a pumping rate of 1.5 gallons per minute (gpm). Specific yield of 0.3 (indicative of an unconfined sandy aquifer; Morris and Johnson 1967) was used in the analysis. The hydraulic gradient used in the analysis is based on the gradient from well T-11 to Snow Creek. Based on this analysis, drawdown in the well is not predicted to exceed the available water column (approximately 7 feet). The analysis also predicts that a 1.5-gpm pumping rate should result in measurable drawdown up to 12 feet away from well T-11 after pumping for 8

hours. The predicted drawdown is sensitive to the hydraulic conductivity; therefore, this analysis will be updated based on the slug testing results conducted in Phase 1 as further described below.

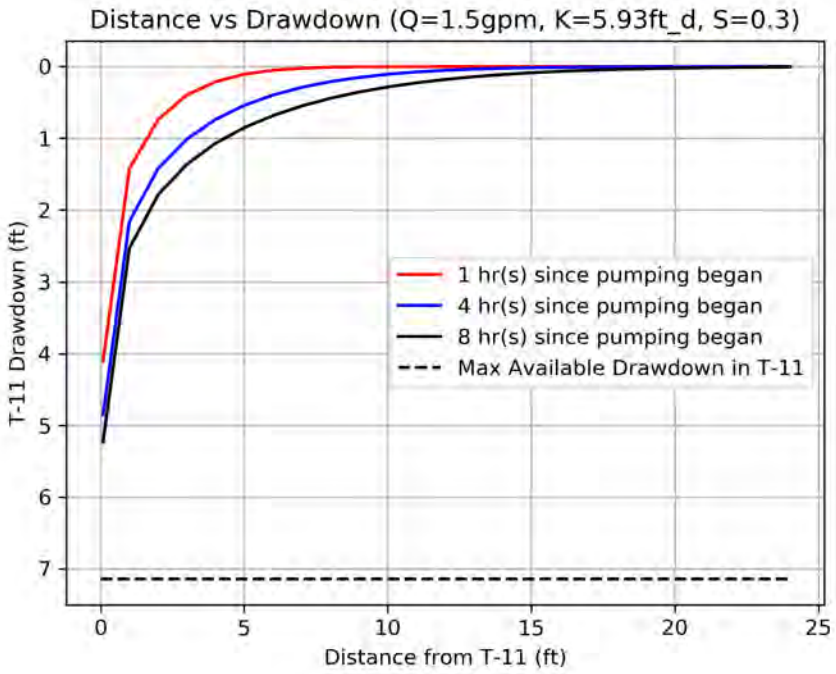

Exhibit 1. Expected drawdown using Theis equation

Based on these calculations, temporary observation wells are proposed to be placed at distances of approximately 5 feet upgradient (to the northeast), 10 feet downgradient (to the south), and 12 feet cross-gradient (to the west) from T-11 (Figure 3-6). If the hydraulic conductivity calculated from slug testing conducted in Phase 1 is significantly different (i.e., more than 1 order of magnitude [10 times] difference) than the previously reported value of 5.93 feet per day, then the proposed observation well locations will be reassessed.

The three temporary observation wells will be drilled, installed, and developed in accordance with the specified procedures in Attachment A-6 (Subsurface Drilling and Monitoring Well Installation Procedures) of the UFP-QAPP (Appendix A). Sonic drilling with temporary surface isolation casings is anticipated for installation of these wells. Based on the observed depth at which moisture occurred in well T-11, these wells will be drilled to similar depths (approximately 15 feet bgs) and have similar screened intervals (8.5 feet to 13.5 feet bgs). Since these wells will be very shallow, surface casings will only be installed to 5 feet bgs instead of the standard 10 feet specified in Attachment A-6 (Subsurface Drilling and Monitoring Well Installation Procedures) of the UFP-QAPP. Following the aquifer testing and associated data processing, and following consultation with USEPA, the three observation wells will be overdrilled, plugged, and abandoned following the procedures in Attachment A-8 (Monitoring Well/Borehole Abandonment Procedure) of the UFP-QAPP.

A geotechnical boring will be advanced to an approximate depth of 40 feet bgs to satisfy data needs for the soil and groundwater portion of the PDI in the T-11 area. This boring will also be

used as part of the groundwater program. At least one sample will be collected from the interval of 1.5–2 feet bgs, and two samples will be collected from the depth interval of the groundwater-bearing unit at 7–8 feet bgs and 9–10 feet bgs. Additional samples may be submitted for analysis to satisfy the data needs of the soil PDI (as discussed in Section 3.1.2), and all samples will be maintained under chain-of-custody protocol in accordance with Attachment A-1 (Field Sample Packing, Handling, Shipping, and Chain-of-Custody Procedures) of the UFP-QAPP (Appendix A).

Once drilling is complete, the borehole will be tremie grouted from the bottom of the borehole (approximately 40 feet bgs) to approximately 15 feet bgs before the well screen is installed to have similar construction details as the other observation wells to be installed in the T-11 area.

Phase 3: Specific-Capacity and Pump Testing

For Phase 3, aquifer pumping tests at well T-11 will be used to evaluate aquifer response and well yield for designing the groundwater extraction-and-treatment system. Aquifer testing will be conducted to evaluate groundwater response within the groundwater-bearing unit to various pumping rates. Aquifer testing will use the three temporary observation wells installed during Phase 2 and will include step-drawdown, constant-rate, and recovery tests at well T-11. Data from the test(s) will be analyzed with a commercially available software package (i.e., AQTESOLV) to derive appropriate aquifer properties and evaluate well performance. The aquifer specific-capacity test (also known as a step test) and pumping test (also known as a constant-rate test) will follow the procedures in Attachment A-11 (Specific-Capacity and Pumping Test Procedures) of the UFP-QAPP (Appendix A).

The specific-capacity test will be conducted first to determine the maximum sustainable pumping rate that can be used during the pumping test. As described in Phase 2 above, an approximate maximum pumping rate for well T-11 based on assumed parameters (including the reported hydraulic conductivity of 5.93 feet per day) was calculated to be 1.5 gpm. The hydraulic conductivity calculated from the results of the slug test conducted in Phase 1, if significantly different than 5.93 feet per day (i.e., 1 order of magnitude [10 times] difference), will be used to reevaluate the pumping rate steps described in Section 5.0 of Attachment A-11 of the UFP-QAPP.

The constant-rate pumping test will commence after groundwater levels have fully recovered to static water level conditions (or at least 24 hours) following the end of the specific-capacity test. The groundwater discharge from the aquifer pump test will be containerized, treated, and disposed of using methods like those used for purge water generated during OU-3 groundwater sampling activities. Approximately 120 gallons of the discharge water from the pump test will not be treated; instead, it will be containerized in 30-gallon drums or 5-gallon plastic totes and shipped via chain-of-custody control to SiREM in Knoxville, Tennessee, for use in the groundwater TS described in Section 4.1 and Appendix B. The actual amount of water required for the TS may be larger or smaller depending on the reported PCB concentrations of the groundwater samples collected during Phase 1.

The data from the specific-capacity test and pumping test will be analyzed using the AQTESOLV software to estimate hydraulic properties of the groundwater-bearing unit including transmissivity, hydraulic conductivity, and storativity (or storage coefficient). The results of the pumping test will be used to support the detailed design of the full-scale extraction-and-treatment system.

3.3 Snow Creek Sediment

3.3.1 Rationale and Objectives

As described in Section 2.1.3, most of the existing sediment data for the OU-1/OU-2 portion of Snow Creek were generated as part of the 1999 RFI investigation. Additional data are needed to address the data gaps listed in Section 2.2.3 and provide updated information to refine the sediment remedial extent and sediment characteristics.

The overall purpose of the sediment PDI is to further define the chemical and physical characteristics of the sediment to support the OU-1/OU-2 RD. Specific DQOs for the OU-1/OU-2 sediment PDI are as follows:

- SED-DQO 1: Provide an updated delineation of the current locations, extents, and depths of sediment deposits within the OU-1/OU-2 portion of Snow Creek as compared to the deposits depicted in the OU-1/OU-2 FS to refine removal volume estimates.
- SED-DQO 2: Refine the current understanding of sediment in the OU-1/OU-2 portion of Snow Creek that exceed the remedial criteria listed in the ROD to define the lateral and vertical limits of sediment removal.
- SED-DQO 3: Evaluate potentially efficient and cost-effective methods for dewatering and stabilizing sediment excavated from Snow Creek.
- SED-DQO 4: Evaluate treatment technologies that may be necessary to meet the requirements for discharging the supernatant that drains from sediment excavated from the creek.

Details of the proposed PDI activities to achieve SED-DQO 1 and SED-DQO 2 are provided in Section 3.3.2, and TS activities to be completed as part of the sediment PDI to achieve SED-DQO 3 and SED-DQO 4 are provided in Section 4.2.

3.3.2 Scope of Work and Investigative Methods

The sediment PDI will use a two-phase approach to evaluate the current condition of sediment deposits in the creek. Each phase will be designed to gather specific data to address the specified DQOs, as follows:

- Phase 1 will include reconnaissance and probing to identify the current locations of sediment deposits and measure their dimensions to quantify the volume of sediment deposits in the creek.
- Phase 2 will include sampling the sediment deposits identified in Phase 1 to supplement existing sediment data, support the delineation of sediment that has PCB and other

constituent concentrations above the cleanup levels defined in the ROD, and establish waste disposal requirements.

The PDI activities for each phase are described in the following subsections.

3.3.2.1 Phase 1: Sediment Probing and Reconnaissance

Phase 1 of the sediment PDI will include site reconnaissance and probing to identify the presence and extent of sediment deposits and soft sediments within the OU-1/OU-2 portion of Snow Creek. The Phase 1 probing will measure the sediment deposit dimensions, including thicknesses, to quantify the volume of sediment deposits in the creek. The physical dimensions of the creek bottom and the top elevation of the creek bed will also be measured, and the substrate types will be observed and mapped.

The Phase 1 sediment PDI approach will be like the approach used in the 1999 sediment deposit mapping and the geomorphological characterization (e.g., aggrading bar, channel deposit, terrace deposit, bank deposit, sand bar). The data generated during the PDI will be used to supplement, where appropriate, the data collected during the 1999 RFI. The Phase 1 PDI will also target the culvert beneath Quintard Mall that was constructed after the RFI was completed.

The geographical distribution of sediment in Snow Creek will be evaluated based on continuous visual inspections (access permitting) between the 11th Street Ditch and Highway 78 downstream of Quintard Mall (the termination point of OU-1/OU-2). Field reconnaissance and probing will be conducted along transects spaced approximately 100 feet apart along both sides of the creek and across the midsection of the channel to identify sediment deposits. In addition, the channel widths and bank heights will be measured at each of the 100-foot transects (Figures 3-9a through 3-9cc), and observations of bank erosion will be noted. Sediment deposits and areas of soft sediment between 100-foot transects will also be identified and mapped to determine the presence, area, and volume of each deposit. For comparison, the sediment deposits identified during the 1999 RFI and the prior sediment sampling locations are also shown on Figures 3-9a through 3-9cc. The final transect locations may be adjusted based on conditions encountered in the field. Probing will be conducted every 10 feet along each transect.

The reconnaissance and probing task will be accomplished by walking or wading along Snow Creek. To the extent possible, probing will be performed during a period of low creek flow and when significant rain is not forecasted. The probing will be performed using a small-diameter (less than 0.5 inches) steel rod advanced manually through the sediment to refusal to identify depositional areas. Areas that are penetrable with the rod by at least 4 inches and are at least 50 square feet in area will be considered sediment deposits. Each deposit will then be probed further to determine its lateral extent and the apparent average thickness. A standard survey rod (approximately 2 inches in diameter) will be used to measure water depth and identify the sediment–water interface. The field SOP included as Attachment A-3 (Sediment Probing and Sampling Procedures) of the UFP-QAPP (Appendix A) provides additional guidance and details regarding probing methods to be used.

Sediment deposits identified during probing will be characterized with respect to texture (fine vs. coarse) as well as localized geomorphological characteristics of the creek, including channel deposits, terraces, aggrading bars, and bank slopes. Each of the sediment classifications and geomorphological features will be mapped on a detailed aerial photograph of each creek section. The geographical distribution of sediment in Snow Creek will be determined based on continuous visual inspections (access permitting). Snow Creek is wadable and does not warrant the use of underwater cameras.

During the probing activities, sediment thickness, top of sediment elevation, bottom of sediment elevation, horizontal coordinates, relative sediment consistency, location, water depth, date, time, and any pertinent visual observations will be recorded. The extent of each identified sediment deposit will be sketched, and its dimensions will be marked on the sketch. The presence and location of large debris and obstructions visible in the creek will also be documented. The lateral boundaries of the sediment deposits will be recorded with a differential global positioning system (DGPS) (sub-meter accuracy) where adequate signal is available. In areas where DGPS signals are not available (e.g., in the culvert beneath Quintard Mall), sediment deposit locations will be obtained by taking measurements to known reference points.

The Highway 202 culverts (Figure 3-10) and the culvert beneath Quintard Mall (Figure 3-11) are permit-required confined spaces (Section 6.2). As such, special protocols and procedures will be followed while conducting sediment probing and sampling within the culverts. Detailed descriptions of the specific hazards and confined space entry procedures for working inside the Highway 202 culverts and the Quintard Mall culvert are presented in the *Highway 202 Confined Space Entry Plan* (Appendix D) and the *Quintard Mall Confined Space Entry Plan* (Appendix E).

The Quintard Mall culvert is accessible during periods of low or normal stream flow. At a minimum, the culvert can be accessed by walking into the culvert from the downstream end. Details for access from the upstream end of the culvert will be confirmed during PDI preparation tasks. Based on culvert foundation plan design drawings, the Quintard Mall culvert is trapezoidal with an upper width of approximately 100 feet. The height of the culvert varies and is estimated to be between 9 and 11 feet. Dimensions of the culvert will be confirmed during the PDI.

The Phase 1 sediment probing results will be provided to USEPA before the Phase 2 sediment sampling program begins (Section 3.3.2.2).

3.3.2.2 Phase 2: Sediment Sampling and Analysis

The results of the PDI Phase 1 sediment probing and mapping program will be reviewed and compared with the results from the previous field efforts to evaluate potential changes in the location and thickness of sediment deposits since the 1999 RFI. The Phase 1 measurements will be used to calculate the estimated volume of each sediment deposit similar to the process that was followed during the RFI. Phase 2 will include sampling new sediment deposits or sediment deposits in a different location or size than were identified and characterized in the RFI evaluation. For comparison, the results of the PDI sediment probing and mapping will be summarized and evaluated by segmenting Snow Creek into the seven sections (summarized in Table 3-2) like the approach used to summarize the sediment data collected as part of the 1999 RFI. The results of

this comparison will be used to identify where Phase 2 sampling is warranted. The Phase 2 sampling will occur as a separate mobilization after the sampling locations are identified. The Phase 1 sediment probing results and the Phase 2 sampling plan will be submitted to USEPA prior to sampling.

Additional sampling will not be necessary for most sediment deposits where PDI probing indicates sediment deposits in the same location and size as measured in the RFI and that were previously characterized to contain PCBs or metals above the remedial criteria identified in the ROD. For example, if the Phase 1 mapping confirms that a deposit identified for removal in the ROD is still in the same location as documented during the RFI, it will be identified for removal in the OU-1/OU-2 RD without collecting additional samples. For confirmatory purposes, a subset of sediment samples (up to five samples) will be collected from sediment deposits that were previously characterized for removal and appear to be present at the same location and size as measured in the RFI. If the PCB results for the sediment deposit are greater than or equal to 3 mg/kg, the deposit will continue to be identified for remediation. If the PCB results for a sample are less than 3 mg/kg, additional sampling may be proposed for the sediment deposit to further assess whether remediation is no longer required.

Sediment deposits identified in the Phase 1 mapping that differ in location or extent compared to those identified in the RFI mapping will be characterized under the Phase 2 sampling program. Where necessary, sampling will be conducted to provide data to supplement existing sediment data to delineate the sediment that has PCB or metals concentrations above the cleanup levels defined in the ROD.

Where additional sediment sampling is warranted, the PDI sediment sampling locations will be selected using the following approach and summarized on Figure 3-12:

- For uncharacterized sediment deposits larger than 50 cubic yards, up to five full-depth subsamples will be collected and homogenized into one composite sample.
- For uncharacterized sediment deposits larger than 5 cubic yards and smaller than 50 cubic yards, one full-depth sediment sample will be collected.
- Uncharacterized sediment deposits between 1 and 5 cubic yards will be characterized together with other nearby sediment deposits (located within five transects and are larger than 5 cubic yards when combined) by collecting and homogenizing up to five full-depth subsamples into one composite sample.
- Sediment deposits smaller than 1 cubic yard will not be sampled.
- Sediment deposited within each of the five Highway 202 box culverts (Figure 3-10) will be characterized by collecting five full-depth subsamples spaced evenly within each culvert and homogenizing the subsamples into one composite sample. Sampling within the culverts will evaluate the extent of PCBs previously detected above 50 mg/kg within this portion of the creek.
- Sediment deposited within the culvert beneath Quintard Mall will be characterized in three different sections: the upstream section between T195-00 and T200-00, the

middle section between T200-00 and T205-00, and the downstream section between T205-00 and T210-00 (Figure 3-11). Five full-depth subsamples spaced evenly within each culvert section will be collected and homogenized into one composite sample.

The additional sampling will only target sediment deposits consisting of sand, silt, or clay. Samples will not be collected from deposits that are predominantly gravel or cobbles, and samples will not be collected from underlying material that represents refusal.

Where sediment deposits exceed the remedial criteria of 3 mg/kg based on the PDI results, it is anticipated that the full depth and extent of the sediment deposit will be removed. As such, full-depth subsamples will be collected and composited across the sediment deposit to characterize the full depth and extent of the sediment deposits that will be removed as part of the remediation. Partial depth removal of sediment deposits is not anticipated during the remediation project. This current assumption is based on the relatively shallow nature of the sediment deposits that have been previously observed in Snow Creek, absent the deposits in the Highway 202 culverts and possibly the Quintard Mall culvert. The sediment deposits in the Highway 202 culverts are expected to require full removal based on the previous characterization data. Final details regarding the extent of remediation will be determined as part of the OU-1/OU-2 RD and will be based on the PDI results.

The Highway 202 culverts and the culvert beneath Quintard Mall are permit-required confined spaces (Section 6.2). Due to the potential hazards presented by these permit-required confined spaces, the Phase 2 sediment sampling will be conducted concurrently with the Phase 1 reconnaissance and probing activities within these culverts. Detailed descriptions of the specific hazards and confined space entry procedures for the work inside the culverts are presented in the *Highway 202 Confined Space Entry Plan* (Appendix D) and the *Quintard Mall Confined Space Entry Plan* (Appendix E).

The sediment core samples will be collected by walking or wading in the creek and using direct-push coring techniques in accordance with the field SOP included as Attachment A-3 (Sediment Probing and Sampling Procedures) in the UFP-QAPP (Appendix A). Sediment cores will be collected by advancing Lexan® tubing that is 2 to 4 inches in diameter through the sediment by hand or by using a driving device if necessary. The core tubing will be pushed from the top of the sediment to the full depth of the deposit to collect a continuous sediment core. Once a core is collected, the recovery date, time, location, and other pertinent information will be recorded. The recovered sediment core will be capped within the tube, labeled, and handled for processing. The sediment cores will be split longitudinally and logged using the USCS to include soil type, color, consistency, odors, and visible evidence of impacts (e.g., sheen) and then photographed. The full core depth will be collected and homogenized in a stainless steel tray/bowl or disposable equivalent in accordance with the field SOP included as Attachment A-9 (Procedures for Compositing or Homogenizing Soil or Sediment Samples) in the UFP-QAPP (Appendix A). The homogenized samples will be placed into the appropriate container provided by the analytical testing laboratory.

In areas where sediment deposits are less than 6 inches in thickness and difficult to sample using Lexan® tubing, a stainless steel bucket auger or hand trowel will be used to collect a representative sediment sample that will be processed as described previously.

When practicable, disposable equipment (e.g., core liners, bowls, spoons, aluminum pans) will be used for sampling, homogenizing, and subsampling procedures. However, when equipment is reused (e.g., stainless steel bucket auger), the equipment will be decontaminated between sampling locations and before leaving the Site in accordance with the field SOP included as Attachment A-2 (Field Cleaning and Decontamination Procedures) in the UFP-QAPP (Appendix A).

The sediment core locations will be recorded in the field with a DGPS when a sufficient signal is available. In areas, where DGPS signals are not available (e.g., in the culvert beneath Quintard Mall), the locations will be determined by collecting measurements to known reference points and recorded. Field notes will be recorded using a field tablet, in a field logbook, or on data collection forms.

Each sediment sample will be analyzed for the following parameters:

- PCBs (USEPA SW-846 8082)
- TOC (Lloyd Kahn)
- Particle size (including hydrometer for cohesive samples only; ASTM D6913/D7928)
- Atterberg Limits (cohesive samples only; ASTM D4318)
- Specific gravity (ASTM D854)
- Moisture content (ASTM D2216/D2974A)

Sediment samples collected from the downstream section of Snow Creek (downstream of T130-00) will also be analyzed for metals because prior investigations indicated the presence of metals above the remedial criteria in the downstream section of the creek and floodplain where PCB concentrations were below the remedial goals. Upstream of this location, metals concentrations were co-located with PCB detections in sediment samples. The sediment samples collected in the downstream section of Snow Creek (downstream of T130-00 [Figure 3-9r]) will be analyzed for barium, chromium (total), cobalt, lead, manganese, mercury (total), nickel, and vanadium (USEPA SW-846 6010C/7471B).

Once the samples are prepared, they will be labeled, and information will be entered onto a chain-of-custody form for transport to the laboratory in accordance with the field SOP included as Attachment A-1 (Field Sample Packing, Handling, Shipping, and Chain-of-Custody Procedures) in the UFP-QAPP (Appendix A). Sample containers will be placed in a secure area and stored on wet ice or under refrigeration at 4±2°C pending shipment to the analytical laboratory.

QA/QC samples will be collected and submitted in accordance with the UFP-QAPP (Appendix A). Sample container sizes, holding times, preservation requirements, and other information on

the analytical program, specific methods, and QA/QC procedures are provided in the UFP-QAPP (Appendix A).

Three bulk sediment samples will be collected for treatability testing from target removal areas within Snow Creek. The bulk sediment sampling locations will be selected based on the following criteria:

- To provide a range in sediment types (i.e., fine material vs. coarse material) based on historical data and data collected during Phase 1 and Phase 2 of the sediment PDI
- To focus on areas with the largest expected volume of sediment to be removed
- To be spatially representative of the sediment removal areas within Snow Creek

The bulk sediment samples will be composited from sediment samples collected in the target remedial areas. The bulk material samples collected for the treatability testing will be collected from the full-depth samples of sediment deposits at up to five locations and then composited together. It is anticipated that, at a minimum, one bulk sediment sample will be composited from samples collected upstream, within, and immediately downstream of the Highway 202 culverts, which are anticipated to be handled together as part of the remediation. Other sampling locations will be determined after the PDI survey and sampling data has been reviewed. Additional information regarding the TSs for sediment are provided in the TS work plan (Appendix C).

3.4 OU-1/OU-2-Wide Evaluations

The OU-1/OU-2-wide evaluations described in the following subsections are common elements needed to complete the OU-1/OU-2 RD for soil, groundwater, and sediment. The following tasks will be completed OU-1/OU-2-wide:

- A geophysical survey will be conducted to evaluate whether there are buried structures, pipes, utilities, or other features within the OU-1/OU-2 RD/RA areas.
- The Highway 202 and Quintard Mall culverts and other structures adjacent to OU-1/OU-2 RD/RA areas will be evaluated to assess whether special considerations will be required during the RA.
- Topographical surveys of OU-1/OU-2 will be conducted to create a survey-level base map for the RD.
- An assessment of cultural and archeological resources will be conducted to evaluate the presence of historical or archeological resources.

The rationale, objectives, and investigative methods for each of these scopes of work are presented in the subsections below.

3.4.1 Utility Surveys

Desktop and geophysical field investigations will be completed to evaluate the presence of buried structures, pipes, utilities, or other features within the OU-1/OU-2 areas as described below.

3.4.1.1 Rationale and Objectives

The presence of aboveground and underground utilities in the OU-1/OU-2 areas could pose risks during excavation to both the integrity of the utility and the safety of the workers. During the PDI, active outreach will be completed with property owners, local city building departments, area utility companies (including 811), and county and state transportation agencies regarding the presence of utilities that could impact remedy implementation, worker safety, and/or utility integrity. Utility organizations that would typically be contacted as part of the outreach process include sewer, water, gas, electric, oil, and cable/fiber optic. The data and information obtained from this work element will be integrated into the Preliminary (30%) RD submittal as existing conditions to allow the OU-1/OU-2 RD to be implemented safely in the vicinity of active utilities.

The DQO to support the utility survey as part of the OU-1/OU-2 PDI is as follows:

- US-DQO 1: Identify utilities located within or adjacent to the proposed remedial areas and gather information for those features to design the RA and potential mitigation measures to prevent damage.

A description of the work to be conducted to achieve this DQO is provided in the following subsection.

3.4.1.2 Scope of Work and Investigative Methods

Prior to starting utility survey work, P/S will complete a desktop study (e.g., review historical documents, contact Alabama One-Call) to obtain copies of the available record mapping of utilities within the OU-1/OU-2 RD/RA areas. P/S will request existing conditions surveys, permits, and topographical surveys from appropriate parties (e.g., owner, municipalities, utility agencies). This information will be used to supplement the geophysical utility survey to be completed within the OU-1/OU-2 RD/RA areas.

Geophysical surveys will be conducted over soil boring locations, ISM sampling areas, and monitoring well and piezometer locations where intrusive sampling activities will be completed as part of the PDI work. Additionally, geophysical surveys will be conducted over areas (e.g., excavation areas) where utility information is needed to support the OU-1/OU-2 RD. The following geophysical techniques will be used to locate subsurface features and utilities:

- Ground-penetrating radar (GPR) system: The GPR instrumentation emits pulses of high-frequency electromagnetic (EM) waves into the subsurface. The EM waves either dissipate or reflect back to the GPR sensor based on contact with subsurface features (e.g., a metal pipe will reflect energy back to sensor). The GPR profiles obtained during the survey will provide cross-sectional subsurface information that can be reviewed in real time. Underground storage tanks (USTs) and buried pipelines typically exhibit anomalous responses that have characteristic GPR signatures (i.e., hyperbola or inverted "U"). From the cross-sectional subsurface information, the size, orientation, and approximate depth of the identified anomalies can be estimated. GPR survey resolution is anticipated to be a minimum of 0.3 feet.

- Radio frequency (RF) instrument: An RF instrument is capable of tracing active electric lines, telecommunication lines, and other buried lines that might have an induced charge. RF instrumentation is connected directly to or through inductive coupling at a point that allows the entirety of the utility line to be traced by introducing a small current and measuring these signals at remote locations. Strong response peaks are observed directly over the lines by an RF sensor.
- EM unit: An EM instrument induces a current by applying magnetic fields into the subsurface and measuring the resulting response. EM is highly sensitive to buried metal features, such as USTs, rebar, and buried pipelines, within the upper 3.5 feet of the subsurface, which is the typical burial depth of underground utilities.

Before geophysical survey work begins in upland areas, grid markers will be established. The grid markers will be used to locate the geophysical intersecting traverse lines. GPR, RF, and EM measurements will be obtained at 10-foot intervals along parallel traverse lines that are spaced 10 feet apart. This spacing corresponds to a 10-foot by 10-foot grid pattern.

Data will be acquired in the scan mode of the various instruments throughout accessible portions of the OU-1/OU-2 RD/RA area by qualified personnel with expertise in the selected geophysical instrumentation. The instrument responses will be continuously monitored, and the locations of anomalous responses from significant buried objects will be indicated on the ground with stakes, spray paint, or other preferred marking medium. Additionally, as-built coordinates will be collected of the anomalies using a mapping-grade GPS with sub-foot accuracy. Identified anomalies will be evaluated with statistical techniques to assess if further investigation should be conducted.

3.4.2 Structural Evaluations

Desktop and survey field investigations will be completed to locate and document existing conditions of structures, slopes, and utilities along Snow Creek as described below.

3.4.2.1 Rationale and Objectives

Snow Creek passes through, under, or immediately adjacent to several structures within OU-1/OU-2 (Table 3-2, Figure 3-13). Field data and information will be collected during the PDI to support the evaluation of these structures (e.g., bridges, culverts, outfalls) along Snow Creek.

Structures adjacent to potential remedial areas in Snow Creek will be evaluated during the RD to determine whether the remedial construction will present special concerns for structural integrity. The first step in the design process will be to determine the final extent and depths of remediation to analyze whether nearby structures may be affected. The results of the Phase 2 PDI sediment sampling program (Section 3.3) will be evaluated, along with existing sediment sampling data, to refine the extent of sediment that exceeds the remedial criteria. Details regarding the locations and depths of sediment remediation will be necessary to complete a structural evaluation.

The DQO to support the structural evaluation as part of the OU-1/OU-2 PDI is as follows:

- STR-DQO 1: Identify structures, slopes, and utilities located within or adjacent to the proposed remedial areas and gather information for those features to design the RA and potential mitigative measures to prevent damaging them.

A description of the work to be conducted to achieve this DQO is provided in the following subsection.

3.4.2.2 Scope of Work and Investigative Methods

In addition to the PDI sediment investigation activities described in Section 3.3, the following investigative efforts will be undertaken to gather information about the structures along Snow Creek that may potentially be affected by remedial construction activities:

- The field crew will conduct an initial reconnaissance along Snow Creek to identify and note any visible structures not listed in Table 3-3. Each observed structure will be photographed from various angles and directions. In addition, construction material types will be noted, and field measurements will be collected from accessible portions of the structures to determine approximate dimensions. The field crew will note any debris observed at each structure and any obvious conditions related to the structures.
- P/S will review property records to identify the owners of each potentially affected structure along the OU-1/OU-2 portion of Snow Creek.
- P/S will contact the owners of the potentially affected structures to request record drawings or design drawings for the structures. In addition, P/S will request any available recent conditions survey reports for the structures.

Once the sediment remediation extents and depths are understood based on the PDI results, the engineering team will engage an experienced structural engineer to review the remediation extents, field data, and available structural records to determine whether any structures may warrant additional structural evaluations regarding the remediation work.

Structures that might be at risk from the remediation work will be evaluated further as the RD progresses. Details for the next steps in the evaluation will be determined following review of the available data and information. The structural evaluation may include outreach to owners of the structures to present the conceptual approach for remediation near the structures and to determine if they will perform a conditions survey for the structure. The results of a recent (after 2019) structural assessment conducted could also be acceptable. The assessment would need to have been performed under the supervision of a professional engineer and address maintenance-related construction activities such as the removal of sediment from within or underneath the structure. Depending on the availability of an owner-prepared structural survey that can be used to describe current baseline structural conditions, P/S may retain an Alabama-licensed structural engineer or civil engineer. The engineer would need to have a background in bridge structures to conduct a detailed existing conditions survey to document the condition of bridge-type structures and provide recommendations on best practices or mitigative measures that could be implemented prior to, during, and following the remediation work for those types of structures.

3.4.3 Base Mapping Activities

Topo-bathymetric surveys will be completed to update the Site's base map in OU-1/OU-2 areas. The surveys will use light detection and ranging (LiDAR) and be supplemented with manual survey methods to obtain structure elevations.

3.4.3.1 Rationale and Objectives

Data regarding the current topo-bathymetric surface of OU-1/OU-2, including creek bank elevations and structures (e.g., bridges, culverts, and outfalls), are needed to create a survey-level base map for the OU-1/OU-2 RD. The DQOs to support the base mapping activities as part of the OU-1/OU-2 PDI are as follows:

- BM-DQO 1: Update the project base mapping to support the development of the RD and contract drawings.
- BM-DQO 2: Gather topography and bathymetry data to support the design for the sediment remediation and to use in the hydraulic modeling of potential flooding impacts associated with potential remediation within and near the Highway 202 culverts.

3.4.3.2 Scope of Work and Investigative Methods

The survey methods discussed below have been selected for the PDI based on their ability to generate data for use in the OU-1/OU-2 RD and their applicability during the RA. LiDAR will be the primary survey method and will be supplemented with manual survey methods to obtain structure elevations.

LiDAR uses an unmanned aerial system (UAS) or survey plane equipped with a laser that emits pulses of light to the ground surface that reflect back to the UAS or survey plane to measure distance to the ground surface or structures. A UAS or survey plane equipped with a LiDAR sensor capable of measuring a minimum of 40 points per square meter with minimum relative accuracies of 1 to 4 centimeters will be flown over OU-1/OU-2 to conduct a topographic survey. Data will be collected and processed in conformance with USGS's LiDAR Base Specification Version 1.3. A point cloud will be generated, allowing for feature extraction and terrain modeling, and a bare earth terrain surface will be delivered as a digital terrain model. In addition to the LiDAR survey, additional technologies (i.e., video or photogrammetry) may be used to meet the inspection and long-term monitoring needs during construction. Ideally, the LiDAR survey will be completed during leaf-off conditions (i.e., winter) to obtain maximum coverage of OU-1/OU-2. Traditional survey work might also be required for locations where UAS or survey plane operations cannot provide adequate LiDAR coverage. The aerial-based survey will be completed in accordance with all applicable federal, state, and local (i.e., City of Oxford, City of Anniston, and Calhoun County) regulations.

Survey data for structures located in OU-1/OU-2 will be collected manually by a professional land-based surveyor. The structural survey will include locations and elevations of abutments, beams, pipe inverts, and any other details for bridges, tide gates, outfalls, and culverts located in or next to OU-1/OU-2 RD/RA areas.

The horizontal and vertical benchmarks will be established and/or verified. The horizontal datum will conform to Alabama State Plane East Zone Coordinate System, North American Datum of 1983 (NAD83) in units of feet. The vertical datum will conform to the National American Vertical Datum of 1988 (NAVD88).

A professional land surveyor will conduct surveys that conform to the requirements of the most current versions of the following guidance documents:

- United States Army Corps of Engineers (USACE) Manual No. 1110-1-1005 Control and Topographic Surveying (USACE 2007)
- USACE Manual No. 1110-1-1000 Photogrammetric Mapping (USACE 2002)
- FM 3-34.331 Topographic Surveying (USACE 2013)

Survey vertical accuracy is anticipated to be 0.1 feet.

The results of the topographic survey will be submitted to P/S by the professional land surveyor in the following formats: (1) AutoCAD files, (2) digital shapefiles and polyline coverage maps, and (3) American Standard Code for Information Interchange (ASCII) files of the XYZ coordinate data used to produce AutoCAD files. Manual elevations of structures will be presented in ASCII files of the XYZ coordinate data, and the linework of these structures will be incorporated into the AutoCAD and digital shapefile deliverables from the professional land surveyor to P/S.

3.4.4 Cultural and Archeological Resource Assessment TBD

Outreach will be completed with the Alabama State Historic Preservation Office (SHPO) to evaluate whether additional research is required regarding the potential presence of historical or archeological resources within the OU-1/OU-2 RD/RA area. If additional research or documentation is deemed necessary by the Alabama SHPO, the requested information will be provided to facilitate further review by SHPO.

3.5 Baseline Surface Water Sampling

3.5.1 Rationale and Objectives

Surface water monitoring will be conducted at the upstream and downstream ends of OU-1/OU-2 in accordance with the selected remedy described in the ROD. Most of the existing surface water data for the OU-1/OU-2 portion of Snow Creek were generated as part of the RFI and the Nonresidential Properties FSP. The PDI will include surface water sampling to establish a baseline for comparison to post-remedy monitoring.

The DQO for the OU-1/OU-2 surface water PDI is as follows:

- SW-DQO 1: Provide baseline surface water data that can be used for comparison with post-remedy surface water monitoring data.

Details of the proposed PDI activities to achieve SW-DQO 1 are provided in Section 3.5.2.

3.5.2 Scope of Work and Investigative Methods

The baseline surface water monitoring program will include collecting surface water samples from the upstream and downstream ends of the OU-1/OU-2 portion of Snow Creek during seasonal (i.e., quarterly) base flow. The samples will be collected during base flow as these conditions are present approximately 90% of the time. The sample locations are shown on Figure 3-14. The upstream sampling location is located downstream of the confluence of Snow Creek and the West 9th Street Creek on the downstream side of the West 14th Street Bridge. The downstream sampling location is at the southern end of OU-1/OU-2 at the outfall of the culvert that passes beneath the Quintard Mall. The sampling will be conducted once per quarter (i.e., seasonally, 4 times per year) during base-flow conditions and will start following USEPA approval of the PDIWP and continue for 2 years or to the start of remediation, whichever occurs first.

Baseline surface water samples will be collected using grab sampling techniques and in situ passive sampling techniques. Grab sampling techniques will be used to measure total[3] and dissolved concentrations in surface water. In situ passive samplers, specifically commercially available polyethylene-based passive samplers, will be used to measure PCB concentrations truly dissolved in surface water (i.e., not associated with suspended particles or colloids).

The general approach for sampling surface water is as follows:

- The sampling procedure will depend on the access method.
- If the location is accessed from the shoreline without entering the creek, sampling personnel will collect surface water using a stainless steel dipper.
- If the location is accessed by wading into the creek, sampling personnel will collect surface water by submerging the sample container. Sampling personnel will face upstream in areas of flow and collect the sample without disturbing the bottom sediment.
- If the location is accessed from a bridge, sampling personnel will deploy a Kemmerer sampler. Once the Kemmerer sampler has been lowered to the correct sample depth, sampling personnel will trigger the Kemmerer sampler to close by releasing the weighted messenger. Care will be taken to collect the sample without disturbing the bottom sediment.
- Filtered samples will be collected using a 0.1-micron filter to evaluate the dissolved fractions of PCBs. Filtering of surface water will be completed in the field.

Additional details regarding surface water grab sampling are in the SOP included as Attachment A-13 (Surface Water Sampling, Filtering, and Measuring Procedures) of the UFP-QAPP (Appendix A). Samples will be labeled, placed in ice coolers, and shipped to Eurofins-TestAmerica for analysis of PCB homologs by USEPA Method 680 with a detection limit less than the remedial goal of 0.014 µg/L. In addition, the filtered and unfiltered grab samples will be

[3] Total concentration in surface water includes concentrations associated with suspended particles and colloids.

analyzed for metals (lead and total chromium only) by USEPA Method 6010C and hexavalent chromium by USEPA Method 7196A.

Passive samplers will be deployed in the creek at the same upstream and downstream grab sample locations shown on Figure 3-14. Passive sampling will be conducted twice per year (for up to 2 years) at each location.[4] In situ surface water sampling will be conducted in general accordance with procedures included in Attachment A-13 of the UFP-QAPP (Appendix A). The general deployment procedures are as follows:

- Passive samplers and any support frames will be deployed such that the device is suspended mid-depth under base-flow conditions and a minimum of 3 inches above the sediment surface such that the sampler is submerged continuously over the deployment period.
- The passive samplers will be deployed for a minimum of 28 days. Sampling personnel will retrieve the passive samplers as close to the end of the 28-day deployment period as possible accounting for weekends or possible holidays. The retrieved passive sampler will be wrapped in foil in accordance with the UFP-QAPP and procedures included in Attachment A-13 of the UFP-QAPP (Appendix A).

Samples will be labeled, placed in ice coolers, and shipped to Eurofins-TestAmerica for analysis of PCB congeners by USEPA Method 1668A and PCB homologs by USEPA Method 680 using a common extract to minimize the potential for variability.

[4] In situ passive samplers will typically be deployed during the late spring to early summer and early fall to avoid extreme low-water and high-water conditions and the potential for temperatures to fall below freezing that could damage the passive sampling devices.

4. TREATABILITY STUDIES

TSs for groundwater and sediment will be conducted to support the development of the Preliminary (30%) RD. The TSs are summarized in Sections 4.1 and 4.2, respectively. Supporting details are provided for the groundwater and sediment in stand-alone TS work plans provided in Appendices B and C, respectively.

4.1 Groundwater Treatability Study

A bench-scale TS will be completed to support the design of the groundwater remedy component for the T-11 area, with specific focus on performance of the GAC component of the planned treatment. A TS to assess GAC performance for the T-11 area is recommended based on the presence of lower-chlorinated PCBs and the potential for competing demand on the carbon from naturally occurring organics that might also be present in groundwater. The overall objective and purpose of the groundwater TS is to generate data for designing and evaluating groundwater treatment using GAC filtration to satisfy the GW-DQOs 3 and 4 presented in Section 3.2.1.

Groundwater samples for the bench-scale treatability tests will be collected from monitoring well T-11 as part of the PDI sampling and aquifer testing program (Section 3.2). Bench-scale treatability tests will include an isotherm batch test to address GW-DQO 3 and a rapid small-scale column test to address GW-DQO 4. Details of these tests and the associated data analysis and reporting for the groundwater TS are provided in Appendix B.

4.2 Sediment Treatability Study

A bench-scale TS will be completed to support the design of the sediment remedy component of the OU-1/OU-2 portion of Snow Creek. The TS will generate data that will be used in designing and evaluating sediment removal, transport, processing, and disposal components of the remedy. The sediment TS will be performed specifically to satisfy SED-DQO 3 and SED-DQO 4.

The sediment to be excavated from Snow Creek might require processing, treatment, and conditioning to allow it to be loaded into trucks, to meet regulatory requirements for transportation on public roads (i.e., no free liquids permitted), and to strengthen the sediment to satisfy waste acceptance criteria for the selected off-site landfill. The results of the proposed bench-scale testing program will help identify potential methods for implementing the sediment RA.

Sediment excavated from water bodies contains excess water (referred to as supernatant) that needs to be removed through dewatering operations prior to sediment transport for disposal. The supernatant from Snow Creek sediment will likely require treatment prior to discharge. The bench-scale treatability testing program will provide data on the potential concentrations of contaminants in the supernatant for review as part of the OU-1/OU-2 RD to evaluate potential treatment requirements. During design, data from analytical testing of the supernatant will be compared to the expected discharge limits to assess treatment requirements prior to discharge. Details of these tests and the associated data analysis and reporting for the sediment TS are provided in Appendix C.

5. PROPERTY ACCESS EVALUATION

P/S are required to use best efforts, as defined under Section VIII (Property Requirements) Paragraph 21 of the CD, to secure enforceable access agreements from third parties to conduct the work identified in the CD. Properties for which access or use restriction agreements may be required have been identified as part of developing this PDIWP. These properties are listed in Table 5-1. The table includes the property identification numbers (PPINs); the owner(s); the street address; the reason(s) for access, including bridges (that conveys vehicular or rail traffic); the low-activity special use properties; locations within 100 feet of Snow Creek for sediment-related efforts; nonresidential soil and IM areas; and dredge spoil piles. There are two unique features where access will be required—a building that was built over Snow Creek and portions of the Quintard Mall parking lot that overlie Snow Creek (Table 5-1). These two features along with other structures that span Snow Creek are also listed in Table 5-2 to highlight features that might require structural evaluations (described in Section 3.4.2). While Table 5-1 includes over 120 individual PPINs, multiple parties own multiple individual properties and, as a result, the number of individual access agreements will be substantially less. In addition to the individual properties, access to right-of-way properties will be required from multiple parties, including the City of Anniston, the City of Oxford, Calhoun County, the Alabama Department of Transportation, and Norfolk Southern Railway. These parties are also identified in Table 5-1 for specific properties and, thus, access-related discussions with these entities will include both specific parcels and right-of-way areas.

The process for obtaining property access was started following submittal of the PDIWP in November 2021, recognizing the time necessary for obtaining access that may include grants allowing P/S and USEPA to access Non-Settling Owner's Affected Property (as defined by the RD/RA CD) and/or may require a Non-Settling Owner to agree to limitations on the use of Non-Settling Owner's Affected Property and to agree to refrain from interfering with or adversely affecting the implementation, integrity, or protectiveness of the RA.

In addition to requests to conduct the PDI work detailed herein, access will be required for a subset of properties to allow P/S to conduct the RA activities (including soil and sediment removal and backfill, material staging, and support activities), monitor completed RAs, and provide ingress and egress on the affected property. These future access needs will be presented in the Preliminary (30%) RD. Potential use restriction agreements may also be included in the Preliminary (30%) RD that could place restrictions on the use of groundwater for potable purposes and constraints on soil-disturbance activities.

Once the properties that will need to be accessed are finalized, the process to obtain the access and use restriction agreements required by the RD/RA CD will include the following steps:

1. The current owner of record of each Non-Settling Owner Affected Property will be identified through Calhoun County, Alabama's available on-line mapping portal (see https://gis.calhouncounty.org/Parcelviewer2/).
2. P/S will transmit a letter and access agreement or use restriction agreement or both to the current owner of record.

3. If the access agreement or use restriction agreement is not returned to P/S within 30 days from the date of delivery, a follow-up letter will be transmitted to the owner of record requesting a meeting to discuss the request for the access agreement or the use restriction agreement or both.
4. If a meeting is not scheduled within 30 days of the date of delivery of the follow-up letter or if following a meeting with P/S and exhaustion of best efforts as described in the CD, a Non-Settling Owner refuses to provide access or use restrictions, then P/S will provide a copy of all correspondence to USEPA for review and further action (i.e., assist P/S in obtaining access or use restrictions or take independent action) if deemed appropriate.

6. HEALTH AND SAFETY

Key health and safety concerns and considerations associated with implementing the PDI are discussed in the following subsections. The overarching concerns are presented in Section 6.1, and a summary of the confined space entry plans developed to support PDI activities for the Highway 202 culverts and the portion of Snow Creek that passes under the Quintard Mall parking lot are provided in Section 6.2.

6.1 Health and Safety Plan

Work performed during the PDI will be conducted in accordance with the OU-1/OU-2 RD/RA HASP. An initial version of the OU-1/OU-2 RD/RA HASP was submitted to USEPA as Appendix A of the RDWP (P/S 2021a) and an updated version (P/S 2022) was submitted as a companion document to this PDIWP. The OU-1/OU-2 RD/RA HASP is a stand-alone document that covers work conducted by P/S for the RD/RA. Job Safety Analyses (JSAs) will be developed to identify task-specific hazards and prescribe hazard control measures and emergency preparedness actions for each scope of work described in this PDIWP.

Subcontractors who are hired to carry out activities supporting the RD/RA are required to work under the OU-1/OU-2 RD/RA HASP, or they might be required to develop their own HASP. When applicable, the subcontractor's HASP will be specific to OU-1/OU-2 and the task(s) that the subcontractor will be conducting. All subcontractor-specific HASPs must also comply with the requirements of the OU-1/OU-2 RD/RA HASP and will be distributed to the project parties and kept on file electronically. P/S will approve each subcontractor-specific HASP prior to the start of work. Subcontractors are responsible for protecting their workers, and subcontractor work must be conducted in accordance with the approved HASP. Subcontractors are required to adhere to the health and safety roles, responsibilities, and commitments mutually and contractually agreed upon between themselves and P/S.

All personnel involved in implementing the PDI and TS scopes of work will be required to meet the health and safety requirements presented in the HASP. The following general health and safety requirements will be implemented during the project:

- A JSA will be developed for each PDI task or activity. The JSA will identify potential hazards for each task and describe mitigation measures and action levels to address each hazard. The JSA may incorporate procedures discussed in the OU-1/OU-2 RD/RA HASP or attachments or it may identify the need for new or updated procedures. JSAs will be developed in accordance with Section 3.2 of the OU-1/OU-2 RD/RA HASP.
- Health and safety meetings will be completed at the start of each workday, at the beginning of each new task, and when new personnel are introduced to OU-1/OU-2. As discussed in Section 3.3 of the OU-1/OU-2 RD/RA HASP, these meetings will be used to discuss specific safety topics relevant to the task and obtain personnel feedback.
- Utility avoidance and clearance activities will be performed prior to intrusive field work in accordance with Section 4.1 of the OU-1/OU-2 RD/RA HASP. Utility

clearance/avoidance activities will include contacting local public utility clearance system (e.g., contacting 811), reviewing the detailed utility plan, and visually inspecting the area for utilities. Additional utility avoidance and clearance activities (e.g., private utility-location service, hand-clearing boring location) may be performed as discussed in the OU-1/OU-2 RD/RA HASP.

- Field activities that occur within a railroad right-of-way or within 25 feet of a railroad line will be performed in accordance with Section 4.2 of the OU-1/OU-2 RD/RA HASP. Personnel will meet with a representative of the railroad company to determine what standards are required for work on that railroad property, conduct the required job briefing, and log it as an OU-1/OU-2 safety meeting.
- Soil boring and monitoring well installation activities will be performed in accordance with Section 4.4 of the OU-1/OU-2 RD/RA HASP and task-specific JSAs.
- Sediment probing and sampling will be performed in accordance with Section 4.5 of the OU-1/OU-2 RD/RA HASP and task-specific JSAs. Due to the configuration and specific hazards associated with work inside the Highway 202 culverts and the Quintard Mall culvert, these structures are considered permit-required confined spaces and will require a confined space entry permit.
- Surface water sampling will be performed in accordance with Section 4.7 of the OU-1/OU-2 RD/RA HASP and task-specific JSAs.
- Safety procedures will be included to account for applicable federal, state, local, and P/S requirements due to the COVID-19 pandemic. Individual company-specific policies and procedures can be integrated into the task-specific JSAs or subcontractor HASPs (where applicable) provided they meet the minimum requirements set by the above listed entities.

6.2 Confined Space Entry Plans

Entry into the Highway 202 culverts and the culvert beneath Quintard Mall will be necessary to complete the PDI work described in Section 3.3. Due to the configuration and specific hazards associated with work inside these structures, the Highway 202 culverts and the Quintard Mall culvert are considered permit-required confined spaces.

The Highway 202 culverts are in Anniston, Alabama, and consist of five separate concrete box culverts, each approximately 10 feet wide by 10 feet tall, that convey Snow Creek flows beneath Highway 202. The culverts are open at both ends and contain varying amounts of accumulated sediment.

The Quintard Mall culvert is in Oxford, Alabama, and conveys Snow Creek stream flow for approximately 0.3 miles beneath a portion of the parking lot and mall building. There are only two entry points to the culvert: one at the upstream end and one at the downstream end. The Quintard Mall culvert is accessible during periods of low or normal stream flow. At a minimum, the culvert can be accessed by walking into the culvert from the downstream end. Details for access from the upstream end of the culvert will be confirmed during PDI preparation tasks. Based on culvert

foundation plan design drawings, the Quintard Mall culvert is trapezoidal with an upper width of approximately 100 feet. The height of the culvert varies and is estimated to be between 9 and 11 feet. Dimensions of the culvert will be confirmed during the PDI.

These confined spaces will be entered during the PDI program to perform such tasks as surveying, visual observations, sediment probing, and sediment sampling. Due to the specific hazards presented by these structures, P/S have prepared area-specific confined space entry plans that will be followed while working within these confined spaces. Detailed descriptions of the specific hazards and confined space entry procedures for the work inside the Highway 202 culverts and the Quintard Mall culvert are presented in the *Highway 202 Confined Space Entry Plan* (Appendix D) and the *Quintard Mall Confined Space Entry Plan* (Appendix E). The work inside these culverts will be conducted in accordance with these plans and with the project-specific HASP and the associated JSAs.

7. QUALITY ASSURANCE PROJECT PLAN

The objective of the UFP-QAPP is to help generate scientifically valid analytical data. The UFP-QAPP has been developed in accordance with the requirements of the following:

- Requirements for Quality Assurance Project Plans, QA/R-5, EPA/240/B-01/003 (USEPA 2001)
- Guidance for Quality Assurance Project Plans, QA/G-5, EPA/240/R 02/009 (USEPA 2002a)
- Uniform Federal Policy for Quality Assurance Project Plans, Parts 1–3, EPA/505/B-04/900A through 900C (USEPA 2005)

The UFP-QAPP includes sampling and laboratory QA/QC programs. The sampling QA/QC program combines USEPA-approved sampling, preservation, and field monitoring techniques with the necessary documentation and chain-of-custody requirements. The sampling QA/QC program also specifies the field QA/QC samples that will be collected. The laboratory QA/QC program provides a systematic set of standards of operation and surveillance procedures. Important elements of the QA/QC program for the PDI and TS elements discussed in Sections 3 and 4 of this PDIWP are discussed in the project UFP-QAPP (Appendix A).

QC procedures will be followed to monitor the analytical process through each phase of the project from sample collection through laboratory analysis and reporting. QC sampling will be incorporated into the scope of work for the field sampling program and laboratory analysis program. Field QC samples used to assess data usability will consist of blind duplicate soil, groundwater, and sediment samples and matrix spike/matrix spike duplicate samples. The QC samples will be collected from the sample location at frequencies specified in the UFP-QAPP and will be recorded in the field book.

If additional PDIs are needed to complete the RD, the UFP-QAPP will be amended as needed to incorporate the associated means and methods and the QA/QC elements for these additional PDI scopes of work that are not currently described in the UFP-QAPP. Amended worksheets will be provided as an appendix to any subsequently developed work plans (e.g., addenda to PDIWP) and RD/RA plans as necessary.

8. PREDESIGN INVESTIGATION REPORT AND SCHEDULE

Once the PDI field investigations and TS bench-scale studies are completed, a PDI evaluation report will be prepared for submittal to USEPA. If any additional investigations are required based on the PDI findings, P/S will submit an addendum to the PDIWP and the UFP-QAPP (if necessary).

8.1 Reporting

A PDI evaluation report will be prepared in accordance with Section 3.3(b) of the SOW. The report will include the following:

- Summary of the PDI field investigations and TS bench-scale studies performed, including deviations from the PDIWP
- Summary of the results from the PDI field investigation and TS bench-scale studies
- Tables and figures presenting validated laboratory analytical results as appropriate for individual PDI field investigations and TS bench-scale studies
- Narrative interpretation of soil, groundwater, and sediment data and results
- Results of statistical and modeling analyses (if generated)
- Sampling logs, surveying reports photographs, and the laboratory analytical reports, included as appendices (or attachments)
- Conclusions and recommendations for the Preliminary (30%) RD and the identification of any additional PDIs

The data validation approach is consistent with the applicable USEPA guidelines for data verification and data validation (USEPA 2002b). Data validation will include 95% Stage 2A and 5% Stage 4 data validation per analytical test and matrix. Level IV laboratory reports will be requested for all sample delivery groups. Following validation, the data will be entered into the project database.

8.2 Schedule

To advance the schedule of PDI field work, P/S are advancing the property access process in parallel with USEPA's review of the PDIWP. If additional property access is necessary based on USEPA's review of the PDIWP, these properties will be added to Table 5-1, and the access process will be initiated for these additional properties. Field mobilization for PDI efforts following USEPA approval of the PDIWP is anticipated in the summer and fall of 2022. The field investigation and TS work efforts are expected to take 5–6 months to complete, with draft analytical chemistry results anticipated to be available in late spring 2023. The validated analytical chemistry results are anticipated to be available in late summer of 2023, and the PDI evaluation report will be submitted to USEPA within 60 calendar days of completing validation of all data.

Several interim working deliverables will also be submitted to support consultation with USEPA regarding decisions to advance the PDI program. These interim deliverables will take various forms and will generally include a brief memorandum summarizing the investigation results along with supporting tables, figures, and photographs. For those interim deliverables where analytical chemistry data are being provided, the data will be summarized in tabular form with the validated data also being provided to USEPA electronically. A list of anticipated interim working deliverables is provided below recognizing that additional deliverables may be identified as the PDI work is conducted and data are validated:

- Land use survey results for the low-activity special use properties identified in the OU-1/OU-2 ROD. These properties will be surveyed to confirm land use and could include three potential outcomes: low-activity special use, high-activity special use, or nonresidential. The surveys will be conducted in a manner such that the results could apply in part or in whole to the properties and will identify areas that are not suitable for removal. The survey results will be accompanied by a list of properties proposed for subsurface soil sampling and suitable documentation to remove properties (or portions of properties) that no longer fit the definition of low-activity special use. Following consultation with USEPA, the subsurface soil sampling will be scheduled and conducted.
- Soil and groundwater results for the Eastside Properties area will be provided to USEPA for consultation relative to the potential for additional characterization work for the Eastside Properties.
- Vertical soil PCB concentration profiling for the PB-RR-37 area will be provided to USEPA for consultation relative to the potential for installing a groundwater well at this location.
- The results of the Phase 1 sediment probing results and proposed Phase 2 sediment sampling plan will be submitted to USEPA for consultation prior to implementing the Phase 2 sediment sampling.

Notes:

ProUCL 4.1 was utilized for statistical summaries and UCL calculation for EUs with sufficient sample population. Microsoft Access 2010 was utilized for base statistical summaries.

Parent and duplicate samples were combined. If both detect or both nondetect, a mean was taken. If one was detected and other was nondetect, then the detected value was utilzed to represent the pair.

Results for maximum, mean, and UCL were rounded to two significant figures.

--: not sampled

APCO: Alabama Power Company
ES: eastside
EU: exposure unit
mg/kg: milligrams per kilogram
NC: not calculated; due to low sample count and/or low number of detected concentrations.
NS: northside
UCL: upper confidence limit

Notes:
1. Low-activity special use areas, IM areas, nonresidential areas, and the drainage ditch near PB-RR-37 that are less then 0.5 acres in size will be sampled as one 5-point composite per 0.25 acre area. Each 5-point composites will be collected at three sample depths from low-activity special use areas, IM areas, and nonresidential areas: 1 to 2 feet bgs, 2 to 3 feet bgs, and 3 to 4 feet bgs. Samples from 2 to 3 feet bgs and 3 to 4 feet bgs will be archived for analysis pending results of the shallower depth horizon sample. 5-point composites will be collected from four sample depths for the PB-RR-37 area and the drainage ditch downstream of PB-RR-37: 0 to 1 foot bgs, 1 to 2 feet bgs, 2 to 3 feet bgs, and 3 to 4 feet bgs. Samples from 1 to 2 feet bgs, 2 to 3 feet bgs, and 3 to 4 feets bgs will be archived pending analysis of the shallower depth horizon.

2. Four geotechnical borings will be advanced in the T-11 area. Split-spoon samples will be collected continuously to boring termination at approximately 40 feet bgs or refusal whichever is encountered first. Split-spoon samples from each boring will be collected from the geotechnical borings for the following geotechnical laboratory analyses: Natural Moisture Content (ASTM D2216), Particle-Size Analysis (ASTM D6913 and ASTM D7928), Atterberg Limits (ASTM D4318), and Engineering Classification (ASTM D2487).
One thin-walled Shelby-tube sample from each of the borings will be collected from cohesive soil horizons encountered in the borings. Representative Shelby-tube samples will be submitted for the following geotechnical laboratory analyses: Unconsolidated Undrained Triaxial Compression Test (ASTM D2850) and Consolidated Undrained Triaxial Compression Test (ASTM D4767).
3. The PB-RR-37 area will be sampled continuously until soil-groundwater interface is achieved based on observations made during boring advancement.
4. Nonresidential areas greater than 0.5 acres will be sampled using ISM as three DUs based on sample depth: 1 to 2 feet bgs, 2 to 3 feet bgs, and 3 to 4 feet bgs. The incremental sample for each DU will consist of 30 increments collected and composited. Samples from 2 to 3 feet bgs and 3 to 4 feet bgs will be archived for analysis pending results of the shallower depth horizon sample.
5. ISM field triplicates will be collected at a rate of 10% of number of DUs.
APCO: Alabama Power Company
ASTM: ASTM International
bgs: below ground surface
DU: decision unit
IM: interim measure
ISM: incremental sampling methodology
MS/MSD: matrix spike/matrix spike duplicate
PCB: polychlorinated biphenyl

QA/QC: quality assurance/quality control
TBD: to be determined
USEPA: United States Environmental Protection Agency

Table 3-2. Snow Creek Sediment Characterization Areas
OU-1/OU-2 Predesign Work Plan
Anniston PCB Site, Anniston, Alabama

Area	General Description
1	From the 11th Street Ditch to West 9th Street Bridge
2	From the West 9th Street Bridge to the Railroad Bridge at the southwest corner of Calhoun County Jail
3	From the southwest corner of Calhoun County Jail to the end of the concrete spillway
4	From the end of the concrete spillway to downstream of the Sandy Lumber Company property
5A[1]	From downstream of the Sandy Lumber Company property to upstream of Quintard Mall culvert
5B[1]	Quintard Mall culvert
5C[1]	From downstream of the Quintard Mall culvert to Highway 78

1. Area 5 was segmented into three separate subreaches to avoid confusion with Area 6, which was characterized as part of the 1999 Resource Conservation and Recovery Act Facility Investigation and is located in OU-4 downstream of Highway 78.

Notes

1. This includes areas where the HDPE liner is interpreted to be present based on field observations and discussions with parties involved in the IM construction.

2. Figure presents analytical and screening PCB data in the Eastside Area. Maximum PCB concentration at any depth in analysis profile shown for each location. Screening data is presented where no analytical data is available.

3. Where IM cover systems were constructed, the data shown represent conditions below the cover, except for samples: PC-023-A, PC-023-B, PC-024-B, 2506-3A, CA-06-2136-03, PA-126-A and PA-126-B.

   IM: interim measure
   mg/kg: milligrams per kilogram
   ND: nondetect
   OU: operable unit
   PCB: polychlorinated biphenyl
   PDI: pre-design investigation
5. Proposed IM samples will be composited from five sample locations within each area. Sample locations are for illustration purposes and may be revised in the field based on site conditions.
6. Five-point composite soil samples will be collected from the drainage ditches located upstream and downstream of PB-RR-37. Composite samples will be collected from four sample depths: 0 to 1 foot bgs, 1 to 2 feet bgs, 2 to 3 feet bgs, and 3 to 4 feet bgs. Additionally, during collection of the 5-point composite sample, discrete samples for the two locations closest to Snow Creek will be collected from the same depth intervals. Samples collected from the soil depths of 1 to 2 feet bgs and below will be archived at the analytical laboratory pending analysis of samples collected from 0 to 1 foot bgs.
7. Five-point composite soil samples will be collected from the interim measure area remediation footprint surrounding PB-RR-37. Composite samples will be collected from four sample depths: 0 to 1 foot bgs, 1 to 2 feet bgs, 2 to 3 feet bgs, and 3 to 4 feet bgs. One of the composite locations will be co-located with the discrete boring at PB-RR-37 that is separately implemented to profile PCB concentrations in soil from ground surface to the water table. Split samples will be collected at this location to be submitted as part of the composite sample and as a discrete sample.

4. bgs: below ground surface
   mg/kg: milligrams per kilogram
   ND: nondetect
   OU: operable unit
   PCB: polychlorinated biphenyl
   PDI: pre-design investigation
5. Five-point composite soil samples will be collected from the drainage ditch adjacent to and downstream of PB-RR-37. Composite samples will be collected from four sample depths: 0 to 1 foot bgs, 1 to 2 feet bgs, 2 to 3 feet bgs, and 3 to 4 feet bgs. Additionally, during collection of the 5-point composite sample, discrete samples for the two locations closest to Snow Creek will be collected from the same depth intervals. Samples collected from the soil depths of 1 to 2 feet bgs and below will be archived at the analytical laboratory pending analysis of samples collected from 0 to 1 foot bgs.
6. Five-point composite soil samples will be collected from the interim measure area remediation footprint surrounding PB-RR-37. Composite samples will be collected from four sample depths: 0 to 1 foot bgs, 1 to 2 feet bgs, 2 to 3 feet bgs, and 3 to 4 feet bgs. One of the composite locations will be co-located with the discrete boring at PB-RR-37 that is separately implemented to profile PCB concentrations in soil from ground surface to the water table. Split samples will be collected at this location to be submitted as part of the composite sample and as a discrete sample.

- Approximate Extent of Quintard Mall Culvert
- Calhoun County Parcels

Snow Creek Sediment Deposits

- < 3 mg/kg PCB (estimated concentration)
- < 3 mg/kg PCB (average concentration)

Notes:

1. Aerial imagery is from Esri basemaps service (accessed: 10/25/2021)
2. Transect station lines are spaced every 100 feet perpendicular to the Snow Creek cernterline.
3. Snow Creek sediment deposits are based on the 1999 Resource Conservation Recovery Act Facility Investigation (RFI) geomorphological mapping of the creek.

mg/kg: milligrams per kilogram
PCB: polychlorinated biphenyl
PDI: predesign investigation

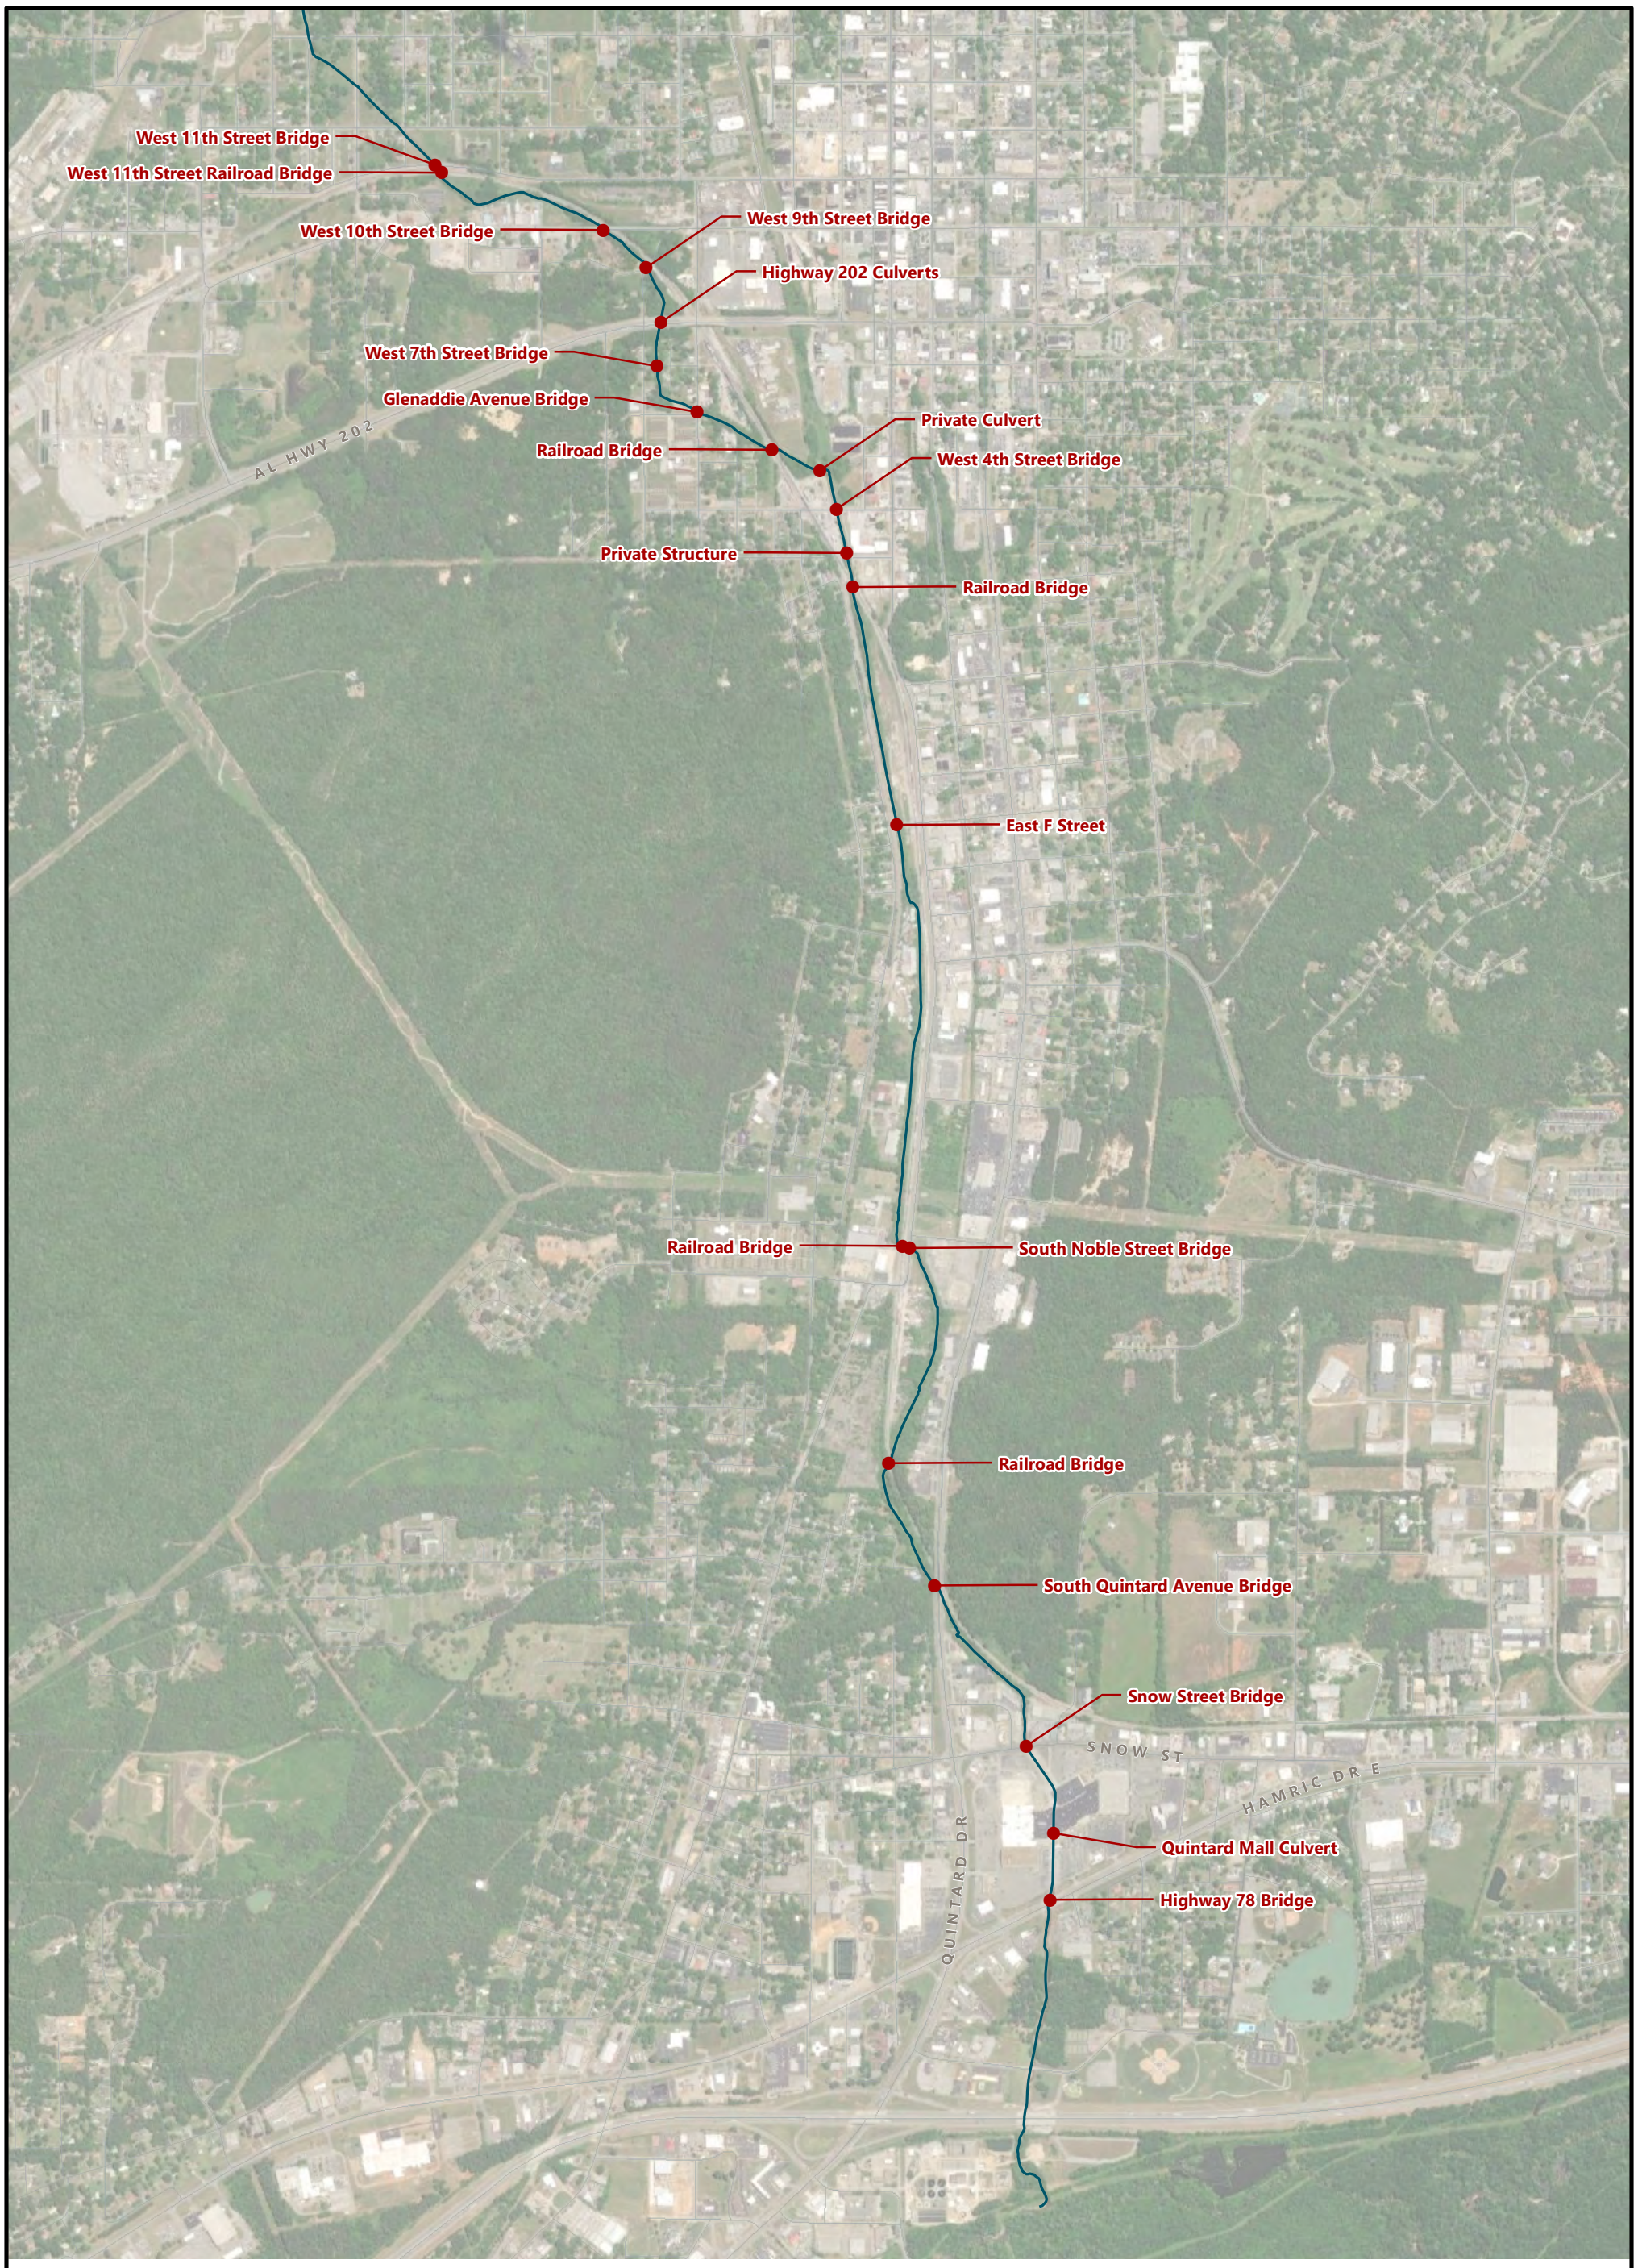
Notes.



1. Sediment sampling will be performed within the Highway 202 culverts regardless of the sediment deposit location or size to evaluate the extent of polychlorinated biphenyls (PCBs) previously detected above 50 milligrams per kilogram within this portion of the creek.
2. Sediment samples will be submitted for laboratory analysis in accordance with Section 3.3.2 of the OU-1/OU-2 PDI Work Plan. Sampling for waste characterization and treatability testing will also be performed in accordance with Section 3.3.2 of the OU-1/OU-2 PDI Work Plan.
3. As described in Section 3.3.2.2 of the PDI Work Plan, for confirmational purposes, a subset of sediment samples (up to five samples) will be collected from sediment deposits that were previously characterized for removal and appear to be present at the same location and size as measured in the RFI.
4. cy: cubic yards
   PDI: predesign investigation
   RFI: Resource Conservation Recovery Act Facility Investigation

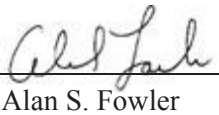
UFP-QAPP Worksheet #1 & #2: Title and Approval Page

Project Identifying Information

Site Name/Project Name:	Anniston PCB Site OU-1/OU-2
Site Location:	702 Clydesdale Ave., Anniston, Alabama 36201
Contract/Work Assignment Number:	Geosyntec Project Number #BR0579

Lead Organization:

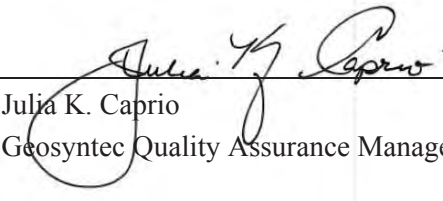
June 8, 2022



Gayle Macolly — Date
Anniston PCB Site Manager
Pharmacia LLC and Solutia Inc. (P/S)

Federal Regulatory Agency:

PAMELA SCULLY Digitally signed by PAMELA SCULLY
Date: 2022.07.05 11:56:24 -04'00'



Pamela Scully, P.E. — Date
Remedial Project Manager
USEPA Region 4

Other Stakeholders:

June 8, 2022

Alan S. Fowler — Date
Geosyntec Project Manager

June 8, 2022

Julia K. Caprio — Date
Geosyntec Quality Assurance Manager

List plans and reports from previous investigations relevant to this project

BBL. 1999. *Supplemental RCRA Facility Investigation Work Plan for the Off-Site Portion of the RFI/CS Program*. Blasland, Bouck & Lee, Inc. February.

BBL. 2000. *Off-Site RCRA Facility Investigation (RFI) Report*. Blasland, Bouck & Lee, Inc. June 2000.

BBL. 2004. *Field Sampling Plan for the Non-Residential Properties of the Operable Unit 1/Operable Unit 2 Area of the Anniston PCB Site*. Blasland, Bouck & Lee, Inc. October.

BBL. 2005. *Addendum to Field Sampling Plan for the Non-Residential Properties of the Operable Unit 1/Operable Unit 2 Area of the Anniston PCB Site* (Addendum #1). Blasland, Bouck & Lee, Inc. November.

BBL. 2006. *Addendum to the Field Sampling Plan for the Non-Residential Properties of the Operable Unit 1/Operable Unit 2 Area of the Anniston PCB Site* (Addendum #2). Blasland, Bouck & Lee, Inc. May.

Environ. 2015. *Remedial Investigation Report for Operable Unit 1/Operable Unit 2 of the Anniston PCB Site*, Revision 3. February.

USEPA. 2006a. *Stipulation of the Parties Clarifying Partial Consent Decree between USEPA, Solutia Inc., and Pharmacia Corporation*. United States Environmental Protection Agency. July

USEPA. 2017. *Record of Decision, Operable Unit 1/Operable Unit 2, Anniston PCB Site, Anniston, Calhoun County, Alabama*. United States Environmental Protection Agency. November.

USEPA. 2021. *Remedial Design/Remedial Action Consent Decree.* United States of America v. Pharmacia LLC, and Solutia, Inc. Civil Action No. 1:02-CV-0749-KOB. U.S. District Court Northern District of Alabama Eastern Division. Effective date: March 26.

UFP-QAPP Worksheet #3 & #5: Project Organization and UFP-QAPP Distribution

PE: professional engineer
P/S: Pharmacia LLC and Solutia Inc.
PTW: principal threat waste

UFP-QAPP Worksheets #4, #7 & #8: Personnel Qualifications and Sign-Off Sheet

The final UFP-QAPP will be distributed to key project personnel listed in UFP-QAPP Worksheets #3 & #5, as well as to the Field Team Lead(s). A controlled electronic copy of the final UFP-QAPP will be made available to project personnel. Additionally, copies of applicable worksheets will be distributed to the analytical laboratories for reference during completion of project tasks to better ensure successful achievement of project data quality objectives (DQOs).

This worksheet identifies key project personnel for each organization performing tasks defined in this UFP-QAPP. The field supervisor, field team, and any subcontractors performing any hazardous waste on-site tasks are required to have current Occupational Safety and Health Administration (OSHA) HAZWOPER certifications (i.e., 40-hour and 8-hour annual refresher training) and also be current in medical monitoring clearance to work on hazardous waste sites. Additionally, the field supervisor will have completed the OSHA HAZWOPER 8-hour supervisor training.

Name	Project Title/Role	Organization	Responsibilities	Signature and Date of UFP-QAPP Read
Pamela Scully, PE	Remedial Project Manager	United States Environmental Protection Agency (USEPA)	• Project oversight and management • Project quality assurance and quality management • Community Involvement Plan, if determined to be necessary	
Gayle Macolly	Anniston PCB Site Manager	Pharmacia LLC/Solutia Inc. (P/S)	• Project oversight and management, and technical oversight of the Anniston PCB Site; communications with USEPA and the community in conjunction with USEPA and the Community Involvement Plan (if determined to be necessary)	
John Loper, PE	Supervising Contractor	The Loper Group	• Principal contractor retained by P/S to supervise and direct the implementation of the work; communications with P/S	
Alan Fowler	Project Manager	Geosyntec	• Initiate administrative actions with P/S, if budget or schedule changes. • Provide overall scheduling, supervision, and technical direction for sampling and related activities. • Coordinate site reviews and on-site inspections. • Maintain and organize project files, including field and analytical data. • Review and verify quality of field data during sampling and monitoring. • Maintain data acquisition documentation. • Ensure that all work is performed in accordance with USEPA policies and procedures and meets the requirements of the technical specifications, applicable codes and regulations, project contract, and scope. • Track budget and contract revisions and overall authority on documents. • Verify that work is performed in accordance with Geosyntec policies and procedures. • Lead approval authority for project documents. • Function as primary contact between the project team for information related to the project execution and decision-making. • Issue final reports.	
Rudy Bonaparte, PhD, PE (AL)	Engineer of Record and Project Director	Geosyntec	• Direct work to be performed in accordance with USEPA policies and procedures and so the work meets the requirements of the technical specifications, applicable codes and regulations, project contract, and scope. • Direct work to be performed in accordance with Geosyntec policies and procedures. • Provide senior leadership and direction.	

Name	Title	Organization	Responsibilities	Signature and Date of UFP-QAPP Read
Courtney L. Thomas, PhD	Field Team Lead	Geosyntec	• Provide field oversight of investigation activities and sample collection/field data acquisition. • Monitor quality and safety issues in the field and report deficiencies. • Review field forms for completeness and accuracy. • Organize field documents, including sampling forms and field data sheets. • Maintain daily field logs of work activities. • Verify proper calibration of sampling and field equipment. • Coordinate disposal investigation-derived waste (IDW). • Prepare and submit waste manifests and waste profiles.	
Julia K. Caprio	Quality Assurance Manager	Geosyntec	• Provide project quality assurance and quality control. • Assess final data usability, limitations, and completeness. • Perform field and laboratory audits as necessary. • Review field and laboratory nonconformance and corrective actions. • Provide data validation oversight.	
Kristoffer Henderson	Data Validator Team Lead	Geosyntec	• Perform data validation and verification according to Worksheets #34 through #36. • Conduct data usability assessment according to Worksheet #37. • Monitor corrective action documentation for adverse quality conditions and verify implementation of corrective actions. • Review definitive data with field records to apply data qualifiers. • Serve as main contact with analytical laboratory(ies) regarding data quality issues.	
John Andros	Analytical Laboratory Project Manager	Eurofins-TestAmerica Excel	• Perform analytical services for analytical samples collected. • Conduct quality assurance/quality control of laboratory procedures and analytical methods.	
Nader Rad	Geotechnical Laboratory Project Manager	Geotechnical Testing, Inc. (EGT)	• Perform geotechnical testing services for geotechnical samples collected. • Conduct quality assurance/quality control of laboratory procedures and geotechnical analytical methods.	

UFP-QAPP Worksheet #6: Communication Pathways

Communication Drivers	Responsible Affiliation	Name	Phone Number/E-mail	Procedure
Review of the UFP-QAPP	Pharmacia LLC and Solutia Inc. (P/S) Loper Group Geosyntec	P/S: Gayle Macolly Supervising Contractor: John R. Loper, PE Geosyntec Project Manager (PM): Alan Fowler	(256) 770-1299 egmaco@eastman.com (281) 635-2509 jloper@lopergroup.com (617) 834-5847 afowler@geosyntec.com	Review UFP-QAPP for submission to the United States Environmental Protection Agency (USEPA) Remedial Project Manager (RPM) for approval.
Final Approval of UFP-QAPP or Amendments	USEPA	USEPA RPM: Pamela Scully	(404) 562-8935 scully.pamela@epa.gov	Final approved UFP-QAPP or amendments received from P/S for USEPA RPM approval.
Approval of Amendments to the UFP-QAPP	Geosyntec	Geosyntec PM: Alan Fowler	(617) 834-5847 afowler@geosyntec.com	Obtain initial approval from P/S prior to completing amendments.
Review of Amendments to the UFP-QAPP	P/S Loper Group Geosyntec	P/S: Gayle Macolly Supervising Contractor: John R. Loper, PE Geosyntec PM: Alan Fowler	(256) 770-1299 egmaco@eastman.com (281) 635-2509 jloper@lopergroup.com (617) 834-5847 afowler@geosyntec.com	Review amendments to the UFP-QAPP for submission to the USEPA RPM for approval.
Final Approval of UFP-QAPP Amendments	USEPA	USEPA RPM: Pamela Scully	(404) 562-8935 scully.pamela@epa.gov	Final approved UFP-QAPP Amendments received from P/S for USEPA RPM approval.

Communication Drivers	Responsible Affiliation	Name	Phone Number/E-mail	Procedure
Approval of Activities Deviating from the UFP-QAPP	Loper Group Geosyntec	Supervising Contractor: John R. Loper, PE Geosyntec PM: Alan Fowler	(281) 635-2509 jloper@lopergroup.com (617) 834-5847 afowler@geosyntec.com	Obtain initial approval from P/S prior to deviating from the UFP-QAPP.
Review of Activities Deviating from the UFP-QAPP	P/S	P/S: Gayle Macolly	(256) 770-1299 egmaco@eastman.com	Review deviations to the UFP-QAPP for submission to the USEPA RPM for approval.
Document Control	P/S Loper Group Geosyntec	P/S: Gayle Macolly Supervising Contractor: John R. Loper, PE Geosyntec PM: Alan Fowler	(256) 770-1299 egmaco@eastman.com (281) 635-2509 jloper@lopergroup.com (617) 834-5847 afowler@geosyntec.com	All reports and formal correspondence will be reviewed by the Geosyntec PM prior to being submitted to P/S. Documents prepared by Geosyntec PM for submittal to USEPA will be reviewed by the Quality Assurance (QA) Manager or other team member prior to submittal to P/S for submission to the USEPA RPM.

Communication Drivers	Responsible Affiliation	Name	Phone Number/E-mail	Procedure
Stop Work and Initiation of Corrective Action	All staff	All staff	All staff	Any member of the team has the authority to stop work based on concerns related to quality control (QC), H&S, or other serious deficiencies that may compromise the integrity of the long-term monitoring program or the safety of the field crew. The Geosyntec PM will communicate work stoppages to P/S within 24 hours. P/S will notify the USEPA RPM, as needed.
	P/S	P/S: Gayle Macolly	(256) 770-1299 egmaco@eastman.com	
	Loper Group	Supervising Contractor: John R. Loper, PE	(281) 635-2509 jloper@lopergroup.com	
	Geosyntec	Geosyntec PM: Alan Fowler	(617) 834-5847 afowler@geosyntec.com	

Communication Drivers	Responsible Affiliation	Name	Phone Number/E-mail	Procedure
Reporting of Health and Safety (H&S) Issues	P/S Loper Group Geosyntec	P/S: Gayle Macolly Supervising Contractor: John R. Loper, PE Geosyntec PM: Alan Fowler	(256) 770-1299 egmaco@eastman.com (281) 635-2509 jloper@lopergroup.com (617) 834-5847 afowler@geosyntec.com	H&S issues involving an injury, a near miss, or a condition that may result in an incident must be reported to the H&S Manager immediately. The H&S Manager will forward this information to the Geosyntec PM using telephone and email as soon as possible. The Geosyntec PM will notify P/S or designee as soon as possible. P/S will notify the USEPA RPM, as needed, of any serious H&S incident/issues. Incidents/issues that are not serious may be forwarded to the USEPA RPM through P/S monthly in the monthly progress reports.
Reporting Issues Related to Statement of Work (SOW) Requirements	P/S Loper Group Geosyntec	P/S: Gayle Macolly Supervising Contractor: John R. Loper, PE Geosyntec PM: Alan Fowler	(256) 770-1299 egmaco@eastman.com (281) 635-2509 jloper@lopergroup.com (617) 834-5847 afowler@geosyntec.com	All issues that may impact data quality objectives (DQOs) will be reported to the Geosyntec PM and P/S immediately.

Communication Drivers	Responsible Affiliation	Name	Phone Number/E-mail	Procedure
Community Relations, Including Community Involvement Plan (if needed at later date)	USEPA	USEPA RPM: Pamela Scully	(404) 562-8935 scully.pamela@epa.gov	All community relations will be reported to P/S, and P/S will coordinate with the USEPA RPM and community involvement coordinator (if assigned at a later date), as needed.
		USEPA Community Involvement Coordinator: Stephanie Brown	(404) 562-8450 brown.stephanie@epa.gov	
	P/S	P/S: Gayle Macolly	(256) 770-1299 egmaco@eastman.com	
		P/S Community Outreach Coordinator: Carol Kirk	(256) 231-8447 ckirk@eastman.com	
	Loper Group	Supervising Contractor: John R. Loper, PE	(281) 635-2509 jloper@lopergroup.com	
	Geosyntec	Geosyntec PM: Alan Fowler	(617) 834-5847 afowler@geosyntec.com	
Schedule Changes	P/S	P/S: Gayle Macolly	(256) 770-1299 egmaco@eastman.com	Changes to USEPA-approved schedules (e.g., field sampling schedule) will be communicated to the Geosyntec PM, who will in turn communicate changes to P/S for discussion with the USEPA RPM.
	Loper Group	Supervising Contractor: John R. Loper, PE	(281) 635-2509 jloper@lopergroup.com	
	Geosyntec	Geosyntec PM: Alan Fowler	(617) 834-5847 afowler@geosyntec.com	

Communication Drivers	Responsible Affiliation	Name	Phone Number/E-mail	Procedure
Data Release	P/S Loper Group Geosyntec	P/S: Gayle Macolly Supervising Contractor: John R. Loper, PE Geosyntec PM: Alan Fowler QA Manager: Julia Caprio	(256) 770-1299 egmaco@eastman.com (281) 635-2509 jloper@lopergroup.com (617) 834-5847 afowler@geosyntec.com (865)291-4696 jklenscaprio@geosyntec.com	Data (in format of standard regional electronic data deliverable [EDD] and laboratory reports) will be reviewed by the QA Manager and Geosyntec PM prior to being provided to P/S for release to the USEPA RPM. All data records will be delivered to USEPA in accordance with the Consent Decree.
Notification of Delays or Changes to Field Work	P/S Loper Group Geosyntec	P/S: Gayle Macolly Supervising Contractor: John R. Loper, PE Geosyntec PM: Alan Fowler Field Team Lead (FTL): Courtney Thomas	(256) 770-1299 egmaco@eastman.com (281) 635-2509 jloper@lopergroup.com (617) 834-5847 afowler@geosyntec.com (713)408-6885 clthomas@geosyntec.com	Delays or changes to the approved work plan will require approval by the Geosyntec PM and P/S. P/S will communicate delays or changes to USEPA, as needed.

Communication Drivers	Responsible Affiliation	Name	Phone Number/E-mail	Procedure
Real-Time Changes to Sample Collection or Analysis Procedures	P/S Loper Group Geosyntec Eurofins-TestAmerica Excel Geotechnical Testing (EGT)	P/S: Gayle Macolly Supervising Contractor: John R. UFP-QAPP Worksheet #9: Project Scoping Session Participants Sheet

Project Name: Anniston PCB Site **Project Manager: Alan Fowler**	**Site Name: Anniston PCB Site** **Site Location: Anniston, Alabama**

Date of Session: July 29, 2021
Scoping Session Purpose: Predesign investigation data gap identification

Name	Affiliation	E-mail Address	Project Role
Gayle Macolly	Pharmacia LLC./ Solutia Inc. (P/S)	egmaco@eastman.com	P/S Project Coordinator
John Loper	The Loper Group	jloper@lopergroup.com	Supervising Contractor
Thomas Loper	The Loper Group	tloper@lopergroup.com	Technical support resource
Michael Price	Genesis Project, Inc.	mprice@genproject.com	Residential Removal Manager
John Schell	TEA, Inc.	jschell@teainconline.com	Technical support resource
Chuck Guest	Anchor QEA	cguest@anchorqea.com	Project Manager for Anchor QEA
Chris Yates	Anchor QEA	cyates@anchorqea.com	Field Lead for Anchor QEA
Travis McGuire	GSI	tmmcguire@gsi-net.com	GSI Project Manager
Ben Smith	GSI	wbsmith@gsi-net.com	Field Lead for GSI
Kenneth Walker	GSI	klwalker@gsi-net.com	Field sampling support for GSI
Alan Fowler	Geosyntec	afowler@geosyntec.com	Geosyntec Project Manager
Rudy Bonaparte	Geosyntec	rbonaparte@geosyntec.com	Engineer of Record and Geosyntec Project Director

Decisions reached during meetings on date listed above:

- July 29, 2021, virtual meeting/conference call with key members of the remedial design (RD) team to identify data gaps based on an assessment of data needs and a review of existing data.
- Data gaps identified in the July 29, 2019, meeting were used to scope and plan the in-person Predesign Investigation Work Plan (PDIWP) and Site-walk meeting that was scheduled for August 25–26, 2021, in Anniston, Alabama.

Project Name: Anniston PCB Site Project Manager: Alan Fowler	Site Name: Anniston PCB Site Site Location: Anniston, Alabama

Date of Session: August 25 and 26, 2021

Scoping Session Purpose: Site Walk and Predesign Investigation Work Plan (PDIWP) Planning Meeting

Name	Affiliation	E-mail Address	Project Role
Gayle Macolly	Pharmacia LLC./ Solutia Inc. (P/S)	egmaco@eastman.com	P/S Project Coordinator
John Loper	The Loper Group	jloper@lopergroup.com	Supervising Contractor
Thomas Loper	The Loper Group	tloper@lopergroup.com	Technical support resource
Michael Price	Genesis Project, Inc.	mprice@genproject.com	Residential Removal Manager
Josh Threadgill	Genesis Project, Inc.	jthreadgill@genproject.com	Construction Manager
John Schell	TEA, Inc.	jschell@teainconline.com	Technical support resource
Chuck Guest	Anchor QEA	cguest@anchorqea.com	Project Manager for Anchor QEA
Chris Yates	Anchor QEA	cyates@anchorqea.com	Field Lead for Anchor QEA
Travis McGuire	GSI	tmmcguire@gsi-net.com	GSI Project Manager
Ben Smith	GSI	wbsmith@gsi-net.com	Field Lead for GSI
Alan Fowler	Geosyntec	afowler@geosyntec.com	Geosyntec Project Manager
Rudy Bonaparte	Geosyntec	rbonaparte@geosyntec.com	Engineer of Record and Geosyntec Project Director
Mark Hendry	Geosyntec	mhendry@geosyntec.com	Engineering support for Geosyntec
Jeremy Gasser	Geosyntec	jgasser@geosyntec.com	Engineering support for Geosyntec
Courtney Thomas	Geosyntec	cthomas@geosyntec.com	Field Team Lead

Decisions reached during meetings on date listed above:

- RD team meeting to review the planned predesign investigation (PDI) activities to address data gaps discussed during the July 29, 2021, meeting held via teleconference.
- August 25–26, 2021, in-person meeting provided the RD team with a boots-on-the-ground opportunity to conduct a field review of the remediation areas identified in the Operable Unit 1/Operable Unit 2 (OU-1/OU-2) Remedial Design/Remedial Action Consent Decree Statement of Work (RD/RA CD SOW). This was especially important

because some RD team members either had not physically been to the Site or had only worked on other OUs and had not viewed the portions of the Anniston PCB Site that will be remediated under the OU-/OU-2 RD/RA CD.

- The site-specific knowledge gained during the August 25–26, 2021, Site walk and the data gaps identified during the July 29, 2021, virtual meeting were used to finalize the outline for the PDIWP and the approach to prepare this UFP-QAPP.
- Analytical and geotechnical laboratory reports and electronic data deliverables will be submitted to USEPA in accordance with the Consent Decree (USEPA 2021).

UFP-QAPP Worksheet #10: Problem Definition

Problem Statement: The remedy the United States Environmental Protection Agency (USEPA) selected for Operable Unit 1 and Operable Unit 2 (OU-2/OU-2) includes multiple components for soil, groundwater, and sediment as described in the Remedial Design Work Plan (Pharmacia LLC and Solutia Inc. [P/S] 2021a) based on the presence of polychlorinated biphenyls (PCBs) and non-PCB constituents in these media at concentrations greater than their respective goals from the OU-1/OU-2 Record of Decision (ROD).

Project Description: The work to be conducted as part of a predesign investigation (PDI) and treatability studies (TSs) includes the following:

Floodplain and Creek Bank Soil Sampling

The existing floodplain soil and creek bank data were reviewed relative to the data needed to prepare a remedial design (RD) that meets the requirements of the OU-1/OU-2 ROD to identify data gaps. Data gaps were not identified for residential soil because all removal actions have been conducted for residential properties in OU-1/OU-2 where access has been granted and the properties have been identified as suitable for removal. No data gaps were identified for the high-activity special use areas because these areas have been sampled and removal actions completed where required under the Non-Time-Critical Removal Action Agreement.

Comparing the data needed to complete the RD with the existing data revealed data gaps for several other categories of floodplain soil and the creek bank areas identified in the OU-1/OU-2 ROD. The results of this process are presented below for the low-activity special use areas, interim measure (IM) areas, dredge spoil piles, nonresidential soils, and creek bank areas.

- **Low-activity special use areas:** PCB concentration data for subsurface soil in the low-activity special use area are needed to compare with the remedial goal of 97 milligram per kilogram (mg/kg). While these data could be collected as confirmation samples during remedial action (RA) construction, most of these low-activity areas are easy to access , and the data can be efficiently collected during the PDI and used to scope the required excavation depths as part of the RD. Land use conditions at the low-activity special use areas will be reviewed during the PDI prior to sampling to confirm they are consistent with the Stipulation's definition of a low-activity special use area and are suitable for removal (e.g., are not heavily vegetated or wooded; like low-activity special use area with property identification number [PPIN] 20717). Documentation of current land use will be collected for all low-activity special use areas identified in the OU-1/OU-2 ROD. This information will be used to confirm that the land use initially identified as part of the investigations conducted under the Stipulation have not changed. For example, if a low-activity area has transitioned to industrial use, relevant information (ownership, zoning, the removal or addition of built-structures, etc.) will be gathered to document this change in land use. If no changes to the properties have taken place since the initial surveys were conducted under the Stipulation, the plan is

to conduct the sampling as described in Section 3.1.2.1 of the OU-1/OU-2 PDI Work Plan (PDIWP) for locations shown on Figures 3-2a through 3-2l of OU-1/OU-2 PDIWP. Any changes in land use will be discussed with USEPA and may result in modifying the sampling program. Consistent with the OU-1/OU-2 ROD, subsurface soil sampling will be conducted only for low-activity special use areas that are suitable for removal. For example, overgrown and paved areas will not be sampled.

- **IM areas:** PCB concentrations in subsurface soil for the specific IM areas identified in the OU-1/OU-2 ROD are needed to compare with the remedial goal of 97 mg/kg. These IM areas are accessible, and the data can be efficiently collected as part of the PDI. The Hall Street IM area is also accessible for conducting physical inspections of the cover integrity as part of the PDI. PCB concentrations in surface and subsurface soil for the drainage ditch located west and east of the PB-RR-37 location will be collected for comparison with the surface remedial goals for surface and subsurface soil of 21 mg/kg and 97 mg/kg, respectively. Surface soil at the downstream end of the eastern portion of this ditch that have the potential to erode and migrate to Snow Creek will also be compared to the remedial goal for sediment of 3 mg/kg. Proposed sample locations are shown on Figures 3-3a-f of OU-1/OU-2 PDIWP.
- **Dredge spoil piles:** PCB concentration data are needed to assess whether remediation of dredge spoil pile SC-2 is required. Dredge spoil SC-1 and dredge spoil pile SC-2 are located sufficiently away from Snow Creek such that soils located at the outside edge of the piles are not potential sources to Snow Creek. Soil PCB concentrations beneath the dredge spoil piles required for removal will be assessed through post-removal samples collected during the RA construction phase of the project. The dredge spoil piles are in remote areas with difficult physical access. Collecting samples beneath the piles during RA construction will limit the disturbance of existing vegetation because the equipment needed to sample beneath these piles is like the equipment that will be used for their excavation. Since dredge spoil pile SC-8 is located adjacent to and within the borders of Snow Creek, this dredge spoil pile is being addressed as part of the Snow Creek sediment RD. The available analytical testing results for these dredge spoil piles are shown on Figure 2-5a of the OU-1/OU-2 PDIWP for dredge spoil pile SC-1 and on Figure 2-5b of the OU-1/OU-2 PDIWP for dredge spoil piles SC-7 and SC-8.
- **Nonresidential soil:** PCB concentrations in subsurface soil for the nonresidential soil areas identified in the OU-1/OU-2 ROD as candidate removal areas are needed to compare with the remedial goals of 97 mg/kg. For the PB-RR-37 area, confirmation of surface soil PCB concentrations will be conducted as an initial activity and pending the results, the subsurface soils may be analyzed. Additionally, PCB concentrations at PB-RR-37 will be profiled from ground surface to the groundwater table to evaluate potential leaching of PCBs to groundwater. Surface and subsurface soils from the ditch upstream and downstream of PB-RR-37 will also be evaluated relative to the applicable goals. The surface soil PCB results from samples collected from the portion of the ditch closest to Snow Creek will also be assessed relative to potential erosion into Snow Creek. Geotechnical data are also needed to design the excavation of principal threat waste (PTW) soil at the T-11 area and for the broader T-11 area that will be capped with clean backfill and a low-permeability cover. These data will assist in assessing the potential for differential settlement of the post-cap surface if groundwater treatment

equipment is constructed on the T-11 side of Snow Creek. Geotechnical data are also needed to design long-term access to the T-11 area that may include a bridge or pipe bridge. The nonresidential areas selected for remediation in the OU-1/OU-2 ROD and included in the Statement of Work (SOW) are shown on Figure 3-4a through 3-4h of the OU-1/OU-2 PDIWP.

- **Creek bank areas:** Geotechnical data are needed to assess creek bank stabilization options along Snow Creek at and immediately downstream of its confluence with the 11th Street Ditch.

Specific data quality objectives (DQOs) for the OU-1/OU-2 PDI program are as follows for soil:

- SO-DQO 1: Refine the current understanding of PCBs for dredge spoil pile SC-2 to evaluate whether PCB concentrations exceed the remedial goal of 3 mg/kg. Once the dredge spoil piles identified for remediation are removed, surface soil and subsurface soil beneath the dredge spoil piles will be sampled and assessed for PCBs based on the ROD requirements of 21 mg/kg for surface soil and 97 mg/kg for subsurface soil.
- SO-DQO 2: Refine the current understanding of subsurface soil PCB concentrations in floodplain soil areas, including confirmed low-activity special use areas, certain IM areas, and the nonresidential areas, for comparison with the OU-1/OU-2 ROD remedial goal of 97 mg/kg.
- SO-DQO 3: Gather geotechnical characterization data from the T-11 area to support the detailed design of a low-permeability cap and creek bank stabilization measures.
- SO-DQO 4: Evaluate whether representative soil PCB concentrations at the PB-RR-37 area, including soils along the drainage ditch upstream and downstream of this area, are above the ROD requirements of 21 mg/kg for surface soil and 97 mg/kg for subsurface soils. For locations adjacent to Snow Creek, concentrations will be compared to the OU-1/OU-2 ROD remedial goal of 3 mg/kg, and evaluated relative to their ability to erode and migrate into Snow Creek. If PCB are detected in subsurface soil proximate to the groundwater table in the PB-RR-37, discussions will be held with USEPA regarding the potential installation of a groundwater monitoring well to assess if groundwater PCB concentrations in this area exceed the remedial goal of 0.5 µg/L.
- SO-DQO 5: Evaluate whether portions of the Hall Street IM cover soils require augmentation to meet the IM design requirements.

The PDI efforts are focused on the following activities for floodplain and creek bank soils to address these DQOs:

- For the dredge spoil piles, sampling will be focused on SC-2 to evaluate PCB concentrations relative to the remedial goal of 3 mg/kg.
- For low-activity special use areas, subsurface soil will be sampled at the same surface soil locations associated with the *Stipulation of the Parties Clarifying Partial Consent Decree between USEPA, Solutia Inc., and Pharmacia Corporation* (USEPA 2006a) and the OU-1/OU-2 ROD requirement of 97 mg/kg. Composite samples will be collected from each low-activity special use area. Material from five sample locations will make up one composite sample.

- For IM areas (excluding the Hall Street IM area), soil will be sampled relative to the subsurface remedial goal of 97 mg/kg by collecting 5-point composites of soil material. For the Hall Street IM area, the area will be visually inspected to evaluate whether portions of the IM cover soils require augmentation to meet the IM design requirements.
- For the nonresidential areas, subsurface soil will be sampled using incremental sampling methodology (ISM) for the candidate removal areas greater than 0.5 acres identified in the OU-1/OU-2 ROD for comparison with the subsurface remedial goal of 97 mg/kg. 5-point composites will be collected for nonresidential areas smaller than 0.5 acres. One 5-point composite will be collected per 0.25-acre area.
- For the PB-RR-37 area, historical results of collocated soil samples (PB-RR-37 and PB-RR-40) exhibited PCB concentrations differing by more than 3 orders of magnitude (3,700J mg/kg and 2.3J mg/kg, respectively). These variable concentrations suggest significant heterogeneity in surface soil PCB concentrations. Confirmation soil sampling will be conducted to determine a representative PCB concentration in soils. Subsurface soil sampling at PB-RR-37 will also be conducted to the elevation of the groundwater table and if PCBs are detected in soils at the groundwater interface, the potential installation of a groundwater well at this location will be discussed with USEPA.
- For the T-11 area, a geotechnical characterization will be completed to support the development of the RD for excavation and low-permeability capping in this area. The geotechnical investigation will also be used to evaluate potential bridge or pipe bridge options to access the T-11 area during and after engineering design aspects of the low-permeability cap, the groundwater treatment plant, and bridge foundations. Results of the geotechnical investigations along the banks of Snow Creek in the T-11 area will also be used along with physical inspection results to develop the RD for the select creek bank areas identified in the OU-1/OU-2 ROD.

Groundwater Sampling and TS

Groundwater investigations were conducted in OU-1/OU-2 prior to the remedial investigation (RI) as part of previous activities conducted at and adjacent to OU-3 and under the non-time-critical residential removal program. Groundwater was also investigated as part of the RI. Details of investigations and their results relevant to the groundwater RD for the Eastside Properties and T-11 area are provided in the following subsections. Section 2.1.1.6 of the PDIWP discusses existing data for the PB-RR-37 area, where the need for groundwater RD activities will be determined based on findings of the PDI.

- **Eastside Properties**: As discussed in the OU-1/OU-2 ROD, PCB concentrations in soil in portions of the Eastside Properties have been detected at concentrations over 500 mg/kg, indicating the potential presence of PTW. Between 1997 and 2012, IMs were implemented to reduce potential exposure to and migration of PCB-impacted soil. The IMs generally included soil caps where total PCB concentrations were less than 500 mg/kg and geomembrane caps where PCB concentrations exceeded 500 mg/kg. Existing soil characterization data for the Eastside Properties (shown on Figures 2-14a through 2 14c of the PDIWP) were used to evaluate potential locations for a new groundwater monitoring

well that met the following criteria: (1) an area with low or no PCB impacts in shallow soil to minimize potential drag-down of PCBs from soil to groundwater during well installation and (2) an area close to and downgradient of areas within the Eastside Properties with high PCB concentrations in soil.

- **T-11 Area**: Groundwater samples collected from monitoring well T-11 (Figure 2-12 of the PDIWP) as part of the OU-1/OU 2 RI in 2008 exhibited total PCB concentrations in unfiltered samples ranging from 3.3 micrograms per liter (µg/L) (Aroclors) to 17.3 µg/L (homologs), with a nondetect result (Aroclors) and a concentration of 10.4 µg/L (homologs) reported following redevelopment of the monitoring well that was completed due to high turbidity noted in the initial samples. Additional samples collected from T-11 in 2012 exhibited total PCB concentrations in the unfiltered sample between 12 µg/L based on Aroclors and 30 µg/L based on the sum of PCB homologs. As noted in the ROD, the distribution of PCBs in the floodplain area surrounding T-11 appeared to be unique for the Site, characterized by the presence of the lower-chlorinated PCB compounds (e.g., Aroclor 1221, and monochlorobiphenyl and dichlorobiphenyl homolog groups).

  Existing hydrogeologic data related to T-11 groundwater includes information on the dominant soil type observed during well installation, groundwater elevation data over time, and aquifer slug testing data. The soils encountered at T-11 consisted of an "orange to red, stiff to soft clay" that were present from ground surface to the termination depth of 21 feet below ground surfaces (bgs). Based on the proximity of T-11 to the surface water of Snow Creek, the well was installed to monitor an interval of "minor moisture" observed from 6 to 10 feet bgs. The well is constructed with a 5-foot screen placed from 8.5 to 13.5 feet bgs. The water table at T-11 was observed at approximately 7 feet bgs following installation. Recent depth-to-water measurements have been consistent with the initial observation, corresponding to a static water elevation of approximately 687.7 feet above mean sea level. The hydraulic conductivity reported for T-11 based on slug testing was 5.93 feet per day, corresponding to 2×10^{-3} centimeters per second.

Specific DQOs for the OU-1/OU-2 PDI program are as follow for groundwater:

- GW-DQO 1: Evaluate whether representative groundwater PCB concentrations at the Eastside Properties (and potentially location PB-RR-37) exceed the remedial goal of 0.5 µg/L.
- GW-DQO 2: Gather hydrogeologic data at the T-11 area to support the detailed design of a groundwater extraction-and-treatment system.
- GW-DQO 3: Evaluate potentially efficient and cost-effective granular activated carbon (GAC) media for PCB treatment.
- GW-DQO 4: Estimate the time for PCB breakthrough in a full-scale GAC system.

Groundwater samples will be collected to support the design of the T-11 area treatment system and the evaluation of potential PTW that will be conducted for the Eastside Properties area. Groundwater in the PB-RR-37 area may be sampled depending on the results of the soil investigation to be completed in the PB-RR-37 area. As part of the groundwater TS, bench-scale

testing will be conducted to evaluate groundwater treatment using granular activated carbon filtration.

Sediment Sampling and TS

Most of the existing sediment data for the OU-1/OU-2 portion of Snow Creek were generated as part of the 1999 Resource Conservation and Recovery Act Facility Investigation (RFI). Due to the dynamic nature of the creek system, there is the potential for sediment deposits to have moved or for new sediment deposits to have formed over the past 20-plus years. In addition, the culvert beneath Quintard Mall and other portions of Snow Creek where property access was not granted were not characterized during the 1999 RFI.

The sediment PDI will be conducted to address the following data gaps:

- Additional chemical and physical data are needed to provide updated information to refine the sediment remedial extents and volumes and to determine off-site disposal requirements.
- Treatability testing is needed to evaluate potential options for dewatering sediment that will be removed from the creek.

Specific DQOs for the OU-1/OU-2 PDI program are as follows for sediment:

- SED-DQO 1: Provide an updated delineation of the current locations, extents, and depths of sediment deposits within the OU-1/OU-2 portion of Snow Creek as compared to the deposits depicted in the OU-1/OU-2 FS to refine removal volume estimates.
- SED-DQO 2: Refine the current understanding of sediment in the OU-1/OU-2 portion of Snow Creek that exceed the remedial criteria listed in the ROD to define the lateral and vertical limits of sediment removal.
- SED-DQO 3: Evaluate potentially efficient and cost-effective methods for dewatering and stabilizing sediment excavated from Snow Creek.
- SED-DQO 4: Evaluate treatment technologies that may be necessary to meet the requirements for discharging the supernatant that drains from sediment excavated from the creek.

SED-DQOs 1 and 2 will be addressed through field investigations. SED-DQO 3 and SED-DQO 4 will be addressed through a bench-scale TS.

Reconnaissance and probing activities will be completed to identity the current locations of sediment deposits and measure their dimensions to quantify the volume of sediment deposits in Snow Creek. Once reconnaissance and probing activities are completed, the deposits will be sampled to further define the chemical and physical characteristics of Snow Creek sediment to support the RD of the OU-1/OU-2 portion of Snow Creek. As part of the sediment TS, bench-scale testing will be conducted to evaluate methods for dewatering and stabilizing sediment excavated from Snow Creek and treatment technologies that may be necessary to meet the requirements for discharging the supernatant that drains from sediment excavated from Snow Creek.

Surface Water Sampling

The USEPA-selected remedy includes monitoring surface water at the upstream and downstream ends of OU-1/OU-2. Surface water sampling will be conducted as part of the PDI to establish a baseline for comparing post-remedy conditions. Since the ROD specified remedial goals for surface water are based on the USEPA's chronic aquatic life freshwater ambient water quality criteria (AWQC), the monitoring will be conducted during base flow conditions that are present 90% of the time.

The specific DQO for the surface water sampling as part of the OU-1/OU-2 PDI program is as follows:

- SW-DQO 1: Provide baseline surface water data that can be used for comparison with post-remedy surface water monitoring data.

OU-1/OU-2-Wide Evaluations

Data needs and data gaps were identified for floodplain and creek bank soil, groundwater, and Snow Creek sediment, as well as site-wide evaluations for utilities, structures, and topo-bathymetry that need to be addressed to complete the OU-1/OU-2 RD as defined in the ROD. Descriptions of these data needs and data gaps are provided below.

As part of the OU-1/OU-2 RD process, existing conditions of utilities, structures (e.g., bridges, roadways, outfalls, and culverts), surface elevations, and the presence of cultural and archeological resources need to be evaluated for inclusion on design drawings and for any preventative measures that need to be implemented to protect the integrity of the utilities and structures.

The PDI will be conducted to address the following data gaps:

- Information is needed regarding structures immediately adjacent to target remedial areas to confirm that the remediation work will not affect the integrity of the structures.
- Current project base mapping is needed to support the development of the RD and contract drawings.
- Updated topography and bathymetry data are needed to support the design for the soil and sediment remediation and for use in hydraulic modeling of potential flooding impacts associated with potential remediation within and near the creek and the Highway 202 culvert area.

The DQOs for these site wide evaluations (i.e., utility [US], structural [STR], and base mapping [BM]) activities as part of OU-1/OU-2 investigation are as follows:

- US-DQO 1: Identify utilities located within or adjacent to the proposed remedial areas and gather information for those features to design the remedial action and potential mitigative measures to prevent damaging them.
- STR-DQO 1: Identify structures, slopes, and utilities located within or adjacent to the proposed remedial areas and gather information for those features to design the remedial action and potential mitigative measures to prevent damaging them.
- BM-DQO 1: Update the project base mapping to support development of the remedial design and contract drawings.

- BM-DQO 2: Gather topography and bathymetry data to support the design for the sediment remediation and for use in hydraulic modeling of potential flooding impacts associated with potential remediation within and near the Highway 202 culverts.

The OU-1/OU-2-wide evaluations are common elements needed to complete the RDs for soil, groundwater, and sediment. The following tasks will be completed OU-1/OU-2-wide:

- A geophysical survey will be conducted to evaluate whether there are buried structures, pipes, utilities, or other features within the OU-1/OU-2 RD/RA areas.
- The Highway 202 and Quintard Mall culverts and other structures adjacent to OU-1/OU-2 RD/RA areas will be evaluated to assess whether special considerations will be required during the RA.
- Topographical surveys of OU-1/OU-2 will be conducted to create a survey-level base map for the RD.
- An assessment of cultural and archeological resources will be conducted to evaluate the presence of historical or archeological resources.

Proposed Analytical Methods to Characterize Contamination and Environmental Indicators

Samples will be analyzed by the analytical methods listed in the PDIWP. Further details regarding analysis are provided in Worksheets #12, #15, and #18.

UFP-QAPP Worksheet #11: Project/Data Quality Objectives

Data quality objectives (DQOs) are used to establish performance or acceptance criteria that will serve as the basis for collecting data of sufficient quality and quantity to support the goals of this study. The DQO process is a seven-step process; the seven steps are enumerated below. The DQOs included in this UFP-QAPP, the Predesign Investigation Work Plan (PDIWP), and Treatability Study Work Plans (TSWPs) included as Appendix B and C to the PDIWP, were developed to support the scopes of work listed in those work plans.

1. **State the problem**

The Site includes residential and nonresidential (i.e., commercial/industrial, and public) properties located in and around Anniston, Oxford, Hobson City, and areas of Calhoun and Talladega Counties in Alabama. The Site is divided into operable units (OUs). OU-1/OU-2 is a combination of residential and nonresidential properties around Solutia's Anniston Facility (the Facility) and downstream along Snow Creek to Highway 78. The Facility and its adjacent closed landfills (i.e., the South Landfill and West End Landfill) comprise OU-3. OU-4 includes Choccolocco Creek and its 100-year floodplain downstream of its confluence with Snow Creek and the portion of Snow Creek downstream of Highway 78 to its confluence with Choccolocco Creek.

The remedy the United States Environmental Protection Agency (USEPA) selected for OU-1/OU-2 includes multiple components for soil, groundwater, and sediment. The Record of Decision (ROD) identified eight categories or types of remedies based on the range of remedial alternatives presented in the OU-1/OU-2 Feasibility Study (Ramboll Environ 2016), and Pharmacia LLC and Solutia, Inc. (P/S) and USEPA agreed that P/S would implement the selected remedy for seven of these categories. The seven categories of remedial alternatives for OU-1/OU-2 identified in the CD and the selected remedy for each category are as follows:

- **Residential soils:** The selected remedy for residential soil is removal and on-site or off-site disposal of surface soil (i.e., soil from ground surface to 12 inches below ground surface [bgs]) with polychlorinated biphenyl (PCB) concentrations greater than or equal to 1 milligram per kilogram (mg/kg) but less than 10 mg/kg and removal and off-site disposal of surface and subsurface soil (i.e., soil deeper than 12 inches bgs) with PCB concentrations greater than or equal to 10 mg/kg. The selected remedy also includes long-term soil management for (1) properties with residual PCBs greater than or equal to 1 mg/kg, (2) properties with PCB concentrations in soil greater than or equal to 1 mg/kg that have been designated as "unsuitable for removal," and (3) properties that potentially have residual PCBs beneath a structure (i.e., a building, shed, or paved area) that limits exposure.
- **Special use properties:** For high-activity special use properties, the selected remedy includes removal and on-site or off-site disposal of surface soil with PCB concentrations greater than or equal to 1 mg/kg but less than 10 mg/kg and removal

and off-site disposal of subsurface soil with PCB concentrations greater than or equal to 10 mg/kg. For low-activity special use properties, the selected remedy includes removal and on-site or off-site disposal of surface soil with PCB concentrations greater than or equal to 1 mg/kg but less than 10 mg/kg and removal and off-site disposal of surface soil with PCB concentrations greater than or equal to 10 mg/kg and subsurface soil with PCB concentrations greater than or equal to 97 mg/kg. The selected remedy also includes long-term soil management for (1) properties where residual PCBs are at concentrations greater than or equal to 1 mg/kg, (2) properties with PCB concentrations in soil greater than or equal to 1 mg/kg that have been designated as "unsuitable for removal," and (3) properties that potentially have residual PCBs beneath a structure (i.e., a building, shed, or paved area) that limits exposure.

- **Interim measure (IM) areas:** The IM component of the OU-1/OU-2 remedy includes maintaining the existing IMs and excavating soil around the Northside Area, Eastside Area, and the Eastside Drainageway (including the drainage ditch to the north and PB RR-37 area) IMs to meet the surface soil remedial goal for PCBs of 21 mg/kg and subsurface soil remedial goal for PCBs of 97 mg/kg. Excavated soil will be disposed of off-site. The OU-1/OU-2 remedy also includes assessing the potential for principal threat waste (PTW) to be present in the portion of OU-1/OU-2 that is located just east of OU-3. The presence of PTW will be characterized by groundwater with PCBs at concentrations greater than the State maximum contaminant level and the Federal Safe Drinking Water Act maximum contaminant level. If PTW is found to be present, the specific approach to address the PTW material will be developed in coordination with USEPA during the RD.
- **Dredge spoil piles:** The remedy includes removal and off-site disposal of four dredge spoil piles located near or adjacent to Snow Creek. The CD includes predesign investigation (PDI) sampling for dredge spoil pile SC-2, which was not characterized during the remedial investigation (RI) to assess whether PCB concentrations are greater than or equal to the threshold concentration of 3 mg/kg for dredge spoil pile removal in OU-1/OU-2 under the selected remedy. The surface soil located directly beneath the dredge spoil piles will also be evaluated for conformance with the surface soil remedial goal of 21 mg/kg. The subsurface soil will be evaluated using the remedial goal of 97 mg/kg. Long-term soil management for areas underlying dredge spoil piles with residual PCBs greater than or equal to 1 mg/kg is also part of the remedy.
- **Nonresidential soils:** For nonresidential soil, the remedy includes removal and off-site disposal of surface soil with PCB concentrations greater than or equal to 21 mg/kg, removal and off-site disposal for subsurface soil with PCB concentrations greater than or equal to 97 mg/kg, and long-term soil management for residual soil with PCB concentrations greater than or equal to 1 mg/kg. The remedy also includes the removal and off-site disposal of nonresidential soil from several small areas where non-PCB constituents are present at concentrations greater than their respective remedial goals from the OU-1/OU-2 ROD.

- **Soil and groundwater at T-11:** For the T-11 area, the remedy includes removal and off-site disposal of soil from the upper 18-inch horizon across the broader T-11 area and the removal and off-site disposal of soil at depth directly surrounding groundwater well T-11; placement of a low-permeability cap over the broader T-11 area; the extraction, treatment, and discharge of groundwater from new groundwater wells installed in the T-11 area; and land use controls (e.g., deed restrictions or environmental covenant) that prohibit future groundwater use.
- **Sediment and creek bank soils:** For sediment and creek bank soil, the remedy includes stabilization of select creek bank areas and the removal and off-site disposal of sediment with PCB concentrations greater than or equal to 3 mg/kg. The remedy also includes the removal and off-site disposal of several sediment deposits containing non-PCB constituents at concentrations greater than their respective remedial goals from the OU-1/OU-2 ROD. The remedy for creek bank areas along Snow Creek includes stabilization of the specific reaches of the creek identified in the OU-1/OU-2 ROD.

As detailed in the PDIWP, additional investigation will be completed to support the remedial design.

2. Identify the Goals of the Study

The field investigation and treatability studies (TSs) detailed in the PDIWP will be conducted to support the remedial design. The PDI and TS activities are critical to developing a remedial design that is protective of human health and the environment over the long term and will receive regulatory approval. Study questions and DQOs for the PDI field investigations and TSs are included below.

The following study questions will be addressed through the PDI:

Principal Study Question	Alternative Actions	Decision Statement
What is the spatial extent of PCB concentrations in floodplain soil areas, including dredge spoil piles, low-activity special use areas, certain IM areas, and nonresidential areas in comparison to the OU-1/OU-2 ROD remedial goals?	Conduct excavation for soils above OU-1/OU-2 ROD remedial goals.	Evaluate whether soils are above the OU-1/OU-2 ROD remedial goals and complete excavation.
	No action.	
What are the geotechnical properties of soils within the T-11 area?	Complete excavation and low-permeability cap design for the T-11 area to support placement of groundwater treatment equipment.	Evaluate the potential for differential settlements and collect design parameters of low-permeability cover surfaces in the T-11 area to support placement of groundwater treatment equipment in this area.
	No action.	

Principal Study Question	Alternative Actions	Decision Statement
What are the geotechnical properties of creek banks along Snow Creek at and immediately downstream of its confluence with the 11th Street Ditch?	Complete design of creek bank stability measures.	Evaluate the appropriate design parameters for creek bank stabilization measures.
	No action.	
Do portions of the Hall Street IM area cover soils require augmentation to meet the IM design requirements?	Complete augmentation of cover soils to meet the IM design requirements.	Evaluate whether portions of the Hall Street IM cover soils require augmentation to meet the IM design requirements and complete augmentation.
	No action.	
Do PCB concentrations in groundwater at the Eastside Properties exceed OU-1/OU-2 ROD remedial goals?	Install new monitoring well for routine sampling and testing concurrently with the OU-3 annual groundwater monitoring program.	Evaluate if groundwater concentrations are in exceedance of OU-1/OU-2 ROD remedial goals and complete installation of new monitoring well in the Eastside Properties area.
	No further monitoring.	
What is the appropriate dosage and type of granular activated carbon to be used for treatment of PCBs in groundwater?	Complete design of treatment system using granular activated carbon.	Evaluate if GAC is an effective groundwater treatment remedy and collect design parameters for treatment of PCB-impacted groundwater.
	Complete additional treatability studies if granular activated carbon is not effective for groundwater treatment.	
What are the current locations, extents, and depths of sediment deposits within the OU-1/OU-2 portion of Snow Creek? If sediment deposit extents and depths have changed, what are the concentrations of site constituents within these sediment deposits?	Complete removal of sediment deposits above OU-1/OU-2 ROD remedial goals.	Evaluate extent of sediment deposits within Snow Creek that require removal.
	No action.	
What are applicable treatment technologies and design parameters for sediment dewatering and stabilization of excavated sediment from Snow Creek?	Complete design based on treatability study results.	Evaluate the appropriate design parameters for sediment dewatering and stabilization of excavated sediment and treatment of filtrate.
	Complete additional treatability studies if treatment technologies evaluated are not effective for sediment dewatering/stabilization or filtrate treatment.	

Specific DQOs for the OU-1/OU-2 PDI program are as follows for soil:

- SO-DQO 1: Refine the current understanding of PCBs for dredge spoil pile SC-2 to evaluate whether PCB concentrations exceed the remedial goal of 3 mg/kg. Once the dredge spoil piles identified for remediation are removed, surface soil and subsurface soil beneath the dredge spoil piles will be sampled and assessed for PCBs based on the ROD requirements of 21 mg/kg for surface soil and 97 mg/kg for subsurface soil.
- SO-DQO 2: Refine the current understanding of subsurface soil PCB concentrations in floodplain soil areas, including confirmed low-activity special use areas, certain IM areas, and the nonresidential areas, for comparison with the OU-1/OU-2 ROD remedial goal of 97 mg/kg.
- SO-DQO 3: Gather geotechnical characterization data from the T-11 area to support the detailed design of a low-permeability cap and creek bank stabilization measures.
- SO-DQO 4: Evaluate whether representative soil PCB concentrations at the PB-RR-37 area, including soil along the drainage ditch upstream and downstream of this area, are above the ROD requirements of 21 mg/kg for surface soil and 97 mg/kg for subsurface soils. For locations adjacent to Snow Creek, concentrations will be compared to the OU-1/OU-2 ROD remedial goal of 3 mg/kg, and evaluated relative to their ability to erode and migrate into Snow Creek. If PCB are detected in subsurface soil proximate to the groundwater table in the PB-RR-37, discussions will be held with USEPA relative to the potential installation of a groundwater monitoring well to assess if groundwater PCB concentrations in this area exceed the remedial goal of 0.5 µg/L.
- SO-DQO 5: Evaluate whether portions of the Hall Street IM cover soils require augmentation to meet the IM design requirements.

Specific DQOs for the OU-1/OU-2 PDI program are as follow for groundwater:

- GW-DQO 1: Evaluate whether representative groundwater PCB concentrations at the Eastside Properties (and potentially location PB-RR-37) exceed the remedial goal of 0.5 µg/L.
- GW-DQO 2: Gather hydrogeologic data at the T-11 area to support the detailed design of a groundwater extraction-and-treatment system.
- GW-DQO 3: Evaluate potentially efficient and cost-effective GAC media for PCB treatment.
- GW-DQO 4: Estimate the time for PCB breakthrough in a full-scale GAC system.

GW-DQOs 1 and 2 will be addressed through field investigations. GW-DQO 3 and GW-DQO 4 will be addressed through a bench-scale TS.

Specific DQOs for the OU-1/OU-2 PDI program are as follows for sediment:

- SED-DQO 1: Provide an updated delineation of the current locations, extents, and depths of sediment deposits within the OU-1/OU-2 portion of Snow Creek as compared to the deposits depicted in the OU-1/OU-2 FS to refine removal volume estimates.
- SED-DQO 2: Refine the current understanding of sediment in the OU-1/OU-2 portion of Snow Creek that exceed the remedial criteria listed in the ROD to define the lateral and vertical limits of sediment removal.
- SED-DQO 3: Evaluate potentially efficient and cost-effective methods for dewatering and stabilizing sediment excavated from Snow Creek.
- SED-DQO 4: Evaluate treatment technologies that may be necessary to meet the requirements for discharging the supernatant that drains from sediment excavated from the creek.

SED-DQOs 1 and 2 will be addressed through field investigations. SED-DQO 3 and SED-DQO 4 will be addressed through a bench-scale TS.

TSs are being conducted under the PDIWP to support the development of the preliminary (30%) remedial design. The TSs are being conducted for groundwater and sediment and are summarized in Sections 4.1 and 4.2 of the PDIWP. Supporting details are provided for the groundwater and sediment in stand-alone TS work plans that are provided in Appendices B and C of the PDIWP.

The specific DQO for the surface water sampling as part of the OU-1/OU-2 PDI program is as follows:

- SW-DQO 1: Provide baseline surface water data that can be used for comparison with post-remedy surface water monitoring data.

In addition to sampling environmental media, the PDI includes utility (US), structural (STR), and base mapping (BM) activities as part of OU-1/OU-2 investigation. Specific DQOs for these evaluations are as follows:

- US-DQO 1: Identify utilities located within or adjacent to the proposed remedial areas and gather information for those features to design the remedial action and potential mitigative measures to prevent damaging them.

- STR-DQO 1: Identify structures, slopes, and utilities located within or adjacent to the proposed remedial areas and gather information for those features to design the remedial action and potential mitigative measures to prevent damaging them.

- BM-DQO 1: Update the project base mapping to support development of the remedial design and contract drawings.

- BM-DQO 2: Gather topography and bathymetry data to support the design for the sediment remediation and for use in hydraulic modeling of potential flooding impacts associated with potential remediation within and near the Highway 202 culverts.

3. **Identify Information Inputs**

Sampling locations, intervals, matrices, and analytical methods to achieve the objectives of the PDIWP are presented in Worksheet #18 and the PDIWP. Specifically, for each media, the inputs to address the goal are as follows:

- *Soil*: Soil samples will be collected for chemical and geotechnical characterization to support the design of the remedy for OU-1/OU-2. Composite and ISM soil sampling methods will be used. See Worksheets #17 and #18 for additional detail.
- *Groundwater*: Groundwater samples will be collected for chemical characterization, completion of a TS, and evaluation of hydrogeologic properties of the groundwater-bearing unit to support the design of a treatment system for OU-1/OU-2. See Worksheets #17 and #18 for additional details.
- *Sediment*: Sediment samples will be collected for chemical and physical characterization and completion of a TS to support the design of the remedy for OU-1/OU-2. See Worksheets #17 and #18 for additional details.
- *Surface Water*: Surface water samples will be collected for chemical characterization to establish a baseline for comparison of post-remedy monitoring. See Worksheets #17 and #18 for additional details.

In addition to collection of environmental samples, utility, structures, and topo-bathymetric data will be collected to support the design for soil and sediment removal activities.

4. Define the Boundaries of the Study

Boundaries of the Study and Potential Constraints: The approximate spatial boundaries of the PDI study area for the low-activity special use areas are shown on Figures 2-1a through 2-1l of the PDIWP. Spatial boundaries for PDI efforts to address the dredge spoil piles are shown on Figures 2-5a and 2-5b. Spatial boundaries for PDI activities to address IM areas including soil and groundwater are shown on Figures 2-3a through 2-3e and Figures 2-14a through 2-14c of the PDIWP. The spatial boundaries for PDIs to address nonresidential soil and groundwater at the T-11 area are shown on Figure 2-12 of the PDIWP. Spatial boundaries to address Snow Creek sediment are shown on Figure 2-8 of the PDIWP and include the upstream limit of Snow Creek beginning at the northeastern end of EU5 and flowing south to the downstream end of EU28. The geographic limits of the creek bank PDIs are shown on Figures 2-5a and 2-5b of the PDIWP. The PDI field work is expected to be conducted as described in the PDIWP and Worksheet #14/16 during 2022.

Target Population of Interest: The target populations of interest consist of the soil, groundwater, and sediment from within OU-1/OU-2 as shown in the PDIWP figures identified above.

5. **Develop the Analytical Approach**

The PDI is intended to collect data that support the goals and questions of the study (listed above). Data will be collected and compared against regulatory criteria listed in Worksheet #15. Data will be presented in a PDI Evaluation Report, and additional sampling may be planned for collection to achieve the goals listed above. Data will be collected from soil, groundwater, sediment, and surface water and will be evaluated using the following analytical approaches:

- *Soil samples*: Discrete and ISM soil samples will be collected and analyzed for the parameters listed in the PDIWP and Worksheet #15. Results will be used to 1) develop an understanding of contaminant distribution laterally and vertically in areas of investigation prior to implementing the removal activities in floodplain soil areas, including confirmed low-activity special use areas, certain IM areas, and the nonresidential areas, 2) evaluate the potential for PCBs to leach from soil to groundwater at the Eastside Properties and the PB-RR-37 area, and 3) design a low-permeability cap and groundwater treatment area within the T-11 area. Soil sampling will consist of the following:
    - A single five-point composite soil sample will be collected from the dredge spoil pile SC-2 from the 0–1-foot horizon.
    - Five-point composite subsurface soil samples will be collected in confirmed low-activity special use areas from the same locations that were used for surface soil sampling under the Stipulation where surface soil concentrations were found to be greater than or equal to 1 mg/kg. Composite samples will be collected from three soil depth intervals of 1 to 2 feet bgs, 2 to 3 feet bgs, and 3 to 4 feet bgs. Composite samples collected from the soil depths of 2 to 3 feet bgs and 3 to 4 feet bgs will be archived at the analytical laboratory pending analysis of the composite sample collected from 1 to 2 feet bgs. The subsequent depth interval sample will be analyzed if PCB concentrations detected in the analyzed interval are above the PCB remedial goal for subsurface soils (97 mg/kg). For example, if PCB concentrations in the 1-to-2-foot-bgs composite sample interval are detected above the remedial goal for subsurface soils (97 mg/kg), the composite sample collected from the 2–3-foot depth interval will be analyzed.
    - Five-point composite subsurface soil samples will be collected in IM areas and nonresidential areas where the size of the contiguous area to be sampled is equal to or less than 0.5 acres. All of the IM areas evaluated under this PDI are less than 0.5 acres and will be sampled by collecting one 5-point composite per 0.25-acre area. Composite samples will be collected as described above from three soil depth intervals of 1 to 2 feet bgs, 2 to 3 feet bgs, and 3 to 4 feet bgs. Composite samples collected from the soil depths of 2 to 3 feet bgs and 3 to 4 feet bgs will be archived at the analytical laboratory pending analysis of the composite sample collected from 1 to 2 feet bgs. The subsequent depth interval sample will be analyzed if PCB concentrations detected in the analyzed interval are above the PCB remedial goal for subsurface soils (97 mg/kg).

- A five-point composite soil samples from the drainage ditch upstream and downstream of PB-RR-37. Composite samples will be collected as described above from four sample depths: 0 to 1 foot bgs, 1 to 2 feet bgs, 2 to 3 feet bgs, and 3 to 4 feet bgs. Additionally, during collection of the 5-point composite samples, individual split samples (aliquots) for the two locations closest to Snow Creek will be collected from 0 to 1 foot bgs and analyzed for comparison to 3 mg/kg. The composite PCB result for samples collected from this ditch will be compared to the nonresidential remedial goal of 21 mg/kg. Samples collected from the soil depths of 1–2 feet and below will be archived at the analytical laboratory pending analysis of samples collected from 0–1 feet bgs.
- The subsurface soil in nonresidential areas that are larger than 0.5 acres will be sampled using ISM in accordance with the Interstate Technology Regulatory Council (ITRC) Technical Guidance: Incremental Sampling Methodology Update (ISM-2) guidance document (ITRC 2020) and Attachment A-12 (Incremental Sampling Methodology Procedures). ISM is a probabilistic sampling method used to evaluate the representative concentration of a constituent in an area. It is designed to provide an unbiased and statistically valid estimate of the mean concentration of analyzed constituents within each sample area of the IM areas. ISM was developed to decrease the effect of soil sample variability due to heterogeneity and provides a reasonably unbiased estimate of mean concentration in a defined soil volume, referred to as a decision unit (DU) (ITRC 2020). Each IM and nonresidential area will be sampled as three DUs based on sample depth: 1 to 2 feet bgs, 2 to 3 feet bgs, and 3 to 4 feet bgs.
- Surface and subsurface soil samples will be collected from depth intervals from a discrete location proximate to PB-RR-37. Samples will be collected at 1-foot depth intervals from ground surface until the soil–groundwater interface is reached based on field observations (approximately 15 to 25 feet bgs). The last depth interval will be located immediately above the observed groundwater level.
- Four geotechnical borings will be advanced at locations within the T-11 area where the RA excavation and bank stabilization will be completed.

- *Groundwater samples*: Groundwater samples will be analyzed for the parameters listed in the PDIWP and Worksheet #15. Analytical results will be compared to applicable remedial goals specified in the ROD. These data will be used to assess the impact of PCB leaching from soil to groundwater in the Eastside Properties area and PB-RR-37 Area. Additionally as part of the groundwater TS, bench-scale testing will be conducted to evaluate groundwater treatment using granular activated carbon filtration. Groundwater sampling will consist of the following activities:
  - Two new groundwater monitoring wells will be installed in the Eastside Properties area for sampling.
  - Groundwater samples will be collected from well T-11

- *Sediment samples*: Sediment probing will be completed to identify the current locations of sediment deposits and measure the deposits' dimensions to quantify the volume of sediment in Snow Creek. New sediment deposits or sediment deposits in a different location or size than identified and characterized in the Off-Site Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) Program evaluation (Blasland, Bouck & Lee, Inc. [BBL] 1999) will be sampled for parameters listed in the PDIWP and Worksheet #15. Results will supplement existing sediment data, support the delineation of sediment that has PCBs and other constituent concentrations above the applicable remedial goals specified in the ROD, and establish waste disposal requirements. As part of the sediment TS, bench-scale testing will be conducted to evaluate methods for dewatering and stabilizing sediment excavated from Snow Creek and treatment technologies that may be necessary to meet the requirements for discharging the supernatant that drains from sediment excavated from Snow Creek.
- *Surface water samples*: Surface water samples will be collected for the parameters listed in the PDIWP and Worksheet #15. Results will be used to establish a baseline data set that can be used for comparison with post-remedy surface water monitoring data. Surface water will be collected from two locations (i.e., the upstream and downstream ends of Snow Creek in OU-1/OU-2).

6. **Specify Performance Criteria**

Data collected as part of the PDI will be assessed as inputs to the remedial design. Following data validation, the data will be entered into the project database. Data will be summarized on figures and tables. Comparisons between and among sample locations may be presented to assess distributions of the data based on available data sets.

The measurement performance criteria for data associated with the target population and specific analyses include considerations for precision, accuracy, representativeness, completeness, comparability, and sensitivity (PARCCS). To meet PARCCS requirements, quality control (QC) criteria are provided in the standard field and laboratory methods. These criteria include the following:

- Field duplicates, laboratory duplicates, and matrix spike/matrix spike duplicate (MS/MSD) samples to assess precision
- MS, laboratory control samples (LCS), calibration results, and field and method blanks to assess accuracy and bias
- Field sampling design and sample collection standard operating procedures (SOPs) to measure representativeness
- Standard methods and the consistent use of field and laboratory SOPs to achieve comparability and method detection limit (MDL) studies, calibration, and method blanks to determine and assess sensitivity

Consistent sampling protocols, applicable documentation, sample handling procedures, and measurement system procedures will be used during field and laboratory activities associated with the PDIWP. Worksheet #12 provides the measurement performance criteria associated with the field and laboratory QC parameters and samples associated with the criteria. Data that are generated from the sample handling system described in this UFP-QAPP and whose associated QC results meet the criteria described in the applicable method will be considered usable for supporting the goals of the PDIWP.

7. **Develop the Plan for Obtaining Data**

The PDIWP is based on the requirements of the OU-1/OU-2 *Remedial Design/Remedial Action Consent Decree* (USEPA 2021). The basis of the sampling design and rationale for the PDI and TS tasks are presented in the PDIWP, along with the sampling locations for each matrix and associated analytical suites. This includes the specific PDIWP figures identified above, Table 3-1, Section 3 of the PDIWP, and Worksheet #18 of this UFP-QAPP.

UFP-QAPP Worksheet #12a: Measurement Performance Criteria for Water Matrices with Volatiles

Matrix	Aqueous (toxicity characteristic leaching procedure [TCLP] leachate, aqueous water quality control [QC] samples, equipment/source/trip blanks)
Analytical Group	Volatile Organic Compounds (United States Environmental Protection Agency [USEPA] SW-846 Method 8260C)
Anticipated Concentration Level	Low to Moderate

Analytical Method/Standard Operating Procedure (SOP) Reference	Data Quality Indicators (DQIs)[1]	Measurement Performance Criteria	QC Sample and/or Activity Used to Assess Measurement Performance	QC Sample Assesses Error for Sampling (S), Analytical (A) or both (S&A)
USEPA SW-846 Method 8260C/SA-VO-004	Precision; Comparability	Relative percent difference ≤ 35 percent (%) when detections for both primary and duplicate samples are ≥ Limit of Quantitation (LOQ*)	Field duplicates	S
	Accuracy/Bias	Statistically derived control limits (CLs) in accordance with SOPs in Attachment B	Surrogate spikes, laboratory control samples, matrix spikes	A
	Accuracy/Bias	No target compounds > LOQ	Method blank, instrument blank, trip blank	S&A
	Representativeness/ Completeness	Samples collected as described in Predesign Investigation Work Plan (PDIWP) and sampling SOPs	Field measurements	S
	Sensitivity	Statistically derived CLs in accordance with SOPs in Attachment B	Laboratory fortified blank at LOQ	A
	Completeness	Samples collected and analyzed as described in PDIWP; Data completeness > 90%	Data completeness check	S&A

[1] Data quality indicators are defined in Worksheet #37.
*LOQ is considered comparable with the reporting limit.

UFP-QAPP Worksheet #12b: Measurement Performance Criteria for Water Matrices with Semivolatiles

Matrix	Aqueous (toxicity characteristic leaching procedure [TCLP] leachate, aqueous water quality control [QC] samples, equipment/source blanks)
Analytical Group	Semivolatile Organic Compounds (United States Environmental Protection Agency [USEPA] SW-846 Method 8270D)
Anticipated Concentration Level	Low to Moderate

Analytical Method/Standard Operating Procedure (SOP) Reference	Data Quality Indicators (DQIs)[1]	Measurement Performance Criteria	QC Sample and/or Activity Used to Assess Measurement Performance	QC Sample Assesses Error for Sampling (S), Analytical (A) or both (S&A)
USEPA SW-846 Method 8270D/SA-SM-003	Precision; Comparability	Relative percent difference ≤ 35% when detections for both primary and duplicate samples are ≥ Limit of Quantitation (LOQ)	Field duplicates	S
	Accuracy/Bias	Statistically derived control limits (CLs) in accordance with SOPs in Attachment B	Surrogate spikes, laboratory control samples, matrix spikes	A
	Accuracy/Bias	No target compounds > LOQ	Method blank, instrument blank	A
	Representativeness/ Completeness	Samples collected as described in the Predesign Investigation Work Plan (PDIWP) and sampling SOPs	Field measurements	S
	Sensitivity	Statistically derived CLs in accordance with SOPs in Attachment B	Laboratory fortified blank at LOQ	A
	Completeness	Samples collected and analyzed as described in the PDIWP; Data completeness > 90%	Data completeness check	S&A

[1] Data quality indicators are defined in Worksheet #37.

UFP-QAPP Worksheet #12c: Measurement Performance Criteria for Water Matrices with Polychlorinated Biphenyl Aroclors, Homologs, and Congeners

Matrix	Aqueous (groundwater, porewater performance reference compounds, sediment filtrate, toxicity characteristic leaching procedure [TCLP] leachate quality control [QC] samples, equipment/source blanks)
Analytical Group	Polychlorinated Biphenyls (United States Environmental Protection Agency [USEPA] SW-846 Methods 8082A and 680)
Anticipated Concentration Level	Low to High

Analytical Method/Standard Operating Procedure (SOP) Reference	Data Quality Indicators (DQIs)[1]	Measurement Performance Criteria	QC Sample and/or Activity Used to Assess Measurement Performance	QC Sample Assesses Error for Sampling (S), Analytical (A) or both (S&A)
USEPA SW-846 Method 8082A/BR-GC-005 or PT-GC-005 and Method 680/BR-MS-010	Precision; Comparability	Relative percent difference ≤ 35% when detections for both primary and duplicate samples are ≥ Limit of Quantitation (LOQ)	Field duplicates	S
	Accuracy/Bias	Statistically derived control limits (CLs) in accordance with SOPs in Attachment B	Surrogate spikes, laboratory control samples, matrix spikes	A
	Accuracy/Bias	No target compounds > LOQ	Method blank, instrument blank	A
	Representativeness/ Completeness	Samples collected as described in the Predesign Investigation Work Plan (PDIWP) and sampling SOPs	Field measurements	S
	Sensitivity	Statistically derived CLs in accordance with SOPs in Attachment B	Laboratory fortified blank at LOQ	A
	Completeness	Samples collected and analyzed as described in the PDIWP; Data completeness > 90%	Data completeness check	S&A

[1] Data quality indicators are defined in Worksheet #37.

UFP-QAPP Worksheet #12d: Measurement Performance Criteria for Solid Matrices with Polychlorinated Biphenyl Aroclors and Homologs

Matrix	Solids (soil and sediment)
Analytical Group	Polychlorinated Biphenyls (United States Environmental Protection Agency [USEPA] SW-846 Methods 8082A and 680)
Anticipated Concentration Level	Low to High

Analytical Method/Standard Operating Procedure (SOP) Reference	Data Quality Indicators (DQIs)[1]	Measurement Performance Criteria	Quality Control (QC) Sample and/or Activity Used to Assess Measurement Performance	QC Sample Assesses Error for Sampling (S), Analytical (A) or both (S&A)
USEPA SW-846 Method 8082A/BR-GC-005 or PT-GC-005 and Method 680/BR-MS-010	Precision; Comparability	Relative percent difference ≤ 50% when detections for both primary and duplicate samples are ≥ Limit of Quantitation (LOQ)	Field duplicates	S
	Accuracy/Bias	Statistically derived control limits (CLs) in accordance with SOPs in Attachment B	Surrogate spikes, laboratory control samples, matrix spikes	A
	Accuracy/Bias	No target compounds > LOQ	Method blank, instrument blank	A
	Representativeness/ Completeness	Samples collected from distinct intervals as described in the predesign investigation work plan (PDIWP) and sampling SOPs	Field measurements	S
	Sensitivity	Statistically derived CLs in accordance with SOPs in Attachment B	Laboratory fortified blank at LOQ	A
	Completeness	Samples collected and analyzed as described in the PDIWP; Data completeness > 90%	Data completeness check	S&A

[1] Data quality indicators are defined in Worksheet #37.

UFP-QAPP Worksheet #12e: Measurement Performance Criteria for Water Matrices with Metals/Cations

Matrix	Aqueous (groundwater, sediment filtrate, toxicity characteristic leaching procedure leachate, quality control [QC] samples, equipment/source blanks)
Analytical Group	Metals/Cations (United States Environmental Protection Agency [USEPA] SW-846 Method 6010C)
Anticipated Concentration Level	Low to Moderate

Analytical Method/Standard Operating Procedure (SOP) Reference	Data Quality Indicators (DQIs)[1]	Measurement Performance Criteria	QC Sample and/or Activity Used to Assess Measurement Performance	QC Sample Assesses Error for Sampling (S), Analytical (A) or both (S&A)
USEPA SW-846 Method 6010D/SA-ME-070	Precision; Comparability	Relative percent difference ≤ 35% when detections for both primary and duplicate samples are ≥ Limit of Quantitation (LOQ)	Field duplicates	S
	Accuracy/Bias	Statistically derived control limits (CLs) in accordance with SOPs in Attachment B	Laboratory control samples, matrix spikes	A
	Accuracy/Bias	No target compounds > LOQ	Method blank, instrument blank	A
	Representativeness/ Completeness	Samples as described in the Predesign Investigation Work Plan (PDIWP) and sampling SOPs	Field measurements	S
	Sensitivity	Statistically derived CLs in accordance with SOPs in Attachment B	Laboratory fortified blank at LOQ	A
	Completeness	Samples collected and analyzed as described in the PDIWP; Data completeness > 90%	Data completeness check	S&A

[1] Data quality indicators are defined in Worksheet #37.

UFP-QAPP Worksheet #12f: Measurement Performance Criteria for Solid Matrices with Metals

Matrix	Solids (soils and sediment)
Analytical Group	Metals/Cations (United States Environmental Protection Agency [USEPA] SW-846 Method 6010C)
Anticipated Concentration Level	Low to Moderate

Analytical Method/Standard Operating Procedure (SOP) Reference	Data Quality Indicators (DQIs)[1]	Measurement Performance Criteria	Quality Control (QC) Sample and/or Activity Used to Assess Measurement Performance	QC Sample Assesses Error for Sampling (S), Analytical (A) or both (S&A)
USEPA SW-846 Method 6010D/SA-ME-070	Precision; Comparability	Relative percent difference ≤ 50% when detections for both primary and duplicate samples are ≥ Limit of Quantitation (LOQ)	Field duplicates	S
	Accuracy/Bias	Statistically derived control limits (CLs) in accordance with SOPs in Attachment B	Laboratory control samples, matrix spikes	A
	Accuracy/Bias	No target compounds > LOQ	Method blank, instrument blank	A
	Representativeness/ Completeness	Samples as described in the Predesign Investigation Work Plan (PDIWP) and sampling SOPs	Field measurements	S
	Sensitivity	Statistically derived CLs in accordance with SOPs in Attachment B	Laboratory fortified blank at LOQ	A
	Completeness	Samples collected and analyzed as described in the PDIWP; Data completeness > 90%	Data completeness check	S&A

[1] Data quality indicators are defined in Worksheet #37.

UFP-QAPP Worksheet #12g: Measurement Performance Criteria for Water Matrices with Mercury

Matrix	Aqueous (sediment filtrate, toxicity characteristic leaching procedure leachate. quality control [QC] samples, equipment/ source blanks)
Analytical Group	Mercury (United States Environmental Protection Agency [USEPA] Method 7470A)
Anticipated Concentration Level	Low to Moderate

Analytical Method/Standard Operating Procedure (SOP) Reference	Data Quality Indicators (DQIs)[1]	Measurement Performance Criteria	QC Sample and/or Activity Used to Assess Measurement Performance	QC Sample Assesses Error for Sampling (S), Analytical (A) or both (S&A)
USEPA SW-846 Method 7470A/ PT-MT-005	Precision; Comparability	Relative percent difference ≤ 35% when detections for both primary and duplicate samples are ≥ Limit of Quantitation (LOQ)	Field Duplicates	S
	Accuracy/Bias	Statistically derived control limits (CLs) in accordance with SOPs in Attachment B	Laboratory control samples, matrix spikes	A
	Accuracy/Bias	No target compounds> LOQ	Method blank, instrument blank	A
	Representativeness/ Completeness	Samples collected as described in the Predesign Investigation Work Plan (PDIWP) and sampling SOPs	Field measurements	S
	Sensitivity	Statistically derived CLs in accordance with SOPs in Attachment B	Laboratory fortified blank at LOQ	A
	Completeness	Samples collected and analyzed as described in the PDIWP; Data completeness > 90%	Data completeness check	S&A

[1] Data quality indicators are defined in Worksheet #37.

UFP-QAPP Worksheet #12h: Measurement Performance Criteria for Solid Matrices with Mercury

Matrix	Solids (soil and sediment)
Analytical Group	Mercury (United States Environmental Protection Agency [USEPA] Method 7471B)
Anticipated Concentration Level	Low to Moderate

Analytical Method/Standard Operating Procedure (SOP) Reference	Data Quality Indicators (DQIs)[1]	Measurement Performance Criteria	Quality Control (QC) Sample and/or Activity Used to Assess Measurement Performance	QC Sample Assesses Error for Sampling (S), Analytical (A) or both (S&A)
USEPA Method 7471B/ SA-ME-028	Precision; Comparability	Relative percent difference ≤ 50 percent (%) when detections for both primary and duplicate samples are ≥ Limit of Quantitation (LOQ)	Field duplicates	S
	Accuracy/Bias	Statistically derived control limits (CLs) in accordance with SOPs in Attachment B	Laboratory control samples, matrix spikes	A
	Accuracy/Bias	No target compounds > LOQ	Method blank, instrument blank	A
	Representativeness/ Completeness	Soil samples collected from distinct intervals as described in the Predesign Investigation Work Plan (PDIWP) and sampling SOPs	Field measurements	S
	Sensitivity	Statistically derived CLs in accordance with SOPs in Attachment B	Laboratory fortified blank at LOQ	A
	Completeness	Samples collected and analyzed as described in the PDIWP; Data completeness > 90%	Data completeness check	S&A

[1] Data quality indicators are defined in Worksheet #37.

UFP-QAPP Worksheet #12i: Measurement Performance Criteria for Soil/Water Matrices for General Chemistry Parameters

Matrix	Aqueous (groundwater, sediment filtrate, aqueous water quality control [QC] samples, equipment/source blanks)/Soil (soil and sediment)
Analytical Group	General Chemistry Parameters (Alkalinity, Anions, Hardness, Total Dissolved Solids, Total Suspended Solids. Total Dissolved Solids, Total Organic Carbon, and Dissolved Organic Carbon)
Anticipated Concentration Level	Low to Moderate

Analytical Methods/Standard Operating Procedure (SOP) References	Data Quality Indicators (DQIs)[1]	Measurement Performance Criteria	QC Sample and/or Activity Used to Assess Measurement Performance	QC Sample Assesses Error for Sampling (S), Analytical (A) or both (S&A)
United States Environmental Protection Agency (USEPA) Methods 300.0/SA-GE-115, 9060A/SA-GE-204 and Standard Methods 2320B/SA-GW-193, 2340B/SA-GE-201, 2540C/PT-WC-043, 2540D/PT-WC-045; Lloyd Khan/BR-WC-008	Precision; Comparability	Relative percent difference (RPD) ≤ 35% for water matrices and RPD ≤50% for solid matrices when detections for both primary and duplicate samples are ≥ Limit of Quantitation (LOQ)	Field duplicates	S
	Accuracy/Bias	Statistically derived control limits (CLs) in accordance with SOPs in Attachment B	Laboratory control samples, matrix spikes	A
	Accuracy/Bias	No target compounds > LOQ	Method blank, instrument blank	A
	Representativeness; Completeness	Samples collected and analyzed as described in the Predesign Investigation Work Plan; Data completeness > 90%	Field measurements; data completeness check	S&A

[1] Data quality indicators are defined in Worksheet #37.

UFP-QAPP Worksheet #12j: Measurement Performance Criteria for Water Matrices with Hexavalent Chromium

Matrix	Aqueous (surface water, quality control [QC] samples, equipment/source blanks)
Analytical Group	Hexavalent chromium (United States Environmental Protection Agency [USEPA] SW-846 Method 7196A)
Anticipated Concentration Level	Low to Moderate

Analytical Method/Standard Operating Procedure (SOP) Reference	Data Quality Indicators (DQIs)[1]	Measurement Performance Criteria	QC Sample and/or Activity Used to Assess Measurement Performance	QC Sample Assesses Error for Sampling (S), Analytical (A) or both (S&A)
USEPA SW-846 Method 7196A/SA-GE-001	Accuracy/Bias	Statistically derived control limits (CLs) in accordance with SOPs in Attachment B	Laboratory control samples, matrix spikes	A
	Accuracy/Bias	No target compounds > LOQ	Method blank, instrument blank	A
	Representativeness/ Completeness	Samples as described in the Predesign Investigation Work Plan (PDIWP) and sampling SOPs	Field measurements	S
	Sensitivity	Statistically derived CLs in accordance with SOPs in Attachment B	Laboratory fortified blank at LOQ	A
	Completeness	Samples collected and analyzed as described in the PDIWP; Data completeness > 90%	Data completeness check	S&A

[1] Data quality indicators are defined in Worksheet #37.

UFP-QAPP Worksheet #13: Secondary Data Criteria and Limitations

Secondary Data	Data Source (Originating Organization, Report Title, and Date)	Data Generator(s) (Originating Org., Data Types, Data Generation/ Collection Dates)	How Data Will Be Used	Limitations on Data Use
Historical soil, groundwater, and sediment data	Blasland, Bouck & Lee, Inc. (BBL), Off-Site Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) Program Report, 2000	BBL, environmental media, 1999	Provide information for decision-making for subsequent Site characterization activities.	No known limitations
	BBL, Nonresidential Properties Field Sampling Plan (FSP), 2004 and associated addenda (BBL 2005 and 2006)	BBL, environmental media, 2004 to 2006	Provide information for decision-making for subsequent Site characterization activities.	No known limitations
	Arcadis BBL, Preliminary Site Characterization Summary Report for OU-1/OU-2, 2007	BBL, environmental media, 2007	Provide information for decision-making for subsequent Site characterization activities.	No known limitations
	Golder, Operable Unit 1/Operable Unit 2 Third Non-Residential Groundwater Investigation for the Anniston PCB Site, 2012	Golder, groundwater, 2012	Provide information for decision-making for subsequent Site characterization activities.	No known limitations
Historical soil, groundwater, and sediment data	Golder, NTC Removal Action Completion Report for Residential Properties in OU-1/OU-2, 2015	Golder, environmental media. 2015	Provide information for decision-making for subsequent Site characterization activities.	No known limitations

Secondary Data	Data Source (Originating Organization, Report Title, and Date)	Data Generator(s) (Originating Org., Data Types, Data Generation/ Collection Dates)	How Data Will Be Used	Limitations on Data Use
Historical soil, groundwater, and sediment data (cont.)	United States Environmental Protection Agency (USEPA) electronic data transfer, 2000	USEPA, sediment samples, 2000	Provide information for decision-making for subsequent Site characterization activities.	No known limitations
	CDM, Anniston PCB Site Operable Units 1 and 2 Baseline Risk Assessment, 2009	CDM, environmental media, 2009	Provide information for decision-making for subsequent Site characterization activities.	No known limitations
	USEPA, Remedial Design/Remedial Action Consent Decree for Portions of the Record of Decision for Operable Unit 1/Operable Unit 2, 2021	USEPA	Provide information for decision-making for subsequent Site characterization activities needed to satisfy requirements of Consent Decree.	No known limitations
	USEPA, Record of Decision for Operable Unit 1/Operable Unit 2, Anniston PCB Site, 2017	USEPA	Provide information for decision-making for subsequent Site characterization activities needed to satisfy requirements of ROD.	No known limitations
	Pharmacia LLC/Solutia Inc. (P/S), Supplemental Work Plan for the Off-Site Portion of the RFI/CS Program, 1999	P/S, sediment, surface water, fish tissue, 1999	Provide information for decision-making for subsequent Site characterization activities.	No known limitations

Secondary Data	Data Source (Originating Organization, Report Title, and Date)	Data Generator(s) (Originating Org., Data Types, Data Generation/ Collection Dates)	How Data Will Be Used	Limitations on Data Use
Historical soil, groundwater, and sediment data (cont.)	P/S, RFI/CS Report, 2002	P/S, groundwater, surface water, soil, 1998	Provide information for decision-making for subsequent Site characterization activities.	No known limitations
	P/S, Remedial Investigation Report for OU-1/OU-2, 2015	P/S, environmental media, 2010–2015	Provide information for decision-making for subsequent Site characterization activities.	No known limitations
	P/S. Feasibility Study for OU-1/OU-2, 2016	P/S. environmental media,	Provide information for decision-making for subsequent Site characterization activities needed to satisfy requirements to complete design activities.	No known limitations

UFP-QAPP Worksheets #14 and #16: Project Tasks & Schedule

Preliminary Tasks

Before subsurface drilling activities begin, utilities will be located as described in the Predesign Investigation Work Plan (PDIWP).

Sampling Tasks

Sampling tasks are described in the PDIWP and Worksheet #17.

Analysis Tasks

Soil, groundwater, and sediment samples will be collected and documented as described in the PDIWP. Samples will be sent to analytical laboratories for analysis in accordance with Worksheets #18, #19, and #30.

Soil and soil leachates will be analyzed using the following methods depending on scope of work to satisfy data quality objectives (DQOs):

- Polychlorinated biphenyl (PCB) Aroclors (United States Environmental Protection Agency [USEPA] SW-846 8082A)
- PCB homologs (USEPA Method 680)
- Moisture content (ASTM International [ASTM] D2216)
- Particle size (ASTM D6913/D7928)
- Atterberg (Liquid and Plastic) limits (ASTM D4318)
- Unconsolidated undrained (UU) triaxial (ASTM D2850)
- Consolidated undrained (CU) triaxial (ASTM D4767)
- Toxicity characteristic leaching procedure (TCLP) metals (USEPA SW-846 6010C/7471B/7470A), volatile organic compounds (VOCs; USEPA SW-846 8260C), and semivolatile organic compounds (SVOCs; USEPA SW-846 8270D)
- Corrosivity (USEPA SW-846 9045D)
- Ignitability (USEPA Chapter 7, Section 7.1)
- Reactivity – cyanide (USEPA SW-846 Method 9010C) and sulfide (USEPA SW-846 9030B/9034)

Sediment and sediment filtrates from the sediment treatability study will be analyzed using the following methods depending on scope of work to satisfy DQOs:

- PCBs Aroclors (USEPA SW-846 8082A)

- Metals (barium, chromium [total], cobalt, lead, manganese, mercury [total], nickel, and vanadium only) (USEPA SW-846 6010C/7471B)
- Total organic carbon (TOC; Lloyd Kahn)
- Specific gravity (ASTM D854)
- Moisture content (ASTM D2216)
- Particle size (ASTM D6913/D7928)
- Atterberg (Liquid and Plastic) limits (ASTM D4318)
- Dry density (ASTM D2937)
- Organic content (ASTM D2974)
- Unconfined compression strength (ASTM D2166)
- Paint filter test (USEPA Method 9095B)
- Total suspended solids (SM2540D)
- Oil and Grease (USEPA Method 1664B)

Groundwater will be analyzed using the following methods:

- PCBs Aroclors (USEPA SW-846 8082A)
- PCB homologs (USEPA Method 680)
- Total and dissolved organic carbon (USEPA 9060A)
- Total and dissolved cations (calcium, magnesium, sodium, potassium, manganese, iron; USEPA Method 6010C)
- Total and dissolved anions (sulfate, chloride, nitrate; USEPA Method 300.0)
- Alkalinity (SM2320B)
- Hardness by calculation (USEPA Method 2340B)
- Total suspended solids (SM2540D)
- Total dissolved solids (SM2540C)
- TCLP metals (USEPA SW-846 6010C/7470A), VOCs (USEPA SW-846 8260C), and SVOCs (USEPA SW-846 8270D)
- Corrosivity (USEPA SW-846 9045D)
- Ignitability (USEPA Chapter 7, Section 7.1)
- Reactivity – cyanide (USEPA SW-846 Method 9010C) and sulfide (USEPA SW-846 9030B/9034)

Surface water will be analyzed using the following methods:

- PCB homologs (USEPA Method 680)
- PCB congeners (USEPA Method 1668A)
- Metals (lead and total chromium only) (USEPA Method 6010C)
- Hexavalent chromium (USEPA Method 7196A)

Quality Control Tasks

All applicable quality control (QC) protocols will be performed according to the listed method and the associated standard operating procedures (SOPs). Specified QC criteria will be met and documented.

Secondary Data

Previous studies and reports. See Worksheet #13.

Data Management Tasks

Data are generated from three primary pathways: (i) data derived from field activities; (ii) laboratory analytical data; and (iii) validated data. Data from all three pathways are entered into an electronic format in accordance with the project protocols.

Data generated during field activities will be recorded using a field logbook and/or field forms. The Field Team Lead reviews these forms for completeness and accuracy. Pertinent data from the field forms are entered into the project database. Hard copy field records are stored in a secure project file or scanned and stored on the project server.

Data generated during laboratory analysis are recorded as electronic reports in portable document format (PDF) format, and in electronic data deliverables (EDDs) after the samples have been analyzed. These data are then submitted for data validation. Data validation is performed in accordance with Worksheets #33, #34, #35, #36, and #37. Data and chain-of-custody forms are stored securely. Laboratories that generated the data archive data for a minimum of 5 years. Data are archived in electronic format.

Documentation and Records

In association with sample collection, field personnel are required to document pertinent data, including date, time, location (coordinates), field personnel, weather conditions, instrument identification, and any other factors that may affect data quality. Chain-of-custody procedures will be followed for all samples. All hardcopy data (field notebooks; photos; hard copies of chain-of-custody forms; etc.) are housed at the Geosyntec office (Portsmouth, New Hampshire) and/or scanned and stored on the project server. These records will be retained for at least 10 years after USEPA's Certification of Work Completion of the Statement of Work (SOW) as specified in the Consent Decree Section XIX.

Assessment/Audit Tasks

Review of SOPs as applicable relating to field and laboratory measurements, data validation, and project activities is required prior to project start. Audit records of the laboratories are maintained by the laboratory and available upon request.

Data Review Tasks

Peer and senior review of documentation will occur during data analysis and reporting. Senior and peer reviews are documented. Laboratory data will undergo data validation and verification.

Schedule

Activities	Organization	Anticipated Date(s) of Initiation	Anticipated Date of Completion	Deliverable	Deliverable Due Date
Preparation of draft Predesign Investigation Work Plan (PDIWP) and UFP-QAPP	Pharmacia LLC and Solutia Inc. (P/S), Geosyntec, GSI, and Anchor QEA	September 2021	November 2021	Draft PDIWP and UFP-QAPP with Attachments	November 9, 2021
Final PDIWP and UFP-QAPP after United States Environmental Protection Agency (USEPA) review of draft *(60 days following receipt of USEPA comments unless an extension is granted)*	P/S, Geosyntec, GSI, and Anchor QEA	May 2022	June 2022	Final PDIWP and UFP-QAPP with Attachments	June 8, 2022
Implementation of predesign investigation (PDI) activities *(schedule depends on property access that will be ongoing after submittal of the draft PDIWP and subcontractor availability)*	P/S, Geosyntec, GSI, and Anchor QEA	Summer 2022	Summer–Fall 2022	N/A	N/A
Monthly Progress Reports (initiated following USEPA's approval of the Remedial Design Work Plan and will continue monthly as a combined report for the Site as a whole)	P/S	N/A	TBD	Progress Reports, submitted at month's end	Monthly
PDI Evaluation Report *(60 days following completion of data validation for the PDI data collected under the PDIWP)*	P/S, Geosyntec, GSI, and Anchor QEA	Fall 2022	Spring 2023	Final Report	TBD

UFP-QAPP Worksheet #17: Sampling Design and Rationale

Soil, groundwater, and sediment samples will be collected for laboratory analysis during the implementation of the Predesign Investigation Work Plan (PDIWP). Sampling rationale is summarized below and is provided in the PDIWP.

Sampling locations are shown in PDIWP figures. Samples of each media will be collected and analyzed according to the PDIWP.

The purpose of the assessment is to obtain additional information needed to complete the remedial design through the investigation of polychlorinated biphenyls (PCBs) and other Site compounds in these media. The data will be used to (i) evaluate the presence or absence of target compounds in media; (ii) provide additional information regarding the nature and extent of target compounds in media; (iii) evaluate potential treatment technologies for groundwater; and (iv) evaluate potential options for dewatering sediment.

Media sampled to accomplish these objectives will include soil, groundwater, sediment, and surface water, and these media will be sampled using conventional techniques. Media will be collected to achieve the above-stated objectives and the following additional objectives:

- Soil borings will be advanced to provide an updated understanding of Site geology and contaminant distribution.
- Groundwater samples will be collected to evaluate the presence of target compounds in groundwater and support the design of a treatment system. Additionally, monitoring wells will be installed to evaluate the groundwater flow regime and to support the design of a groundwater extraction system.
- Sediment samples will be collected to provide an updated delineation of location, physical extents, and contaminant distribution of sediment deposits.
- Surface water samples will be collected to generate a baseline dataset that can be used for comparison with post-remedy surface water monitoring data.

Sample Naming Convention

Each sample bottle will be labeled with the following information: unique sample identification (ID), date and time of sample collection, project name, and sampler's initials. Indelible ink will be used to record information on the sample label. Field documentation will accurately trace sample IDs to corresponding sample locations.

Samples that are collected in the field will be identified with a unique alpha-numeric sample ID that will abide by the following format:

XXX-WWA-D0-D1-YYYYMMDD

Where:

- "XXX" is a two- or three-letter description of the sample matrix.
- "WW" is a two-digit number describing the sample location. Numbers begin at "01" and continue upwards.
- "A" is used to indicate whether a monitoring well sample is shallow or deep. If this designation is not relevant to the sample, A will be omitted from the sample name.
- D0-D1: "D0" indicates sample start depth, and "D1" indicates sample end depth. All sampling depths are presumed to be measured in units of feet with one decimal. If D0 and/or D1 are not relevant to the sample, they will be omitted from the sample name.
    - "YYYYMMDD" is an 8-digit number representing the year, month, and date of sampling.

For example, the groundwater sample collected from the 01 shallow monitoring well from 10 feet below ground surface on July 4, 2021, would be assigned the sample ID: "MW-01S-10-20210704." A soil sample collected from SBS-05 from a start depth of 3 feet below ground surface and an end depth of 5 feet below ground surface would be given a sample ID of "SBS-05-3.0-5.0-YYYYMMDD."

Quality Assurance/Quality Control (QA/QC) Sample IDs

QA/QC samples to be collected include duplicate samples, equipment blanks, trip blanks, matrix spikes, and matrix spike duplicates (MS/MSD). Data about the source of the duplicate samples will be documented in field notes, but not provided to the laboratory.

QA/QC samples that are collected in the field will be identified with a unique alpha-numeric sample ID that will abide by the following format:

XXX-QC-BB-YYYYMMDD

Where:

- "XXX" is the two- or three-letter description of the sample matrix described above
- "QC" is the QC sample designation:

QC	QC Sample Type
DUP	Duplicate or Split Sample
EB	Equipment Blank Sample
TB	Trip Blank Sample

- "BB" is the is a numerical code starting at 01 and increasing based on the number of those samples collected on the day designated in the ID.
    - "YYYYMMDD" is an 8-digit number representing the year, month, and date of sampling.

For example, a duplicate sample collected at MW-01S on July 5, 2021, would be labeled "MW-DUP-01-20210705."

MS/MSD samples will follow a different convention from other QC samples: they will be labeled with the unique sample ID, as described above for each sample, with the suffix "-MS" or "-MSD" appended to the end of the sample ID. For example, an MSD sample collected from 10 feet deep from the 01 soil boring location on-site on July 5, 2021, would be labeled, "SBS-01-10-20210705-MSD."

Field Procedures

The following factors will be considered to meet the objectives of this field effort:

- Decontamination of Non-dedicated Equipment: Non-dedicated equipment will be decontaminated as described in the PDIWP.
- Complete and Appropriate Documentation: Field notes and other documentation will be maintained as described in the PDIWP.
- Sampling Equipment Construction Material: The material from which sampling equipment is constructed can affect sample analytical results. Materials must not contaminate the sample being collected, and reusable equipment must be able to be readily cleaned so that samples are not cross-contaminated.
- Sample Containers and Volumes: The sample volume obtained will be sufficient to supply the laboratory with adequate material to perform all required analyses and QC. Container types and required sample volumes are specified in Worksheet #19.
- Sample Preservation: Samples will be preserved to maintain their integrity as specified in Worksheet #19.
- Sample Holding Times: The elapsed time between sample collection and initiation of laboratory analyses will be consistent with the analytical methods per matrix and is specified in Worksheet #19.
- Sample Chain of Custody: Chain-of-custody procedures will be maintained from the point of sampling to final analysis as described in the PDIWP.

Inspection/Acceptance for Field Supplies and Consumables

Critical field supplies and consumables include the following:

- Sample bottleware
- Decontamination fluids (e.g., Liquinox®, nitric acid, acetone, deionized water, and distilled water)
- Personal protective equipment (PPE)
- Calibration standards for field measurement equipment
- General sampling consumables (ice, plastic bags, paper towels, aluminum foil, etc.).

For bottleware, the acceptance criteria will entail an inspection upon receipt to confirm the presence of appropriate preservatives (e.g., hydrochloric acid or nitric acid). For decontamination fluids, the field staff shall verify that the fluids meet the necessary requirements for concentration and quality grade (e.g., reagent-grade acetone). Calibration standards will be used within the specified expiration dates. PPE will be inspected to confirm integrity and ensure that the appropriate sizes are available as required by sampling team members.

Non-direct Measurements

In limited cases, non-direct measurement sources and tools will be used for project tasks. These sources and tools include the following:

- Geographic information system (GIS) base data, including aerial photographs, topographic quadrangles, and land use/land control data
- Regional literature describing the local geologic setting and geochemical environment
- Site characterization reports prepared under previous regulatory frameworks
- Analytical or numerical models to support fate and transport assessments, which may include both computational packages and internal databases for key site setting or transport parameters, such as climatic parameters

These non-direct measurement sources will play an important role in meeting project data quality objectives (DQOs). The acceptance criteria for these measurement sources are as follows:

- Where possible, GIS base data will be acquired from public data sources, such as the United States Department of Agriculture (USDA), Natural Resources Conservation Service (NRCS), or Geospatial Data Gateway (http://datagateway.nrcs.usda.gov/). These public sources provide a standardized approach to data quality review and georeferencing, with thorough documentation in accompanying metadata. Before these data are used in the Site GIS, the metadata shall be reviewed to ensure that the appropriate coordinate translation is applied.

- Regional literature will be sought from peer-reviewed public sources, such as United States Geological Survey (USGS) reports, to ensure a standard level of data review.
    - Prior Site characterization reports that have been reviewed by the United States Environmental Protection Agency (USEPA) will be used as the primary source for historical data.

Field Documentation

Field personnel will record the field sampling, field analysis, and sample chain-of-custody information. This documentation consists of a record that allows reconstruction of field events to aid in the data review and evaluation process. Documents, records, and information relating to the performance of the field work will be retained in the project files in accordance with Worksheet #29.

The following are various forms of documentation to be maintained throughout field activities:

- Daily Production Documentation: A field notebook consisting of a waterproof, bound notebook that will contain a record of activities performed at the Site. Field data sheets may also be used to record observations and sample collection information.
- Sampling Information: Detailed notes will be made as to the sampling location, physical observations, and weather conditions (as appropriate).
- Chain of Custody: Chain-of-custody forms will provide the record of responsibility for sample collection, transport, and submittal to the laboratory. Chain-of-custody forms will be completed for all samples collected at the Site. In the event that the samples are relinquished by the designated sampling person to other sampling or field personnel, the chain-of-custody form will be signed and dated by the appropriate personnel to document the sample transfer. The original chain-of-custody form will accompany the samples to the laboratory, and copies will be forwarded to the project files. Persons will have custody of samples when the samples are in their physical possession, in their view after being in their possession, or in their physical possession and secured so they cannot be tampered with. In addition, when samples are secured in a restricted area accessible only to authorized personnel, they will be deemed to be in the custody of such authorized personnel.
    - Field Equipment, Calibration, and Maintenance Logs: Calibration and maintenance of field instrumentation will be documented for each piece of field equipment.

Sample Handling and Custody

The first step in proper sample handling and custody is observance of analytical holding times, which can vary from 24 hours to 180 days depending upon the analytical method(s) selected for the samples. Knowledge of required holding times will directly affect scheduling of sample

collection, packing, and shipping activities. The sample container, volume, preservation, and holding times applicable to each analytical method are shown in Worksheet #19.

Field sample custody ensures that samples are not tampered with between the time of sample collection and the time of receipt at the analytical laboratory. Chain-of-custody procedures serve at least two essential purposes:

- They provide a formalized mechanism to assign responsibility for sample integrity.
- They provide objective, physical evidence of the procession history and integrity of each sample—collection through analysis to data reporting—supporting the validity of Site investigation data.

Upon sample receipt, laboratory personnel will be responsible for sample custody. The original field chain-of-custody form will accompany samples requiring laboratory analysis. The laboratory will use chain-of-custody guidelines described in the USEPA guidance documents listed in Worksheet #2. Samples will be kept secured in the laboratory until the analysis and reporting are complete. Laboratory personnel having samples in their custody will be responsible for documenting and maintaining sample integrity.

Upon sample receipt, the laboratory sample custodian will verify the cooler seal, open the cooler, check and document the cooler temperature, and compare the contents against the field chain-of-custody form. If a sample container is missing, a sample container is broken upon receipt, the sample is in an inappropriate container, or the sample has not been preserved by appropriate means, the contact designated on the chain-of-custody form will be notified. The laboratory sample custodian will be responsible for logging in the samples, assigning each sample a unique laboratory ID number, labeling the sample bottle with the laboratory ID number, and moving the sample to an appropriate storage location to await analysis. The project name, field sample code, date sampled, date received, analysis required, storage location and date, and action for final disposal will be recorded in the laboratory tracking system. Relevant custody documentation will be placed in the project file.

Samples will be organized into sample delivery groups (SDGs) by the laboratory. An SDG may contain up to 20 field samples of the same matrix (field duplicates, trip blanks, and rinse blanks are considered field samples for the purposes of SDG assignment). Field samples received by the laboratory over a duration of no more than 14 calendar days can be assigned to a single SDG and processed through the laboratory (preparation, analysis, and reporting) as a group. Each SDG will include laboratory batch QC.

Once analysis is complete, the sample volume and extracts remaining will be maintained by the laboratory for at least 1 month after the final report is delivered. The laboratory will be responsible

for the eventual and appropriate disposal of the samples. The analytical laboratory will inform the project prior to disposal of samples or extracts. Unused portions of samples, sample extracts, and associated wastes will be disposed of by the laboratory in accordance with applicable rules and regulations.

UFP-QAPP Worksheet #18: Sampling Locations and Methods/SOP Requirements Table

Sampling Media	Sample ID[1]	Matrix	Depth	Analytical Group[2]	Number of Samples Per Sampling Event (Field Quality Control)	Sampling Standard Operating Procedure (SOP) Reference	Rationale for Sampling Location
Groundwater	To be determined (TBD)	Groundwater	TBD	• Polychlorinated biphenyl (PCB) Aroclors • PCB homologs • Total organic carbon (TOC) and dissolved organic carbon (DOC) • Cations (calcium, magnesium, sodium, potassium, manganese, iron; total and dissolved) • Alkalinity • Anions (sulfate, chloride, nitrate; total and dissolved) • Hardness • Total suspended solids • Total dissolved solids • Toxicity characteristic leaching procedure (TCLP) (full suite)[3]	TBD	A-7	See Predesign Investigation Work Plan (PDIWP) and Worksheets #10 and #11

Sampling Media	Sample ID[1]	Matrix	Depth	Analytical Group[2]	Number of Samples Per Sampling Event (Field Quality Control)	Sampling Standard Operating Procedure (SOP) Reference	Rationale for Sampling Location
Soil Samples	TBD	Soil (Composite)	Dredge Spoil Pile SC-2: 0 to 1 foot below grade surface Low-Activity Special Use Areas: 1-foot intervals between 1 and 4 feet bgs	• PCB Aroclors • PCB homologs • TCLP (full suite)[3]	TBD	A-5	See PDIWP and Worksheets #10 and #11
	TBD	Soil (Geotechnical)	Up to 40 feet bgs	• Moisture content • Particle size • Atterberg limits • Engineering Classification • Unconsolidated undrained (UU) triaxial • Consolidated undrained (CU) triaxial	TBD	A-5	
	TBD	Soil (Composite and Incremental Sampling Methodology [ISM])	Interim Measure and Nonresidential Areas: 1-foot intervals between 0 and 4 feet bgs depending on area	• PCB Aroclors • PCB homologs	TBD	A-12	

Sampling Media	Sample ID[1]	Matrix	Depth	Analytical Group[2]	Number of Samples Per Sampling Event (Field Quality Control)	Sampling Standard Operating Procedure (SOP) Reference	Rationale for Sampling Location
Sediment	TBD	Sediment	TBD	• PCB Aroclors • Metals (barium, chromium [total], cobalt, lead, manganese, nickel, and vanadium only) • Mercury • TCLP (full suite)[3] • TOC • Specific gravity • Moisture content • Particle size • Atterberg Limits • Dry density • Organic content • Unconfined compressive strength • Paint filter test • Total suspended solids (filtrate) • Oil and Grease (filtrate)	TBD	A-3	See PDIWP and Worksheets #10 and #11

Sampling Media	Sample ID[1]	Matrix	Depth	Analytical Group[2]	Number of Samples Per Sampling Event (Field Quality Control)	Sampling Standard Operating Procedure (SOP) Reference	Rationale for Sampling Location
Surface Water	TBD	Surface Water (Passive Sampler)	Mid-depth under base flow conditions and a minimum of 3 inches above sediment surface	• PCB homologs (dissolved) • PCB congeners (dissolved)	2 (2 events per year)	A-13	See PDIWP and Worksheets #10 and #11
	TBD	Surface Water (Grab Sample)	Mid-depth under base flow conditions[4] and a minimum of 3 inches above sediment surface	• PCB homologs (total and dissolved) • Metals (lead and total chromium only; total and dissolved) • Hexavalent chromium (total and dissolved)	2 (4 events per year)	A-13	

1. Sample naming conventions are described in Worksheet #17.
2. Analytical methods for each media are listed in PDIWP.
3. Toxicity characteristic leaching procedure (TCLP) (full suite) includes: TCLP metals (USEPA SW-846 6010C/7471B/7470A), TCLP volatile organic compounds (USEPA SW-846 8260C), TCLP semivolatile organic compounds (USEPA SW-846 8270D), corrosivity (USEPA SW-846 9045D), ignitability (USEPA SW-846 1030), and reactivity – cyanide/sulfide (Ch. 7 USEPA SW-846)
4. For surface water grab sampling, samples will not be collected if significant precipitation has occurred within 72 hours of the planned sampling date.

UFP-QAPP Worksheets #19 & #30: Sample Containers, Preservation, and Hold Times

Geotechnical Laboratory: Excel Geotechnical Laboratory, Nader Rad, 953 Forrest Street, Roswell, GA 30075, (770) 910-7537
Required accreditations/certifications: Not applicable
Sample Delivery Method: Courier or FedEx

Matrix	Analytical Group	Analytical Method/Standard Operating Procedure (SOP) Reference	Containers (Number, Size, and Type)	Minimum Sample Volume	Preservation	Analytical Holding Time

Notes:

1. The number of soil samples to be provided for analytical or geotechnical analyses cannot be provided as several sampling scopes of work are dependent on field observations; however the anticipated number of sample locations or areas has been provided where known.

2. The number of sediment sampling locations is dependent upon completion of Phase 1 of the sediment pre-design investigation (i.e., sediment probing and reconnaissance) as described in Section 3.3.2 of the OU-1/OU-2 Pre-Design Investigation Work Plan (P/S 2022).
3. The number of sampling locations or areas is not applicable to define for groundwater and soil/sediment IDW. Excess sample material, purge water, and spent decontamination liquids will be containerized in drums and tested to determine proper disposal methods.

IDW: investigation-derived waste

ISM: incremental sampling methodology

MS/MSD: matrix spike/matrix spike duplicate

UFP-QAPP Worksheet #22: Field Equipment Calibration, Maintenance, Testing, and Inspection Table

The following field instruments will be used in support of field sampling and field-testing tasks:

- Trimble differential global positioning system (DGPS) or equivalent (soil, groundwater, surface water and sediment)
- YSI Model Pro Plus multimeter or equivalent (groundwater and surface water)
- Hach Model 2100Q turbidimeter or equivalent (groundwater and surface water)

Instruments will be inspected and calibrated (if applicable) daily prior to use and as needed during use in accordance with the manufacturer's instructions and the Predesign Investigation Work Plan (PDIWP). The Predesign/Field Investigation Coordinator and Field Team Leads (or a qualified delegate) identified in UFP-QAPP Worksheet #3 & #5 (Project Organization and UFP-QAPP Distribution) will manage the field equipment calibration, maintenance, testing, and inspection in accordance with manufacturer's instructions and the PDIWP. Additionally, an inspection and calibration check (if applicable) will be completed at the end of each day in accordance with the manufacturer's instructions and the PDIWP. Pertinent data will be recorded on the appropriate field forms.

Geosyntec consultants

CVAA	See SOP provided in Attachment B				Lab Manager/ Analyst	SA-ME-028, Rev. 15A

Instrument	Calibration Procedure	Frequency of Calibration	Acceptance Criteria	Corrective Action (CA)	Person Responsible for CA	SOP Reference
Carbon Analyzer	See SOP provided in Attachment B				Lab Manager/ Analyst	BR-WC-008, Rev. 17
Spectrophotometer	See SOP provided in Attachment B				Lab Manager/ Analyst	PT-WC-018, Rev. 21
Balance	See SOPs provided in Attachment B				Lab Manager/ Analyst	BR-GT-006, Rev. 9 PT-WC-028, Rev. 16 PT-WC-034, Rev. 5
Konelab Model 20 Autoanalyzer	See SOPs provided in Attachment B				Lab Manager/ Analyst	SA-GE-001, Rev. 9

CVAA: cold vapor atomic absorption
GC/ECD: gas chromatography/electron capture detector
GC/MS: gas chromatography/mass spectrometry
HRGC/HRMS: high resolution gas chromatography/high resolution mass spectrometry
ICP: inductively coupled plasma
ICP MS: inductively coupled plasma mass spectrometry

UFP-QAPP Worksheet #25: Analytical Instrument and Equipment Maintenance, Testing, and Inspection Table

For information regarding analytical laboratory instruments, testing and inspection procedures, and quality control, see Attachment B (Laboratory SOPs).

UFP-QAPP Worksheets #26 & #27: Sample Handling, Custody, and Disposal

Sample Collection (Labeling and Chain-of-Custody Form Completion), Packaging, and Shipment
Sample Collection (Personnel/Organization): Field Team Lead/Geosyntec, GSI, and Anchor QEA
Sample Packaging (Personnel/Organization): Field Team Lead/Geosyntec, GSI, and Anchor QEA
Coordination of Shipment (Personnel/Organization): Field Team Lead/Geosyntec, GSI, and Anchor QEA
Type of Shipment/Carrier: Overnight Shipping/Commercial Courier or Laboratory Courier
Sample Receipt, Inspection, and Analysis
Sample Receipt (Personnel/Organization): Sample Receiving Personnel/Eurofins-TestAmerica and EGT
Sample Custody and Storage (Personnel/Organization): Sample Receiving Personnel/ Eurofins-TestAmerica and EGT
Sample Preparation (Personnel/Organization): Sample Extraction/Preparation Personnel/ Eurofins-TestAmerica and EGT
Sample Determinative Analysis (Personnel/Organization): Analytical Testing Department Personnel/ Eurofins-TestAmerica and EGT
Sample Archiving
Field Sample Storage (No. of days from sample collection): Field Samples are stored for 30 days after submittal of the completed data package.
Sample Extract/Digestate Storage (No. of days from extraction/digestion): Sample extracts (as applicable) will be stored in the laboratory for 30 days after submittal of the completed data package unless notified by the client to archive for a longer period of time.
Sample Disposal
Personnel/Organization: Sample Receiving Personnel/ Eurofins-TestAmerica and EGT
Number of Days from Analysis: Field samples are stored for 30 days after submittal of the completed data package. Client will be notified prior to sample disposal by the laboratory.

Sample Custody

Sample collection and sample custody procedures are designed so that field custody of samples is maintained and documented. These procedures provide identification and documentation of the sampling event and the sample chain of custody from shipment of sample bottleware, through sample collection, to receipt of the sample by the subcontracted laboratory. When used in conjunction with the laboratory's custody procedures and the sample bottleware documentation, these data establish full legal custody and allow complete tracking of a sample from preparation and receipt of sample bottleware to sample collection, preservation, and shipping through laboratory receipt, sample analysis, and data validation. The chain of custody is defined as the sequence of persons who have the item in custody.

The persons responsible for sample custody and a brief description of their duties, are as follows:

- Laboratory Sample Custodian or Commercial Supplier: Verifies that the bottleware is certified clean and arranges for bottleware shipment to field sampling personnel or the contractor's equipment shop. Receives samples from shipping courier or field staff, inspects samples, compares received sample containers to Chain-of-Custody Record, logs samples into laboratory system for designated analyses, and secures sample containers until ready for analysis.
- Field Staff: Receives sample bottleware from laboratory, inspects bottleware for physical integrity, collects and preserves samples, retains bottleware and samples under custody until sample shipment, and relinquishes samples to shipping courier or to lab representative.
    - Laboratory Project Manager: Verifies reported laboratory analyses to the sample Chain-of-Custody Record and ensures that chain-of-custody documentation is incorporated into the project file.

A sample or other physical evidence is in custody if it is or was one of the following:

- In the field investigator's, transferee's, or lab technician's actual possession
- In the field investigator's, transferee's, or lab technician's view, after being in his/her physical possession
- In the field investigator's, transferee's, or lab technician's physical possession and then he/she secured it to prevent tampering
- Placed in a designated secure area

Chain-of-Custody Record

The field Chain-of-Custody Record is used to record the custody of all samples or other physical evidence collected and maintained. This form shall not be used to document the collection of split or duplicate samples. The Chain-of-Custody Record also serves as a mechanism to log samples for the analytical laboratories' sample custodian.

The following information must be supplied in the indicated spaces in detail to complete the field Chain-of-Custody Record:

- Project-specific information, including the project number and project name, must be added in the indicated space.
- The signatures of the sampling team leader must be included in the designated signature block.
- The sampling station number, date, and time of sample collection; grab or composite sample designation; and sample preservation type must be included on each line (each line shall contain only those samples collected at a specific location).
- The total number of sample containers must be listed in the indicated space for each sample, and the total number of individual containers must also be listed for each type of analysis under the indicated media or miscellaneous columns (it is impossible to have more than one media type per sample).
    - The field investigator and subsequent transferee(s) must document the transfer of the samples listed on the Chain-of-Custody Record in the spaces provided at the bottom of the form. Both the person relinquishing the samples and the person receiving them must sign the form and provide the date and time that this occurred in the proper space on the form. Usually, the last person receiving the samples or evidence should be a laboratory sample custodian.

Once the Chain-of Custody Record is completed, it becomes an accountable document and must be maintained in the project file. The suitability of any other form for chain of custody should be evaluated upon its inclusion of all of the above information in a legible format.

Laboratory Sample Custody Procedures

Once the samples reach the laboratory, they will be checked against information on the chain-of-custody form for anomalies. The condition, temperature, and appropriate preservation of samples will be checked and documented on the chain-of-custody form. Checking an aliquot of the sample using pH paper is an acceptable procedure. The occurrence of any anomalies in the received samples and their resolution will be documented in laboratory records. All sample information will then be entered into a tracking system, and unique analytical sample identifiers will be assigned. A copy of this information will be reviewed by the laboratory project manager for accuracy. Sample holding time will be tracked beginning with the collection of samples and will continue until the analysis is complete. Holding times will be observed as specified in Worksheet #19. All analyses will be documented with the chain-of-custody form. Procedures ensuring internal laboratory chain of custody will also be implemented and documented by the laboratory. Specific instructions concerning the analysis specified for each sample will be communicated to the analysts. Analytical batches will be created, and laboratory quality assurance/quality control (QA/QC) samples will be introduced into each batch.

While in the laboratory, samples will be stored in limited-access, temperature-controlled areas. Refrigerators, coolers, and freezers will be monitored for temperature 7 days a week. Acceptance criterion for the temperatures of the refrigerators and coolers will be 0 to 6 degrees Celsius (°C). The sample temperature will be noted on the chain of custody at the time of receipt.

Acceptance criterion for the temperatures of the freezers will be less than -10°C. All of the cold storage areas will be monitored by thermometers or temperature monitoring devices calibrated against National Institute of Standards and Technology (NIST)-traceable certified thermometers. Correction factors will be applied to each thermometer as indicated by the findings of the calibration. Records that include acceptance criteria will be maintained. Samples will be stored after analysis until disposed of in accordance with applicable local, state, and federal regulations. Disposal records will be maintained by the laboratory.

Standard operating procedures (SOPs) describing sample control and custody will be maintained by the laboratory.

UFP-QAPP Worksheet #28a: QC Samples Table for USEPA Method 8260C – Volatiles

Matrix	Aqueous (toxicity characteristic leaching procedure leachate, aqueous water quality control [QC] samples, equipment/source/trip blanks)
Analytical Group	Volatile Organic Compounds
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) SW-846 Method 8260C/SA-VO-004, Rev. 11
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica, Savannah, Georgia
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Tune Standard (BFB)	At the beginning of each 12-hour clock	Refer to Attachment 7 of SOP	Troubleshoot; perform instrument maintenance; retune	Analyst	Refer to Attachment 7 of SOP
Initial Calibration (ICAL)	Upon instrument set-up and after failing continuing calibration verification (CCV)	Minimum 5-point response factor criteria (RRF) per Attachment 6 of SOP. % relative standard deviation (RSD) $\leq$20%. If %RSD >20%, use curve fit with $r^2 \geq 0.990$; Read back criteria for all levels of +/- 30% of true value	Troubleshoot; reanalyze standard(s), prepare new standard(s) and reanalyze; perform injector port maintenance and reanalyze standards; retune and reanalyze standards; replace column and reanalyze standards; clean source and reanalyze standards	Analyst	Minimum 5-point RRF per Attachment 6 of SOP. %RSD $\leq$20%. If %RSD >20%, use curve fit with $r^2 \geq 0.990$; Read back criteria for all levels of +/- 30% of true value
Initial Calibration Verification (ICV)	After each ICAL	%RSD <30% Poor Performer 30% < %RSD < 50% as per Attachment 11 of SOP	Troubleshoot; reanalyze standard, prepare new standard and reanalyze; recalibrate	Analyst	%RSD <30% Poor Performer 30% < %RSD < 50% as per Attachment 11 of SOP

Matrix	Aqueous (toxicity characteristic leaching procedure leachate, aqueous water quality control [QC] samples, equipment/source/trip blanks)
Analytical Group	Volatile Organic Compounds
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) SW-846 Method 8260C/SA-VO-004, Rev. 11

Analytical Organization	Eurofins-TestAmerica Burlington, Vermont
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Method Blank (MB)	1 per batch of up to 20 samples	< ½ RL	Examine project data quality objectives (DQOs) and take appropriate corrective action, which may include reanalysis of MB, reextraction of batch, and/or nonconformance report (NCR). Corrective action must be documented on NCR. If there are no detects in samples, or if all detects are >10X MB level, repreparation and reanalysis may not be required.	Analyst	< ½ RL
Laboratory Control Sample (LCS)	1 per batch of up to 20 samples	See Table 2 of SOP for recovery and relative percent difference (RPD) limits for LCS	Examine project DQOs and take appropriate corrective action, which may include reanalysis of LCS, reextraction of batch, and/or nonconformance memo (NCM). Corrective action must be documented on NCM. Flag all reported values outside of control limits.	Analyst	See Table 2 of SOP for recovery and RPD limits for LCS

Matrix	Aqueous (groundwater, surface water, aqueous water quality control [QC] samples, equipment/source blanks)/Solid (soil and sediment)
Analytical Group	Polychlorinated Biphenyls (PCB) Homologs
Anticipated Concentration Level	Low to High
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) Method 680/BR-MS-010
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Burlington, Vermont
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Laboratory Control Sample Duplicate (LCSD)	1 per batch of up to 20 samples, when insufficient sample is provided for MS/MSD/sample duplicate (SD).	See Table 2 of SOP for recovery and RPD limits for LCSD	Examine project DQOs and take appropriate corrective action, which may include re-analysis of LCSD, reextraction of batch, and/or NCR. Corrective action must be documented on NCR. Flag all reported values outside of control limits.	Analyst	See Table 2 of SOP for recovery and RPD limits for LCSD
Matrix Spike/ Matrix Spike Duplicate (MS/MSD)	1 per batch of up to 20 samples	See Table 2 of SOP for recovery and RPD limits for MS/MSD	Evaluate data and determine if a matrix effect or analytical error is indicated. If analytical error, reanalyze and/or reextract. Flag all reported values outside of control limits.	Analyst	See Table 2 of SOP for recovery and RPD limits for MS/MSD

1. SOPs are reviewed/revised on an annual schedule by the laboratory. The current version of the SOP will be followed at the time of sample receipt.
2. This is a summary of the acceptance limits and measurement performance criteria; refer to the method SOP included in Attachment B of this UFP-QAPP for specific or more information. The acceptance limits and measurement performance criteria are in accordance with the government-required limits or criteria (i.e., National Functional Guidelines and/or USEPA Region 4 Laboratory Operations and Quality Assurance Manual [USEPA 2022]) if appliable.

UFP-QAPP Worksheet #28e: QC Samples Table for USEPA Method 6010C – Cations/Metals

Matrix	Aqueous (groundwater, surface water, toxicity characteristic leaching procedure [TCLP] leachate, aqueous water quality control [QC] samples, equipment/source blanks)/Solid (soil and sediment)
Analytical Group	Cations/Metals
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) Method SW-846 6010C / SA-ME-070
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Savannah, Georgia
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Initial Calibration (ICAL)	Daily	Single Point: 1 standard and 1 blank Multipoint: Minimum 3 standards and 1 blank; Correlation coefficient ≥0.998	Recalibrate	Analyst	Single Point: 1 standard and 1 blank Multipoint: Minimum 3 standards and 1 blank; Correlation coefficient ≥0.998
High Standard	Immediately after every calibration	Recoveries within ±5% of expected values	New initial calibration	Analyst	Recoveries within ±5% of expected values
Initial Calibration Verification (ICV)	At the beginning of the analysis	Within ±10% of the true value	Recalibrate	Analyst	Within ±10% of the true value
Continuing Calibration Verification (CCV)	At the beginning and end of analysis, and after every 10 samples	Within ±10% of the true value; ≤5% relative standard deviation (RSD)	Terminate the analysis, troubleshoot and reanalyze the previous 10 samples	Analyst	Within ±10% of the true value; ≤5%RSD

Matrix	Aqueous (groundwater, surface water, toxicity characteristic leaching procedure [TCLP] leachate, aqueous water quality control [QC] samples, equipment/source blanks)/Solid (soil and sediment)
Analytical Group	Cations/Metals
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) Method SW-846 6010C / SA-ME-070
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Savannah, Georgia
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Calibration Blank (ICB/CCB)	After ICV and every CCV	Absolute value < ½ the reporting limit (RL)	Terminate the analysis, troubleshoot and reanalyze the previous 10 samples	Analyst	Absolute value < 1/2 RL
Interference Check Standards (ICSA/ICSAB)	At the beginning of the analysis	±20% of the true values Pay attention to false positives and false negatives for elements not present in solutions.	Terminate the analysis, correct problem, recalibrate, and reanalyze all samples since the last ICS that was in control	Analyst	±20% of the true values Pay attention to false positives and false negatives for elements not present in solutions.
Method Blank (MB)	1 per batch of up to 20 samples or less	Absolute value of result less than 1/2 RL or result <10% of the analyte level in the sample	Refer to SOP SA-QA-017	Analyst	Absolute value of result less than 1/2 RL or result <10% of the analyte level in the sample

Matrix	Aqueous (groundwater, surface water, toxicity characteristic leaching procedure [TCLP] leachate, aqueous water quality control [QC] samples, equipment/source blanks)/Solid (soil and sediment)
Analytical Group	Cations/Metals
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) Method SW-846 6010C / SA-ME-070
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Savannah, Georgia
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Laboratory Control Sample/ Laboratory Control Sample Duplicate (LCS/LCSD)	LCS: 1 per batch of up to 20 samples LCSD: 1 per batch, if insufficient sample provided for MS/MSD	Within laboratory generated limits	Refer to SOP SA-QA-017	Analyst	Within laboratory generated limits
Matrix Spike/ Matrix Spike Duplicate (MS/MSD)	1 per batch of up to 20 samples	Within laboratory generated limits	Refer to SOP SA-QA-017	Analyst	Within laboratory generated limits
Serial Dilution (1/5 Dilution)	1 per batch of up to 20 samples	If sample concentration greater than 50x method detection limit (MDL): percent difference ≤ 10%	Troubleshoot; redigest and reanalyze if sufficient sample available; otherwise, flag data as appropriate	Analyst	If sample concentration greater than 50x MDL: percent difference ≤ 10%

Matrix	Aqueous (groundwater, surface water, toxicity characteristic leaching procedure [TCLP] leachate, aqueous water quality control [QC] samples, equipment/source blanks)/Solid (soil and sediment)
Analytical Group	Cations/Metals
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) Method SW-846 6010C / SA-ME-070
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Savannah, Georgia
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Post-digestion Spike	1 per batch of up to 20 samples	75%–125% recovery	Troubleshoot; redigest and reanalyze if sufficient sample available; otherwise, flag data as appropriate	Analyst	75%–125% recovery
Reporting Limit Check Solution	At the beginning and end of analysis run when using both single point and multipoint calibrations.	+/- 30% of true concentration	Opening: Stop analysis, troubleshoot and reanalyze affected samples Capping: Qualify affected samples; reanalyze if required by project plan	Analyst	+/- 30% of true concentration

Matrix	Aqueous (groundwater, surface water, toxicity characteristic leaching procedure [TCLP] leachate, aqueous water quality control [QC] samples, equipment/source blanks)/Solid (soil and sediment)
Analytical Group	Cations/Metals
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) Method SW-846 6010C / SA-ME-070
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Savannah, Georgia
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
%RSD (CV) of Multiple Exposures	Evaluate for all Calibration, QC, and samples	Conc. ≥ RL - Warning: ≤20% - Acceptance: ≤30%	If CV>20 but ≤30, review data for possible interferences; If interference present, reanalyze digest; If no interference present, report average; If CV≥30%, reanalyze digest, report the result that has the lower precision value or dilute the digestion and reanalyze	Analyst	Conc. ≥ RL - Warning: ≤20% - Acceptance: ≤30%
		Conc. < RL Use professional judgment	Use professional judgment		Conc. < RL Use professional judgment
Linear Range	Determined at least every 6 months in accordance with Attachment 7 of SOP.	% difference ≤10%	Reanalyze at a lower concentration	Analyst	% difference ≤10%

Matrix	Aqueous (groundwater, surface water, toxicity characteristic leaching procedure [TCLP] leachate, aqueous water quality control [QC] samples, equipment/source blanks)/Solid (soil and sediment)
Analytical Group	Cations/Metals
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) Method SW-846 6010C / SA-ME-070
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Savannah, Georgia
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Interelement Correction Factors (IEC)	Determined every 6 months. Verified at the beginning of an analysis run	Refer to ICSA, ICSAB criteria	See ICSA, ICSAB corrective action	Analyst	Refer to ICSA, ICSAB criteria
Lower Limit of Quantitation Check Sample	Annually	70%–130%	Reanalyze at a higher concentration, elevate RL accordingly	Analyst	70%–130%
Initial Demonstration of Capability (IDOC)	Initially, per analyst, per analyte/method/ matrix combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006. Note unsupervised work must not begin until acceptable IDOC is obtained.	Analyst	Refer to SOP SA-QA-006
Continued Demonstration of Capability (CDOC)	Annually, per analyst, per analyte/ method/matrix combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006	Analyst	Refer to SOP SA-QA-006

Matrix	Aqueous (groundwater, surface water, toxicity characteristic leaching procedure [TCLP] leachate, aqueous water quality control [QC] samples, equipment/source blanks)/Solid (soil and sediment)
Analytical Group	Cations/Metals
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) Method SW-846 6010C / SA-ME-070
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Savannah, Georgia
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Reporting Limit Verification (RLV)	Upon method/ instrument setup, per analyte/method/ matrix combination. Then annually thereafter	Refer to SOP SA-QA-007	Refer to SOP-QA-007	Analyst	Refer to SOP SA-QA-007
Method Detection Limit (MDL) Study	Upon method/ instrument setup, per analyte/method/ matrix combination	Refer to SOP SA-QA-007	Refer to SOP-QA-007	Analyst	Refer to SOP SA-QA-007
MDL Verification (MDLV)	Upon method/ instrument setup, per analyte/method/ matrix combination. Then annually thereafter	Refer to SOP SA-QA-007	Refer to SOP-QA-007	Analyst	Refer to SOP SA-QA-007

Matrix	Aqueous (groundwater, surface water, toxicity characteristic leaching procedure [TCLP] leachate, aqueous water quality control [QC] samples, equipment/source blanks)/Solid (soil and sediment)
Analytical Group	Cations/Metals
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) Method SW-846 6010C / SA-ME-070
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Savannah, Georgia
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Instrument Detection Limit (IDL)	Upon method/instrument set-up. Then quarterly thereafter	Refer to SOP SA-QA-007	Refer to SOP-QA-007	Analyst	Refer to SOP SA-QA-007

1. SOPs are reviewed/revised on an annual schedule by the laboratory. The current version of the SOP will be followed at the time of sample receipt.
2. This is a summary of the acceptance limits and measurement performance criteria; refer to the method SOP included in Attachment B of this UFP-QAPP for specific or more information. The acceptance limits and measurement performance criteria are in accordance with the government-required limits or criteria (i.e., National Functional Guidelines and/or USEPA Region 4 Laboratory Operations and Quality Assurance Manual [USEPA 2022]) if appliable.

UFP-QAPP Worksheet #28f: QC Samples Table for USEPA Methods 7470A and 7471B – Mercury

Matrix	Aqueous (sediment filtrate, toxicity characteristic leaching procedure [TCLP] leachate. quality control [QC] samples, equipment/ source blanks)/Solid (soil and sediment)
Analytical Group	Mercury
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) Methods 7470A and 7471B/SA-ME-028
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Savannah, Georgia
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Initial Calibration (ICAL)	Daily	Correlation ≥ 0.995 (1 blank and 5 standards)	Troubleshoot; recalibrate	Analyst	Correlation ≥ 0.995 (1 blank and 5 standards)
Initial Calibration Verification (ICV)	At the beginning of the analysis	Within ±10% of the true value	Troubleshoot; recalibrate	Analyst	Within ±10% of the true value
Continuing Calibration Verification (CCV)	At the beginning and end of analysis, and after every 10 samples	Within ±10% of the true value	Terminate the analysis, correct problem, recalibrate, and reanalyze all samples since the last compliant CCV	Analyst	Within ±10% of the true value
Calibration Blank (ICB/CCB)	After ICV and every CCV	Absolute value of the calibration blank must be less than ½ the reporting limit (RL)	Terminate the analysis, correct problem, recalibrate, and reanalyze all samples since the last compliant calibration blank	Analyst	Absolute value of the calibration blank must be less than ½ RL

Matrix	Aqueous (sediment filtrate, toxicity characteristic leaching procedure [TCLP] leachate. quality control [QC] samples, equipment/ source blanks)/Solid (soil and sediment)
Analytical Group	Mercury
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) Methods 7470A and 7471B/SA-ME-028
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Savannah, Georgia
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
RL Standard	After every calibration but not before the ICV. This standard is not a requirement of SW846, if a multipoint calibration encompassing the RL level is used	50%–150% of true value	Troubleshoot; recalibrate	Analyst	50%–150% of true value
Method Blank	1 per batch of up to 20 samples	Less than ½ RL	Refer to SOP SA-QA-017	Analyst	Less than ½ RL
Laboratory Control Sample (LCS)	1 per batch of up to 20 samples	Within laboratory generated limits	Refer to SOP SA-QA-017	Analyst	Within laboratory generated limits
Matrix Spike/ Matrix Spike Duplicate (MS/MSD)	1 per batch of up to 20 samples	Within laboratory generated limits	Refer to SOP SA-QA-017	Analyst	Within laboratory generated limits

Matrix	Aqueous (sediment filtrate, toxicity characteristic leaching procedure [TCLP] leachate. quality control [QC] samples, equipment/ source blanks)/Solid (soil and sediment)
Analytical Group	Mercury
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) Methods 7470A and 7471B/SA-ME-028
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Savannah, Georgia
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Post Digestion Spikes (PDS)	When MS/MSD is unacceptable	Within laboratory generated limits	Refer to SOP SA-QA-017	Analyst	Within laboratory generated limits
Initial Demonstration of Capability (IDOC)	Initially, per analyst, per analyte/method/ matrix combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006. Note unsupervised work must not begin until acceptable IDOC is obtained.	Analyst	Refer to SOP SA-QA-006
Continued Demonstration of Capability (CDOC)	Annually, per analyst, per analyte/method/ matrix combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006	Analyst	Refer to SOP SA-QA-006
Reporting Limit Verification (RLV)	Upon method/ instrument setup, per analyte/ method/matrix combination. Then annually thereafter	Refer to SOP SA-QA-007	Refer to SOP-QA-007	Analyst	Refer to SOP SA-QA-007

Matrix	Aqueous (sediment filtrate, toxicity characteristic leaching procedure [TCLP] leachate. quality control [QC] samples, equipment/ source blanks)/Solid (soil and sediment)
Analytical Group	Mercury
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) Methods 7470A and 7471B/SA-ME-028
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Savannah, Georgia
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Method Detection Limit (MDL) Study	Upon method/ instrument setup, per analyte/ method/matrix combination	Refer to SOP SA-QA-007	Refer to SOP-QA-007	Analyst	Refer to SOP SA-QA-007
MDL Verification (MDLV)	Upon method/ instrument setup, per analyte/ method/matrix combination. Then annually thereafter	Refer to SOP SA-QA-007	Refer to SOP-QA-007	Analyst	Refer to SOP SA-QA-007
Instrument Detection Limit (IDL)	Upon method/instrument set-up. Then quarterly thereafter	Refer to SOP SA-QA-007	Refer to SOP-QA-007	Analyst	Refer to SOP SA-QA-007

1. SOPs are reviewed/revised on an annual schedule by the laboratory. The current version of the SOP will be followed at the time of sample receipt.
2. This is a summary of the acceptance limits and measurement performance criteria; refer to the method SOP included in Attachment B of this UFP-QAPP for specific or more information. The acceptance limits and measurement performance criteria are in accordance with the government-required limits or criteria (i.e., National Functional Guidelines and/or USEPA Region 4 Laboratory Operations and Quality Assurance Manual [USEPA 2022]) if appliable.

UFP-QAPP Worksheet #28g: QC Samples Table for USEPA Method 300.0 – Anions

Matrix	Aqueous (groundwater, aqueous water quality control [QC] samples, equipment/source blanks)
Analytical Group	Anions
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference	United States Environmental Protection Agency (USEPA) Method 300.0/PT-GC-009
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Pittsburgh, Pennsylvania
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Initial Calibration (ICAL)	Prior to sample analysis; when CCV fails; at lease every 6 months	$r^2 \geq 0.995$ (Minimum three standards and one blank)	Recalibrate	Analyst	$r^2 \geq 0.995$ (Minimum three standards and one blank)
Low Level of Quantitation (LLOQ)	After analysis of ICAL	50%–150% of true value	Troubleshoot, reanalyze, if second failure perform ICAL	Analyst	50%–150% of true value
Initial Calibration Verification (ICV)	After each ICAL	Within ±10% of the true value	Troubleshoot; reanalyze ICV if second failure perform ICAL	Analyst	Within ±10% of the true value

Matrix	Aqueous (groundwater, aqueous water quality control [QC] samples, equipment/source blanks)
Analytical Group	Anions
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference	United States Environmental Protection Agency (USEPA) Method 300.0/PT-GC-009
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Pittsburgh, Pennsylvania
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Continuing Calibration Verification (CCV)	At the beginning and end of analysis, and after every 10 samples	Within ±10% of the true value	Terminate the analysis, correct problem, recalibrate, and reanalyze previous 10 samples; if results are associated with a failed CCV, they must be reported with qualifier in all cases	Analyst	Within ±10% of the true value
Continuing Calibration Blank (CCB)	After every CCV	Result < method detection limit (MDL)	Source of contamination should be investigated and corrected and all associated samples reanalyzed, unless one of the situations described in Section 9.1.1 of the SOP exists	Analyst	Result < MDL

Matrix	Aqueous (groundwater, aqueous water quality control [QC] samples, equipment/source blanks)
Analytical Group	Anions
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference	United States Environmental Protection Agency (USEPA) Method 300.0/PT-GC-009
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Pittsburgh, Pennsylvania
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Method Blank	1 per batch of up to 20 samples	Result < MDL	Source of contamination should be investigated and corrected and all associated samples reanalyzed, unless one of the situations described in Section 9.1.1 of the SOP exists	Analyst	Result < MDL
Laboratory Control Sample/ Laboratory Control Sample Duplicate (LCS/LCSD)	1 per batch of up to 20 samples	90%–110% of true value	Reanalyze all samples associated with unacceptable LCS	Analyst	90%–110% of true value

Matrix	Aqueous (groundwater, aqueous water quality control [QC] samples, equipment/source blanks)
Analytical Group	Anions
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference	United States Environmental Protection Agency (USEPA) Method 300.0/PT-GC-009
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Pittsburgh, Pennsylvania
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Matrix Spike/ Matrix Spike Duplicate (MS/MSD)	1 per batch of up to 10 samples	Within laboratory generated limits; 90%–110% ±20% RPD	Troubleshoot; reprepare and reanalyze if sufficient sample available; if an MS/MSD is not possible due to limited sample volume then an LCS duplicate may be analyzed.	Analyst	Within laboratory generated limits; 90%–110% ±20% RPD

1. SOPs are reviewed/revised on an annual schedule by the laboratory. The current version of the SOP will be followed at the time of sample receipt.
2. This is a summary of the acceptance limits and measurement performance criteria; refer to the method SOP included in Attachment B of this UFP-QAPP for specific or more information. The acceptance limits and measurement performance criteria are in accordance with the government-required limits or criteria (i.e., National Functional Guidelines and/or USEPA Region 4 Laboratory Operations and Quality Assurance Manual [USEPA 2022]) if applicable.

UFP-QAPP Worksheet #28h: QC Samples Table for SM 2340B– Hardness by Calculation

Matrix	Aqueous (toxicity characteristic leaching procedure [TCLP] leachate)
Analytical Group	Hardness
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	Standard Methods 2340B/PT-MT-WI-011
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Pittsburgh, Pennsylvania
No. of Sample Locations	See Worksheet #18

Quality Control (QC) Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Hardness is completed by calculation using calcium and magnesium concentrations from ICP or ICPMS analysis (United States Environmental Protection Agency [USEPA] Method 6010C). See UFP-QAPP Worksheet #28e for QC samples associated with USEPA Method 6010C.					

1. SOPs are reviewed/revised on an annual schedule by the laboratory. The current version of the SOP will be followed at the time of sample receipt.
2. This is a summary of the acceptance limits and measurement performance criteria; refer to the method SOP included in Attachment B of this UFP-QAPP for specific or more information. The acceptance limits and measurement performance criteria are in accordance with the government-required limits or criteria (i.e., National Functional Guidelines and/or USEPA Region 4 Laboratory Operations and Quality Assurance Manual [USEPA 2022]) if applicable.

UFP-QAPP Worksheet #28i: QC Samples Table for SM 2540D– Total Dissolved Solids and Total Suspended Solids

Matrix	Aqueous (groundwater, aqueous water quality control [QC] samples, equipment/source blanks)
Analytical Group	Total Dissolved Solids and Total Suspended Solids
Anticipated Concentration Level	Low to Moderate
Analytical Method / SOP Reference[1]	Standard Methods 2540C/D/PT-WC-043 and PT-WC-045
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Pittsburgh, Pennsylvania
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Method Blank	1 per batch of up to 20 samples	Result < reporting limit (RL)	Reanalyze batch	Analyst	Result < RL
Laboratory Control Sample (LCS)	1 per batch of up to 20 samples	Within laboratory generated limits; 80% to 120% of true or certified value	Reanalyze all associated samples with an acceptable LCS, unless the original LCS recovery is high and sample results are <RL	Analyst	Within laboratory generated limits; 80% to 120% of true or certified value
Sample Duplicate (SD)	1 per batch of up to 10 samples	Relative percent difference (RPD) within laboratory generated limits; 10%	Reanalyze; if second failure flag data as appropriate and address in case narrative	Analyst	RPD within laboratory generated limits; 10%

1. SOPs are reviewed/revised on an annual schedule by the laboratory. The current version of the SOP will be followed at the time of sample receipt.
2. This is a summary of the acceptance limits and measurement performance criteria; refer to the method SOP included in Attachment B of this UFP-QAPP for specific or more information. The acceptance limits and measurement performance criteria are in accordance with the government-required limits or criteria (i.e., National Functional Guidelines and/or USEPA Region 4 Laboratory Operations and Quality Assurance Manual [USEPA 2022]) if applicable.

UFP-QAPP Worksheet #28j: QC Samples Table for Lloyd Khan – Total Organic Carbon

Matrix	Solid (soil and sediment)
Analytical Group	Organic Carbon
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	Lloyd Khan/BR-WC-008
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica, Burlington, Vermont
No. of Sample Locations	See Worksheet #18

Quality Control (QC) Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Method Blank	1 per batch of up to 20 samples	Result < reporting limit (RL)	Troubleshoot; reanalyze if sufficient sample available; otherwise, flag data as appropriate	Analyst	Result < RL
Laboratory Control Sample/ Laboratory Control Sample Duplicate (LCS/LCSD)	1 per batch of up to 20 samples	Within laboratory generated limits; % recovery (75–125)	Troubleshoot; reanalyze if sufficient sample available; otherwise, flag data as appropriate	Analyst	Within laboratory generated limits; % recovery (75–125)
Matrix Spike/ Matrix Spike Duplicate (MS/MSD)	1 per batch of up to 20 samples	Within laboratory generated limits	Troubleshoot; reanalyze if sufficient sample available; otherwise, flag data as appropriate	Analyst	Within laboratory generated limits
Initial Calibration (ICAL)	Initial method set-up, after combustion chamber is changed (approx. every 200 drops)	Correlation coefficient must be >0.995	Troubleshoot; standards check, recalibrate	Analyst	Correlation coefficient must be >0.995
Initial Calibration Verification (ICV)	Following calibration	% recovery (75–125)	Troubleshoot; reanalyze ICV if second failure perform ICAL	Analyst	% recovery (75–125)

Matrix	Solid (soil and sediment)
Analytical Group	Organic Carbon
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	Lloyd Khan/BR-WC-008
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica, Burlington, Vermont
No. of Sample Locations	See Worksheet #18

Quality Control (QC) Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Calibration Verification (CCV)	Every 20 drops and at the end of the analytical sequence	% recovery (75–125)	Terminate the analysis, correct problem, recalibrate, and reanalyze previous samples. If results are associated with a failed CCV, they must be reported with qualifier in all cases.	Analyst	% recovery (75–125)
Calibration Blank (CCB)	After every CCV	<RL	Source of contamination should be investigated and corrected and all associated samples reanalyzed.	Analyst	<RL

1. SOPs are reviewed/revised on an annual schedule by the laboratory. The current version of the SOP will be followed at the time of sample receipt.
2. This is a summary of the acceptance limits and measurement performance criteria; refer to the method SOP included in Attachment B of this UFP-QAPP for specific or more information. The acceptance limits and measurement performance criteria are in accordance with the government-required limits or criteria (i.e., National Functional Guidelines and/or USEPA Region 4 *Laboratory Operations and Quality Assurance Manual* [USEPA 2022]) if applicable.

UFP-QAPP Worksheet #28k: QC Samples Table for 9060A – Total and Dissolved Organic Carbon

Matrix	Aqueous (groundwater, aqueous water quality control [QC] samples, equipment/source blanks)
Analytical Group	Organic Carbon
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	9060A/PT-WC-017
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Pittsburgh, Pennsylvania
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Method Blank	1 per batch of up to 20 samples	Result < reporting limit (RL)	Troubleshoot; reanalyze if sufficient sample available; otherwise, flag data as appropriate	Analyst	Result < RL Note: If individual results and average are reported, each individual injection must meet the MB criteria.
Laboratory Control Sample/ Laboratory Control Sample Duplicate (LCS/LCSD)	LCS: 1 per batch of up to 20 samples LCSD: if insufficient sample provided for an MS/MSD	Within laboratory generated limits; % recovery (85–115); 20% relative standard deviation (RSD) for LCSD	Troubleshoot; reinject the standard once. If failure repeats, all associated samples must be reanalyzed unless one of the situations listed in section 9.3.1 of the SOP exists.	Analyst	Within laboratory generated limits; % recovery (85–115); 20% RSD for LCSD
Matrix Spike/ Matrix Spike Duplicate (MS/MSD)	1 per batch of up to 10 samples	Within laboratory generated limits; % recovery (75–125); 20% RSD	Troubleshoot; reanalyze if sufficient sample available; otherwise flag data as appropriate	Analyst	Within laboratory generated limits; % recovery (75–125); 20% RSD

Matrix	Aqueous (groundwater, aqueous water quality control [QC] samples, equipment/source blanks)
Analytical Group	Organic Carbon
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	9060A/PT-WC-017
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Pittsburgh, Pennsylvania
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Initial Calibration (ICAL)	At least every 6 months or more often as needed when CCVs or CCBs fail to meet acceptance criteria	Correlation coefficient must be >0.995	Troubleshoot; prepare fresh standards and repeat calibration.	Analyst	Correlation coefficient must be >0.995
Initial Calibration Verification (ICV)	Following calibration	% recovery (90–110)	Troubleshoot; prepare fresh standards and repeat calibration. reanalyze ICV if second failure perform ICAL	Analyst	% recovery (90–110)
Initial Calibration Blank (ICB)	Following ICV	< RL	Source of contamination should be investigated and corrected and repeat calibration if needed.	Analyst	< RL
Calibration Verification (CCV)	Every 10 samples and at end of run using midrange CCV	% recovery (90–110)	Terminate the analysis, correct problem, recalibrate, and reanalyze previous samples. If results are associated with a failed CCV, they must be reported with qualifier in all cases.	Analyst	% recovery (90–110)
Calibration Blank (CCB)	Every 10 samples	< RL	Source of contamination should be investigated and corrected and all associated samples reanalyzed.	Analyst	< RL

1. SOPs are reviewed/revised on an annual schedule by the laboratory. The current version of the SOP will be followed at the time of sample receipt.
2. This is a summary of the acceptance limits and measurement performance criteria; refer to the method SOP included in Attachment B of this UFP-QAPP for specific or more information. The acceptance limits and measurement performance criteria are in accordance with the government-required limits or criteria (i.e., National Functional Guidelines and/or USEPA Region 4 Laboratory Operations and Quality Assurance Manual [USEPA 2022]) if applicable.

UFP-QAPP Worksheet #28l: QC Samples Table for 9045D - Corrosivity (pH)

Matrix	Aqueous (toxicity characteristic leaching procedure [TCLP] leachate)
Analytical Group	Corrosivity (pH)
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) SW-846 9045D/PT-WC-026
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Pittsburgh, PA
No. of Sample Locations	See Worksheet #18

Quality Control (QC) Sample:	Frequency/ Number	Method/SOP QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Initial Calibration	Daily	The slope of the calibration must meet > 95%, or the manufacturer's requirements if tighter. The pH readings must be within 0.05 pH units of each buffer solution value.	If the manufacturer's slope requirement is not met, the meter will display an error message. Pour fresh buffer solutions into the cups and repeat the calibration. If this does not resolve the problem, change the KCL solution in the electrode. If still having a problem the probe may need to be changed. Note any needed maintenance in the meter maintenance log, including electrode maintenance. If pH readings are not within 0.05 pH units of each buffer solution value, repeat adjustments on successive portions of the two buffer solutions until the readings are within 0.05 pH units (s.u.).	Analyst	The slope of the calibration must meet > 95%, or the manufacturer's requirements if tighter. The pH readings must be within 0.05 pH units of each buffer solution value.

Matrix	Aqueous (toxicity characteristic leaching procedure [TCLP] leachate)
Analytical Group	Corrosivity (pH)
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) SW-846 9045D/PT-WC-026
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Pittsburgh, PA
No. of Sample Locations	See Worksheet #18

Quality Control (QC) Sample:	Frequency/ Number	Method/SOP QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Initial Calibration Verification/ Laboratory Control Sample (ICV/LCS)	Second source pH buffer 7 is analyzed after initial calibration	Reading between 6.95 to 7.05 pH units	If the ICV reading is outside the range, repeat once with a fresh portion of second source buffer. If the failure repeats, the initial meter calibration must be repeated with fresh buffers. Sample analysis must not proceed until the meter calibration is verified successfully.	Analyst	Reading between 6.95 to 7.05 pH units
Continued Calibration Verification (CCV)	pH buffer 7 is analyzed after every 10 samples and at the end of the sequence	Reading between 6.95 to 7.05 pH units	If a CCV falls outside the required range, repeat once with a fresh portion of buffer. If the failure repeats, the initial meter calibration must be repeated with fresh buffers. All samples analyzed after the last passing CCV must be reanalyzed.	Analyst	Reading between 6.95 to 7.05 pH units
Sample Duplicate (SD)	1 per batch of up to 10 samples	Relative percent difference (RPD) within laboratory generated limits; ≤ 2%	Reanalyze; two fresh portions of sample and duplicate must be analyzed until the readings stabilize within the required limit.	Analyst	RPD within laboratory generated limits; ≤ 2%

1. SOPs are reviewed/revised on an annual schedule by the laboratory. The current version of the SOP will be followed at the time of sample receipt.
2. This is a summary of the acceptance limits and measurement performance criteria; refer to the method SOP included in Attachment B of this UFP-QAPP for specific or more information. The acceptance limits and measurement performance criteria are in accordance with the government-required limits or criteria (i.e., National Functional Guidelines and/or USEPA Region 4 Laboratory Operations and Quality Assurance Manual [USEPA 2022]) if applicable.

UFP-QAPP Worksheet #28m: QC Samples Table for USEPA SW-846 Chapter 7, Section 7.1 - Ignitability

Matrix	Aqueous (toxicity characteristic leaching procedure [TCLP] leachate)
Analytical Group	Ignitability
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) SW-846 Chapter 7, Section 7.1/PT-WC-022
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Pittsburgh, Pennsylvania
No. of Sample Locations	See Worksheet #18

Quality Control (QC) Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Sample/Sample Duplicate (DUP)	1 per batch of up to 20 samples	The sample and sample duplicate pair is evaluated qualitatively. If both the sample and its duplicate are found to be either ignitable (YES/YES) or both not ignitable (NO/NO), the QC is considered in control.	If the sample and sample duplicate are out of control (YES/NO), the data must be qualified appropriately (e.g., sample heterogeneity) and an explanation provided in the report narrative.	Analyst	The sample and sample duplicate pair is evaluated qualitatively. If both the sample and its duplicate are found to be either ignitable (YES/YES) or both not ignitable (NO/NO), the QC is considered in control.

1. SOPs are reviewed/revised on an annual schedule by the laboratory. The current version of the SOP will be followed at the time of sample receipt.
2. This is a summary of the acceptance limits and measurement performance criteria; refer to the method SOP included in Attachment B of this UFP-QAPP for specific or more information. The acceptance limits and measurement performance criteria are in accordance with the government-required limits or criteria (i.e., National Functional Guidelines and/or USEPA Region 4 Laboratory Operations and Quality Assurance Manual [USEPA 2022]) if applicable.

UFP-QAPP Worksheet #28n: QC Samples Table for SW-846 9010C – Reactivity (Total Cyanide)

Matrix	Aqueous (groundwater, aqueous water quality control [QC] samples, equipment/source blanks)
Analytical Group	Reactivity (Cyanide)
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) SW-846 9014 / PT-WC-018
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica, Pittsburgh, Pennsylvania
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Method Blank	After initial calibration verification (ICV) and continued calibration verification (CCVs)	Result < reporting limit (RL)	Troubleshoot; reanalyze if sufficient sample available; otherwise, flag data as appropriate	Analyst	Result < RL
Laboratory Control Sample/ Laboratory Control Sample Duplicate (LCS/LCSD)	LCS: 1 per batch of up to 20 samples LCSD: if insufficient sample provided for an MS/MSD	Within laboratory generated limits; % recovery (85–115); 20% relative standard deviation (RSD) for LCSD	If LCS recovery is above control limits and all associated samples are nondetect, results may be reported with the nonconformance memo (NCM). Samples associated with low LCS recovery, or samples with detected cyanide associated with high LCS recovery must be redistilled and reanalyzed.	Analyst	Within laboratory generated limits; % recovery (85–115); 20% RSD for LCSD
Low and High Distilled Standard Check	1 set per prep batch	Within laboratory generated limits; 90%–110%	Corrective actions are the same as for the LCS.	Analyst	Within laboratory generated limits; 90%–110%

Matrix	Aqueous (groundwater, aqueous water quality control [QC] samples, equipment/source blanks)
Analytical Group	Reactivity (Cyanide)
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) SW-846 9014 / PT-WC-018
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica, Pittsburgh, Pennsylvania
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Matrix Spike/ Matrix Spike Duplicate (MS/MSD)	1 per batch of up to 20 samples	Within laboratory generated limits; % recovery (75–125); ≤ 20% RSD for MSD	Troubleshoot; reanalyze if sufficient sample available; otherwise, flag data as appropriate	Analyst	Within laboratory generated limits; % recovery (75–125); ≤ 20% RSD for MSD
Initial Calibration (ICAL)	Daily	Correlation coefficient must be ≥ 0.995, y-intercept ≤ +/- ½ RL	Troubleshoot; recalibrate	Analyst	Correlation coefficient must be ≥ 0.995, y-intercept ≤ +/- ½ RL
Initial Calibration Verification (ICV)	Following calibration	% recovery (90–110)	If the ICV does not verify the calibration curve, check the instrument conditions and if necessary, perform instrument maintenance, then analyze a new calibration curve followed by a fresh ICV.	Analyst	% recovery (90–110)
Continuing Calibration Verification (CCV)	Every 10 samples	% recovery (90–110)	Terminate the analysis, correct problem, recalibrate, and reanalyze previous samples. If results are associated with a failed CCV, they must be reported with qualifier in all cases.	Analyst	% recovery (90–110)

Matrix	Aqueous (groundwater, aqueous water quality control [QC] samples, equipment/source blanks)
Analytical Group	Reactivity (Cyanide)
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) SW-846 9014 / PT-WC-018
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica, Pittsburgh, Pennsylvania
No. of Sample Locations	See Worksheet #18

QC Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Initial Calibration Blank (ICB) and Continuing Calibration Blank (CCB)	After ICV and CCVs	< RL	Source of contamination should be investigated and corrected and all associated samples reanalyzed.	Analyst	< RL
Low Level of Quantitation (LLOQ) Verification	Quarterly to validate quantitation capability at low analyte concentration levels	±35% of true value with ≤20% RSD between MDL verifications (MDLVs)	If recovery or RPD is outside the acceptance range, an MDL study must be performed and the RL (LLOQ) must be reestablished.	Analyst	±35% of true value with ≤20% RSD between MDLVs

1. SOPs are reviewed/revised on an annual schedule by the laboratory. The current version of the SOP will be followed at the time of sample receipt.
2. This is a summary of the acceptance limits and measurement performance criteria; refer to the method SOP included in Attachment B of this UFP-QAPP for specific or more information. The acceptance limits and measurement performance criteria are in accordance with the government-required limits or criteria (i.e., National Functional Guidelines and/or USEPA Region 4 Laboratory Operations and Quality Assurance Manual [USEPA 2022]) if applicable.

UFP-QAPP Worksheet #28o: QC Samples Table for SW-846 9030B/9034 – Reactivity (Sulfide)

Matrix	Aqueous (toxicity characteristic leaching procedure [TCLP] leachate)
Analytical Group	Reactivity (Sulfide)
Anticipated Concentration Level	Low to Moderate
Analytical Method / SOP Reference[1]	United States Environmental Protection Agency (USEPA) SW-846 9030B/9034 /PT-WC-010
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Pittsburgh, Pennsylvania
No. of Sample Locations	See Worksheet #18

Quality Control (QC) Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Method Blank	1 per batch of up to 20 samples	Result < reporting limit (RL)	Reanalyze batch	Analyst	Result < RL
Initial Calibration Verification/ Continued Calibration Verification (ICV/CCV)	Prior to sample analysis, after every 10 titrations and at the end of the run	85%–115%	If the ICV does not meet recovery criteria, check calculations, re-standardize the iodine solution and titrant and repeat. If a CCV does not meet criteria, reanalyze once. If the failure repeats, re-standardize the iodine solution and titrant and repeat the analysis of all samples run after the last passing CCV.	Analyst	85%–115%
Initial Calibration Blank/Continued Calibration Blank (ICB/CCB)	Prior to sample analysis, after every 10 titrations and at the end of the run	Result < RL	Reprepare and reanalyze samples unless all associated samples are nondetect, sample quantity is insufficient to reanalyze, or outside of holding time	Analyst	Result < RL
Laboratory Control Sample (LCS)	1 per batch of up to 20 samples	Within laboratory generated limits; % recovery (85–115)	Troubleshoot; redistill and reanalyze if sufficient sample available; otherwise, flag data as appropriate	Analyst	Within laboratory generated limits; % recovery (85–115)

Matrix	Aqueous (toxicity characteristic leaching procedure [TCLP] leachate)
Analytical Group	Reactivity (Sulfide)
Anticipated Concentration Level	Low to Moderate
Analytical Method / SOP Reference[1]	United States Environmental Protection Agency (USEPA) SW-846 9030B/9034 /PT-WC-010
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Pittsburgh, Pennsylvania
No. of Sample Locations	See Worksheet #18

Quality Control (QC) Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Matrix Spike/ Matrix Spike Duplicate (MS/MSD)	1per batch of up to 20 samples	Within laboratory generated limits; % recovery (75–125); 20% relative percent difference (RPD)	Troubleshoot; reanalyze if sufficient sample available; otherwise, flag data as appropriate	Analyst	Within laboratory generated limits; % recovery (75–125); 20% RPD

1. SOPs are reviewed/revised on an annual schedule by the laboratory. The current version of the SOP will be followed at the time of sample receipt.
2. This is a summary of the acceptance limits and measurement performance criteria; refer to the method SOP included in Attachment B of this UFP-QAPP for specific or more information. The acceptance limits and measurement performance criteria are in accordance with the government-required limits or criteria (i.e., National Functional Guidelines and/or USEPA Region 4 Laboratory Operations and Quality Assurance Manual [USEPA 2022]) if applicable.

UFP-QAPP Worksheet #28p: QC Samples Table for USEPA Method 9095B - Paint Filter Test

Matrix	Solids (Sediment)
Analytical Group	Paint Filter Test
Anticipated Concentration Level	Not applicable
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) Method 9095B/PT-WC-034
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Pittsburgh, Pennsylvania
No. of Sample Locations	See Worksheet #18

Quality Control (QC) Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Sample Duplicate (SD)	1 per batch of up to 20 samples	The sample and sample duplicate pair is evaluated qualitatively. Because this procedure does not report numeric results, no relative percent difference (RPD) can be applied to the duplicate. The sample and duplicate must agree on the presence or absence of free liquid.	If liquid is collected from one and not the other, 2 more portions of the sample must be analyzed.	Analyst	The sample and sample duplicate pair is evaluated qualitatively. Because this procedure does not report numeric results, no %RPD can be applied to the duplicate. The sample and duplicate must agree on the presence or absence of free liquid.

1. SOPs are reviewed/revised on an annual schedule by the laboratory. The current version of the SOP will be followed at the time of sample receipt.
2. This is a summary of the acceptance limits and measurement performance criteria; refer to the method SOP included in Attachment B of this UFP-QAPP for specific or more information. The acceptance limits and measurement performance criteria are in accordance with the government-required limits or criteria (i.e., National Functional Guidelines and/or USEPA Region 4 Laboratory Operations and Quality Assurance Manual [USEPA 2022]) if applicable.

UFP-QAPP Worksheet #28q: QC Samples Table for SW-846 1664B – Oil and Grease

Matrix	Aqueous (Sediment leachate)
Analytical Group	Oil and Grease
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) SW-846 1664B/PT-WC-028
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Pittsburgh, Pennsylvania
No. of Sample Locations	See Worksheet #18

Quality Control (QC) Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Method Blank	1 per batch of up to 20 samples	Result < reporting limit (RL)	Reanalyze batch	Analyst	Result < RL
Laboratory Control Sample (LCS)	1 per batch of up to 20 samples	Within laboratory generated limits; % recover (78–114)	Troubleshoot; redistill and reanalyze if sufficient sample available; otherwise, flag data as appropriate	Analyst	Within laboratory generated limits; % recovery (78–114)
Matrix Spike/ Matrix Spike Duplicate (MS/MSD)	1per batch of up to 20 samples	Within laboratory generated limits; %recovery (78–114); and 18% relative percent difference (RPD) for MSD	Troubleshoot; reanalyze if sufficient sample available; otherwise, flag data as appropriate	Analyst	Within laboratory generated limits; % recovery (78–114); 18% RPD
Balance Check	1 per batch of up to 20 samples	Criteria for 2 milligrams (mg) weight check is +/- 10% Criteria for 1 gram (g) weight check is +/- 0.5%	If the balance check is outside of acceptance criteria, do not begin weighing pans. Clean the balance pan, recalibrate the balance and check the required weights again.	Analyst	Criteria for 2 mg weight check is +/- 10% Criteria for 1 g weight check is +/- 0.5%

1. SOPs are reviewed/revised on an annual schedule by the laboratory. The current version of the SOP will be followed at the time of sample receipt.
2. This is a summary of the acceptance limits and measurement performance criteria; refer to the method SOP included in Attachment B of this UFP-QAPP for specific or more information. The acceptance limits and measurement performance criteria are in accordance with the government-required limits or criteria (i.e., National Functional Guidelines and/or USEPA Region 4 *Laboratory Operations and Quality Assurance Manual* [USEPA 2022]) if applicable.

UFP-QAPP Worksheet #28r: QC Samples Table for SW-846 7196A – Hexavalent Chromium

Matrix	Aqueous (Surface Water)
Analytical Group	Hexavalent Chromium
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) SW-846 7196A/SA-GE-001
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Savannah, Georgia
No. of Sample Locations	See Worksheet #18

Quality Control (QC) Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Method Blank	1 per batch of up to 20 samples	Result < 1/2 reporting limit (RL)	Evaluate according to SOP SA-QA-017	Analyst	Result < ½ RL
Laboratory Control Sample (LCS)	1 per batch of up to 20 samples	Within laboratory generated limits	Evaluate according to SOP SA-QA-017	Analyst	Within laboratory generated limits
LCS Duplicate	1 per batch of up to 20 samples (if insufficient sample provided for Matrix Spike/ Matrix Spike Duplicate [MS/MSD] or Sample Duplicate [SD])	Within laboratory generated limits	Evaluate according to SOP SA-QA-017	Analyst	Within laboratory generated limits
MS/MSD	1 per batch of up to 20 samples	Within laboratory generated limits	Evaluate according to SOP SA-QA-017	Analyst	Within laboratory generated limits
Initial Calibration (ICAL)	Daily	Correlation ≥ 0.995 and each point on curve must be within ± 10% of true value	Recalibrate	Analyst	Correlation ≥ 0.995 and each point on curve must be within ± 10% of true value

Matrix	Aqueous (Surface Water)
Analytical Group	Hexavalent Chromium
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) SW-846 7196A/SA-GE-001
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Savannah, Georgia
No. of Sample Locations	See Worksheet #18

Quality Control (QC) Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
Second Source Initial Calibration Verification (ICV)	Immediately following the initial calibration; at a minimum, quarterly	within ± 10% of true value	Recalibrate	Analyst	within ± 10% of true value
Continuing Calibration Verification (CCV)	At the beginning and end of the analysis, and after every 10 samples	within ± 10% of true value	Terminate the analysis, fix the problem and reanalyze the previous samples.	Analyst	within ± 10% of true value
Initial Calibration Blank (ICB)	After ICV	Result < ½ RL	Terminate the analysis, correct problem and reanalyze the previous 10 samples.	Analyst	Result < ½ RL
Continuing Calibration Blank (CCB)	After every CCV	Result < ½ RL	Terminate the analysis, correct problem and reanalyze the previous 10 samples.	Analyst	Result < ½ RL
Batch Frequency	≤ 20 field samples or 24 hours	Not applicable	Not applicable	Not applicable	Not applicable
Linear Calibration Range (LCR) (also called Linear Dynamic Range, LDR)	Upon method/instrument set-up, and when LCR verification fails acceptance criteria.	within ± 10% of true value	This determines the range at which the instrument is considered linear. The highest concentration of the calibration curve cannot exceed the highest concentration of the LCR study.	Analyst	within ± 10% of true value

Matrix	Aqueous (Surface Water)
Analytical Group	Hexavalent Chromium
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) SW-846 7196A/SA-GE-001
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Savannah, Georgia
No. of Sample Locations	See Worksheet #18

Quality Control (QC) Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
LCR Verification (LCRV) (also called LDR Verification, LDRV)	Every 6 months	within ± 10% of true value	Re-perform the LCR study	Analyst	within ± 10% of true value
Initial Demonstration of Capability (IDOC)	Initially, per analyst, per analyte/method combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006 (Unsupervised work cannot begin until successful IDOC is obtained.)	Analyst	Refer to SOP SA-QA-006
Continuing Demonstration of Capability (CDOC)	Annually, per analyst, per analyte/method combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006	Analyst	Refer to SOP SA-QA-006
Reporting Limit Verification (RLV)	Upon method/instrument set-up, per analyte/method/matrix combination.	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007	Analyst	Refer to SOP SA-QA-007
Method Detection Limit Study (MDL)	Upon method/instrument set-up, per analyte/method/matrix combination and annually thereafter	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007	Analyst	Refer to SOP SA-QA-007

Matrix	Aqueous (Surface Water)
Analytical Group	Hexavalent Chromium
Anticipated Concentration Level	Low to Moderate
Analytical Method/SOP Reference[1]	United States Environmental Protection Agency (USEPA) SW-846 7196A/SA-GE-001
Field Sampling Organization	Geosyntec Consultants, GSI, and Anchor QEA
Analytical Organization	Eurofins-TestAmerica Savannah, Georgia
No. of Sample Locations	See Worksheet #18

Quality Control (QC) Sample	Frequency/ Number	Method/Standard Operating Procedure (SOP) QC Acceptance Limits[2]	Corrective Action	Person(s) Responsible for Corrective Action	Measurement Performance Criteria[2]
MDL Verification (MDLV)	Upon method/instrument set-up, per analyte/method/matrix combination.	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007	Analyst	Refer to SOP SA-QA-007

1. SOPs are reviewed/revised on an annual schedule by the laboratory. The current version of the SOP will be followed at the time of sample receipt.
2. This is a summary of the acceptance limits and measurement performance criteria; refer to the method SOP included in Attachment B of this UFP-QAPP for specific or more information. The acceptance limits and measurement performance criteria are in accordance with the government-required limits or criteria (i.e., National Functional Guidelines and/or USEPA Region 4 *Laboratory Operations and Quality Assurance Manual* [USEPA 2022]) if applicable.

UFP-QAPP Worksheet #29: Project Documents and Records Table

Sample Collection Documents and Records	On-Site Analysis Documents and Records	Off-Site Analysis Documents and Records	Data Assessment Documents and Records	Other
• Field notes and field forms • Boring logs • Well diagrams • Identification of quality control (QC) samples • Chain-of-custody forms • Air bills • Custody seals	• Equipment calibration logs • Field parameter data • Water level and water depth measurements • Soil lithology information • Waste labels and manifests	• Sample receipt, custody and tracking records • Equipment calibration logs • Sample preparation logs • Sample run logs • Equipment maintenance, testing, and inspection logs • Instrument printouts • Standards results • Corrective action forms • Sample disposal records • Raw data (electronic) • Analytical results: portable document format (PDF) files, and electronic data deliverables • Level II and Level IV standard data deliverables	• Field sampling assessment checklists • Laboratory assessment checklists • Data validation/ usability assessments • Corrective Action Plan • Final Report	• Corrective action communication • Approval authority responses/concurrence

UFP-QAPP Worksheets #31, #32 & #33: Assessments and Corrective Action

Assessments:

Assessment Type	Responsible Party & Organization	Frequency	Estimated Dates	Assessment Deliverable	Deliverable due date
Field Safety and Sampling Technical Systems Audit	Field Team Lead and Project Manager (Geosyntec)	At the beginning of each sampling event	TBD	Checklist including examinations of field sampling and measurement records, field instrument operating and calibration records, sample collection, handling and packaging in compliance with the established procedures, maintenance of quality control (QC) procedures, chain of custody, field and sample documentation, safety procedures	2 business days after assessment
Laboratory Technical Systems Assessment	Laboratory and Operations Managers (Eurofins-TestAmerica)	Annually	TBD	Per requirements of QA Manager	Not applicable
Data Quality Assessment	Field Team Lead and Quality Assurance (QA) Manager (Geosyntec) Laboratory Manager (Eurofins-TestAmerica)	Per analytical data package	TBD	Communication in the form of an email requesting additional laboratory forms, backup data that may be missing and/ or clarification of the analytical report.	2 weeks after receipt of data

TBD: to be determined

Assessment Response and Corrective Action:

Assessment Type	Responsibility for Responding to Assessment Findings	Assessment Response Documentation	Timeframe of Response	Responsibility for Implementing Corrective Action	Responsible for Monitoring Corrective Action Implementation
Field Safety and Sampling Technical Systems Audit	Project Manager/ Field Team Lead (Geosyntec)	Letter report or email	2 business days after assessment	Field Team Lead (Geosyntec)	Project Manager (Geosyntec)
Laboratory Technical Systems Assessment	Laboratory Manager/ Operational Manager (Eurofins TestAmerica)	Letter report or email	2 business days after assessment	Laboratory Manager/ Operational Manager (Eurofins TestAmerica)	Laboratory Manager/ Operational Manager (Eurofins TestAmerica)
Data Quality Assessment	Laboratory Manager/ Operational Manager (Eurofins TestAmerica)	Per requirements of Quality Assurance (QA) Manager	Per requirements of QA Manager	Laboratory Manager/ Operational Manager (Eurofins TestAmerica)	Laboratory Manager/ Operational Manager (Eurofins TestAmerica)

QA Management Reports Table:

Type of Report	Frequency (daily, weekly monthly, quarterly, annually, etc.)	Projected Delivery Date(s)	Person(s) Responsible for Report Preparation (Title and Organizational Affiliation)	Report Recipient(s) (Title and Organizational Affiliation)
Field Progress Reports	Daily during sampling events; email or oral communication	Daily during sampling events	Field Team Lead (Geosyntec)	Project Manager (Geosyntec)
Monthly Project Progress Report	Monthly for duration of the project	Monthly	Project Manager/Field Team Lead (Geosyntec)	Project Manager (Geosyntec)/On-Scene Coordinator (EPA)
Data Validation and Usability Assessment	Per analytical data package	Within 3 weeks of receiving analytical package	Data Validation Team/Geosyntec	Project Manager/Field Team Lead (Geosyntec)

UFP-QAPP Worksheet #34: Validation Process Table (Data Review Step I)

Verification Input	Description	Internal/ External	Responsible for Verification (Name, Organization)
Chain of Custody	Chain-of-custody forms and shipping documentation will be reviewed internally upon completion and compared with the packed sample shipment.	Internal	Validation Team/ Geosyntec
Field Notes	Field notes documenting all field activities will be maintained, scanned, and placed in the appropriate project directories.	Internal	Field Team Lead/ Geosyntec
Field Logs	Boring logs, well-installation logs, well-development records, field-sampling data sheets, and other field forms will be scanned and stored in project directories.	Internal	Field Team Lead/ Geosyntec
Laboratory Data	All data packages including electronic data deliverables (EDDs) will be verified by the lab for completeness and technical accuracy prior to submittal.	External	Project Manager/ Eurofins-TestAmerica and EGT
	All data packages including EDDs will be verified internally in accordance with the stated data validation procedures (100% Stage 2A).	Internal	Validation Team/ Geosyntec
Deliverables Review	All deliverables will be reviewed internally, and comments will be verified. Following internal verification, each deliverable will be distributed for external review by the United States Environmental Protection Agency (USEPA).	Internal	Validation Team/ Geosyntec

UFP-QAPP Worksheet #35: Validation Process Table
(Data Review Steps IIa and IIb)

The data validation strategy will be consistent with the applicable United States Environmental Protection Agency (USEPA) guidelines. Data validation will consist of 100% Stage 2A data validation, per analytical test and matrix.

Step IIa/IIb	Validation Input	Description	Responsible for Validation (Name, Organization)
IIa	Methods/SOPs	Ensure that all sampling and analytical SOPs are followed.	Field Team Lead, Validation Team/ Geosyntec
IIb	Sampling Schedule	Confirm that all sampling locations listed in Worksheet #18 are sampled and analyzed with the appropriate analytical methods.	Field Team Lead/ Geosyntec
IIa	Field Sheets	Review and edit field-sampling sheets for consistency and proper information.	Field Team Lead/ Geosyntec
IIa	Equipment Calibration	Perform proper calibration of groundwater gauging and sampling equipment, and document results.	Field Staff/Geosyntec
IIa/IIb	Performance Requirements	Check that the performance requirements specified by this UFP-QAPP are met.	Validation Team/ Geosyntec
IIa/IIb	All Required Elements of the Data Package	Check that all of the required reporting elements are present in the laboratory data package applicable to the requirements for Stage 2A validation.	Laboratory Personnel/ Eurofins TestAmerica and Validation Team, QA Manager/Geosyntec
IIb	Analytical QC Results	Verify that all method QC samples were run and met the referenced measurement performance criteria listed in Worksheets #12a -12i	Validation Team/ Geosyntec
IIb	Project Quantitation Limits	Compare sample results to project quantitation limits (PQLs) listed in Worksheets #15.	Validation Team/ Geosyntec
IIb	Deliverables	Keep deliverable review documentation during internal and external review process. Distribute deliverables on time as listed in Worksheets #14 and #16.	Validation Team/ Geosyntec

QC: quality control
SOP: standard operating procedure

Data Validation

The evaluation of the data will extend beyond method, procedural, or contractual compliance (verification) to check the analytical quality of the specific data set. The data will be evaluated in regard to compliance to the data quality objectives (DQOs) and measurement quality objectives. During data validation, data qualifiers will be assigned to provide the basis of describing data quality. Should nonconformance issues be generated from the laboratory, the validation procedure evaluates the effects of the nonconformance(s) on the quality and usability of the data set.

Step IIa denotes a list of validation activities, which include the following and are associated with methods, procedures, and contracts:

- Data Deliverables: Check that all required information on sampling and analysis are provided.
- Analytes: Check that all analytes were reported as required.
- Chain of Custody: Evaluate traceability of data and examine against procedural requirements.
- Holding Times: Check holding times for analysis.
- Sample Handling: Check that sample preservation, handling, and storage procedures were met.
- Sampling Methods and Procedures: Check that field measurement and performance criteria were met and, if field measurements and performance criteria did not meet specifications, be sure that is documented. Check that required sampling methods were used.
- Field Transcription: Check transcription accuracy of sampling data where applicable.
- Analytical Methods and Procedures: Evaluate whether the required methods and procedures were performed.
- Data Qualifiers: Check that the laboratory qualifiers were used correctly.
- Laboratory Transcription: Check accuracy of transcription where applicable.
- Proficiency Testing: Evaluate acceptance of proficiency testing sample results against performance requirements as specified by the project.
- Standards: Check that standards are traceable and meet project and contract requirements.
    - Communication: Check that required communication procedures were followed by field and laboratory personnel.

Step IIb denotes a list of validation activities, which include the following and are associated with comparison with measurement performance Criteria in the Predesign Investigation Work Plan (PDIWP):

- Data Deliverables and PDIWP: Check that data report from Step IIa was provided.
- Sampling Plan: Check whether the sampling plan was executed as specified.
- Sampling Procedures: Evaluate whether sampling procedures were followed with respect to equipment and proper sampling support.
- Collocated Field Duplicates: Compare results of collocated field duplicates with criteria established in the PDIWP.
- Project Quantitation Limits: Check that quantitation limits were achieved as outlined in the PDIWP and that the laboratory successfully analyzed a standard at the quantitation limit.
- Confirmatory Analysis: Evaluate the agreement of the laboratory results.
- Performance Criteria: Evaluate QC data against project-specific performance criteria in the PDIWP (i.e., evaluate quality parameters beyond those outlined in the methods).
- Data Qualifiers: Check that the lab qualifiers and the third-party data validator qualifiers applied in Step IIa were those specified in this UFP-QAPP and that any deviations were specified.
- Step IIb Validation Report: Summarize outcome of comparison of data to methods, procedures, and contracts, in this UFP-QAPP and include qualified data and explanation of all data qualifiers.

UFP-QAPP Worksheet #36: Validation Process Table (Data Review Steps IIa and IIb)

Step IIa/IIb	Matrix	Analytical Group	Validation Criteria	Data Validator (title and organizational affiliation)
IIa/IIb	Floodplain and Creek Bank Soil	All Analytical Parameters	Method and SOP criteria, EPA QA/G8, USEPA Region 4 Data Validation SOPs QAS-SOP-0025, QAS-SOP-12, QAS-SOP-13, QAS-SOP-14); and National Functional Guidelines for Data Review	Geosyntec Data Validation Team/ Geosyntec
IIa/IIb	Groundwater and Surface Water	All Analytical Parameters	Method and SOP criteria, EPA QA/G8, USEPA Region 4 Data Validation SOPs (QAS-SOP-0025, QAS-SOP-12, QAS-SOP-13, QAS-SOP-14); and National Functional Guidelines for Data Review	Geosyntec Data Validation Team/ Geosyntec
IIa/IIb	Snow Creek Sediment	All Analytical Parameters	Method and SOP criteria, EPA QA/G8, USEPA Region 4 Data Validation SOPs (QAS-SOP-0025, QAS-SOP-12, QAS-SOP-13, QAS-SOP-14); and National Functional Guidelines for Data Review	Geosyntec Data Validation Team/ Geosyntec

QAS: quality assurance section
SOP: standard operating procedure
USEPA: United States Environmental Protection Agency

Data Validation

The Geosyntec data validation team will validate all laboratory data in accordance with current United States Environmental Protection Agency (USEPA) National Functional Guidelines (USEPA 2020) and *Guidance on Environmental Data Verification and Data Validation* (USEPA 2002a) as well as USEPA Region 4 Data Validation SOPs (USEPA 2011, 2016a). The data validation strategy will be consistent with the applicable USEPA guidelines. Data validation will consist of 100% Stage 2A data validation, per analytical test and matrix. Field data will also be validated against the standard operating procedures (SOPs) and the acceptance criteria contained in the Predesign Investigation Work Plan (PDIWP).

The data reviewer is required request any missing information needed from the laboratory. Elimination of the data from the review process is not allowed. All data will be qualified, as necessary, in accordance with established criteria. Data summary packages will consist of sample results, quality control (QC) summaries, and all raw data associated with the sample results and QC summaries. During the data validation process, the qualifiers shown below will be applied to the data as applicable.

Data Qualifier Definitions

- U: The analyte was analyzed for but was not detected at or above the reported sample quantitation limit.

- J: The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

- J+: The analyte was positively identified; however, the associated numerical value is likely to be higher than the concentration of the analyte in the sample due to positive bias of associated QC or calibration data or attributable to matrix interference.

- J-:The analyte was positively identified; however, the associated numerical value is likely to be lower than the concentration of the analyte in the sample due to negative bias of associated QC or calibration data or attributable to matrix interference.

- UJ: The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

- R: The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

UFP-QAPP Worksheet #37: Usability Assessment (Data Review Step III)

To the extent possible, the validation team will follow the United States Environmental Protection Agency's (USEPA's) data quality assessment (DQA) process to verify that the type, quality, and quantity of data collected are appropriate for their intended use. DQA methods and procedures are outlined in USEPA's *Guidance, Data Quality Assessment: A Reviewer's Guide* (EPA QA/G-9R). The DQA process included five steps:

1. Review the data quality objectives (DQOs) and sampling design.
2. Conduct a preliminary data review.
3. Select a statistical test.
4. Verify the assumptions of the statistical test.
5. Draw conclusions from the data.

After the data are received from the field team or from the laboratory, validation of the data will occur as described in Worksheet #36. During validation, where necessary, validation qualifiers will be applied to the data indicating that it has limited use, should perhaps be examined more closely, or has dramatically failed one or more data quality indicator (DQI) criteria and has been rejected. This information will be supplied to the project team via a validation report and to the data management team through updates to the database. A DQA report will be prepared periodically summarizing the overall quality of the data, including field data, field quality control (QC) data, laboratory QC data, laboratory QC data trends, and laboratory data. This will further illustrate the limitations of any qualified data that may have resulted during data validation. It is incumbent on the project team to then use the data in an appropriate manner based on any limitations that have been identified.

Summarize the usability assessment process and all procedures (e.g., interim steps, and any statistics, equations, and computer algorithms that will be used)

Data usability is the process of evaluating the data validation results and determining the confidence with which any data point(s) may be used. Usability is determined by evaluating the data validation qualifier applied and the laboratory QC results. Concentration values may be considered to have a high degree of confidence because the associated method performance criteria were achieved. Estimated concentration results are evaluated with respect to the bias contributed to the value by the associated QC result. Bias direction can be estimated for data quality impacts due to surrogate recoveries, matrix spike recoveries, and laboratory control sample recoveries. Sample concentration results that are rejected during data validation are not used in the decision-making process and should not be reported.

Evaluative procedures used to assess overall measurement error associated with the project

Data usability is evaluated with respect to the DQOs presented in this UFP-QAPP to check that the opportunity for incorporating unacceptable and manageable error into the decision-making process is minimized to the extent possible. The acceptable error associated with the analytical data results and their use is contained in Worksheet #12.

The analytical data, data validation qualifiers, and QC results will be evaluated to determine the confidence with which the analytical data can be used in the project decision-making process. The criteria used in the data usability summary are presented as follows using the DQI criteria required for the predesign investigation (PDI) and measured as precision, accuracy, representativeness, completeness, comparability, and sensitivity (PARCCS).

PARCCS OVERVIEW

Introduction

This quality assurance (QA) program addresses both field and laboratory activities. QA objectives are formally measured by computing performance measures known as DQIs, which are compared to predefined measurement quality objectives (MQOs) specific to the project objectives. The DQIs for measurement data are expressed in terms of PARCCS. Evaluation of DQIs provides the mechanism for ongoing control and evaluation of data quality throughout the project and ultimately will be used to define the data quality achieved for the various measurement parameters. The field QA/QC program will be accomplished by collecting field duplicates, equipment blanks, source blanks, field blanks, and trip blanks. The analytical QA/QC program will be assessed through the internal laboratory QC performed, including method blanks, laboratory control sample (LCS) and laboratory control sample duplicates (LCSD) recoveries, surrogate recoveries, and matrix spike/matrix spike duplicate (MS/MSD) recoveries. The following sections describe the DQIs in greater detail, with a discussion of the associated MQOs.

Precision

Precision refers to the reproducibility or degree of agreement among duplicate measurements of a single analyte. The closer the numerical values of the measurements, the more precise the measurement. Poor precision stems from random errors (i.e., mechanisms that can cause both high and low measurement errors at random). Precision is usually stated in terms of standard deviation, but other estimates, such as the coefficient of variation (relative standard deviation), range (maximum value minus minimum values), and relative range, are common and may be used pending review of the data. Precision will be checked by collecting field duplicates and the analysis of MS/MSD and LCS/LCSD samples for the work performed at the site. The overall precision of measurement data is a mixture of sampling and analytical factors. Analytical precision is much easier to control and quantify than sampling precision; there are more historical data related to individual method performance, and the “universe” is not limited to the samples received in the laboratory. In contrast, sampling precision is unique to the project. Sampling precision will be measured through

the laboratory analysis of field duplicate samples. Laboratory precision will be measured through the analysis of MS/MSD and LCS/LCSD samples.

During the collection of data using field methods and/or instrumentation, precision is checked by reporting several measurements taken at one location and comparing the results. Precision will be determined from replicate samples and will be expressed as the relative percent difference (RPD) between replicate/duplicate sample results, computed as follows:

$$RPD = \frac{X_1 - X_2}{(X_1 + X_2)/2} \times 100$$

where X_1 and X_2 are reported concentrations for each replicate sample and subtracted differences represent absolute values. For field duplicates, the precision goals for this project are RPD = 35% for aqueous samples and RPD = 50% for solid samples. For laboratory duplicates, the RPD goals are dictated by the specific analytical and laboratory QC acceptance criteria.

Accuracy and Bias

Accuracy refers to the degree of difference between measured or calculated values and the true value. The closer the numerical value of the measurement comes to the true value or actual concentration, the more accurate the measurement. The converse of accuracy is bias, in which a systematic mechanism tends to consistently introduce errors in one direction or the other. Bias in environmental sampling can occur in one of three ways; these mechanisms and their associated diagnostic and management methods are as follows:

- High bias, which can stem from cross-contamination of sampling, packaging, or analytical equipment and materials. Cross-contamination is monitored through blank samples, such as equipment blanks, field blanks, trip blanks, filter blanks, and method blanks. These samples assess the potential for cross-contamination from, respectively, sampling equipment, ambient conditions, packaging and shipping procedures, field filters, and laboratory equipment. Data validation protocols described in Worksheet #36 present a structured approach for data qualification based on blank samples.
- Low bias, which can stem from the dispersion and degradation of target analytes (e.g., volatilization of chlorinated solvents during field sampling). The effects of these mechanisms are difficult to quantify. Sampling accuracy can be maximized by the adoption and adherence to a strict field QA program. Specifically, sampling will be conducted following standard protocols described in this UFP-QAPP (e.g., eliminating headspace in sampling vials for volatile organic compounds [VOCs] will reduce the potential for dispersion of VOCs during sampling). Through regular review of field procedures, deficiencies will be documented and corrected in a timely manner.
- High or low bias, due to poor recoveries, poor calibration, or other system control problems. The effects of these mechanisms on analytical accuracy may be expressed as the percent recovery of an analyte that has been added to the environmental sample at a

known concentration before analysis. Analytical accuracy in the laboratory will be determined through the analysis of LCSs and MS/MSDs. As with blank samples, data validation protocols provide a structured formula for data qualification based on erroneously high or low analyte recoveries.

Accuracy, when potentially affected by high or low recoveries as described in the third bullet above, is presented as percent recovery (%R) for MS/MSD recoveries, defined as:

$$\%\ R = \frac{Spiked\ Sample\ Concentration - Sample\ Concentration}{Spike\ Concentration} \times 100$$

Accuracy goals are presented as upper and lower control limits for percent recovery and are generated through the compilation of control charts and referenced in each laboratory method SOP attached to this UFP-QAPP. These limits in conjunction with validation-guidance-required percent recoveries will be used for assessing data accuracy.

Representativeness

Representativeness is defined by the degree to which the data accurately and precisely describe a characteristic of a population, parameter variations at a sampling point, a process condition, or an environmental condition. If the results are reproducible, the data obtained can be said to represent the environmental condition. Representativeness is evaluated by collecting a sufficient number of samples of an environmental medium, properly chosen with respect to place and time. The precision of a representative set of samples reflects the degree of variability of the sampled medium, as well as the effectiveness of the sampling techniques and laboratory analysis. Representativeness will be determined through consensus with Region 4 USEPA concerning appropriate sampling scope.

Completeness

Completeness is defined as the percentage of measurements made that are judged to be valid measurements. The completeness goal is essentially the same for all data uses in that a sufficient amount of valid data are to be generated. There are limited historical data on the completeness achieved by individual methods. However, the Contract Laboratory Program (CLP) data have been found to be 80% to 85% complete on a nationwide basis. The percent completeness for each set of samples will be calculated as follows:

$$\%\ Completeness = \frac{Valid\ Data}{Total\ Data\ Planned} \times 100$$

The QA objective for completeness for all parameters will be 90%.

Comparability

Comparability expresses the confidence with which one data set can be compared to another data set measuring the same property. Comparability is evaluated by using established and approved analytical methods, consistency in the basis of analysis (e.g., wet weight, volume), consistency in reporting units (micrograms per liter [µg/L], milligrams per liter [mg/L]), and analysis of standard reference materials. By using standard sampling and analytical procedures, data sets will be comparable.

Sensitivity

Sensitivity refers to the minimum magnitude at which analytical methods can resolve quantitative differences among sample concentrations. If the minimum magnitude for a particular analytical method is sufficiently below an action level or risk-screening criterion, then the method sensitivity is deemed sufficient to fully evaluate the data set with respect to the desired reference values. Frequently, risk-based screening levels fall below the sensitivity of even the most sensitive analytical methods. In such cases, it is necessary to review the qualifications of several laboratories, both from the standpoint of sensitivity as well as other DQIs, to select the best laboratory for the project. The method detection limit (MDL) is a theoretical limit determined through an MDL study, in which the concentration of a spiked solution is tested at least seven times. At least seven method blanks are also used to generate an MDL. The standard deviation of the recovered concentrations (σ_{rec}) is computed and multiplied by the t-distribution value to arrive at the MDL. The higher of the two MDLs is chosen as the MDL for the analyte and matrix. This practice helps alleviate the reporting of false positive results due to background contamination. The reporting limits (RLs) are the lowest quantitative value reported and are generally based on the lowest concentration standard on the calibration curve. Analytical sensitivity is readily evaluated by comparing method RLs to risk-based screening values. The results of this analysis are presented in Worksheet #15, which demonstrate the suitability of the selected methods to the project requirements.

Identify the personnel responsible for performing the usability assessment

Data usability is first evaluated by the laboratory performing the fixed-base analysis, the data validation team, and the QA Manager. Usability of data collected in the field is first determined by the field team, Field Team Lead, and Project Manager. Once the data are validated, the final usability of the data are determined by the project team, specifically the technical leaders for the project and the Project Manager.

Documentation that will be generated during usability assessment and how usability assessment results will be presented so that they identify trends, relationships (correlations), and anomalies

Data usability will be documented through validation reports as well as through the issuance of DQA reports, which will summarize how the data reflect the specific criteria for the DQIs assigned to the

project. A DQA report will be included in interim and final reports where applicable and will provide discussions of the DQI assessment.

ATTACHMENT A

Field Standard Operating Procedures

Attachment A-1
Field Sample Packing, Handling, Shipping, and Chain-of-Custody Procedures

1.0 HANDLING

1. Complete sample label with the following information:
   a. Sample type (sediment, soil, etc.)
   b. Site name and Project number
   c. Sample identification code and other sample identification information, if applicable
   d. Analysis required
   e. Date
   f. Time sampled
   g. Sample type (composite or grab)
   h. Preservative, if applicable (if used, ice should be listed as a preservative)
   i. Sampler's name or initials
2. Cover the label with clear packing tape to secure the label onto the container.
3. Complete the chain-of-custody (COC) forms (an example form is attached).
4. Store samples in a cooler on ice or in a refrigerator until shipped to the lab.

2.0 PACKING

1. Ensure that sample containers have the sample labels securely affixed to the container with clear tape.
2. Check caps on the sample containers to ensure that they are properly sealed.
3. Complete the COC form with sampling information and ensure that recorded information matches the sample labels.
4. Secure, using tape, the outside drain plug at the bottom of the cooler, line the inside of the cooler with a garbage bag or other plastic liner.
5. Wrap sample containers in individual plastic bags. For glass containers, use bubble wrap bags or wrap containers with a second layer of cushioning material.
6. Place 1 to 2 inches of cushioning material at the bottom of the cooler.
7. Place the sealed sample containers into the cooler.
8. Include a bottle of water clearly labeled as "temperature blank" in the cooler.

9. Place ice in plastic bags and seal. Place loosely in the cooler.
10. Fill the remaining space in the cooler with cushioning material.
11. If releasing to a laboratory custodian, both the releaser and receiver will sign and date the COC form indicating the transfer of custody.
12. Indicate on the COC form if shipping by overnight service, include the air bill number on the COC form, sign and date the COC form, place COC forms in a plastic bag and seal. Tape the forms to the inside of the cooler lid.
13. Close the lid of the cooler, and secure with packing tape.
14. Wrap strapping tape around both ends of the cooler at least twice.
15. Mark the cooler on the outside with the following information if shipping by express carrier: shipping address; return address; "Fragile" labels; and arrows indicating “this side up.” Cover the labels with clear plastic tape. Place a signed custody seal on at least two sides of the cooler/lid interface.

3.0 SHIPPING

Samples will be hand delivered or delivered by an express carrier (e.g., Federal Express) using same day or overnight service.

4.0 CHAIN OF CUSTODY (COC)

Field custody documentation consists of both field logbooks, field forms and COC forms. A sample is in a person’s custody if

- it is in that person’s possession;
- it is in that person’s view, after being in his or her possession;
- it was in that person’s possession and he or she locked it up to prevent tampering; or
- it is in a secure area, under the control of that person.

The following custody procedures will be followed in the field:

1. The sampling crew will be responsible for the care and custody of the samples collected until they are transferred to the laboratory or otherwise stored at a controlled location (e.g., in on-site locked storage).
2. When shipping to the laboratory, each sample shipped will be entered on the COC form. Samples sharing a single COC form will be packaged and shipped together. The COC form will contain the following information:
    a. Name and address of laboratory
    b. Method of shipment (courier or overnight service)
    c. Air bill number (if applicable)
    d. Project name

e. Project contact information

f. Signatures for release and acceptance of custody

g. Unique sample identification numbers (must be the same as the identification numbers of the sample labels)

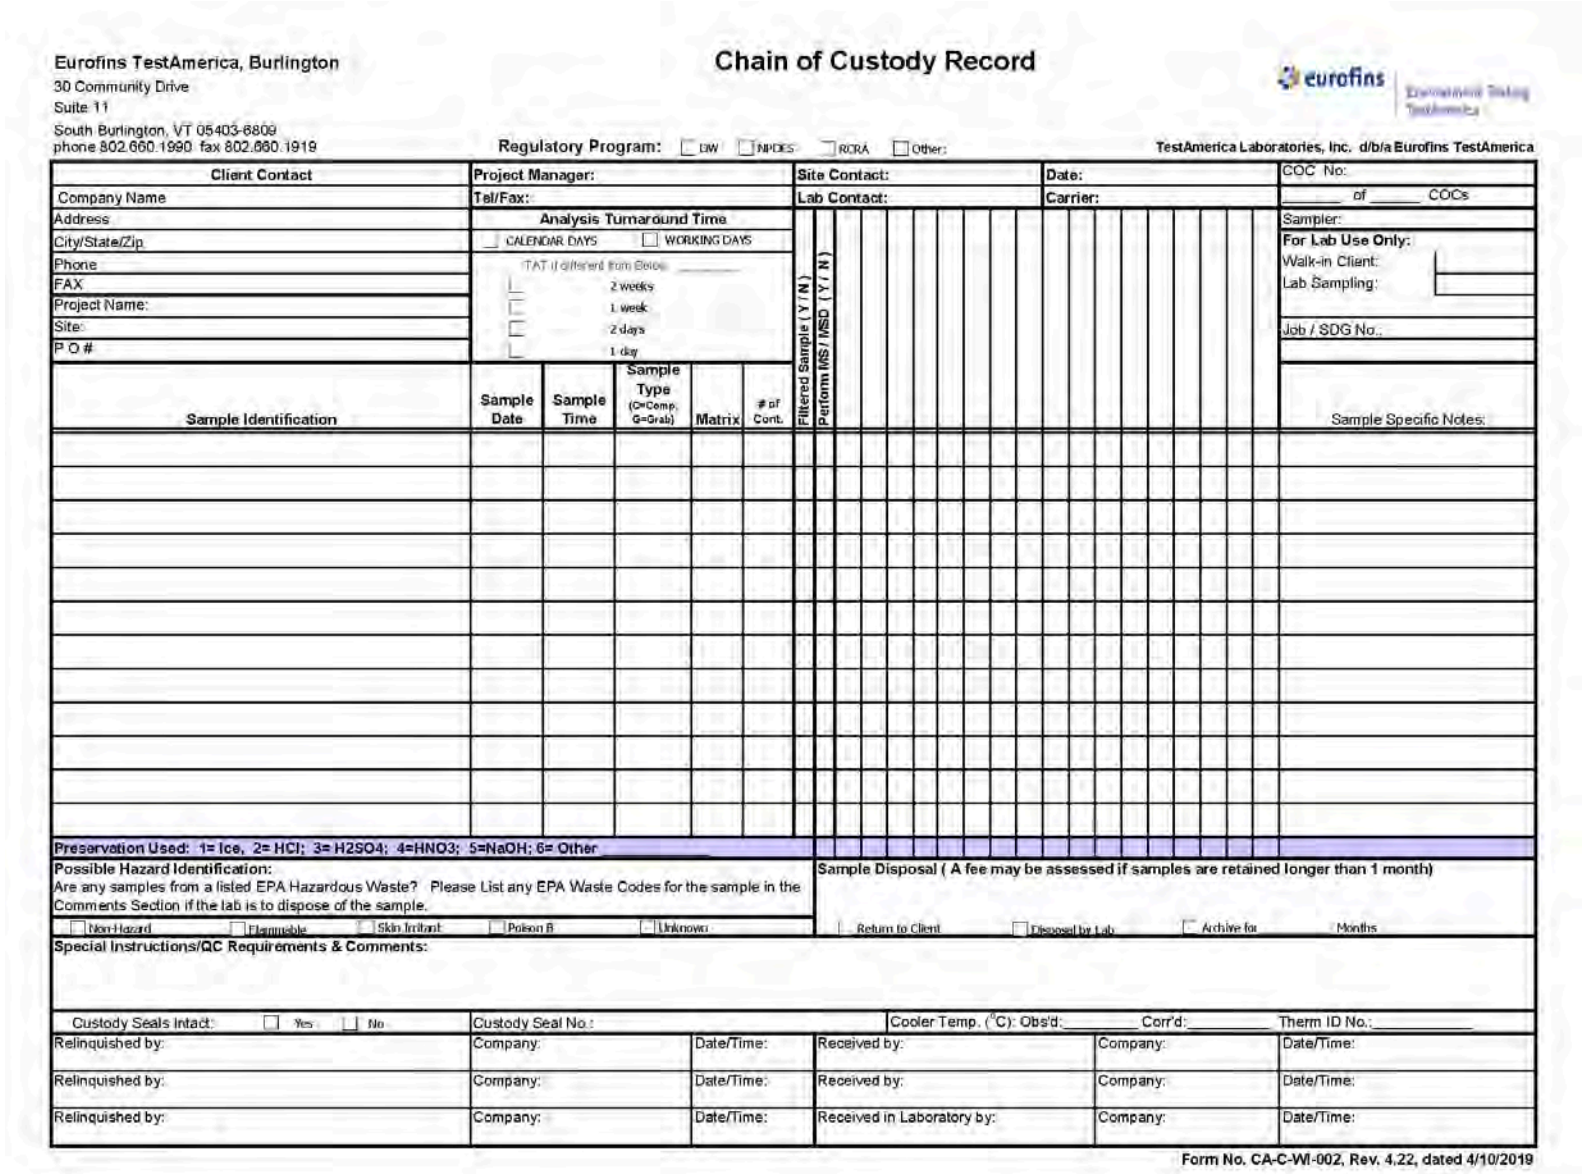
h. Date and time of sample collection

i. Sample matrix

j. Preservation (if any, including ice)

k. Analyses required

3. Samples will be packaged and shipped or transported to the analytical laboratory for analysis.



4. The original COC form will accompany the samples to the laboratory. Copies of the COC will be retained in the project files. The samples and signed COC forms will remain in the possession of the sampling crew until the samples are delivered to the express carrier, hand delivered to a mobile or permanent laboratory, or placed in secure storage.

If samples are shipped via express carrier, the carrier, air bill number and date shipped will be noted on the COC form, and the form will be placed inside the cooler and sealed with COC seals.

If samples are delivered directly to the laboratory or to a laboratory custodian or courier, the releaser and the receiver will sign and date the COC indicating the date and time of transfer.

If samples are split with a government agency or other party, a separate COC will be prepared for those samples and marked to indicate with whom the samples are being split.

Form No. CA-C-WI-002, Rev. 4.22, dated 4/10/2019

Attachment A-2
Field Cleaning and Decontamination Procedures

1.0 INTRODUCTION

This procedure describes the cleaning and decontamination of equipment used for sampling. If disposable sampling equipment is not used, sampling equipment must be cleaned before it is used to collect the next sample.

Construction or other equipment not involved in sampling might require decontamination before being moved to another work location on the site or off-site. Dry decontamination, steam cleaning or power washing may be used to clean large equipment in accordance with applicable procedures not included in this Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP).

Decontamination fluids will be collected, contained, and disposed of in accordance with project requirements and applicable regulations.

2.0 MATERIALS

The following materials will be available, as required, during field cleaning and decontamination activities:

- Personal protective and safety equipment as specified by the task-specific Job Safety Analysis (JSA)
- Analyte-free water
- Non-phosphate detergent (Alconox® or equivalent)
- Appropriate cleaning solvent (e.g., n-propanol, hexane, 10% nitric acid)
- Rinse collection containers
- Knife
- Brushes
- Aluminum foil
- Heavy-duty trash bags or other plastic sheeting
- Spray bottles
- Resealable plastic bags
- Plastic sheeting

3.0 CLEANING PROCEDURE FOR SMALL EQUIPMENT AND SAMPLING DEVICES

Follow the health and safety procedures specified in the task-specific JSA. Cleaning of reusable sampling equipment (e.g., scoops, mixing bowls, spatulas) will follow the decontamination procedures presented below:

- Dry brush or otherwise remove visible material
- Nonphosphate detergent and water wash
- Water rinse
- For organic sampling, rinse equipment with organic solvent (e.g., n-propanol)
- For metals or inorganic sampling, rinse equipment with 10% nitric acid in water solution
- Analyte-free water rinse
- Allow to air dry and wrap in aluminum foil (do not use aluminum foil for metals samples).

Equipment used to collect samples for low reporting limits or specific parameters may be cleaned for those specific parameters using appropriate solvents (e.g., hexane or 10% nitric acid).

Cleaning and decontamination fluids will be collected in appropriate containers and treated at an on-site or off-site treatment facility or otherwise disposed of according to applicable regulations.

Attachment A-3
Sediment Probing and Sampling Procedures

1.0 SCOPE AND APPLICATION

Lexan® tubing will be the primary method used to collect sediment cores. The tubing may be replaced with a calibrated rod if only probing is needed. Coarse material may need to be collected to characterize biota and chemistry. Coarse substrates can range from pebbles and gravel to cobbles, boulders, or bedrock. If the creek bed cannot be penetrated by the Lexan tubing due to large cobbles, boulders, or bedrock, three attempts should be made using a standard split-spoon sampler, stainless-steel bucket auger, trowels or hand collecting, as appropriate. Depending on the sampling plan and objectives, the sampling point may be moved a few feet and the new location documented, in attempt to retrieve a sample. If no sample can be obtained, document the three attempts and proceed to the next location.

Additional methods of sediment sampling (e.g., handheld dredge sampling, Ekman grab sampling) are also described and will be conducted as appropriate to collect surficial sediment samples. Surficial sediment is defined as the upper 2 inches of sediment.

Handheld dredge methods are provided for collecting bulk sediment for benthic macroinvertebrate toxicity studies. Sediment toxicity benchmark (e.g., simultaneously extracted metals/acid-volatile sulfide, total organic carbon) and bulk sediment toxicity (e.g., freshwater amphipod bioassay) sampling studies may involve the use of these procedures for collection of the top 6 inches of sediment.

2.0 EQUIPMENT LIST

The following collection equipment and materials will be available, as required, during sediment sampling:

- Personal protective equipment (PPE) as required by the task-specific Job Safety Analysis (JSA)
- Global positioning system (GPS) unit
- Chest waders
- Cleaning supplies and equipment
- Boat and motor
- Aluminum or stainless-steel tray (do not use aluminum if sediment samples will be analyzed for metals)
- Surveyor’s rods
- Duct tape
- Indelible ink markers

- Lexan tubing with end caps, stainless-steel bucket auger, and/or stainless-steel sediment corer
- Stainless-steel core driver block
- Handheld dredge with rope
- Calibrated rod for sediment depth measurement
- Brass push rod
- Hacksaw, handsaw, or knife
- Vacuum pump
- Stainless-steel Ekman grab sampler (0.25 square feet [ft^2]) with handle (or equivalent)
- Teflon® or polyethylene siphon
- Stainless-steel or plastic ruler
- Stainless-steel spoons
- Stainless-steel mixing bowl
- Stainless-steel trowel
- Camera with date and time setting
- Transport container (cooler) with ice
- Appropriate sample containers and forms
- Field notebook

3.0 CAUTIONS

Cautions include hazards associated with working around water (e.g., drowning, falling on slippery surfaces). Cautions also include biological hazards such as venomous snakes, tick bites, etc. Physical, biological and other site-specific hazards are described in the task-specific Job Safety Analysis (JSA).

4.0 HEALTH AND SAFETY CONSIDERATIONS

Personnel will wear appropriate clothing for working conditions (e.g., light colored, high visibility, long-sleeved clothing) and will have access to warm or cold beverages to avoid dehydration, overheating, or cold stress. Personnel will wear personal flotation devices when working around water. Communication systems and the need for a float plan will be addressed in the task-specific JSA and will be discussed during a task kick-off meeting and during daily health and safety meetings. Physical, biological, and other site-specific hazards are described in the task-specific JSA.

5.0 PROCEDURES

The procedures for sediment probing and sampling using different collection methods are discussed in the following subsections.

5.1 Procedure for Sediment Probing

The calibration rod will be used to probe sediment depths. Measurements made of location, depth, time, and field samples as well as pertinent observations (e.g., staining, odors) will be documented in the field notebook or on task-specific sampling forms.

5.2 Procedure for Lexan Tube Sampling

1. Identify the proposed sample location in the field notebook or sample log along with other appropriate information collected during sediment sampling activities.
2. Don PPE as required by the task-specific JSA.
3. Position boat (if used) or sampling device over the sampling location and record station position.
4. At each sample location, lower a section of Lexan tube until it just reaches the top of sediment. Measure the depth of water. (Sections of Lexan tube might need to be spliced together in deep water locations).
5. Push the Lexan tube into the sediment by hand, then slowly drive the tube into the sediment until the targeted depth (e.g., 2 feet) is achieved, or until refusal. Measure the depth of sediment. If the procedure is being conducted to determine sediment depth (probing), a calibrated rod may be used in place of the Lexan tube. If the procedure is being performed to collect samples for laboratory analysis, continue with Step 6.
6. Drive the tube several more inches, using a stainless-steel core driver and measure the distance. This procedure is performed to obtain a “plug” at the bottom of the core and prevent the loose sediment from escaping.
7. Place a vacuum pump on the top end of the Lexan tube and create a vacuum to prevent the sediments/plug from escaping during retrieval.
8. Slowly pull the tube from the sediment, twisting it slightly as it is removed (if necessary).
9. Before the tube is fully removed from the water, place a cap on the bottom end of the tube while it is still submerged.
10. Keeping the tube upright, wipe the bottom end dry and seal the cap with duct tape. Measure and record the length of sediment recovered and evaluate the integrity of the core. If the core appears to have poor recovery or if the sampling plan requires, attempt a second core adjacent to the first location. The

sampler's judgement will determine which core should be used for the collection of sample increments.

11. Transport the core sample to the sample processing station.
12. While keeping the core upright, use a handsaw to make a horizontal cut in the tube approximately one inch above the sediment.
13. Re-cap the cut end of the tube, seal the cap with duct tape and mark this end as "TOP" with indelible ink marker.
14. Wipe the tube dry.
15. Place a completed sample label on the tube.
16. Record the following information on both the tube and on the cap:
    a. sample number
    b. sampling date
    c. sampling time
17. Place the core sample upright in a container with ice.
18. Repeat the above procedures until all core samples are collected.
19. Sediment cores will be extruded from the Lexan tubing onto an aluminum or stainless-steel tray.
20. If the core is to be photographed, the photograph log will be filled out and a calibrated measuring rod or ruler will be photographed along with the core.
21. Cores will be sectioned into the required depth increments as specified in the sampling plan. Depth intervals and whether and how they are adjusted for poor recovery will be noted in the field book or on the sample logs. Each increment for analysis will be individually packaged. Describe and record sample descriptions.
22. Record the following sediment characteristics in the field logbook or on the core log form:
    a. texture
    b. color
    c. presence of debris
    d. presence of an oily sheen
    e. biological structures
    f. odor (e.g., hydrogen sulfide)
23. Core sections may be frozen to facilitate sectioning when sediment is extremely loose.

24. For cores that require sectioning into thin intervals (e.g., 2 centimeters [cm]), extruding can be accomplished using a mechanical extruder that pushes the core material out through the top of the core tube. Sediment samples are cut into the desired section thickness. Sediment touching the inner sides of the tube will be discarded. Each section will be individually placed into sample containers.
25. The handsaw or knife used to section the core should be decontaminated between each cut.
26. Samples will be stored in coolers on ice until transfer to the laboratory. Label sample containers in accordance with the procedures in Attachment A-1.
27. Record appropriate information in the field notebook.
28. Fill out chain-of-custody form, and handle, pack and ship the samples in accordance with the procedures described in Attachment A-1 to the Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP) for Operable Unit 1/Operable Unit 2 (OU-1/OU-2) Anniston PCB Site.

5.3 Procedures for Handheld Dredge Sampling

1. Identify the proposed sample location and field conditions in the field notebook or on the sample log form.
2. Don PPE as required by the task-specific JSA.
3. At each sample location, drop the opened dredge from side of boat making sure that the end of the rope is kept inside the boat.
4. Once the dredge has been allowed to settle into the bottom sediments, a hard pull on the rope will close the dredge and capture the sediment inside.
5. Retrieve the dredge into the boat.
6. Open the dredge to allow the sediment to empty onto a stainless-steel tray.
7. Record the sediment description (e.g., appearance, color, grain size).
8. If sampling for chemical analysis, use a stainless-steel spoon or spatula to collect the sample and place it into appropriate sample containers.
9. Label sample containers in accordance with the procedures with Attachment A-1.
10. Fill out chain-of-custody form, and handle, pack and ship the samples in accordance with the procedures described in Attachment A-1.

For bulk sediment collection, repeat steps 3 through 6 until sufficient sediment volume is collected. If chemical laboratory analyses are being performed, rinse blanks will be obtained by pouring deionized water through a cleaned dredge onto a cleaned stainless-steel tray and then into appropriate sample containers. Rinse blanks will be collected at the start and finish of sampling activities.

5.4 Procedures for Ekman Grab Sampling

5.4.1 Grab Sampler Deployment

1. Identify the proposed sample location in the field notebook or sample log along with other field conditions.
2. Don PPE as specified in the task-specific JSA.
3. Before each station is sampled, decontaminate the inner surfaces of the grab sampler and sampling utensils.
4. If the water depth is less than 9 feet, attach the grab sampler to the metal handles.
5. Place the grab sampler on a decontaminated surface and open it.
6. Securely place the two release wires around the release pins.
7. Lower the sampler through the water column at a slow and steady speed.
8. Allow the grab sampler to contact the bottom gently, with only its weight being used to force it into the sediments. The sampler should not be allowed to "free fall" to the bottom because this can result in premature triggering, an excessive wake or improper orientation upon contact with the bottom.
9. Deploy trigger weight to release the doors on the bottom of the grab sampler.

5.4.2 Grab Retrieval

1. After the grab sampler has rested on the bottom for approximately 5 seconds, begin retrieving it at a slow and steady rate.
2. After the grab sampler breaks the water surface, gently lower it onto a decontaminated surface, while maintaining the grab sampler in an upright position.
3. Open the doors on the top of the grab sampler, and inspect the sample for the following acceptability criteria:
    a. The sampler is not overfilled with sample to the point that the sediment surface presses against the top of the sampler or is extruded through the top of the sampler.
    b. Overlying water is present (indicates minimal leakage).
    c. The overlying water is not excessively turbid (indicates minimal disturbance or winnowing).
    d. The desired penetration depth is achieved (i.e., 4 to 5 cm for a 2-inch-deep surficial sample).
4. Penetration depth will be determined by placing a ruler against the center of the inside edge of the opening on top of one side of the grab sampler and extending it into the grab sampler until it contacts the top of the sample. The penetration

depth is determined by the difference between that measurement and the total depth of the grab sampler.

5.5 Sample Removal and Processing

Samples will be handled appropriately for the designated physical, chemical and biological analyses according to the following procedures:

1. For acceptable samples, remove the overlying water by slowly siphoning it off near one or more sides of the grab sampler. Provide that the siphon does not contact the sediments or that fine-grained suspended sediment is not siphoned off. If sediment is suspended in the overlying water, allow it to settle before siphoning off the water.
2. After the overlying water is removed, characterize the sample as specified in the study design. Characteristics that are often recorded include:
    a. texture
    b. color
    c. biological structures (e.g., shells, tubes, macrophytes)
    d. presence of debris (e.g., twigs, leaves)
    e. presence of an oily sheen
    f. odor (e.g., hydrogen sulfide, oil)
3. After the sample is characterized, remove the desired interval (e.g., top 2 inches for a surface sample) using a stainless-steel spatula or equivalent alternative. Materials other than sediment (e.g., large shells, stones, leaves) should be removed and noted on the field log sheet.
4. Transfer the surface sediment to a stainless-steel mixing bowl for homogenization (see Attachment A-12). Additional grab samples may be required to collect the volume of sediment specified in the study design. The mixing bowl should be covered while additional samples are being collected to prevent sample contamination (e.g., from precipitation, splashing water).
5. After a sufficient volume of sediment is transferred to the mixing bowl, homogenize the contents of the bowl using stainless-steel spoons until the texture and color of the sediment appears to be uniform.
6. After the sample is homogenized, distribute subsamples to the various containers as required by the sampling plan.
7. Fill out chain-of-custody form, and handle, pack and ship the samples in accordance with the procedures described in Attachment A-1.

6.0 WASTE MANAGEMENT

Dispose of wastes in accordance with project requirements and applicable regulations.

7.0 DATA RECORDING

Field notes will be recorded during sampling activities, and at a minimum, will include the following:

- Names of field crew and oversight personnel
- Weather conditions
- Date, time and sample location (GPS coordinates if specified)
- Photograph number when pictures are taken (if necessary)

8.0 QUALITY ASSURANCE AND QUALITY CONTROL

Field quality control samples including rinsate or equipment blanks, field duplicates, and additional volume for laboratory spiked samples may be required as specified in the sampling plan. The sediment sampling will be conducted consistent with the procedures outlined in this SOP. Deviations from the SOP will be discussed with the Project Manager prior to changing any field procedures.

Attachment A-4
Freezing Procedures for the Preservation of PCBs in Soil, Sediment, and Biota Samples

1.0 INTRODUCTION

Soil, sediment, and biota samples will be frozen to preserve samples for future analyses. The time between sampling and freezing will be minimized to the extent possible.

2.0 PROCEDURE FOR FREEZING CORE SAMPLES

After samples are collected, they will be photographed and stored in a freezer located in a controlled, limited-access location. Cores will be stored until they are required for analysis or until it is deemed that no further analyses are needed. The holding time for polychlorinated biphenyls (PCBs) in frozen samples is one year. The end use of the data should be considered before choosing to analyze samples outside of technical holding times.

2.1 Materials

The following materials will be available, as required, during sample freezing activities:

- Personal protective equipment (PPE) as required by the task-specific Job Safety Analysis (JSA)
- Cleaning supplies and equipment
- Tape
- Lexan tubing with end caps
- Indelible ink markers
- Transport container with ice
- Freezer, capable of maintaining a temperature of -10°C
- Appropriate sample containers and forms
- Field notebook

2.2 Procedure

1. Collect samples according to the relevant procedure or field sampling plan.
2. Check the contents of the cooler against the chain of custody (COC). Sample labels should be checked for completeness and any necessary corrections made.
3. Place sediment cores in the freezer in an upright position.
4. Note the date and time of freezing on the COC.

5. Cores will remain in an upright position until they are thoroughly frozen, at which time they may be stored stacked horizontally on shelves in the freezer.
6. Cores selected for analysis will be thawed at room temperature in a vertical position prior to processing. Processing will consist of extrusion and sectioning of the core and placement into laboratory provided sample containers. Samples will then be shipped to the laboratory.

2.3 Quality Control

The freezer(s) containing frozen samples will be checked daily during active field work to confirm proper working order and to record the temperature. If a freezer malfunctions, it will be repaired or replaced immediately. After field work is complete, the freezer will be checked at least monthly to verify it continues to work properly. To control/record access to the freezer, a completed COC sticker should be placed across the freezer door opening at the end of each workday during the active sampling effort and after field work is complete. Information on the COC sticker will be recorded in the field notebook. The next person who opens the freezer should first verify the COC sticker is in place, and place a new COC sticker across the freezer door opening—recording pertinent details in the field notebook—when work is complete.

2.4 Disposal

Sample cores will be stored frozen. After the investigation is complete, remaining cores will be disposed of in accordance with project requirements and applicable regulations.

3.0 PROCEDURE FOR FREEZING BIOTA SAMPLES

After biota samples are collected, they will be wrapped, labeled, placed in a cooler, frozen or shipped to the analytical laboratory for analysis. The samples will be stored frozen at the laboratory until they are required for analysis, relinquished to others under COC, or until it is deemed that no further analyses are needed.

3.1 Materials

The following materials will be available, as required, during biota freezing activities:

- PPE as specified by the task-specific JSA
- Cleaning equipment
- Field notebook and forms
- Aluminum foil
- Freezer paper
- Transport container with ice
- Freezer capable of maintaining a temperature of -20 °C

3.2 Procedure

1. Collect biota samples as provided in the relevant field sampling plan.
2. Measure and weigh samples.
3. Field process samples, when necessary.
4. Wrap samples in aluminum foil and then freezer paper with both an inner and outer sample label.
5. Enter the sample information on a COC form.
6. Place the sample in an insulated cooler with ice for transportation.
7. Upon arrival at the laboratory, the contents of the cooler are checked against the COC. Sample labels should be checked for completeness and any deviations brought to the attention of the project manager.
8. Place the samples in the freezer. Note the date and time of freezing on the COC.

3.3 Quality Control

The temperature of the freezer(s) will be monitored continuously via a temperature probe attached to a computerized data system. The freezer(s) containing frozen samples will be manually checked daily during active field work to confirm proper working order and to record the temperature. If a freezer malfunctions, it will be repaired or replaced immediately. After field work is complete, the freezer will be checked at least monthly to verify it continues to work properly. To control/record access to the freezer, a completed COC sticker should be placed across the freezer door opening at the end of each workday during the active sampling effort. Information on the COC sticker will be recorded in the field notebook. The next person who opens the freezer should first verify the COC sticker is in place, and place a new COC sticker across the freezer door opening—recording pertinent details in the field notebook. Laboratory COC procedures are included in the laboratory Quality Assurance Plan.

3.4 Disposal

Samples will be stored frozen until analysis. After the investigation is complete, the samples will be disposed of in accordance with project requirements and applicable regulations.

Attachment A-5
Surface and Subsurface Soil Sampling

1.0 INTRODUCTION

Surface and subsurface soil sampling may be conducted using hand tools. Depth sampling will be performed using hand tools, conventional drill rigs, and/or direct-push technology (DPT) drilling methods. Manual sampling procedures are described below.

2.0 MATERIALS

Sample bottles and preservatives appropriate for the parameters to be analyzed will be used, as well as analyte-free water, coolers, and ice.

The following materials will be available, as needed, for soil sampling activities:

- Personal protective equipment (PPE) and safety equipment as required by the task-specific Job Safety Analysis (JSA)
- Disposable aluminum pie plates or stainless-steel bowls (do not use aluminum if samples are collected for metals analysis)
- Disposable wooden spatulas, spoons or stainless-steel spoons
- Stainless-steel spades
- Stainless-steel hand augers
- Conventional/DPT drill rig and associated equipment
- Global positioning system (GPS) unit
- Indelible ink pens
- Ruler or survey rod
- Zip-top plastic bags
- Transport container (cooler) with ice
- Appropriate sample containers and forms
- Field notebooks

Documentation methods may include sample log forms, chain-of-custody (COC) forms, sample labels and seals, field logbooks, and a camera.

3.0 SOIL SAMPLING PROCEDURE

Soil samples may be collected in intervals from the ground surface to a variety of depths. Sample locations will be identified using stakes, flagging, or other appropriate means, and will be noted

in field logbooks and/or soil sampling logs. Sample points will be located using a GPS, or alternatively using measurements from structures and/or permanent property.

1. Clean equipment that will come in contact with the soil sample (see Attachment A-2) for the procedure for field cleaning/decontamination or use clean, disposable equipment). Collect field and equipment blanks in accordance with the appropriate field sampling plan and Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP) to document possible contamination from sampling equipment.
2. Clear the ground surface of brush, root mat, grass, leaves, or other debris
3. Use a spade, spoon, scoop, or hand auger to collect a sample over the required depth interval.
4. Use a ruler to ensure the sample is collected to the correct depth and record the top and bottom depths from the ground surface.
5. Collect samples below the surface interval by removing the surface interval first. Clean equipment that will come in contact with the soil sample (see Attachment A-2 to review the procedure for field cleaning/decontamination or use clean, disposable equipment). Then collect the deeper interval. It may be necessary to prevent the hole from collapsing by removing a wider section from the surface or using cut polyvinyl chloride (PVC) tubing or pipe to maintain the opening.
6. Collect samples for volatile organic compounds (VOCs) as discrete samples using Encore® samplers or cut syringes and will be collected before other samples are collected and homogenized (see Attachment A-13 for the procedure for VOC solid sample collection).
7. Samples for other analyses will be homogenized across the required interval or mixed with other discrete grab samples a to form a composite sample (Attachment A-9 for the procedure for compositing samples).
8. Place sample in clean sample container; label with sample ID, date, and time of collection; and place on ice. Prepare for packaging and shipping to the laboratory in accordance with the SOP for sample handling, packaging, shipping and COC (Attachment A-1).
9. Backfill sample holes to grade with native material or with clean builder's sand or other suitable material.

Attachment A-6
Subsurface Drilling and Monitoring Well Installation Procedures

1.0 INTRODUCTION

The following procedures will be implemented during drilling, installing, and developing temporary or permanent monitoring wells. Equipment will be decontaminated as outlined in Attachment A-2 (Field Cleaning/Decontamination Procedures) to the Anniston PCB Site Operable Unit 1/Operable Unit 2 Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP). Subsurface drilling and monitoring well installation will comply with the Alabama Department of Environmental Management (ADEM) *Alabama Environmental Investigation and Remediation Guidance* (AEIRG) (ADEM 2017) and the United States Environmental Protection Agency (USEPA) *Design and Installation of Monitoring Wells Guidance* (USEPA 2013).

2.0 GENERAL DRILLING PROCEDURES

The drilling and well installation procedures will conform to state and local regulations and guidance. The drill rig will be cleaned and decontaminated according to the guidelines described in Attachment A-2 of the UFP-QAPP and will conform with the procedures detailed in Appendix E.4 of the AEIRG. Drill rigs will not be used if they are leaking fluids that could enter the borehole or contaminate equipment that is placed in the borehole. Use of rags or absorbent materials to absorb fluids leaking form the drill rig is not acceptable. Drilling lubricants will not be used within the borehole.

The boreholes will be advanced using hollow-stem augers, rotosonic drilling, or other site-appropriate drilling methods outlined in Appendix B.2 of the AEIRG, and Section 2.2 in USEPA 2013, with preferred methods being those that case the borehole during drilling. Continuous soil samples will be collected throughout the length of the borehole for lithologic description.

Soil samples will be inspected and logged by qualified field personnel. The soil description will follow the Unified Soil Classification System (USCS) general format and include the following:

- Consistency or density
- Color
- Structural characteristics
- Composition with major components in capital letters
- Minor characteristics
- Geologic description in capital letters

For environmental soil samples, additional descriptions (such as odor, staining, oily sheen) will be noted in field notebooks. A log of drilling activities will be kept in a bound field notebook. Information in the field notebook will include location, date and time, personnel and equipment present, down time, materials used, samples collected, blow count measurements (if performed), and other observations or information that is relevant to the data collection objectives.

3.0 MONITORING WELL INSTALLATION

Typically, monitoring wells will be double-cased (a Type-III well per AEIRG) to prevent cross-contamination of the borehole from the shallow soils during drilling. Initially, a large-diameter pilot borehole (nominally 12 inches) will be advanced to a depth of approximately 5 feet for shallow residuum wells and to a depth of approximately 40 feet for deep residuum wells. Per AEIRG stipulations (Appendix B.3.3) the pilot borehole should extend a minimum of 2 feet, if possible, into the confining layer underlying the respective saturated zones. If the pilot borehole is installed into bedrock, 1-foot penetration is adequate. An 8-inch or 10-inch diameter casing will be placed in the pilot borehole and the annular space grouted (see grout specification below in Section 9.0) by tremie method per AEIRG procedures contained in Appendix B.3.3 The grout will be allowed to cure for a minimum of 24 hours prior to continuing drilling. A 6-inch or 8-inch nominal diameter (depending on the diameter used for the surface casing) borehole will be advanced through the surface casing to the target depth of the well.

If the rotosonic drilling method is used, temporary override casings may be used in place of permanent surface casings as an acceptable alternative to prevent cross-contamination of the borehole from shallow soils during drilling. This approach is referred to as the "telescoping method" and is conducted as follows:

- A 4-inch-diameter core barrel is advanced to the depths specified above for surface isolation (5 feet for shallow residuum wells, 40 feet for deep residuum wells, at least 2 feet into confining layers underneath saturated zones, or 1 foot into a bedrock-confining layer underneath a saturated zone), collecting soil cores continuously.

- A 6-inch-diameter or 8-inch-diameter inner casing is then drilled to the same depth as the 4-inch core barrel. Water may be used, if necessary, to assist in removal of materials between the 4-inch core barrel and inner casing.

- An 8-inch-diameter or 10-inch-diameter (depending on diameter used for the inner casing) override casing is drilled to the same depth, again, using water to remove material between the casings.

- If deemed necessary, a second override casing of 10-inch-diameter or 12-inch-diameter (depending on diameter used for the first override casing) is drilled to the same depth, again, using water to remove material between the first and second override casings. If the second override casing (10-inch-diameter or 12-inch-diameter) was used, then the 4-inch core barrel, inner casing, and first override casing (8-inch-diameter or 10-inch-diameter) are then sequentially advanced from 5 to 10 feet below ground surface.

- The 4-inch core barrel and inner casing are then sequentially advanced to the target depth of the well. After the boring is drilled to depth, the core barrel is removed and the well installed within the inner casing.

- The inner casing is removed as the sand pack is set (so that the bottom of the inner casing is set to the top of the sand pack interval), raised again as the bentonite seal is set (so that the bottom of the inner casing is set to the top of the bentonite seal interval), and then the inner casing is completely removed from the borehole as grout is placed between the inner and override casings.

- After removal of the inner casing, the annular space between the well casing and the override casings is topped off with grout and then the override casings are removed from the borehole. Grout is topped off one last time and left to set before a pad is built.

Permanent or temporary surface casings may be eliminated for wells installed in areas with measured low concentrations of PCBs in the soil.

Monitoring wells will be constructed using a 2-inch-diameter, flush-threaded, Schedule 40 polyvinyl chloride (PVC) casing and a section of slotted, Schedule 40 PVC screen. Well screen lengths will depend on site-specific considerations and will not exceed the maximum length of 10 feet stipulated by the AEIRG (Appendix B.3.2) and will not be less than 5 feet in length (Section 2.5; USEPA 2013). ADEM approval will be required if longer screens are warranted, due to large fluctuations in water table levels for example. An appropriately sized quartz filter pack will be used to fill the annular space between the borehole and the well and will act as a filter to keep fine-grained materials from clogging the well screen. The filter pack and screen slot size will be based on the formation material and the procedures described in Region 4 guidance documents (USEPA 2013). Before the screen and casing are placed into the borehole, a minimum of 6 inches of filter pack material will be placed at the bottom of the borehole to serve as firm footing.

The filter pack will be placed by tremie pipe or by pouring the sand through the hollow stem augers (or casing) as the augers (or casing) are withdrawn, to a minimum of 2 feet above the top of the well screen. A bentonite seal (minimum thickness of 2 feet of dry/non-hydrated pellets) will be installed on top of the filter pack. The bentonite will be allowed to hydrate for a minimum of 8 hours or the manufacturer's recommended time, whichever is greater. If the water table is below the pellet seal, potable or higher quality water will be added repeatedly to hydrate the pellets prior to grouting. The total volume of water added will be recorded on the monitoring well installation log. The remainder of the annulus will be filled with a bentonite/cement grout by tremie method up to 2 feet below ground surface or below the frost line, whichever is greater. The grout will be allowed to set for a minimum of 24 hours before the well surface is completed. Permanent monitoring wells will be completed at the surface with a 3-foot by 3-foot (minimum 6-inch thickness) concrete pad with locking anodized aluminum protective cover. The pad should be slightly sloped to allow drainage from the protective casing and off the pad.

Procedures for completing the monitoring well will include the following:

1. Only the well screen and filter pack portion of the completed monitoring well should be adjacent to the single water-bearing zone to be monitored.
2. The liquid slurry grouts will be placed by pumping the grout through a tremie pipe to the appropriate locations, or, if bentonite pellets are used, the pellets will be properly hydrated and compacted in place using the following steps:
    a. The bentonite pellets will be poured slowly down the well annulus or tremied into place to mitigate bridging of the pellets within the borehole above the desired depth.
    b. The pellets will be compacted in place using a PVC tremie pipe with a cap.
    c. The pellets will be allowed to hydrate for a minimum of 8 hours or the manufacturer's recommended time (whichever is longer) prior to continuing with well construction activities. Hydration will be completed by existing groundwater in the borehole (if present) or by adding clean water as they are placed into the borehole.
3. The protective surface casing will be set in both the cement grout and the concrete pad.

4.0 CASING REQUIREMENTS

The well casing requirements are as follows:

- Casing will be new and unused.
- Casings will be joined only with water-tight flush-joint threads; glue or solvent will not be used to join casing.
- PVC will conform to the ASTM International (ASTM) Standard F480 or NSF International (NSF) Standard 14 (Plastic Pipe System).
- The casing will be straight and plumb within the borehole. The casing will be notched or marked at the top to provide a point of reference for measuring groundwater elevations.

5.0 WELL SCREEN REQUIREMENTS

Well screen requirements are as follows:

- Requirements that apply to casing, except for strength requirements, also apply to well screen.
- Monitoring wells will not be screened across more than one water-bearing unit.
- Screens will be factory slotted.
- Screen slots will be sized to prevent 90% of the filter pack from entering the well. In formations consisting primarily of fines (silts and clays), the procedures for well screen design might require filter packs and screen slot sizes that are not commercially available. USEPA guidelines state the selection of 0.010-inch screen

slots with a 20-40 sand filter pack or 0.005-inch screen slots with 100 sand filter pack for very fine formations will be acceptable practice (USEPA 2013).

- The bottom of the screen will be capped, and the cap will be joined to the screen by threads. For wells where production of very fine sediment could occur, a 1- to 3-foot section of blank PVC casing may be placed below the screen to serve as a sump.

6.0 ANNULAR SPACE REQUIREMENTS

The annular space requirements are as follows:

- The annular space will be filled with a filter pack, including a 6-inch layer at the bottom of the borehole, a bentonite seal, and casing grout between the well string and the borehole wall.
- As the annular space is being filled, the well string will be centered. Centralizers are recommended for monitoring wells deeper than 50 feet.

7.0 FILTER PACK REQUIREMENTS

The filter pack will consist of silica sand and will extend from the bottom of the borehole to at least 2 feet above the top of the well screen. The filter pack material will be clean, inert, and well-rounded and will contain less than 2% flat particles. The sand will be certified free of contaminants by the vendor or contractor.

The filter pack will have a uniform, well-sorted, grain size and uniformity coefficient compatible with the formation materials and the screen. In formations consisting primarily of fines (silts and clays), the procedures for well screen design might require filter packs and screen slot sizes that are not commercially available. USEPA guidelines state the selection of 0.010-inch screen slots with a 20–40 sand filter pack or 0.005-inch screen slots with 100 sand filter pack for very fine formations will be acceptable practice (USEPA 2013).

The filter pack will not extend across more than one water-bearing unit. The filter pack will be placed by pouring the sand through the drilling string as the drill string is withdrawn.

8.0 BENTONITE SEAL REQUIREMENTS

The bentonite seal requirements are as follows:

- The bentonite seal will consist of at least 2 feet of dry/non-hydrated bentonite between the filter pack and the casing grout.
- The bentonite will be hydrated before casing grout is placed.
- Only 100% sodium bentonite will be used.

9.0 CASING GROUT REQUIREMENTS

The casing grout requirements are as follows:

- The casing grout will extend from the top of the bentonite seal to 2 feet below ground surface or below the frost line, whichever is greater, per AEIRG Appendix B.3.
- The grout will be mixed in the following proportions: 5% bentonite powder and 95% Portland cement, consistent with Section 2.3.5 in USEPA (2018)
- Grout will be pump tremied using either a side-discharge or a bottom-discharge tremie pipe.

10.0 SURFACE COMPLETION REQUIREMENTS

The aboveground surface completion of the permanent monitoring wells will be completed by extending the well a minimum of 2.5 feet above the ground surface (Section 2.3.6; USEPA 2013). A protective casing will be provided for each well, which will be seated in a 3-foot by 3-foot by 6-inch thick concrete surface pad. Flush mounted surface completions will be completed using a commercially available well box, at least 12 inches in diameter, seated in a 3-foot by 3-foot by 6-inch thick concrete pad. To allow atmospheric equilibration of the headspace within the monitoring well, a small-diameter (e.g., 0.25 inches) vent hole will be placed in the well casing, or a ventilated well cap will be used. A weep hole will be installed in the protective casing to prevent the casing from filling with water. The diameter of the protective casing will be at least 2 inches greater than the diameter of the well casing. The concrete pad will be sloped away from the well. A lockable cap or lid will be installed on the protective casing. The identity of the well will be permanently marked on the casing cap, the protective cover, or the concrete pad.

11.0 MONITORING WELL COMPLETION DIAGRAMS

A completion diagram will be submitted for each monitoring well installed. The diagram, at a minimum, will include the following information:

- Well identification (this will be the same as the boring identification described)
- Drilling method
- Drilling company name and driller name(s)
- Field personnel name(s)
- Installation date(s)
- Elevations of ground surface and the top of casing
- Total boring depth
- Lengths and descriptions of the screen and casing
- Lengths and descriptions of the filter pack, bentonite seal, casing grout, and any back-filled material
- Elevation of water surface before and immediately after development

- USCS description of the material penetrated by the boring

12.0 MONITORING WELL DEVELOPMENT

Well development will be conducted in accordance with procedures in AEIRG Appendix B.4., and USEPA (2013) Section 2.7. Monitoring wells will not be developed until at least 24 hours after installing the surface pads or, if a surface pad is not installed, at least 24 hours after grouting the annular space. The monitoring wells will be developed using bailing or pumping to produce representative formation water. Wells will be developed using a standard size pump with a surge block and/or a stainless-steel or Teflon® bailer with nylon rope. Development will be continued until representative water that is free of cuttings or other materials introduced during well construction is obtained. Representative water is generally assumed to have been obtained when the water is free of visible sediment and the pH, temperature, and specific conductivity have stabilized to within ±0.1 standard units, ±0.5°C, and ±10%, respectively. Ideally, the measured turbidity readings should be less than 10 Nephelometric Turbidity Units (NTUs) or should have stabilized to within ±10% for values greater than 10 NTUs.

The minimum duration of well development will vary in accordance with the method used to develop the well. For example, surging and pumping the well may provide a stable, sediment-free sample within minutes; whereas, bailing the well may require several hours of continuous effort to obtain a clear sample. Field personnel will determine appropriate development methods based on site-specific conditions observed during well construction. Field personnel will also record the methods of well development, duration, pH, temperature, turbidity, and specific conductivity readings in the well-development log.

Well development water will be contained and disposed of in accordance with project requirements and applicable regulations.

Attachment A-7
Groundwater Sampling Procedure

1.0 INTRODUCTION

The general procedures for groundwater sampling are outlined below and were developed based on the U.S. Environmental Protection Agency (USEPA) *Standard Operating Procedures (SOP) for Low-Stress (Low Flow)/Minimal Drawdown Ground-Water Sample Collection* (USEPA 2015), the USEPA *Region 4 Groundwater Sampling Operating Procedure* (USEPA 2017), and the Alabama Department of Environmental Management (ADEM) *Alabama Environmental Investigation and Remediation Guidance* (AEIRG) (ADEM 2017). Sampling activities will be documented in the field notebook. Additionally, sampling data will be recorded on a groundwater sampling log form specific to each well sampled. Before groundwater sampling begins, wells will be inspected for signs of tampering or other damage. If tampering is suspected, (e.g., casing is damaged, lock or cap is missing) field personnel will record that information in the field notebook and on the well sampling form.

Before starting sampling activities, field personnel will place plastic sheeting on the ground surrounding the well. The plastic sheeting will be used to provide a clean working area around the wellhead and prevent soil or other debris from contacting sampling equipment. Water will be removed from the protective casing or the vaults around the well casing prior to venting and purging. Purging and sampling will be performed using the low-flow method in a manner that minimizes aeration of the water column and the agitation of sediments in the well and formation. Equipment will not be allowed to free-fall into a well.

The following information will be recorded when a well is purged and sampled: (1) depth to water before and after purging and (2) the condition of each well. Additionally, the total depth of the monitoring well will be sounded annually and after sample collection.

2.0 MATERIALS

Positive-pressure (bladder) pumps will be used to evacuate wells and collect samples. Equipment to operate these dedicated pump systems include a pressure source (e.g., air compressor, compressed air or nitrogen cylinders) a power source (e.g., battery or electric generator), and a controller. In addition, nondedicated sampling apparatus, such as surface discharge tubing and valving, might be required.

If wells do not have dedicated pump systems, a disposable pump system with accessories small enough to enter the wells will be necessary. Equipment that could contact the sample will be made of acceptable materials and cleaned before use. Acceptable materials that may contact groundwater samples are stainless steel, fluorocarbon resin (Teflon®), low-density polyethylene (LDPE), and glass.

Sample bottles and preservatives appropriate for the parameters to be sampled will be necessary as well as organic-free deionized water, coolers, and ice. The following materials will be available, as required, during groundwater sampling activities:

- Personal protective equipment and safety equipment as required by the task-specific Job Safety Analysis (JSA)
- Multiparameter meter or individual meters capable of measuring pH, specific conductivity, dissolved oxygen (DO), temperature, oxidation/reduction potential (ORP), and turbidity
- Calibration standards for field measurements
- Filtration apparatus, if necessary
- Electric water-level indicator with 0.01-foot increments
- Indelible ink markers
- Transport container with ice
- 55-gallon steel drums fitted with bung holes or suitable tank(s) for containing purged groundwater
- Appropriate sample containers and chain-of-custody forms
- Field notebook and groundwater sampling forms

3.0 WATER LEVEL MEASUREMENT PROCEDURE

Water-level measurements will be taken after wells have been installed and developed and water levels have recovered. Static water levels will also be measured each time a well is sampled and before any equipment enters the well. Any substantial change in conditions (e.g., barometric pressure change after a weather change) that may affect water levels during the water level measurement event will be recorded in the field log. If the casing cap is not vented, allow time for pressure equilibration after the cap is removed prior to measurement, and collect several measurements to confirm the water level is stabilized.

The groundwater level will be measured to the nearest 0.0l foot using an electric water-level indicator. Water levels will be measured from the notch or permanent mark located at the top of the well casing and recorded on the groundwater sampling form. If well casings are not notched or marked, measurements will be taken from the north side of the top of the well casing.

Following water level measurement, the total depth of the well from the top of the casing will be determined using the monitoring well installation log (or an updated well depth table) and recorded on the groundwater sampling form. The water level depth will then be subtracted from the total depth of the well to determine the height of the water column present in the well casing. For wells that are part of the sampling program, the total depth of the well will be measured using a weighted tape or electric water-level indicator on an annual basis after sample collection. The total depth measurement will be recorded in an updated well depth table. If well condition indicates a need for well redevelopment to remove accumulated sediment, the total well depth will be measured again after redevelopment.

4.0 FIELD INSTRUMENT CALIBRATION

Field measurements of temperature, specific conductance, DO, pH, ORP, and turbidity will be made during purging and developing each well. Meters will be calibrated according to the guidance supplied in the equipment manual using appropriate calibration standards. Calibration standards for all equipment should be National Institute of Standards and Technology (NIST) traceable. The calibration of the field equipment will be checked at the beginning of each day and after every 10 hours of use or at the manufacturer's suggested interval, whichever is less. The field equipment will only be recalibrated when necessary and in accordance with manufacturer's requirements.

5.0 LOW-FLOW PURGING PRIOR TO SAMPLING

Monitoring wells are purged to evacuate water that has been stagnant in the well and may not be representative of the aquifer. Purging will be accomplished using the low-flow method described in USEPA (2015, 2017) and ADEM (2017) guidance. Other sampling methods, which may be applicable for certain situations at the site, are described in these guidance documents. Using the low-flow method, the pump intake is positioned within the screened interval and the well is purged at a rate that will cause no more than 0.33 feet of drawdown. If this is not practicable (i.e., the flow rate is less than 200 milliliters per minute [ml/min]), greater drawdown will be allowed for a purge rate of 100 to 200 ml/min. For wells completed with screen intervals across the water table, the pump intake will be placed near the top of the water column. If drawdown approaches the screened interval (for wells with screen intervals below the water table) or if drawdown approaches the bottom of the well (for wells with screen intervals across the water table), the pump will be turned off and allowed to recover (the well does not have to fully recover before resuming the purging effort).

During purging, the water level within the well and the water-quality stabilization parameters (i.e., temperature, pH, specific conductivity, turbidity, DO, and ORP) will be monitored and recorded on the groundwater sampling form. Water quality will be assumed stabilized when the water is free of visible sediment and the pH, temperature, specific conductivity, and ORP have stabilized to within ±0.1 standard units, ± 3°C, ±3%, and ±10 millivolts (mV) respectively. Also, the measured turbidity readings should be less than 10 Nephelometric Turbidity Units (NTUs) or should have stabilized to within ±10% for values greater than 10 NTUs. DO stabilization criteria are ±10% for values greater than 0.5 milligrams per liter (mg/L) or 3 consecutive readings below 0.5 mg/L. However, if parameters do not stabilize and all other protocol are followed, well purging will be considered complete after a minimum of three well volumes have been removed, provided the well does not purge dry. Wells that purge dry will be considered properly purged with one well volume. The well volume is defined as the volume of submerged casing and screen. One well volume can be calculated using the following equation:

$$V = \pi (D/2)^2 \times h \times 7.48 \text{ gallons per cubic foot (gal/ft}^3\text{)}$$

where:

V= well volume in gallons

h = height of water column in feet

π = pi or 3.14 (dimensionless)

D = the inside diameter of the well casing (feet)

Water removed from the well during purging will be collected and disposed of according to project requirements and applicable regulations.

6.0 SAMPLE COLLECTION

Field personnel will wait at least 24 hours after wells are developed before sampling. This will allow the aquifer to recover. Groundwater sampling data will be maintained in a hard copy and electronic format and will include specific field sampling data, inspection results, and well maintenance information.

7.0 SAMPLE CONTAINERS AND STORAGE

Groundwater samples will be labeled with indelible ink marker, sealed, and stored in coolers with securely closed lids for storage and transport. The samples will be packed with ice and maintained at a temperature below 6°C, but above freezing. Samples must be received by the analytical laboratory in sufficient time to conduct the requested analyses within the specified holding time.

8.0 SAMPLE ACQUISITION

8.1 Volatile Organic Compounds (VOCs)

Samples for VOCs will be obtained from the well using a dedicated positive pressure (bladder) pump or a disposable pump system and will be collected directly from the pump discharge tube into 40-ml, glass vials provided by the laboratory. Contact with air and sample agitation should be minimized. These samples will not be filtered. Samples for analysis by USEPA SW846 Method 8260 will be preserved with hydrochloric acid (HCl) to a pH less than 2. Immediately after the sample is collected, a Teflon-lined silicon septum cap will be tightened onto the vial. There should be no air bubbles remaining within the vial once the cap has been fastened.

8.2 Semivolatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), and Pesticides

Samples for extractable SVOCs, PCBs, or pesticide analyses will be collected directly from a positive-pressure (bladder) pump discharge port or bailer into appropriate sample bottles with Teflon-lined lids. Samples should not be allowed to overflow the sample bottle. No preservatives

will be added to the samples. The same procedures will be used to collect samples for PCB congeners and for dioxin analyses.

Filtered and unfiltered samples for PCB analysis will be collected as specified in the appropriate field sampling plan and according to program-specific requirements. For monitoring wells sampled, filtration using a 0.1-micron filter is specified.

Filtration is best accomplished by using an in-line filter system in which the sample is directly fed from the discharge port of positive-pressure (bladder) pump through the filter and into the appropriate sample bottle. A less preferred but acceptable method is collecting an adequate sample from a positive-pressure (bladder) pump or bailer into a properly cleaned and prepared glass bottle, then immediately filtering it using a peristaltic pump and collecting it directly into the appropriate sample bottle. In addition, aliquots of unfiltered samples will be collected directly from the pump discharge port into the appropriate sample bottle.

8.3 Metals

Unfiltered and filtered samples for metals analysis will be collected using the sampling method described above. Samples for metals will be filtered in the field, as above. Additionally, these groundwater samples (filtered and unfiltered) will be placed into containers with nitric acid to obtain a pH less than 2. In-line sample filters will be used to fill the preserved containers.

9.0 SAMPLE PRESERVATION

Sample containers will be provided by the laboratories with premeasured preservatives. Additional preservatives may also be provided by the laboratory. Samples requiring field preservation should be preserved immediately upon collection in the field or after filtration.

Attachment A-8
Monitoring Well/Borehole Abandonment Procedure

1.0 INTRODUCTION

This document outlines the general procedures for abandoning (or decommissioning) a permanent or temporary monitoring well or piezometer. Well abandonment will follow the guidelines provided by the Alabama Department of Environmental Management (ADEM) *Alabama Environmental Investigation and Remediation Guidance* (AEIRG) (ADEM 2017).

2.0 MATERIALS

The following materials will be available, as required:

- Personal protective equipment (PPE) and safety equipment as required by the task-specific Job Safety Analysis (JSA)
- Portland® cement
- Bentonite powder
- Field notebook

3.0 DECOMMISSIONING PROCEDURES

3.1 General

Well abandonment procedures include sealing the well to prevent vertical or horizontal migration of contaminants and decontaminating drilling rigs and other down-hole tools prior to and after working on a well. Decommissioning will be conducted by a drilling contractor registered with the state of Alabama. Field personnel under contract to Solutia will oversee the decommissioning of the wells and record the following in the field notebook:

- Well location
- Date
- Time on-site
- Equipment used
- The depth and material used for each layer of sealant
- Measurement of static water level and depth prior to decommissioning
- Materials used and quantity of each material used
- Whether additional materials were added to compensate for settlement

3.2 Standard Decommissioning Procedures

In accordance with ADEM guidance (ADEM 2017), the standard procedure for well abandonment includes complete removal of the well casing and screen from the borehole. The procedure presented below will be used:

- The monitoring well riser and screen will be over-drilled to the original boring depth with an auger or drill bit at least two inches larger than the outer diameter of the well casing. Well materials will be removed from the auger or drill casing during drilling. Well casing, backfill material, and well construction materials should be completely removed from the ground.
- The clean borehole will be backfilled with grout consisting of 5% bentonite and 95% Portland cement. The tremie method will be used to pressure grout the borehole from the bottom up to ground surface.
- A mixing system will be used to prepare the grout and a positive displacement pump will be employed to pump the grout into the borehole.
- Boreholes will be checked at least 24 hours but no more than 48 hours after grouting to ensure the grout has cured properly and settling has not occurred. If settling is observed, grout will be added to fill the hole to within 2 feet of ground surface.
- Well surface completions will be demolished and removed.
- The borehole will be finished with a concrete surface plug for the upper 2 feet of the borehole. A concrete surface pad will be installed only for wells in areas of heavy traffic.

3.3 Additional Decommissioning Procedures for Wells with Surface Casing

For the wells with a surface casing (i.e., double-cased wells), the following modifications will be made:

- The monitoring well casing and screen will be over-drilled as described above; however, the borehole will be grouted to the base of the surface casing instead of to ground surface.
- The surface casing will be over-drilled, removed from the ground, and pressure grouted using the methods described above.
- In the event that a surface casing cannot be removed due to size, alignment, or materials of construction, ADEM will be notified, and the casing will be grouted in place. Per ADEM (2017) guidelines, surface casings with known construction design and without casing integrity issues may be left in the ground and filled with concrete, grout, neat cement, or a bentonite-cement mixture (i.e., 5% bentonite and 95% Portland cement).

3.4 Contingent Decommissioning Procedures

In some cases, it may not be possible to successfully remove the well casing. For such wells, ADEM will be notified with a request for approval to abandon the well by perforating the casing and grouting in place.

3.5 Decontamination of Drilling Equipment

Equipment used for plugging and abandoning wells and piezometers will be decontaminated between well locations and prior to leaving the site. Decontamination will involve steam cleaning, high-pressure washing, or other appropriate method using water from a municipal water supply or from the Solutia facility. Decontamination rinsate will be contained in an isolated, bermed pad and collected in tanks or drums. The rinsate will be characterized either by sampling and laboratory analysis or by process knowledge based on groundwater sampling results for the wells to be decommissioned. The rinsate will be managed and disposed of in accordance with applicable regulations depending on the rinsate characterization and concentrations of potential constituents of concern.

3.6 Waste Management

Excess grout and other well-abandonment-associated waste (e.g., well casings, surface casings, well pad concrete, protective bollards) will be managed and disposed of in accordance with applicable regulations.

4.0 REPORTING

A final report describing the procedures of the well decommissioning program will be prepared for submittal to ADEM and USEPA Region 4. The report will include the following information:

- Site name
- Site address
- Well type
- Reason for abandonment
- Well ID
- Abandonment date
- Abandonment supervisor
- Coordinates of well location
- Well location on site map
- Description of abandonment methods including total depth, sealant used, etc.
- Waste disposal records
- Photographs documenting abandonment

5.0 REFERENCES

ADEM. 2017. *Alabama Environmental Investigation and Remediation Guidance (AEIRG)*. Alabama Department of Environmental Management, Revision 4.0, February.

Attachment A-9
Procedures for Compositing or Homogenizing Soil or Sediment Samples

1.0 INTRODUCTION

The general procedures to be used in composting/homogenizing samples are outlined below.

2.0 MATERIALS

The following materials will be available, as required, when composting or homogenizing samples:

- Personal protective equipment (PPE) and safety equipment as required by the task-specific Job Safety Analysis (JSA)
- Stainless-steel spoon (or the disposable equivalent)
- Stainless-steel bowl (or the disposable equivalent)
- Appropriate sample containers and forms
- Field notebook

3.0 PROCEDURE FOR COMPOSTING OR HOMOGENIZING SAMPLES

Samples might require homogenization across a given depth interval, or several discrete grabs (usually five) might be combined into a composite sample. Samples for volatile organic compound (VOC) analysis will not be homogenized or composited. The procedure for mixing samples is provided below.

1. Mix the materials in a stainless-steel bowl (or the disposable equivalent) using a stainless-steel spoon (or disposable equivalent.) Note: When preparing samples for metals analyses, do not use disposable aluminum (or metal tools or trays other than stainless steel) as they may influence analytical results.
2. Flatten the pile by pressing the top without further mixing.
3. Divide the circular pile into equal quarters by dividing out two diameters at right angles.
4. Mix each quarter thoroughly with a spoon.
5. Mix two quarters (as described above) to form halves. Then mix two halves to form a composite or homogenous sample.

6. Place composite or homogenized sample into specified containers. Remaining material will be disposed of in accordance with project requirements and applicable regulations.

Attachment A-10
Slug Testing Procedure

1.0 INTRODUCTION

The general procedures for aquifer slug testing at the Anniston Polychlorinated Biphenyl (PCB) Site are outlined below and were developed based on the United States Environmental Protection Agency (USEPA) *Compendium of ERT Groundwater Sampling Procedures* (USEPA 1999), the *Ohio EPA Technical Guidance Manual for Ground Water Investigation* (Ohio EPA 2006), and *The Design, Performance, and Analysis of Slug Tests* (Butler 1998). Slug testing activities will be documented in the field notebook. Additionally, key slug testing data and parameters will be recorded on a slug testing log form specific to each well tested. Before slug testing begins, wells will be inspected for signs of tampering or other damage. If tampering is suspected (e.g., casing is damaged, lock or cap is missing), field personnel will record that information in the field notebook and on the slug testing form and will initiate corrective action if necessary, in consultation with the Anniston Remediation Group.

Before slug testing begins, field personnel will place plastic sheeting on the ground surrounding the well. The plastic sheeting will provide a clean working area around the wellhead and prevent soil or other debris from contacting slug testing equipment. Water will be removed from the protective casing or the vaults around the well casing prior to venting and slug testing.

Slug testing will be performed in a manner that creates measurable water rises or water drawdowns within the well. Equipment will not be allowed to free fall into a well.

The following information will be recorded when a well is tested:

- Depth to water before, during and after each slug test, as well as the time of the measurement
- The size(s) (i.e., length and diameter and/or volume) of the slug used for the test
- The elevation of the pressure transducers inside the well.

Additionally, the total depth of the monitoring well will be sounded and recorded before the slug test(s) begins.

2.0 MATERIALS

Polyvinyl chloride (PVC) slugs of known volume will be used to displace the water level within the well. The slugs will be carefully lowered or removed from the well using string strong enough to support the weight of the slug without breaking. In addition, pressure transducers (e.g., an In-Situ LevelTROLL 500) will be used to continuously record the water levels during the slug testing activities. Vented pressure transducer cables should be long enough to place the

transducer 1 foot above the bottom of each well being tested or monitored. Desiccant packs with the proper connection to the wellhead end of the vented cables should be used to protect the transducer from moisture.

The following additional materials will be used during slug testing activities:

- Personal protective equipment (as required by the site-wide health and safety plan [Site-Wide HASP] for the Anniston PCB Site)
- Transducer Bluetooth reader (e.g., In-Situ Wireless TROLL Com) to download water level data
- Electric water-level indicator with 0.01-foot increments
- Stopwatch
- Indelible ink markers
- Field notebook and slug testing forms

3.0 WATER LEVEL MEASUREMENT PROCEDURE

The water level will be measured after wells have been installed and developed and water levels have recovered. Static water levels (SWLs) will also be measured each time a well is tested, and before any equipment enters the well. Any substantial change in conditions (e.g., barometric pressure change after a weather change) that may affect water levels during the slug test will be recorded in the field log. If the casing cap is not vented, allow time for the pressure to equilibrate after the cap is removed prior to measurement, and collect several measurements to confirm the water level is stable.

The groundwater level will be measured to the nearest 0.01 foot using an electric water-level indicator. Water levels will be measured from the notch or permanent mark located at the top of the well casing and recorded on the slug testing form. If well casings are not notched or marked, measurements will be taken from the north side of the top of the well casing.

Once the water level has been measured, the total depth of the well from the top of the casing will be measured using an electric water-level indicator recorded on the slug testing form. The water level depth will then be subtracted from the total depth of the well to determine the height of the water column present in the well casing.

4.0 PREPARATION PRIOR TO SLUG TESTING

A pressure transducer will be placed in each well before the slug test begins. Pressure transducers shall be placed 1 foot above the bottom of the well. The pressure transducer cable shall be properly secured at the wellhead (e.g., using a spring clamp or carabiner). The deployed pressure transducer shall be configured to record in units of “feet of head” at a rate of 1 reading per second with a linear sampling interval. The transducer will be set to start recording shortly

before the initial slug test begins. The desiccant pack must be properly attached to the wellhead end of the pressure transducer cable to prevent moisture from entering the cable after initializing the transducer. Avoid connecting/disconnecting the desiccant pack or Bluetooth reader to the vented cable during the tests to avoid affecting the data being collected by the transducer. Monitoring well caps should be closed when they are not being tested or monitored.

5.0 SLUG TESTING

The following steps shall be conducted to perform a slug test:

1. Determine the initial size of the slug to be used. When deployed, the slug should be fully submerged (the top of the slug should be within 1 foot of the SWL) but remain above the transducer (the bottom of the slug should remain 1 foot above the transducer to avoid any chance of interference between the slug and transducer). The longest possible length of slug to be used is therefore 2 feet less than the distance between the SWL and the top of the transducer. The expected water level rise in the well caused by the slug can be calculated as follows:

$$Expected\ water\ level\ rise = \frac{diameter\ of\ slug\ (in\ inches)^2 * length\ of\ slug\ (ft)}{diameter\ of\ well\ (in\ inches)^2}$$

   The expected water level rise must not be greater than the depth to the SWL in the well to avoid overflowing the well. Select an appropriate length and diameter of the slug based on the above criteria and record both on the slug test field form. The initial slug selected should be smaller than the largest possible slug to minimize the chance of a very long initial slug test if the hydraulic conductivity of the aquifer is very low.

2. Measure the required length of string so that when deployed, the slug is fully submerged and the top of the slug is within 1 foot of the SWL.
3. Slowly lower the PVC slug into the well until the bottom of the slug is approximately 1 foot above the SWL. Record the start and end times for the slug test on the field form and in the field notebook.
4. Quickly lower slug into the well in a fast but controlled manner to minimize splashing and rapid oscillations of the water table and so that top of the slug will be placed at the measured depth. This phase of the test is referred to as the slug-in portion.
5. Monitor the water level in the well with the electronic water-level meter following the slug deployment, recording the initial reading every 2 minutes during the first 10 minutes of the test, and at least every 10 minutes after that. Take care to measure the water level without submerging the water-level meter to avoid affecting the transducer data. Calculate the rate of water level drop to estimate total time it will take to return to the static level.

6. Once the water level has returned to within 5% of the initial head displacement (Butler 1998), the slug-out portion of the test may start. To begin the slug-out phase of the test, quickly remove the slug in a controlled manner to minimize splashing and rapid oscillations of the water table while also avoiding tangling the slug string with the pressure transducer cable.
7. Once slug is removed, monitor the water level in the well with the electronic water-level meter similarly as was done during the slug-in phase of the test. The time for the slug-out phase of the test should be comparable to the time required for the previous slug-in phase.
8. Evaluate the water level rise and fall after the first set of slug-in and slug-out tests to determine slug size for the remaining test(s), ensuring that subsequent tests have measurable initial head displacements and are not excessively long in duration. Preferably, three sets of slug-in and slug-out tests (six total tests) should be performed with at least two different slug volumes; however, if six tests are not feasible due to a very low hydraulic conductivity and long recovery times, a minimum of three tests with usable data must be conducted. The next slug test may commence when the water level in the well has returned to 5% or less of the initial head displacement; if the next test will use a different volume slug, the next test may begin when the water level in the well has returned to within 5% of the expected initial head displacement of the next slug to be used (Butler 1998).
9. At the end of the slug testing, download the groundwater level data from the pressure transducer. Decontaminate the PVC slugs, pressure transducer, and vented cable with approved site decontamination procedures. The electronic data should be quickly viewed in the field to ensure proper function of the transducer and general usability of the data.

Attachment A-11
Specific-Capacity and Pumping Test Procedures

1.0 INTRODUCTION

The general procedures for aquifer specific-capacity (also known as a "step test") and pumping test (also known as a "constant rate test") at the Anniston Polychlorinated Biphenyl (PCB) Site are outlined below and were developed based on the United States Environmental Protection Agency (USEPA) *Compendium of ERT Groundwater Sampling Procedures* (USEPA 1999) and the *Ohio EPA Technical Guidance Manual for Ground Water Investigation* (Ohio EPA 2006). A specific-capacity test is conducted prior to a pumping test to estimate the largest pumping rate a pumping well could sustain without causing the well to go dry. The specific-capacity test and pumping test will be documented in the field notebook. Additionally, key pumping data and parameters will be recorded on a pumping test log form specific to the well being tested. Before conducting specific-capacity or pumping tests, wells will be inspected for signs of tampering or other damage. If tampering is suspected (e.g., casing is damaged, lock or cap is missing), field personnel will record that information in the field notebook and on the pumping test form and will initiate corrective action, if necessary, in consultation with the Anniston Remediation Group.

Before specific-capacity or pumping tests begin, field personnel will place plastic sheeting on the ground surrounding the well. The plastic sheeting will provide a clean working area around the wellhead and prevent soil or other debris from contacting pumping test equipment. Water will be removed from the protective casing or the vaults around the well casing prior to venting and pumping test activities. The specific-capacity and pumping tests will be performed in a manner that should produce measurable water drawdowns within both the pumping well and the observation well(s).

The following information will be recorded when a well is tested:

- Depth to water before, during, and after specific-capacity and pumping test activities, as well as the time of the measurement in both the pumping well and the observation well(s)
- The pumping rate
- The elevation of the pressure transducers inside the well

Additionally, the total depth of the pumping and observation wells will be sounded before testing activities.

2.0 MATERIALS

A pump with variable speed controller will be used to remove water from the pumping well to create drawdown that can be measured accurately in the pumping well and the observation wells. Ensure with the pump vendor and/or manufacturer that the pump(s) selected for specific-capacity and pumping test activities are designed to run continuously within a well of specified diameter for extended periods of time. Pressure transducers (e.g., an In-Situ LevelTROLL 500) will be used to continuously record the water levels during the specific-capacity and pumping test activities at the pump well and the observation well(s). Vented pressure transducer cables should be of sufficient length to place the transducer 1 foot above the bottom of each well being tested or monitored. Desiccant packs with the proper connection to the wellhead end of the vented cables should be used to protect the transducer from moisture.

Equipment used to conduct the pumping tests should be used according to the manufacturer's operating manual. An appropriate maintenance check will be performed on each piece of equipment prior to use. If damaged or failed parts are identified during the maintenance check and it is determined that the damage can impact the equipment performance, the equipment will be removed from service until the part or parts are replaced or repaired.

The following additional materials will be used, as necessary, during specific-capacity tests and pumping tests:

- Personal protective equipment (as required by the site-wide health and safety plan [Site-Wide HASP] for the Anniston PCB Site)
- A power supply, such as a generator or power outlet, that is protected by continuous ground-fault circuit interrupters (GFCI)
- GFCI electrical extension cord
- Large water container/tank(s) (approximately 2,000 gallons of storage)
- Transducer Bluetooth reader (e.g., In-Situ Wireless TROLL Com) to download water level data
- An inline flow meter device (for measuring high flow rates of > 1 gallon per minute [gpm])
- A graduated bucket (for measuring intermediate flow rates of > 0.5 gpm and < 1 gpm)
- A measuring cup (for measuring low flow rates of < 0.5 gpm)
- Sufficient length of appropriate-diameter tubing for the pump(s) being used
- Electric water-level indicator with 0.01-foot increments
- Watch or stopwatch
- Indelible ink markers
- Field notebook and slug testing forms

3.0 WATER LEVEL MEASUREMENT PROCEDURE

The water level will be measured after wells have been installed and developed and water levels have stabilized. Static water levels will also be measured each time a well is tested and before any equipment enters the well. Any substantial change in conditions (e.g., barometric pressure change after a weather change) that may affect water levels during the tests will be recorded in the field log. If the casing cap of the pump well or the observation well(s) is not vented, allow time for the pressure to equilibrate after the cap is removed prior to measurement, and collect several measurements to confirm the water level is stable.

The groundwater level will be measured to the nearest 0.01 foot using an electric water-level indicator. Water levels will be measured from the notch or permanent mark located at the top of the well casing and recorded on the pumping test form. If well casings are not notched or marked, measurements will be taken from the north side of the top of the well casing.

Once the water level has been measured, the total depth of the well will be measured using an electric water-level indicator before specific-capacity and pumping test activities. The water level depth will then be subtracted from the total depth of the well to determine the height of the water column present in the well casing.

4.0 PREPARATION PRIOR TO SPECIFIC-CAPACITY AND PUMPING TEST

Although pumping will only be conducted in one well at a time, place a pressure transducer in each observation well near the well being tested before testing begins. Pressure transducers shall be placed 1 foot above the bottom of the well. The pressure transducers shall be properly secured at the wellhead. Configure the deployed pressure transducers to record in units of "feet of head" at a 5-second linear sampling interval and start recording shortly before the specific-capacity test or pumping test. The desiccants packs must be properly attached to the wellhead end of the pressure transducer cables to prevent moisture from entering the cables after configuring the transducers.

Set up the pump near the pumping well by ensuring the following:

- The pump is connected to a continuous power supply.
- The pump intake within the well is at least 1 foot above the pressure transducer if possible and well below the water table inside the well.
- The pressure transducer is not disturbed while lowering the pump or intake tubing.
- The appropriate pumping rate measurement method is in place at the surface of the well (i.e., in-line flow meter for high flow rates, graduated bucket for intermediate flow rates, or a measuring cup for low flow rates).
- An appropriately sized water container or tank is located near the well to collect the discharged water. Using an unsealed container to collect purge water is necessary

during specific-capacity and pumping tests to avoid back pressures, which can limit the performance and consistency of the pump and its flow rate, respectively.

5.0 SPECIFIC-CAPACITY TESTING

The specific-capacity test (or step test) is used to estimate the largest sustainable pumping rate that be achieved in the pumping well and is therefore conducted prior to the pumping test. During the specific-capacity test, the pumping rate is progressively increased at specified intervals. The following steps describe the activities conducted during the specific-capacity test.

1. Begin the specific-capacity test by setting the first pumping rate at 0.1 gpm (375 milliliters per minute [ml/min]). If drawdown records for groundwater sampling for the well are available, they can be used to estimate an initial pumping rate and flow rate increments. Record the time, flow rate, and depth to water at the following intervals:
    - Every 30 seconds for the first 3 minutes after turning on the pump or adjusting the flow rate
    - Every 1 minute for 3 minutes
    - Every 2 minutes for 4 minutes
    - Every 5 minutes until the next step
2. Maintain the well pumping rate at a constant flow for at least 30 minutes before increasing the flow rate or ending the specific-capacity test (Kruseman 2000).
3. After pumping the well for at least 30 minutes and recording the time, depth to water, and flow rates, increase the flow rate and pump the wells for another 30 minutes at a constant flow rate while recording the depth to water, time, and flow rates. Continue increasing the flow rate every 30 minutes until the water level drops to within 1 foot of the pump intake (i.e., the well approaches going dry) or until the maximum flow rate of the pump is reached. The following are suggested flow rate steps for the specific-capacity test (these increments are only an example and may be adjusted in the field based on observed conditions and pump capability):
    - 0.1 gpm
    - 0.25 gpm
    - 0.5 gpm
    - 0.75 gpm
    - 1.0 gpm
    - 1.5 gpm
    - 2.0 gpm
    - 2.5 gpm

- 3.0 gpm

4. Allow groundwater levels in the pumping well and observation wells to fully recover to static water level conditions after the specific-capacity test (or at least 24 hours after the specific-capacity test) before performing the constant-discharge pumping test.
5. At the end of the specific-capacity test, download the groundwater level data from all the pressure transducers for analysis and leave the pressure transducers on and in place. Ensure the desiccant packs are properly attached to the wellhead end of the pressure transducer cables to prevent moisture from entering the cables.

6.0 PUMPING TEST

The pumping test is conducted using a constant pumping rate, as follows:

1. Set up the equipment to conduct the pumping test at the same well where the specific capacity test was conducted.
2. Select a constant pumping rate to use during the pumping test based on the results from the specific-capacity test.
3. Conduct the pumping test for at least 8 hours. While conducting the pumping test, record the depth to water using the electronic water level meter and flow rate at the pumping well at the following frequencies:
   - Every 15 seconds for the first 2 minutes after turning on the pump
   - Every 30 seconds for 2 minutes
   - Every 1 minute for 2 minutes
   - Every 2 minutes for 12 minutes
   - Every 5 minutes for 10 minutes
   - Every 10 minutes for 30 minutes
   - Every 30 minutes until the end of the pumping test
4. Record the depths to water at the observation wells (existing monitoring wells other than the pump well) every 30 minutes and record the time of the measurements.
5. Record the time the pumping test is stopped on the field form and field notebook.
6. Record the rising depth to water in the pumping well at the following frequencies for only 20 minutes:
   - Every 15 seconds for the first 2 minutes after turning on the pump
   - Every 30 seconds for 2 minutes

- Every 1 minute for 2 minutes
- Every 2 minutes for 12 minutes
- Every 5 minutes for 10 minutes

7. If the initial pumping well discharge rate causes the pumping well to go dry, then the pumping test will cease. Data collected to the time that the pumping well went dry will be analyzed to determine if it is sufficient to estimate the transmissivity and storage coefficient. If the data are not sufficient, then the aquifer will be allowed to recover to the initial depth to water measurements, and the test will be repeated at a lower pumping rate.
8. Wait to download the transducer data for at least 8 hours after the pump is turned off to collect sufficient water level recovery data.

Attachment A-12
Incremental Sampling Methodology Procedures

1.0 INTRODUCTION

The general procedures for using the Incremental Sampling Methodology (ISM) at the Anniston Polychlorinated Biphenyl (PCB) Site are outlined below and were developed based on the Interstate Technology and Regulatory Council's (ITRC's) *ISM-2 Technical/Regulatory Guidance: Incremental Sampling Methodology (ISM) Update* (ITRC 2020).

ISM has been developed to decrease the effect of sample variability and provides a reasonably unbiased estimate of mean contaminant concentrations in a volume of soil targeted for sampling. ISM provides representative samples of specific soil volumes defined as decision units (DUs). An incremental sample is created by collecting many (usually 30 to 100) equal-volume increments in an unbiased manner from throughout the entire DU. The combined increments (frequently totaling a kilogram or more) are typically processed at the laboratory and subsampled to provide an analytical aliquot of only a few grams that is used for analysis. The final analytical aliquot is the target sample. The number of increments to obtain the desired ISM sample mass must be calculated with this information included in the approved field sampling plan (FSP) (ITRC 2020).

2.0 MATERIALS

Sampling equipment should be used according to the manufacturer's operating manual. An appropriate maintenance check will be performed on each piece of equipment prior to use. If damaged or failed parts are identified during the maintenance check and it is determined that the damage can impact the equipment performance, the equipment will be removed from service until the part or parts are replaced or repaired. Typical equipment required for ISM soil sampling includes the following:

- Stainless steel multi-increment sampling tool or equivalent (e.g., Enterprise Ventures Corporation [EVC] SOIL STICK™ or sampling tool described in the United States Environmental Protection Agency [USEPA] Method 8330B)
- 0.750-inch-diameter x 2.50-inch-long coring bore cutter and plunger (diameters range from 0.75 to 1.625 inches)
- Shovel, pickax or equivalent hand tool
- Wooden stakes and/or steel flags
- Rope or twine
- Measuring tape or measuring wheel
- Nitrile gloves
- Sharpie

- Appropriate sample containers sufficient to contain the sample volume for shipment to the laboratory
- Chain-of-custody forms
- Field notebook
- Direct-push drill rig with drill rods and soil core liners (if sampling subsurface soil)

3.0 SOIL SAMPLING PROCEDURE

The following procedure is for sampling surface soil using a two-person field team:

1. Review the FSP and health and safety plan (HASP) and don the appropriate personal protective equipment.
2. Stake the four corners of the DU; use a GPS to locate the corners, if necessary, per the FSP.
3. Physically measure the grid distances for sampling cells (e.g., 2 rows/15 columns measuring 10 feet long and 10 feet wide for cells within a 20-foot x 150-foot DU).
4. Lay out twine or rope to create the grid pattern or mark the rows and columns.
5. From the first grid cell, randomly select the increment location for the initial increment sample.
6. Remove plant material or surface debris (trash, twigs, rocks, etc.) from the location being sampled with hand tools.
7. Collect the increment using the sampling tool and extract the soil into the appropriate storage container.
8. Collect increment samples from adjacent cells sequentially using the same relative location as the first grid cell until all grid cells have been sampled.
9. Label sample for shipment and store samples appropriately for the parameter to be analyzed (e.g., place samples on ice in a cooler if necessary).
10. If collecting replicate samples, repeat steps 5 through 9 for each increment replicate sample (triplicate ISM sampling is recommended per the ITRC 2020 guidance document [ITRC 2020]).
11. Record sampling activities in the field notebook.
12. Once all increments have been collected for the DU, decontaminate equipment and change gloves before moving onto the next DU.

The following procedure is for sampling subsurface soil using a two-person sampling team and a drilling crew:

1. Repeat steps 1 through 6 above.

2. Advance the direct-push rig's drill rod with soil core liner to the depth specified in the FSP.
3. To avoid excessive ISM sample volumes, collect a wedge subsample of the soil core from the depth interval specified in the FSP (e.g., between 4.75 feet and 5.0 feet below ground surface).
4. Repeat steps 8 through 11 above.
5. Once all increments have been collected for the DU, decontaminate equipment and change gloves before moving onto the next DU. The drill rig will be cleaned and decontaminated according to the guidelines described in Attachment A-2 to the site-wide quality assurance project plan for the Anniston PCB Site and will conform with the procedures detailed in Appendix E.4 of the *Alabama Environmental Investigation and Remediation Guidance* (ADEM 2017).

ADEM. 2017. *Alabama Environmental Investigation and Remediation Guidance (AEIRG)*. Revision 4.0. February.

ITRC. 2020. *Technical/Regulatory Guidance: Incremental Sampling Methodology (ISM) Update*. The Interstate Technology and Regulatory Council. October.

Attachment A-13
Surface Water Sampling, Filtering, and Measuring Procedures

1.0 INTRODUCTION

The procedures to be used while collecting water column samples are outlined below. The general procedures for measuring water quality parameters (e.g., turbidity, specific conductivity, pH, and temperature) in situ with a combination water-quality meter are also described.

2.0 MATERIALS

The following materials will be available, as required, during water column sampling:

- Personal protective equipment (PPE) and safety equipment as required the task specific Job Safety Analysis (JSA)
- Cleaning equipment
- Boat and motor
- Surveyor's rod
- Duct tape
- Graduated beaker
- Electronic depth sounder
- Rope
- Flagging
- Large glass mixing container
- Teflon® stirring rod
- Combination water-quality meter (Horiba U-10 or equivalent) or individual meters for each parameter of interest
- Standard solutions for calibration
- Analyte-free water
- Extra batteries for the meter
- Appropriate transport containers and packing, labeling, and shipping materials (coolers) with ice
- Appropriate filters and filtering apparatus (if necessary)
- Forceps (stainless steel)
- Compressed nitrogen gas tank
- Appropriate sample containers and forms
- Field notebook

- Appropriate water sampler and supporting equipment from among the following:
  - Automated ISCO composite water sampler
  - Wildco Kemmerer stainless steel bottle sampler or equivalent
  - Peristaltic pump with short pieces of medical-grade silicone tubing and Teflon tubing
  - SP3^{TM} passive sampling device and support or equivalent

3.0 WATER COLUMN SAMPLING PROCEDURES USING AN AUTOMATED COMPOSITE SAMPLER

Water column samples will be collected using an ISCO sampler or equivalent. The ISCO will be set to collect water when the stream gauge reaches the desired water level or stage. The sampler will be set to automatically collect surface water during each event. If the sampler is triggered to collect samples and the water level drops before sufficient sample volume is collected, the sample containers will be emptied, decontaminated, and reset to collect sufficient sample during the next triggering event.

The automated sampler may be used for volatile organic compounds (VOCs) provided the sampler is used to directly fill the appropriate container. Alternatively, VOC samples may be collected manually using the procedures described in Section 4, as soon as practical after the automated sampler is triggered. Samples for VOCs will not be collected after manually mixing or homogenizing in a larger container.

Sampling equipment will be dedicated for each sampling event or will be decontaminated between each use. The ISCO will be calibrated and set to collect composite samples directly into the appropriate containers or into a single five-gallon (carboy) sample during a high-water event. If a carboy is used as an intermediate homogenization step, a Teflon stirring rod and stirring plate will be used to composite the sample inside the carboy and to keep the sediment suspended in the container. Sample aliquots will be transferred from the carboy to an appropriate container or to a filter and container using a peristaltic pump.

4.0 WATER COLUMN SAMPLING USING MANUAL PROCEDURES

4.1.1 Kemmerer Stainless-Steel Bottle Sampler

Water column samples may be collected from a boat using a stainless-steel Kemmerer water sampler or equivalent. If depth-integrated samples are required, a composite will be prepared by collecting along a transect at various depths. The number of horizontal locations and depths will depend on the width and depth of the river at the point of interest and should be specified in the sampling plan prior to field work. Composite samples should not be collected for VOC analysis. Where possible, single grab samples should be taken for VOCs by directly submerging the sampling container or by collecting single grab samples using the procedures described in this section or Section 4.1.2.

1. Identify sampling location in field notebook along with other appropriate information.
2. Don PPE and safety equipment as specified in the task-specific JSA
3. Decontaminate the sampling equipment before each use.
4. Position the boat at the sampling station in the river.
5. Measure the total depth of the water column with an electronic depth sounder or weighted line.
6. Lower the water sampler to the deepest depth interval and at least 1 foot above the sediment bed and release trigger. Take care not to disturb the bottom sediments during sampling.
7. Raise the water sampler from the water column with minimal disturbance.
8. Transfer the individual grab samples to a larger container to comprise the composite sample for the given location.
9. Additional casts to the shallower depths will be required to obtain the depth-integrated sample.
10. Move to the next location along the transect until the composite sample is completed.
11. Mix the entire sample volume with the stirring rod and transfer the appropriate volume into the laboratory sample jars. Sample containers may be pre-preserved by the laboratory or preservative may be added in the field, if required.
12. Prepare field duplicates by aliquoting the composite into two sets of containers.
13. Label sample containers and secure the sample jar caps tightly.
14. Repeat steps 4–13 at the remaining stations.
15. After sampling containers have been filled, collect and record representative meter readings for pH, temperature, conductivity, and turbidity for the transect.
16. Place filled sample containers on ice in a cooler.
17. Follow procedures for preserving samples and packing, handling, and shipping with associated chain-of-custody (COC) procedures of samples.
18. Record required information on the appropriate forms and field notebook.

4.1.2 Peristaltic Pump Sampler

At locations where a peristaltic pump will be used, the procedures described in this section will be followed. If composite samples are required, samples from appropriate intervals and depths along a transect will be collected as described in Section 4.1.1 above. Composite samples should not be collected for VOCs, and a peristaltic pump is not preferred for VOCs. If samples are

required for VOCs and use of a peristaltic pump is necessary, samples will be collected by filling the VOC container directly from the peristaltic pump as described in this section.

1. Identify sampling location in field notebook along with other appropriate information.
2. Don PPE and safety equipment as specified in the task-specific JSA.
3. Clean the sampling equipment before each use.
4. Install clean, medical-grade silicone tubing in the pump head, as per the manufacturer's instructions. Allow sufficient tubing on the discharge side to facilitate convenient dispensation of liquid into the sample container and only enough on the suction end for attachment to the intake line. This practice will minimize sample contact with the silicone pump tubing.
5. Select the length of Teflon® tubing necessary to reach the required sample depth and attach to intake side of pump tubing. Taping the Teflon tubing to a surveyor's rod will facilitate reaching the required depth.
6. Allow several liters of sample to pass through the system (if possible) before actual sample collection. Collect this purge volume and return the water to the creek after the sample aliquot has been withdrawn.
7. Use a graduated cylinder or beaker as a measuring device and collect equal volumes of water at the required transect locations and depths.
8. Combine the individual grab samples into one composite sample for the given location (except for VOC sampling, where samples will be collected directly in laboratory sample jars and not composited).
9. Mix the entire sample volume with the stir plate and rod and transfer the appropriate volume into the laboratory sample jars. Containers may be pre-preserved or preservative added in the field if required. Secure the sample jar caps tightly.
10. After sample is collected, follow steps 15–18 described in Section 4.1.1.
11. Discard tubing between sampling locations and not reused.
12. Label sample containers and place filled sample containers on ice in a cooler. Follow procedures for preserving samples, as well as packing, handling, and shipping with associated COC procedures of samples.

5.0 WATER COLUMN SAMPLING USING PASSIVE SAMPLING METHODS

Please refer to SiREM's *SP3™ Sampler Deployment and Retrieval* standard operating procedure that is appended to this document. The document contains the procedures to complete deployment and retrieval of SP3™ passive sampling devices.

6.0 MEASURING WATER QUALITY PARAMETERS IN SITU

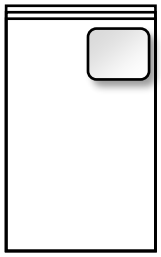
Measurements will be taken using a combination water meter or individual meters for the parameters of interest (e.g., turbidity, pH, temperature) as specified in the field sampling plan. The general standard procedures of calibration, operation, and maintenance are described below.

Calibration: The calibration will be checked daily following the manufacturer's instructions. If a reading falls outside of 95% of the expected value, the meter will be recalibrated. Calibration information will be recorded in the field notebook or on a specific field form. Where possible, the meter will be calibrated with at least two concentrations that bracket the range of interest.

Operation: The meter will be operated following the manufacturer's instructions. Sequential readings will be taken to determine that the instrument is stabilized. The final reading will be recorded in the field notebook or on a specific form.

Maintenance: The meter will be maintained according to the manufacturer's instructions. Maintenance information will be recorded with calibration information. Replacement or alternate meter(s) and probes will be available on-site or ready for overnight shipment, as necessary.

SP3™ Sampler Deployment and Retrieval



Surface Water Sampling, Filtering, and Measuring Procedures

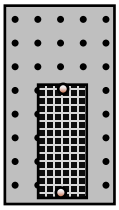
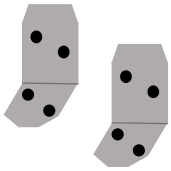
SP3™ Sampler Deployment and Retrieval

Deployment

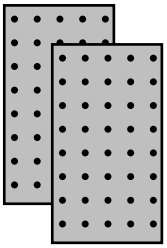


1. The SP3™ samplers are shipped in a cooler at 4°C or lower. Each SP3™ sampler is stored in an opaque Ziploc bag and the opaque bag is stored inside a large clear plastic Ziploc bag.

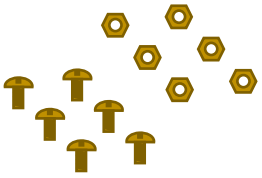
Clear Ziploc Bag



Opaque Ziploc Bag

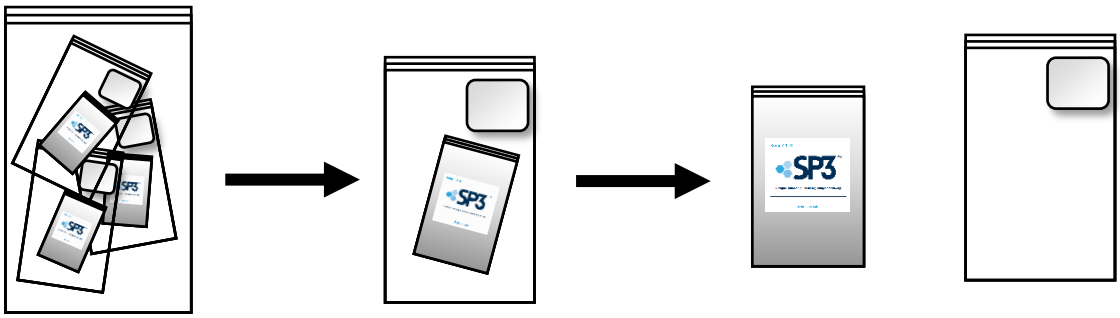


SP3™ Sampler



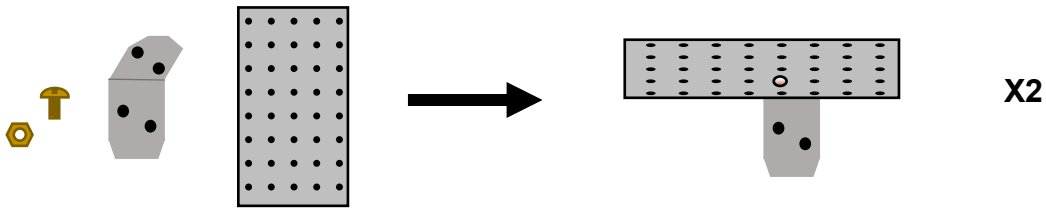
2. Also included in the cooler are bags of pre-cleaned wing brackets, landing wings and screws and nuts used to attach the landing wings to the SP3™.

Wing Brackets

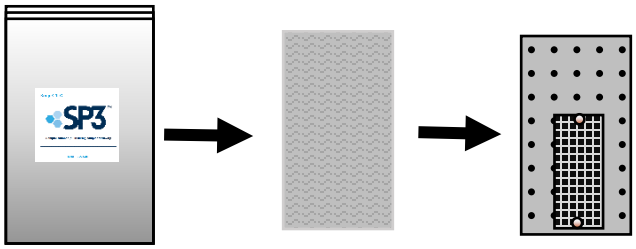


Landing Wings

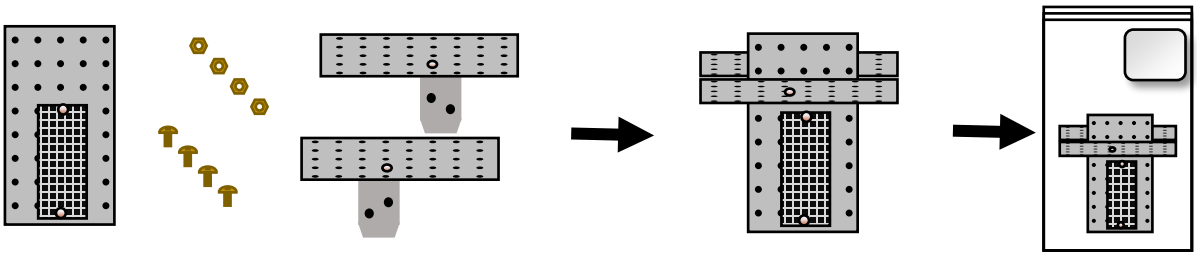
Screws and Nuts



3. Keep the SP3™ samplers cool (4°C or lower) and in the dark prior to use.
4. No more than 30 minutes prior to deployment, remove a single bagged SP3™ sampler from the large bag of samplers or cooler. Then remove the labeled opaque Ziploc sampler bag from the clear plastic Ziploc bag (keep Ziploc bag for next step).

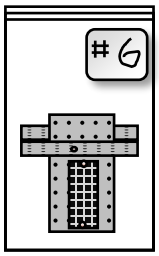


SP3

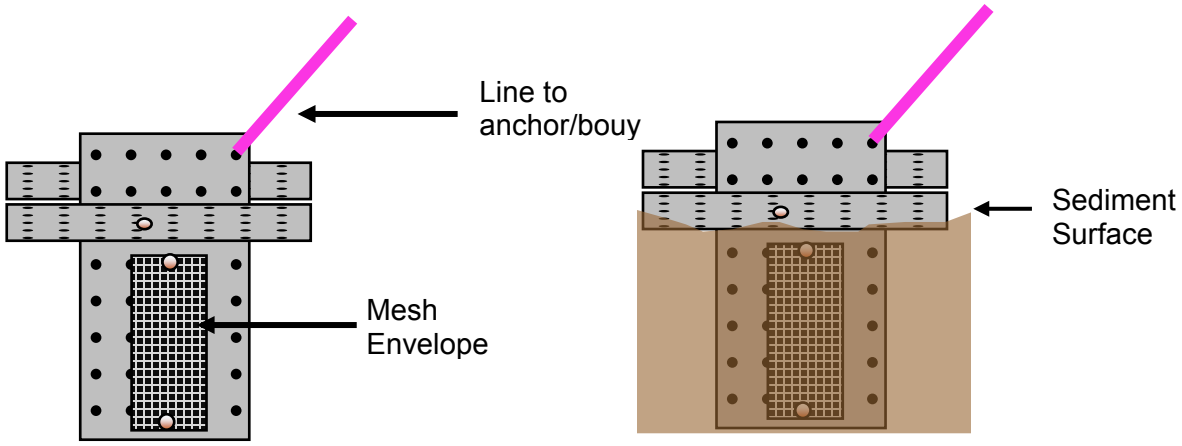


SiREM
130 Stone Rd. W
Guelph, ON N1G 3Z2
(519) 822-2265

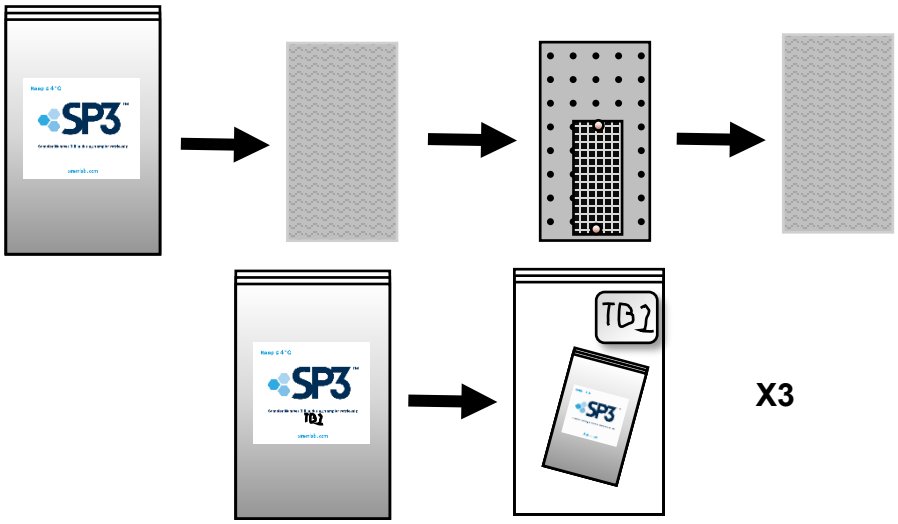
5. Prepare the landing wing apparatus by screwing the wing bracket to the landing wings:



6. Remove the SP3™ sampler from the opaque Ziploc sample bag (keep bag for re-use upon retrieval). Unwrap the aluminum foil around the sample and attach the prepared wing assemblies to the top of the plate (the end of the plate that will remain above the sediment surface when deployed [see below]) using the two screws per wing apparatus. Place the entire SP3™ sampler in the original clear Ziploc bag, and seal bag.



7. It is recommended to mark the sample station at which the sampler will be deployed on the outside label (using a permanent marker or grease pen) so that it can be easily read during deployment.

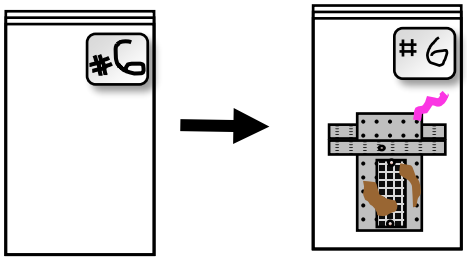


8. Keep the bag out of direct sunlight and heat, to the extent practicable, during the above preparation steps.

SiREM
130 Stone Rd. W
Guelph, ON N1G 3Z2
(519) 822-2265

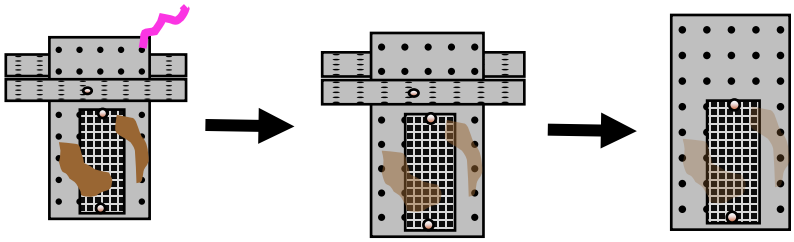
9. Provide the bag for deployment to (i.e., push pole technician, SCUBA diver, wader or direct from small boat). Note, multiple bags can be prepared for deployment if multiple samplers will be deployed in a single mobilization. It is acceptable if water enters the bag. Minimize the time the sampler is underwater in the bag, to the extent practicable, up to a maximum time of approximately 30 minutes.
10. At the deployment location, remove the sampler from the plastic bag, attach the sampler to your anchor or bouy line, etc. Insert the sampler plate into the sediment to the desired depth and retain plastic bag, if possible, for re-use after retrieval.

11. If needed, plant a marker flag. Record the GPS co-ordinates of the deployed sampler and date of deployment.
12. Deploy all but three samplers (as needed). The remaining 3 samplers are for Field Blank (FB) use. For each FB sampler, remove the sampler from its labeled opaque Ziploc sampler bag and unwrap it from the aluminum foil. Expose the sampler to air/light/ambient conditions at sampling site for 5-10 minutes (or however long it took to prepare a sampler for deployment). Re-wrap the sampler in aluminum foil and place back in the labeled opaque Ziploc sampler bag, mark label with a unique sample code (e.g., “FB1”), and place in a clear ziploc bag.



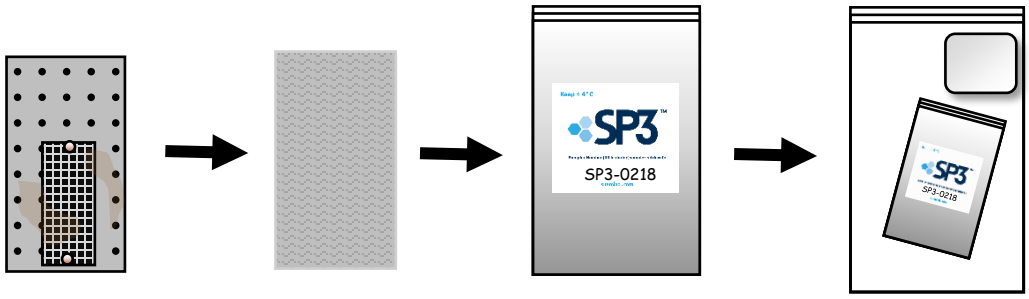
130 Stone Rd. W
Guelph, ON N1G 3Z2
(519) 822-2265

13. For FB samplers, maintain at 4°C or less until they can be shipped to the analytical lab (ideally within 1 to 4 days of deployment).
14. Shipping of FB samplers:
    a. Include ice (double-ziploc bagged) or bagged blue ice packs.
    b. Samplers.
    c. Extra packaging (bubble wrap) as needed.
    d. Chain of custody
        i. Note EPA 1668A for PCB congeners, and/or modified EPA 8270 for PAHs (specify parent PAHs, alkylated PAHs, or both)
        ii. Test America contact is Ryan Henry
    e. Address to ship:
        Test America
        5815 Middlebrook Pike
        Knoxville, TN 37921
        Attn: Sample Receiving, Ryan Henry
        Phone: 865-291-3000
    f. Ship overnight for next morning delivery.



SiREM
130 Stone Rd. W
Guelph, ON N1G 3Z2
(519) 822-2265

Retrieval



15. Use the original clear Ziploc bag for sample location, retrieve sampler from sediment, place in bag (seal if possible), and return bag to cooler within approximately 20 minutes.

16. Detach any remaining rope from the anchor, wipe off any excess sediment, and remove the wing assembly. Some sediment remaining on the sampler is acceptable.

17. Wrap the sampler in aluminum foil, place the wrapped SP3™ sampler in labeled opaque Ziploc sampler bag, mark label with the unique sample ID (e.g., “SP3-0218”), and place in a Ziploc bag.

18. Place in a cooler with ice/cold packs and maintain cold until shipping; samples can be held for several days as needed as long as they are kept cool (4°C or lower) and dark.
19. Ship the cooler as per the instructions in number 14 described above.

SP3™ Data Analysis

Surface Water Sampling, Filtering, and Measuring Procedures
February 2022

ATTACHMENT A:

DATA ANALYSIS METHODS

Attachment A:

Data Analysis Methods
Concentrations of Freely Dissolved Analytes
Measured via SP3™ Passive Samplers

The concentration of analyte PCBs (Table A1-a) and pesticides (Table A1-b) in PE obtained from the information provided in the analytical report (Attachment B) are used in a multi-step data process to calculate C_{free} analytes as described below.

Step 1:

The concentrations of the PRCs in PE [PE_t] were used to calculate the elimination rate (k_e) values for the PRCs in each deployed sampler using the following equation (Lohmann, 2012):

$$PRC\ k_e = \ln\left(\frac{[PE_{t=0}]}{[PE_{t=final}]}\right) \div t_{final}$$

where:

$PE_{t=0}$	= the average concentration of the PRC present in the PE at the beginning of the deployment (obtained from an average measurement of the PRC control blanks)
$PE_{t=final}$	= the concentration of the PRC in the PE after the deployment (obtained from each deployed PE sampler)
t_{final}	= the deployment time (in days)
k_e	= the elimination rate (in days^{-1})

PRC k_e values for the PRCs in each sampler are shown in Table A2. The values are also expressed as a percentage of steady state (concentration at equilibrium). Several PRC k_e values were not calculated and were treated as outliers because $PE_{t=final}$ values were equal to or greater than $PE_{t=0}$ values.

Step 2:

The second step was to estimate k_e values for the non-PRC primary analytes (non-PRC PCB) in each of the deployed samplers. This was accomplished by developing a linear regression model using PRC k_e values (dependent variable, from Table A2) and PE-water partition coefficients (K_{PE}) for each PRC PCB (independent variable, Smedes et al., 2009). Note that regression models were specific to each sampler (i.e. not global to the whole deployment) as local geologic and hydrodynamic conditions can vary greatly within a site.

Values were $\log_{10}$-transformed per Tomaszewski and Luthy (2008). By entering the analyte-specific K_{PE} into the linear regression model developed for each sampler, k_e values for each of the primary analytes for each sampler were calculated.

Step 3:

Concentrations of some non-PRC PCBs (Table A1-a and A1-b) in PE were corrected for trace levels of non-PRC PCBs present in the PRC control blanks (due to trace levels present in the PRC spiking solutions). Using the sample specific k_e values, the expected amount of these trace primary analyte PCBs present in the sample at the end of deployment (*Trace PCB* $_{t = final}$) was calculated via the following equation:

$$[Trace\ PCB_{t=final}] = \frac{[Trace\ PCB_{t=0}]}{e^{k_e \times t_{final}}}$$

where:

Trace PCB$_{t = final}$ = the concentration of trace PCBs remaining in the sample at the end of the deployment

Trace PCB$_{t = 0}$ = the average concentration of the trace PCB in the PE at the beginning of the deployment (obtained from an average measurement of the trace PCBs in the PRC control blanks)

k_e = the elimination rate value predicted by the sampler-specific regression model (in days^{-1})

t_{final} = the deployment time (in days)

Concentrations of *Trace PCB* $_{t = final}$ values were then subtracted from the measured concentrations of non-PRC PCBs and pesticides in PE (Table A1-a and A1-b).

Step 4:

This step describes the calculation of sampling rate correction factors (*CF*s) for each primary analyte in each sampler. The following equation is used, as adapted from Lohmann (2012):

$$CF = \frac{1}{1 - e^{-k_e \times t_{final}}}$$

where:

k_e = the elimination rate value predicted by the sampler-specific regression model (in days^{-1})

t_{final} = the deployment time (in days).

Step 5:

The concentration of primary analyte in the PE of each sampler (obtained from Table A1-a and A1-b) were multiplied by the *CF* values to calculate the steady-state concentration of primary analytes.

Step 6:

In the final step, the steady-state concentrations are divided by K_{PE} values (Smedes et al. 2009) to obtain the concentrations of C_{free} for the primary analytes. These are reported in Table 1. C_{free} Method Detection Limits (MDLs) were calculated in the approach described above using the estimated MDL concentration in PE, as reported the analytical laboratory and shown in Table A1.

For samples in which the percentage of steady state was indicated to be less than 10% for a primary analyte, C_{free} was calculated and given an "L" qualifier in Table 1. Estimates associated with L-qualified values should be evaluated with caution due to the higher level of uncertainty associated with high CF values (i.e., higher than 10).

1.0 Scope and Application

This SOP describes the laboratory procedure for the isolation of organic compounds from aqueous samples by separatory funnel liquid-liquid extraction.

1.1 Analytes, Matrix(s), and Reporting Limits

Refer to analytical methods for analyte lists and reporting limits.

On occasion clients may request modifications to this SOP. These modifications are handled following the procedures outlined in the Quality Assurance Manual.

2.0 Summary of Method

A measured volume of sample, usually 1 L, is serially extracted at a specified pH with methylene chloride using a separatory funnel extractor (SFE). The extract is dried with anhydrous sodium sulfate then concentrated, and if necessary, exchanged into a solvent compatible for extract cleanup or the determinative analysis method.

This SOP is based on the following reference method:

- SW-846 Method 3510C Separatory Funnel Liquid-Liquid Extraction, Revision 3, December, 1996.

3.0 Definitions

Refer to the Laboratory's Quality Assurance Manual (QAM) for the Glossary of Terms, Definitions and Acronyms except as follows.

A list of terms and definitions are provided in Appendix A.

4.0 Interferences

Method interference may be caused by contaminants in solvents, reagents, glassware and other sample processing equipment that can cause interference and/or elevated baselines in chromatography. All reagents and solvents used during this procedure should be reagent grade or high purity in order to minimize interference. All glassware must be cleaned in accordance with laboratory SOP BR-QA-023 *Glassware Cleaning Procedure*.

The decomposition of some analytes has been demonstrated under basic extraction conditions. Organochlorine pesticides may dechlorinate, phthalate esters may exchange, and phenols may react to form tannates. These reactions increase with increasing pH, and are decreased by the shorter reaction times available in Method 3510. Method 3510 is preferred over Method 3520 for the analysis of these classes of compounds. However, the recovery of phenols may be optimized by using Method 3520, and performing the initial extraction at the acid pH.

5.0 Safety

Employees must abide by the policies and procedures in the NDSC Eurofins TestAmerica Laboratories Environmental Health and Safety Manual (CW-E-M-001), Radiation Safety Manual and this document. This procedure may involve hazardous material, operations and equipment.

This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe, nonabsorbent shoes are a minimum.

5.1 Specific Safety Concerns or Requirements

Nitrile gloves should be used when performing this extraction. Latex and vinyl gloves provide no significant protection against the organic solvents used in this SOP and should not be used.

During Kuderna-Danish (K-D) concentration do not allow the extract to boil to dryness. The solvent vapors remaining in the K-D apparatus may superheat and create an explosion or fire hazard.

The use of separatory funnels to extract aqueous samples with methylene chloride creates excessive pressure very rapidly. Initial venting should be done immediately after the sample container has been sealed and inverted. Vent the funnel into the hood away from people and other samples.

The following analytes have been tentatively classified as known or suspected, human or mammalian carcinogens: Benzo(a)anthracene, Benzidine, 3,3'-Dichlorobenzindine, Benzo(a)pyrene, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dibenz(a,h)anthracene, n-Nitrosodimethylamine, 4,4'-DDT, and polychlorinated biphenyl compounds. Primary standards of these toxic compounds should be prepared in hood.

The K-D apparatus has ground glass joints which can become stuck. Technicians must use Kevlar or other cut/puncture resistant gloves when separating stuck joints.

Special care is required to prepare a solution of 6N NaOH because considerable heat is liberated by the exothermic reaction. The solution may splatter or boil during preparation. Stir the sodium hydroxide, a little at a time, into a volume of water. Use borosilicate glass; inspect the glassware prior to use to make sure it is free from any cracks, scratches, or chips that would indicate weakness in the glass. Wear safety goggles and gloves when preparing the mixture.

5.2 Primary Materials Used

Table 1 lists those materials used in this method, which have a serious or significant hazard rating. **Note: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the SDS for each of the materials listed in the table.** A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the SDS for each material before using it for the first time or when there are major changes to the SDS.

6.0 Equipment and Supplies

Catalog numbers listed in this SOP are subject to change at the discretion of the vendor. Analysts are cautioned to be sure equipment used meets the specification of this SOP.

6.1 Extraction Equipment

- Separatory Funnel, 2 Liter with PTFE stopcock and cap. Fisher Scientific or equivalent.

- Glass Funnel – 100 mm. Fisher Scientific or equivalent.
- Class A Volumetric: 1 L capacity. Fisher Scientific or equivalent.
- Fiberglass Wool: 8 um, Fisher Scientific or equivalent.
- pH paper: Narrow and Wide range
- Mechanical Shaker (Optional)

6.2 Miscellaneous

- pH Paper/Strips: Range 1-14.
- Pasteur Glass Pipettes: 1 mL, disposable. Fisher Scientific or equivalent.
- 0.5 mL – 2.0 mL Syringes: Hamilton Gastight® Syringes or equivalent.
- Vials and Caps: 1.8, 4, 8, 16, and 40 mL with Teflon lined septa and screw caps. Fisher Scientific.

7.0 Reagents and Standards

7.1 Reagents

- Sodium Sulfate (granular, anhydrous), Na_2SO_4. J.T. Baker or equivalent. Purify by heating at 400°C for at least 4 hours.
- Methylene Chloride (CH_2Cl_2): Pesticide Quality, J.T. Baker or equivalent.
- Hexane, (C_6H_{14}), Pesticide Quality, J.T. Baker or equivalent.
- Acetone, ($(CH_3)_2CO$), Pesticide Quality, J.T. Baker or equivalent.
- Reagent Water: RO water filtered through a Nanopure System or equivalent.
- Sodium Hydroxide (NaOH): Reagent Grade, J.T. Baker.
- Sulfuric Acid, (H_2SO_4): Reagent Grade, J.T. Baker.
- Nitrogen, Ultra High Purity, Linde or equivalent.

7.1.1 Prepared Reagents

- NaOH Solution (6N): In a 2.5 L clear glass bottle dissolve 240 g NaOH in reagent water and dilute to 1 Liter. Store the solution in reagent bottle at room temperature. Assign an expiration date of 6 months from date of preparation unless the parent material expires earlier, in which case, use the earliest expiration date.

- H_2SO_4 Solution (1:1 v/v): Add 500 mL of reagent water to a 1 L volumetric flask. Slowly add 500 mL of H_2SO_4 to the flask to dilute to volume. Store the solution in reagent bottle at room temperature. Assign an expiration date of 6 months from date of preparation unless the parent material expires earlier, in which case, use the earliest expiration date.

7.2 Standards

Purchase stock standards as certified solutions from commercial vendors. Prepare surrogate and spiking solutions in the laboratory by diluting a known volume of the stock standard solutions in an appropriate solvent using the formulation specified in the analytical SOP. Record the preparation of standard in the LIMS (TALS) module established for this purpose.

Store prepared standard solutions in glass containers at 4°C or below. Unless otherwise specified, assign an expiration date from the date of preparation per the formulation or in

accordance with the expiration date of the parent standard, whichever is sooner. The recommended formulation for each standard used in this procedure is provided in the analytical method along with the recommended source materials, expiration dates and storage conditions.

8.0 Sample Collection, Preservation, Shipment and Storage

The laboratory does not perform sample collection so these procedures are not included in this SOP. Sampling requirements may be found in the published reference method.

Sample container, preservation techniques and holding times may vary and are dependent on sample matrix, method of choice, regulatory compliance, and/or specific contract or client requests. Listed below are the holding times and the references that include preservation requirements.

Matrix	Sample Container	Minimum Sample Size	Preservation	Holding Time[1]	Reference
Water	1 L Amber Glass	2 x 1L	Cool to ≤ 6° without freezing	Extraction: 7 days	SW-846 Chapter 4

[1]Extraction holding time is determined from sampling date. Footnotes to this table specify this information is guidance and does not represent EPA requirements.

Unless otherwise specified by client or regulatory program, after analysis, samples and extracts are retained for a minimum of 30 days after provision of the project report and then disposed of in accordance with applicable regulations.

9.0 Quality Control

9.1 Sample QC

The laboratory prepares the following quality control samples with each batch of samples.

QC Item	Frequency	Acceptance Criteria
Method Blank (MB)	1 in 20 or fewer samples	See Analytical SOP
Laboratory Control Sample (LCS)	1 in 20 or fewer samples	See Analytical SOP
Matrix Spike(s) MS/MSD *If there is not sufficient volume for MS/MSD perform an LCSD*	1 in 20 or fewer samples when sufficient sample volume is provided by the client.	See Analytical SOP
Sample Duplicate (SD)	Client Request	See Analytical SOP

9.2 Instrument QC

Refer to the analytical SOP for the determinative test method.

10.0 Procedure

10.1 Instrument Calibration

Verify the calibration of any mechanical pipettes used is current and if it is not, notify QA. The QA department checks the calibration of pipettes quarterly in accordance with the procedures specified in laboratory SOP BR-QA-012.

10.2 Equipment Preparation

Reusable Glassware: Wash and prepare using the procedures described in laboratory SOP BR-QA-023. Use a Sharpie marker to label each piece of glassware with the last 3 digits of the job ID followed by a dash and the sample ID. Extraction solvent will erase “sharpie” ink, so use caution during the extraction to avoid splashing solvent on the marking.

Create a drying funnel by adding a plug of Pyrex glass wool to a 100mm glass funnel. Add a sufficient amount of baked sodium sulfate to each funnel such that the funnel is approximately ¾ full. Rinse the funnel with methylene chloride collecting the solvent in a waste beaker. Dispose the waste solvent into the designated satellite container. Assemble a Kuderna-Danish (K-D) concentrator by attaching a 10mL concentrator tube to a 500mL evaporation flask. Add 1-2 boiling chips to the concentrator tube. Place this setup under the drying funnel.

10.3 Extraction

Remove the samples from refrigerated storage and let them warm to ambient temperature.

To prepare the method blank (MB) and laboratory control sample (LCS): Measure 1 L of reagent water into a 1L volumetric container, then transfer the measured volume into individually labeled separatory funnel extractor(s) (SFE).

Mark the meniscus of each sample on the sample container with a Sharpie marker.

Quantitatively transfer the entire sample into the SFE.

Using a calibrated pipette or a syringe, add the proper type and amount of spike and surrogate solutions to each QC and field sample following the spike regimen specified in the Extraction Conditions Workbook. Ask a peer analyst familiar with the procedure or the department supervisor to witness the addition of the spike solutions to each sample.

Note: The spiking scheme for all methods is provided in the Extraction Conditions Workbook located in the Controlled SOP distribution folder in the Burlington Public directory. The analyst must always refer to this workbook for the most current spiking information each time extraction is performed.

Check the pH of each sample using wide range pH paper. Adjust the pH, if necessary, using 1:1 Sulfuric acid solution or 6N Sodium hydroxide solution. See the extractions conditions workbook to determine the extraction pH for each test method. If using pH paper, do not dip the paper into the sample, instead aliquot a drop of sample onto the pH paper using a Pasteur piptette.

Rinse the empty sample container with ~ 60 mL of methylene chloride and pour the rinsate into the SFE. Place the stopper on the SFE and twist the stopper to secure it tight.

Caution: Methylene chloride rapidly creates excessive pressure that must be released. Hold the SFE with the bottom facing away from you into and into the fume hood, shake the SFE once then open the stopcock to vent the pressure into the fume hood. Repeat the shake/vent step two more times.

Note: The laboratory uses a mechanical shaker to shake SFEs but use of the mechanical shaker is not required by the method. Samples may also be manually shaken if the mechanical shaker is out of service.

Place the SFE(s) on the mechanical shaker, set the timer for 2 minutes and press start. After 2 minutes, remove the SFE to the holding cart designed for this purpose. Let the sample sit for 10 minutes to allow the solvent layer to separate.

Decant the solvent layer from each SFE into the corresponding drying funnel collecting the solvent in the KD concentrator.

- *If an emulsion forms and the emulsion interface between layers is more than 1/3 the size of the solvent layer, use a mechanical technique to separate the phases. The technique used to break the emulsion depends on the sample but may include stirring, filtration through glass wool, centrifugation or other techniques. Consult with DS to determine the optimum technique for each situation encountered.*

Repeat the extraction/decant process two more times using 60mL of fresh methylene chloride each time.

To measure the sample volume, fill the sample container with tap water to the mark of the meniscus and pour the water into a graduated cylinder for volume measurement. Record the sample volume in the TALS worksheet.

10.4 Extract Concentration

Refer to SOP No. BR-EX-031, Concentration Techniques, for the correct procedures regarding the concentration of extracts.

11.0 Corrective Action

When an out-of-control situation occurs that is not delineated in this corrective action table or the corrective actions listed do not adequately address the circumstances, a Corrective Action Report (CAR) (NCM), etc., must be developed (see SOP BR-QA-016) and the analyst must use his/her best analytical judgment and available resources to determine the corrective action to be taken. The out-of-control situation may be caused by more than one variable. The analyst should seek the assistance of his/her immediate supervisor, QA manager or other experienced staff if they are uncertain of the cause of the out-of-control situation. The analysis must not be resumed until the source of the problem and an in-control status is re-established. All samples associated with the out-of-control situation must be reanalyzed after in-control status has been re-established or if authorization is received from the supervisor or QA Manager for release with data qualification.

12.0 Calculations / Data Reduction

12.1 Calculations

Calculations are provided in the analytical SOP for each method parameter.

12.2 Data Review

Refer to laboratory SOP BR-QA-019 for the required elements of each step of data review.

12.2.1 Primary Review

Review the batch worksheet for correctness and completeness. Record any problems encountered during the extraction process with a nonconformance memo (NCM).

Note: If the TALS log-in does not include cleanup methods in the method chain and there is reason to believe the extract may require cleanup (color, odor, viscosity, etc.) notify the Department Supervisor (DS) of the situation so he/she can determine if cleanup should be performed prior to analysis.

12.2.2 Secondary Review

Review the batch worksheet for correctness and completeness and to ensure the extraction performed is consistent the SOP and project specifications.

If errors are found or if the record is incomplete, initiate a 2nd Level Review NCM to record the observation.

For additional guidance regarding the laboratory's protocol and required elements for data review refer to laboratory SOP BR-QA-019.

13.0 Method Performance

13.1 Method Detection Limit Study (MDL)

The method detection limit (MDL) is the lowest concentration that can be detected for a given analytical method and sample matrix with 99% confidence that the analyte is present. MDLs reflect a calculated (statistical) value determined under ideal laboratory conditions in a clean matrix, and may not be achievable in all environmental matrices. An initial method detection limit study is performed in accordance with SOP BR-QA-005. The laboratory maintains MDL studies for analyses performed; these are verified at least annually unless method or program requirements require a greater frequency.

13.2 Demonstration of Capabilities (DOC)

13.2.1 Four aliquots of the QC check sample are analyzed using the same procedures used to analyze samples, including sample preparation. The concentration of the QC check sample may be equivalent to a mid- level calibration.

13.2.2 Calculate the average recovery and standard deviation of the recovery for each analyte of interest.

13.2.3 If any analyte does not meet the acceptance criteria, the test must be repeated. Only those analytes that did not meet criteria in the first test need to be evaluated. TNI 2016 requires consecutive passing results. Repeated failure for any analyte indicates the need for the laboratory to evaluate the analytical procedure and take corrective action.

13.2.4 Until the IDOC is approved by the QA Manager (or designee); the trainer and trainee must be identified in the batch record.

13.3 Training Requirements

The Group Leader is responsible for ensuring that this procedure is performed by an associate who has been properly trained in its use and has the required experience. A new analyst must be working under documented supervision prior to approval of the IDOC. Documentation that a new analyst is performing under supervision must be entered into the batch record (View Batch Information) until that analyst's IDOC has been approved by the QA Manager (or designee). See requirements for demonstration of analyst proficiency in SOP BR-QA-011.

14.0 Pollution Control

It is Eurofins TestAmerica's policy to evaluate each method and look for opportunities to minimize waste generated (i.e., examine recycling options, ordering chemicals based on quantity needed, preparation of reagents based on anticipated usage and reagent stability). Employees must abide by the policies in Section 13 of the NDSC Eurofins TestAmerica Laboratories Environmental Health and Safety Manual (CW-E-M-001) for "Waste Management and Pollution Prevention."

15.0 Waste Management

Waste management practices are conducted consistent with all applicable rules and regulations. Excess reagents, samples and method process wastes are disposed of in an accepted manner. Waste description rules and land disposal restrictions are followed. Waste disposal procedures are incorporated by reference to BR-EH-001 *Hazardous Waste*. The following waste streams are produced when this method is carried out.

- Organic Solvents - Satellite container: 55 Gallon Covered and Vented Drum.
- Extracted water samples - Satellite Container: 55 Gallon Covered and Vented Drum.
- Vials containing extracts - Satellite Container: 5 Gallon Covered Bucket (inside fume hood).
- Solid Waste - Satellite Container: Solid Waste 5 Gallon Plastic Bucket (inside fume hood).

17.0 Method Modifications

There are no modifications of the referenced method.

18.0 Attachments

- Table 1: Primary Materials Used
- Appendix A: Terms and Definitions

19.0 Revision History

Revision 14:

- Title Page: Updated approval signatures, Copyright info, Branding, and Dates.
- Throughout: Updated SOP references to match currently used ones
- Section 11.0: Added section as required by ETA corporate policy.
- Section 13.0: Updated language and guidance as required by ETA corporate policy.

Revision 13:

- Title Page: Updated approval signatures and copyright date.
- Section 6.0: removed equipment and supplies for extract concentration.
- Section 9.1: Instructions for LCSD added in Sample QC table
- Section 10.1: changed reference to pipettor calibration SOP.
- Section 10.2: Updated instructions on the labeling procedure of samples and minor re-wording of instructions.
- Section 10.3: Updated instructions to state sample transfer to SFE prior to sample spiking and to rinse the empty sample container with MeCl2 as a final step before the first extraction.
- Section 10.4: Removed concentration steps and added instructions to reference concentration SOP.
- Section 15.0: Added reference to concentration SOP
- Section 18: removed older revision history and added statement that previous revisions are retained by QA.

Previous revisions are retained by the QA department.

Table 1: Primary Materials Used

Material[1]	Hazards	Exposure Limit[2]	Signs and symptoms of exposure
Acetone	Flammable	1000 ppm-TWA	Inhalation of vapors irritates the respiratory tract. May cause coughing, dizziness, dullness, and headache.
Hexane	Flammable Irritant	500 ppm-TWA	Inhalation of vapors irritates the respiratory tract. Overexposure may cause lightheadedness, nausea, headache, and blurred vision. Vapors may cause irritation to the skin and eyes.
Sulfuric Acid[1]	Corrosive Oxidizer Dehydra-dator	1 mg/m^3	This material will cause burns if comes into contact with the skin or eyes. Inhalation of vapors will cause irritation of the nasal and respiratory system.
Sodium Hydroxide	Corrosive Poison	2 ppm, 5 mg/m^3	This material will cause burns if comes into contact with the skin or eyes. Inhalation of Sodium Hydroxide dust will cause irritation of the nasal and respiratory system.
Methylene Chloride	Carcinogen Irritant	25 ppm-TWA 125 ppm-STEL	Causes irritation to respiratory tract. Has a strong narcotic effect with symptoms of mental confusion, light-headedness, fatigue, nausea, vomiting and headache. Causes irritation, redness and pain to the skin and eyes. Prolonged contact can cause burns. Liquid degreases the skin. May be absorbed through skin.

[1] *Always add acid to water to prevent violent reactions.*
[2] *Exposure limit refers to the OSHA regulatory exposure limit.*

Appendix A: Terms and Definitions

Batch: environmental samples that are prepared and/or analyzed together with the same process, using the same lot(s) of reagents. A preparation/digestion batch is composed of one to 20 environmental samples of similar matrix, meeting the above criteria. An analytical batch is composed of prepared environmental samples (extracts, digestates and concentrates), which are analyzed together as a group.

Corrective Action: the action taken to eliminate the cause of an existing nonconformity, defect or other undesirable occurrence in order to prevent recurrence.

Holding Time: the maximum time that a sample may be held before preparation and/or analysis as promulgated by regulation or as specified in a test method.

Intermediate Standard: a solution made from one or more stock standards at a concentration between the stock and working standard. Intermediate standards may be certified stock standard solutions purchased from a vendor and are also known as secondary standards.

Laboratory Control Sample (LCS): a blank matrix spiked with a known amount of analyte(s) processed simultaneously with and under the same conditions as samples through all steps of the procedure.

Matrix Spike (MS): a field sample to which a known amount of target analyte(s) is added.

Matrix Spike Duplicate (MSD): a second replicate matrix spike

Method Blank (MB): a blank matrix processed simultaneously with and under the same conditions as samples through all steps of the procedure. Also known as the preparation blank (PB).

Non-conformance: an indication, judgment, or state of not having met the requirements of the relevant specification, contract or regulation.

Preservation: refrigeration and/or reagents added at the time of sample collection to maintain the chemical, physical, and/or biological integrity of the sample.

Quality Control Sample (QC): a sample used to assess the performance of all or a portion of the measurement system.

Stock Standard: a solution made with one or more neat standards usually with a high concentration. Also known as a primary standard. Stock standards may be certified solutions purchased from a vendor.

Surrogate: a substance with properties that mimic the analyte of interest but that are unlikely to be found in environmental samples.

Facility Distribution No. Electronic **Distributed To: Facility Intranet**

1.0 Scope and Application

This SOP describes the laboratory procedure for automated Soxhlet extraction of organic analytes from soils, sediment and waste solids and the subsequent concentration of the extracts in preparation for analysis by GC or GC/MS.

1.1 Analytes, Matrices, and Reporting Limits

Refer to analytical methods for analyte lists and reporting limits.

2.0 Summary of Method

A measured amount of sample, usually 15 g, is mixed with anhydrous Sodium sulfate or a mixture of anhydrous Sodium sulfate and Magnesium sulfate to create a free-flowing mixture that is placed in an extraction thimble and extracted with an appropriate solvent for 3 hours using soxtherm extraction. Following extraction, the extract is dried, concentrated, and relinquished to the analytical department(s) or if necessary, exchanged into a solvent compatible for extract cleanup procedures.

This procedure is based on the following reference method:

SW-846 Method 3541, Automated Soxhlet Extraction, Revision 0, 1994. Test Methods for Evaluating Solid Waste Physical/Chemical Methods, Third Edition, September 1986.

3.0 Definitions

A list of terms and definitions are provided in Appendix A.

4.0 Interferences

Method interferences may be caused by contaminants in solvents, reagents, glassware and other sample processing equipment. These contaminants can lead to elevated baselines and discrete artifacts that appear in gas chromatograms. These materials are demonstrated to be free of interferences by the analysis of method blanks. Interferences from Phthalate esters can also pose a problem for the chlorinated pesticides analysis. To avoid this type of interference, the use of plastics in the laboratory must be minimized.

5.0 Safety

Employees must abide by the policies and procedures in the NDSC Eurofins TestAmerica Laboratories Environmental Health and Safety Manual (CW-E-M-001), and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe, nonabsorbent shoes are a minimum.

5.1 Specific Safety Concerns or Requirements

Nitrile gloves should be used when performing this extraction. Latex and vinyl gloves provide no significant protection against the organic solvents used in this SOP, and should not be used.

The following analytes have been tentatively classified as known or suspected human or mammalian carcinogens: Benzo(a)anthracene, Benzidine, 3,3'-dichlorobenzindine, Benzo(a)pyrene, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dibenz(a,h)anthracene, n-Nitrosodimethylamine, 4,4'-DDT, and polychlorinated biphenyl compounds. Primary standards of these toxic compounds should be prepared in hood.

Company Confidential & Proprietary
This is a Controlled Document. When Printed it Becomes Uncontrolled.

During Kuderna-Danish (K-D) concentration, do not allow the extract to boil to dryness. The solvent vapors remaining in the K-D apparatus may superheat and create an explosion or fire hazard.

The K-D apparatus has ground glass joints that can become stuck. Technicians must use Kevlar or other cut/puncture resistant gloves when separating stuck joints.

5.2 Primary Materials Used

Table 1 lists those materials used in this method, which have a serious or significant hazard rating. **Note: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the SDS for each of the materials listed in the table.** A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the SDS for each material before using it for the first time or when there are major changes to the SDS.

6.0 Equipment and Supplies

Catalog numbers listed in this SOP are subject to change at the discretion of the vendor. Analysts are cautioned to be sure equipment used meets the specification of this SOP.

6.1 Extraction Equipment

- Automated Soxhlet Extraction System: Gerhardt SX001-6 place extraction unit or equivalent.
- 54 mm Glass beaker, AMK Glass or equivalent.
- 45 mm Extraction Thimble with holder, AMK Glass or equivalent.
- Water Chiller, VWR or equivalent.

6.2 Miscellaneous

- Disposable glass Pasteur pipette and bulb.
- Top Loading balance: Capable of measuring to 0.01 gram accuracy. Mettler Model Number PM4800 or equivalent.
- Teflon and Stainless Steel Spatulas
- Adjustable pipette, capable of measuring 200 uL to 5 mL, Finnpipette or equivalent.
- 0.5 mL – 2.0 mL Hamilton Gastight® syringes or equivalent.
- 2, 4, 8, or 16 mL Teflon lined screw vial Fisher Scientific or equivalent

7.0 Reagents and Standards

7.1 Reagents

- Sodium sulfate (granular, anhydrous) (Na_2SO_4), J.T. Baker or equivalent. Purify by heating at 400°C for at least 4 hours
- Methylene chloride (CH_2CI_2), Pesticide quality, J.T Baker or equivalent.
- Hexane, (C_6H_{14}), Pesticide Quality. J.T. Baker or equivalent.
- Acetone, ($(CH_3)_2CO$), Pesticide quality. J.T. Baker or equivalent.
- Nitrogen, Ultra High Purity, Linde or equivalent.

7.2 Prepared Reagents

- Methylene chloride/Acetone (3:1): In a 4 L amber glass bottle, mix 3 L Methylene chloride with 1 L Acetone. Store the solution in a fume hood.
- Hexane /Acetone (1:1): In a 4L amber glass bottle mix 2L Hexane with 2L Acetone. Store the solution in a fume hood.

7.3 Standards

Purchase stock standards as certified solutions from commercial vendors. Prepare surrogate and spiking solutions in the laboratory by diluting a known volume of the stock standard solutions in an appropriate solvent. Record the preparation of standard in the LIMS (TALS) module established for this purpose.

Store prepared standard solutions in glass containers at 4°C or below. Unless otherwise specified, assign an expiration date of 6 months from the date of preparation or in accordance with the expiration date of the parent standard, whichever is sooner. The recommended formulation for each standard used in this procedure is provided in the analytical method along with the recommended source materials, expiration dates and storage conditions.

8.0 Sample Collection, Preservation, Shipment and Storage

The laboratory does not perform sample collection so these procedures are not included in this SOP. Sampling requirements may be found in the published reference method.

Matrix	Sample Container	Minimum Sample Size	Preservation	Holding Time[1]	Reference
Solid	Glass with PTFE lined lid	50 g	4°C	Extraction: 14 days	SW-846 Ch 4 (Table 4-1)

[1] *Extraction holding time is determined from sampling date.*

Unless otherwise specified by client or regulatory program, after analysis, samples and extracts are retained for a minimum of 30 days after provision of the project report and then disposed of in accordance with applicable regulations.

9.0 Quality Control

9.1 Sample QC

The laboratory prepares the following quality control samples with each batch of samples.

QC Item	Frequency	Acceptance Criteria
Method Blank (MB)	1 in 20 or fewer samples	See Analytical SOP
Laboratory Control Sample (LCS)	1 in 20 or fewer samples	See Analytical SOP
Matrix Spike(s) MS/MSD	1 in 20 or fewer samples	See Analytical SOP
Sample Duplicate (SD)	Client Request	See Analytical SOP

Surrogate spikes are added to all field and QC samples before preparation and/or analysis to assess the effect of the sample matrix on the accuracy of the method in the specific sample matrix. Matrix Spikes (MS) and Matrix Spike Duplicates (MSD) are performed upon request or when sufficient sample volume is received. When there is insufficient volume for MS/MSD, an LCS duplicate (LCSD) is analyzed to assess method precision and accuracy and an NCM is initiated. The situation documented with the “MS/MSD/DUP – Insufficient Volume” NCM.

Company Confidential & Proprietary
This is a Controlled Document. When Printed it Becomes Uncontrolled.

9.2 Instrument QC

For information regarding instrument QC refer to the analytical SOP for the determinative test method.

10.0 Procedure

10.1 Instrument Calibration

Check the calibration of the balance each day of use prior to use and record these checks in the logbook designated for this purpose.

Check the calibration of any mechanical pipettes quarterly in accordance with the procedures specified in laboratory SOP BR-QA-012.

10.2 Glassware & Equipment Set-Up

Prepare glassware using the procedures described in laboratory SOP BR-QA-023 and rinse with Acetone and Methylene chloride prior to use. Label the glassware for each field and QC sample clearly and unambiguously during each step of the extraction procedure. Solvent will erase grease pens and “sharpie ink”; so use caution to ensure labels are not obliterated during the procedure.

Turn on the water chiller to the soxtherm unit. Check to ensure there is sufficient 1:1 glycol/water in the unit and refill if necessary.

Initiate the cleaning of the system using program 1 and using 140 mL of the 1:1 Acetone/Methylene chloride solution. Discard the solution to the appropriate waste collection vessel after use. The cleaning should be performed once per month, or sooner if needed.

The recommended operating conditions for the soxtherm units are:

Operating Conditions (Program #1)

Temp Max: 150°C

Boiling Time: 55 Minute

Solvent Reduction A: 5 X 15 mL

Extraction Time: 55 Minute

Solvent Reduction B: 1X15 mL

Cool Time: 10 Minute

Total time: 2 hours 55 minutes

10.3 Sample Preparation

Mix samples thoroughly following the procedures specified in laboratory SOP BR-QA-020. Do not decant water from sediment samples if a large amount of water is present, contact the Project Manager for further guidance.

Initiate an extraction batch in TALS module ADII.

Place a labeled weighing dish on the balance and tare the balance. Measure 15 g (+/- 1 g) into the tared weighing dish and upload the sample mass into the TALS worksheet. Repeat for each sample and any designated MS/MSD or sample duplicates. Use Sodium sulfate for the method blank and LCS.

Mix each sample with a sufficient amount of drying agent to ensure a free-flowing mixture then

Company Confidential & Proprietary
This is a Controlled Document. When Printed it Becomes Uncontrolled.

transfer the sample into an extraction thimble with glass wool in the bottom.

Add ~6-12 silicon carborundum chips to each extraction beaker then place the extraction thimble into an extraction beaker.

Using a syringe add the proper type and volume of surrogate solution to the sample container and add the proper type and volume of spike solution to the sample container. Refer to the Extraction Workbook for proper spikes and volumes. Add 120 mL of extraction solvent to each extraction beaker.

For 8082A, methods use 1:1 Acetone/Hexane solution as the extraction solvent.

For 8270, use 3:1 Methylene Chloride:Acetone.

NOTE: If a sample is very wet and would require an excessive amount of Sodium sulfate to reach a free flowing state, resulting in the extraction thimble being overfilled, it may be permissible to reduce the amount of sample used, provided the project reporting limits can still be met. It may be necessary to reduce the final extract volume to meet the criteria; in this instance, all spiking levels should be adjusted accordingly so that spiking levels in the final extract is unaffected. Consult with the department manager and/or the technology manager prior to performing this modification.

10.4 Extraction

Place the extraction beakers into the extraction unit to ensure a tight seal between the extraction beaker and extraction unit. Check to ensure the chiller system is on and operating properly.

Turn on the soxtherm controller, press number “1” on controller pad to select program 1 and depress the enter key twice to begin the extraction process.

Periodically check the extraction units and do not allow the solvent in the extraction beaker to evaporate to dryness. If the solvent volume becomes low, lift the beakers off the boiling plate by switching the pneumatic control switch and add an additional amount of solvent to assure sufficient solvent volume until the extraction cycle is complete.

When the extraction cycle is finished, remove the beakers from the extraction unit and allow them to cool. Shut the soxtherm and Chiller “off” by depressing the “on” button. Concentrate the extracts to an appropriate final volume.

10.5 Extract Concentration

Refer to SOP BR-EX-031 for concentration techniques

10.6 Extract Preparation & Handling

For final extract volumes less than or equal to 1.0 mL adjust the extract volume using a calibrated graduated concentrator tube. For final extract volumes greater than 1.0 mL use a reference vial. Transfer the extract to labeled Teflon lined screw cap via and store refrigerated. Complete the batch worksheet and perform primary review.

11.0 Corrective Action

When an out-of-control situation occurs, a Corrective Action Report (CAR) (NCM), etc., must be developed (see SOP BR-QA-016) and the analyst must use his/her best analytical judgment and available resources to determine the corrective action to be taken. The out-of-control situation may be caused by more than one variable. The analyst should seek the assistance of his/her immediate supervisor, QA manager or other experienced staff if they are uncertain of the cause of the out-of-control situation. The analysis must not be resumed until the source of the problem and an in-control

Company Confidential & Proprietary
This is a Controlled Document. When Printed it Becomes Uncontrolled.

status is re-established. All samples associated with the out-of-control situation must be reanalyzed after in-control status has been re-established or if authorization is received from the supervisor or QA Manager for release with data qualification.

12.0 Calculations / Data Reduction

12.1 Calculations

Calculations are provided in the analytical SOP for each method parameter.

12.2 Data Review

Primary Review: Review the batch worksheet for correctness and completeness. Record any problems encountered during the extraction process with a non-conformance memo (NCM).

Secondary Review: Review the batch worksheet for correctness and completeness and to ensure the extraction performed is consistent the SOP and project specifications. Print the output worksheets and release extracts and output worksheet to the analytical department or to the next step in the method chain such as extract cleanup.

13.0 Method Performance

13.1 Method Detection Limit Study (MDL)

The method detection limit (MDL) is the lowest concentration that can be detected for a given analytical method and sample matrix with 99% confidence that the analyte is present. MDLs reflect a calculated (statistical) value determined under ideal laboratory conditions in a clean matrix, and may not be achievable in all environmental matrices. An initial method detection limit study is performed in accordance with SOP BR_QA-005. The laboratory maintains MDL studies for analyses performed; these are verified at least annually unless method or program requirements require a greater frequency.

13.2 Demonstration of Capabilities

All personnel are required to perform an initial demonstration of proficiency (IDOC) on the instrument they will be using for analysis prior to testing samples. On-going proficiency must be demonstrated annually. IDOCs and on-going proficiency demonstrations are conducted as follows.

13.2.1 Four aliquots of the QC check sample are analyzed using the same procedures used to analyze samples, including sample preparation. The concentration of the QC check sample can be equivalent to a mid- level calibration.

13.2.2 Calculate the average recovery and standard deviation of the recovery for each analyte of interest.

13.2.3 If any analyte does not meet the acceptance criteria, the test must be repeated. Only those analytes that did not meet criteria in the first test need to be evaluated. TNI 2016 requires consecutive passing results. Repeated failure for any analyte indicates the need for the laboratory to evaluate the analytical procedure and take corrective action.

13.2.4 Until the IDOC is approved by the QA Manager (or designee); the trainer and trainee must be identified in the batch record.

13.3 Training Requirements

The Group Leader is responsible for ensuring that this procedure is performed by an associate who has been properly trained in its use and has the required experience. A new analyst must be working under documented supervision prior to approval of the IDOC. Documentation that a new

Company Confidential & Proprietary
This is a Controlled Document. When Printed it Becomes Uncontrolled.

analyst is performing under supervision must be entered into the batch record (View Batch Information) until that analyst's IDOC has been approved by the QA Manager (or designee). See requirements for demonstration of analyst proficiency in SOP BR-QA-011.

14.0 Pollution Control

It is Eurofins TestAmerica's policy to evaluate each method and look for opportunities to minimize waste generated (i.e., examine recycling options, ordering chemicals based on quantity needed, preparation of reagents based on anticipated usage and reagent stability). Employees must abide by the policies in Section 13 of the NDSC Eurofins TestAmerica Laboratories Environmental Health and Safety Manual (CW-E-M-001) for "Waste Management and Pollution Prevention."

15.0 Waste Management

Waste management practices are conducted consistent with all applicable rules and regulations. Excess reagents, samples and method process wastes are disposed of in an accepted manner. Waste description rules and land disposal restrictions are followed. Waste disposal procedures are incorporated by reference to BR-EH-001 Hazardous Waste. The following waste streams are produced when this method is carried out.

- Solid Waste – Satellite Container: 5 Gallon Polyethylene Bucket
- Solvent Waste- Satellite Container: Steel 55 Gallon Drum

16.0 References / Cross-References

17.0 Method Modifications

#	Method Reference	Modification	Technical Justification
1	SW846 3541	The method calls for the use of 1:1 Methylene Chloride:Acetone for 8270 compounds. TA Burlington uses 3:1.	Used to alleviate aldol-condensation seen in semi samples.

18.0 Attachments

- Table 1: Primary Materials Used

- Appendix A: Terms and Definitions

19.0 Revision History

Revision 5.0, effective date 06/30/2021

- Revision incorporates TNI required updates from 2021 audit findings.
- Title Page: Updated headers, footers, signatories and copyright date
- Sections 5 and 14: Updated to reflect current NDSC required language.
- Section 9.1: Added the use of the NCM when insufficient sample volume to perform batch QC.
- Section 10.2: Updated to include length of automated extraction in response to TNI 2021 audit.
- Section 10.2: Update reference to Glassware Cleaning SOP.

Revision 4.0, effective date 04/13/2020

- Title Page: Updated approval signatures and Copyright date
- Section 10.2 &10.4: Updated to include that the chiller uses 1:1 glycol/water and that Nitrogen is not adjusted.
- Section 10.3: Minor changes to reflect bench practice.
- Throughout: Fixed minor typos/errors.

Previous revisions are retained by the QA department.

Company Confidential & Proprietary
This is a Controlled Document. When Printed it Becomes Uncontrolled.

Table 1: Primary Materials Used

Material[1]	Hazards	Exposure Limit[2]	Signs and symptoms of exposure
Acetone	Flammable	1000 ppm-TWA	Inhalation of vapors irritates the respiratory tract. May cause coughing, dizziness, dullness, and headache.
Hexane	Flammable Irritant	500 ppm-TWA	Inhalation of vapors irritates the respiratory tract. Overexposure may cause lightheadedness, nausea, headache, and blurred vision. Vapors may cause irritation to the skin and eyes.
Methylene Chloride	Carcinogen Irritant	25 ppm-TWA 125 ppm-STEL	Causes irritation to respiratory tract. Has a strong narcotic effect with symptoms of mental confusion, light-headedness, fatigue, nausea, vomiting and headache. Causes irritation, redness and pain to the skin and eyes. Prolonged contact can cause burns. Liquid degreases the skin. May be absorbed through skin.

[1] *Always add acid to water to prevent violent reactions.* [2] *Exposure limit refers to the OSHA regulatory exposure limit.*

Company Confidential & Proprietary
This is a Controlled Document. When Printed it Becomes Uncontrolled.

Appendix A: Terms and Definitions

Acceptance Criteria: specified limits placed on characteristics of an item, process or service defined in requirement documents.

Analyte: The specific chemicals or components for which a sample is analyzed. (EPA Risk Assessment Guide for Superfund, OSHA Glossary).

Batch: environmental samples that are prepared and/or analyzed together with the same process, using the same lot(s) of reagents. A preparation/digestion batch is composed of one to 20 environmental samples of similar matrix, meeting the above criteria. An analytical batch is composed of prepared environmental samples (extracts, digestates and concentrates), which are analyzed together as a group.

Corrective Action: the action taken to eliminate the cause of an existing nonconformity, defect or other undesirable occurrence in order to prevent recurrence.

Holding Time: the maximum time that a sample may be held before preparation and/or analysis as promulgated by regulation or as specified in a test method.

Laboratory Control Sample (LCS): a blank matrix spiked with a known amount of analyte(s) processed simultaneously with and under the same conditions as samples through all steps of the procedure.

Matrix Spike (MS): a field sample to which a known amount of target analyte(s) is added.

Matrix Spike Duplicate (MSD): a second replicate matrix spike

Method Blank (MB): a blank matrix processed simultaneously with and under the same conditions as samples through all steps of the procedure. Also known as the preparation blank (PB).

Non-conformance: an indication, judgment, or state of not having met the requirements of the relevant specification, contract or regulation.

Preservation: refrigeration and/or reagents added at the time of sample collection to maintain the chemical, physical, and/or biological integrity of the sample.

Quality Control Sample (QC): a sample used to assess the performance of all or a portion of the measurement system.

Reporting Limit (RL): the level to which data is reported for a specific test method and/or sample.

Stock Standard: a solution made with one or more neat standards usually with a high concentration. Also known as a primary standard. Stock standards may be certified solutions purchased from a vendor.

Surrogate: a substance with properties that mimic the analyte of interest but that are unlikely to be found in environmental samples.

Facility Distribution No. Electronic **Distributed To: Facility Intranet**

1.0 Scope and Application

This SOP describes the laboratory procedure used to determine the concentration of polychlorinated biphenyls (PCBs) as Aroclors using dual column gas chromatography with electron capture detectors (GC/ECD).

This SOP is applicable to instrument analysis only. Extraction and extract cleanup procedures are provided in separate SOPs.

1.1 Analytes, Matrices, and Reporting Limits

This procedure may be used for a variety of matrices including: air, sediment, soil, tissue, and water.

The list of target compounds that can be determined from this method along with the associated reporting limits (RL) is provided in Table 1.

2.0 Summary of Method

2.0uL of extract is injected into a dual capillary column gas chromatograph equipped with electron capture detectors (GC/ECD). The chromatographic data is used to determine the list of analytes provided in Table 1. NOTE: Injection volumes used must be validated and all samples are to be analyzed with the same injection volume used for standard solutions within the initial calibration. Quantitation is accomplished by averaging the concentration of three to five peaks for each Aroclor against a calibration curve. Internal standards are used to compensate for instrument variation.

This SOP is based on the following reference methods:

- SW-846 Method 8082A Polychlorinated Biphenyls (PCBs) by Gas Chromatography, Revision 0, February 2007.
- Compendium Method TO-4A, Determination of Pesticides and Polychlorinated Biphenyls in Ambient Air using High Volume Polyurethane Foam (PUF) Sampling Followed By Gas Chromatographic/Multi-Detector Detection (GC/MD), January 1999 (EPA/625/R-96/010b)
- Compendium Method TO-10A, Determination of Pesticides and Polychlorinated Biphenyls in Ambient Air using Low Volume Polyurethane Foam (PUF) Sampling Followed By Gas Chromatographic/Multi-Detector Detection (GC/MD), January 1999 (EPA/625/R-96/010b)

If the laboratory procedure is modified from the above reference method, a list of modifications will be provided in Section 16.0 of this SOP.

3.0 Definitions

Refer to the Laboratory's Quality Assurance Manual (QAM) for the Glossary of Terms, Definitions and Acronyms. Additionally, a list of terms and definitions are provided in Appendix A.

Company Confidential & Proprietary
This is a Controlled Document. When Printed it Becomes Uncontrolled.

4.0 Interferences

- Method interference may be caused by contaminants in the extraction solvent. Solvents should be stored away from organochlorine compounds to minimize contamination.

- Non-target compounds co-extracted from the sample matrix can also cause interference, the extent of which will vary depending on the nature of the samples. Elemental sulfur is often found in sediment samples and its presence will result in broad peaks. Samples are screened prior to analysis, and those samples that contain high levels of sulfur are subject to sulfur cleanup (SW-846 3660B). Cleanup procedures that may be used for this method include: GPC (SW-846-3640A), silica gel (SW-846 3630C), Florisil (SW-846 3620B), and Sulfuric acid Cleanup (SW-846 3665A).

- Phthalate esters introduced during sample preparation can pose a problem in the determination of target analytes. Common flexible plastics contain varying amounts of phthalate esters. These phthalate esters can be easily extracted or leached during extraction. To minimize this interference, avoid contact with any plastic materials.

5.0 Safety

Employees must abide by the policies and procedures in the NDSC Eurofins TestAmerica Laboratories Environmental Health and Safety Manual (CW-E-M-001), and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe, nonabsorbent shoes are a minimum.

5.1 Specific Safety Concerns or Requirements

The gas chromatograph contains zones that have elevated temperatures. The analyst must be aware of the locations of those zones and must cool them to room temperature prior to working on them.

There are areas of high voltage in the gas chromatograph. Depending on the type of work involved, either turn the power to the instrument off or disconnect it from its source of power.

5.2 Primary Materials Used

Table 2 lists materials used in this method which have a serious or significant hazard rating. **Note: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the SDS for each of the materials listed in the table.** A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the SDS for each material before using it for the first time or when there are major changes to the SDS.

6.0 Equipment and Supplies

Catalog numbers listed in this SOP are subject to change at the discretion of the vendor. Analysts are cautioned to be sure equipment used meets the specification of this SOP.

6.1 Miscellaneous

- Autosampler Vials, National Scientific or equivalent.
- Hydrogen Generator: Parker Hannafin H2-1200 or equivalent. Alternatively, UHP Hydrogen in cylinders may be used.
- Volumetric Glassware, Class “A” pipettes and flasks ranging in concentration from 0.5mLs to 500 mLs.
- Volumetric Syringes, Class “A” (10µl, 25µl, 50µl, 100µl, 250µl and 500µl), Hamilton or equivalent.

6.2 Analytical System

- Computer Hardware/Software: GC Acquisition Platform – ChemStation. Data Processing – TestAmerica Chrom, current version.
- GC/ECD: with dual columns, dual ECDs, and auto-sampler capable of injecting a 0.2-2.0 µL aliquot split onto two columns: Agilent Technologies 6890N with 7683 Series injector, or equivalent.
- Column Splitter: Siltek Angled Y Presstight Connector (Restek part# 20469) or equivalent. Used with the intent of splitting the injected volume equally into the two analytical columns
- GC Columns: A dual fused silica capillary column system that will provide simultaneous primary and confirmation analyses:
  - RTX-CLP, (30m x 0.32 mm ID x 0.5µm)
  - RTX-CLPII, (30m x 0.25 mm ID x 0.5µm)

Equivalent columns may be used provided the elution orders are documented and compound separations are maintained.

7.0 Reagents and Standards

7.1 Reagents

- Hexane, Ultra-Resi Analyzed, JT Baker or equivalent.

7.2 Standards

Purchase stock standard solutions from commercial vendors and from these prepare calibration and working standards by diluting a known volume of stock standard in an appropriate solvent to the final volume needed to achieve the desired concentration. The recommended formulation for

each standard used in this procedure is provided in Appendix B along with the recommended source materials, expiration dates and storage conditions.

8.0 Sample Collection, Preservation, Shipment and Storage

The laboratory does not perform sample collection, so these procedures are not included in this SOP. Sampling requirements may be found in the published reference method. Sample container, preservation techniques and holding times may vary and are dependent on sample matrix, method of choice, regulatory compliance, and/or specific contract or client requests. Listed below are the holding times and the references that include preservation requirements.

Matrix	Sample Container	Minimum Sample Size	Preservation	Extract Holding Time	Reference
Air	Polyurethane Foam Plug (PUF)	1 PUF	Chilled to 4°C	40 Days	TO-10A
Air	PUF	1 PUF	Chilled to 4°C	40 Days	TO-4A
Water	Glass	1 L	Chilled to 4°C	40 Days	SW-846 8082A
Solid	Glass	50 g	Chilled to 4°C	40 Days	SW-846 8082A

Analytical holding time is determined from date of initiation of extraction.

Unless otherwise specified by client or regulatory program, after analysis, samples and extracts are retained for a minimum of 30 days after provision of the project report and then disposed of in accordance with applicable regulations.

Note: EPA SW-846 Update IV Chapter 4 re-defined the holding times for PCBs as “NONE”. The EPA Methods Update Rule re-defined holding times for PCBs as one year from collection to extraction and one year from extraction to analysis. The laboratory incorporates the extended preparation holding times for PCBs on a project-specific basis, as allowed by that particular state agency and client.

9.0 Quality Control

9.1 Sample QC

The laboratory prepares the following quality control samples with each batch of samples.

QC Item	Frequency	Acceptance Criteria
Method Blank (MB)	1 in 20 or fewer field samples	See Table 3
Laboratory Control Sample (LCS)	1 in 20 or fewer field samples	See Table 3
Laboratory Control Sample Duplicate (LCSD)	1 in 20 or fewer field samples, if volume is not present for MS/MSD	See Table 3
Matrix Spike(s) MS/MSD	1 in 20 or fewer field samples	See Table 3

Sample Duplicate (SD)	Client Request	See Table 3

9.2 Instrument QC

The following instrument QC is performed:

QC Item	Frequency	Acceptance Criteria
Initial Calibration (ICAL)	Initially; when ICV or CCV fail	See Table 3
Second Source Calibration Verification (ICV)	Once, after each ICAL	See Table 3
Continuing Calibration Verification (CCV)	8082: Daily, every 20 field samples or 12 hours (whichever is sooner) TO4/TO10: Daily, every 10 field samples	See Table 3
Retention Time Windows	Once every 24 hours for all Aroclors reported (8082A). Once every 24 hours for Aroclor 1016/1260 (TO4/TO10)	Reference Section 10.2

10.0 Procedure

10.1 Instrument Operating Conditions

Install a five meter deactivated guard column into the injection port and connect the guard column to the separate analytical columns using a glass "Y". The analytical columns are installed into independent ECD detectors.

The recommended instrument operating conditions are as follows:

Initial Temperature	130ºC
Temperature Program	30ºC per minute to 210ºC; 10ºC per minute to 250ºC, hold 0.37 minutes; 20.0ºC per minute to 300°C. 30ºC per minute to 320 ºC. Hold for 3 minutes.
Detector Temperature	300ºC
Injector Temperature	220ºC
Injection port liner	Gooseneck splitless liner w/ deactivated glass wool
Injection volume	2.0µL Split pulse injection at 20psi actual
Carrier Gas	Hydrogen @ 10-15psi actual

Temperature and flow conditions can be moderately adjusted to satisfy chromatographic conditions that must produce Gaussian shaped peaks with defined separation of target analytes.

10.2 Retention Time Window Establishment

Whenever a new GC column is installed, establish RT windows for each analyte by analyzing three standards over a 72-hour period. Calculate the mean RT and Standard Deviation (SD).

The RT window is calculated as the mean RT ± 3SD. If the SD is <0.01 minutes, a default SD of 0.01 minutes may be used.

If this procedure results in RT windows that are too tight, favoring false negatives, the laboratory may opt to use an alternate method to determine the RT windows. An alternate method consists of using a RT window of ± 0.05 minutes. The center of the RT window is set at the midpoint calibration level in the initial calibration sequence. RT windows are then updated daily (minimum frequency), re-centering the windows on the retention times established in a CCV.

When determining retention time windows, analyze a standard of DDT, DDE and DDD. Ensure that the Aroclor peaks being used do not interfere with the major single-peak pesticides.

10.3 Instrument Calibration

10.3.1 Initial Calibration (ICAL)

Analyze a minimum of five calibration levels for each Aroclor. The following Aroclors may be combined in the standards: 1016/1260 (also known as 1660), 1221/1254, 1232/1262, 1242/1268. Aroclor 1248 may not be combined with other Aroclors.

Tetrachloro-m-xylene and Decachlorobiphenyl are calibrated from the Aroclor 1660 standards. Chrom settings for acquisition of other Aroclor calibrations must not have surrogate selected to calibrate.

Note: If the calibration will be used only for 8082A analysis, a single point calibration may be used except for Aroclors 1016 and 1260. The full set of Aroclors do not need to be calibrated if used for projects with a limited requested list. Every initial calibration block requires at least one standard with Aroclor 1016 to be analyzed for pattern recognition purposes, however.

Prepare the calibration standards using the formulations provided in Appendix B then transfer 100 µg/L to an autosampler vial insert. Add 4uL of the internal standard (IS) solution, then crimp the vial tightly.

Place the vials in the autosampler, and initiate the analytical sequence.

A minimum of five quantitation peaks must be chosen for each Aroclor with the exception of Aroclor 1221 which requires a minimum of 3 peaks. The peaks must be characteristic of the Aroclor in question.

The peaks used for quantitation in each Aroclor standard must be at least 25% of the height of the largest Aroclor peak with the exception of Aroclor 1268 where the requirement is 10%.

Each set of 5 peaks should include at least one peak that is unique to that Aroclor.

Calculate the Calibration Factor (CF), mean CF, and Percent Relative Standard Deviation (%RSD) for each analyte on both columns using the peak height, adjusted for internal standard response.

The %RSD for each target analyte must be less than or equal to 20% in order to use the mean CF for quantification. This evaluation is performed for each quantitation peak chosen for each

Aroclor. All peaks must individually pass the 20% evaluation.

Alternately, use linear regression with a correlation coefficient (r) ≥ 0.995. Linear regression requires a minimum of five calibration points.

Whichever calibration model is selected, it should be subjected to an additional check to establish the representativeness of the data that were used to produce it. This check is the refitting of each calibration point response back to the calibration model, or the comparison of the calculated amount of the standard against the expected amount. Calculate the concentration of each calibration standard from the final calibration curve. Calculate the %Error for each point. All points except the lowest point must have an absolute %Error of < 30%. The lowest standard (RL level) must have an absolute %Error < 50%. If these conditions are not met, perform corrective action and recalibrate the instrument.

The laboratory CHROM software provides an Initial Calibration %Drift report which shows the % Error for each calibration point. This report must be reviewed in addition to the %RSD / Linear Response Factor.

%Error is the absolute value of the difference between the calculated concentration and the true concentration divided by the true concentration x100%.

- For example, if the 0.20mg/L standard reads back as 0.17mg/L:

[(0.20 – 0.17)/0.20] x 100% = 15%

The mid-level AR1660 ICAL standard must meet a resolution criteria of <75% for the triplet near the end of the AR1260 pattern on at least one column. The resolution may be calculated per the equation in Appendix C.

10.3.2 Second Source Calibration Verification (ICV)

Immediately after each calibration and prior to the analysis of any QC or field samples, verify the accuracy of the initial calibration by analyzing a standard prepared from a second source of Aroclor 1660.

Prepare the ICV using the formulation provided in Appendix B. Aliquot 100uL of the working standard into a vial, and add 4uL of the IS solution. Crimp tightly. Inject the ICV standard onto the instrument in the same manner as performed for the initial calibration standards.

For 8082A, the percent difference must be within ± 20% of the expected value for the average of the quantitation peaks for each Aroclor. The retention time (RT) of each peak must be within the established RT window. Acceptance criteria must be met on both columns.

For TO-4A/TO-10A, the percent difference must be within ± 15% of the expected value for the average of the quantitation peaks for each Aroclor. The retention time (RT) of each peak must be within the established RT window. Acceptance criteria must be met on both columns.

If this criterion is not met, correct the problem and reanalyze the ICV. If reanalysis fails, remake the calibration standards and/or perform instrument maintenance and recalibrate. The acceptance criteria must be met on both columns. See Table 3.

Company Confidential & Proprietary
This is a Controlled Document. When Printed it Becomes Uncontrolled.

10.3.3 Continuing Calibration Verification (CCV)

Analyze a CCV (AR1660) at or below the mid-calibration range each day before sample analysis. This CCV is used to update the retention times of AR1660.

Analyze a CCV (AR1660) at least every 20 field samples for 8082A. If Aroclors other than 1660 are identified in a sample, a CCV of the identified Aroclor must be analyzed within 12 hours of the sample. Bracketing CCVs are not required.

Analyze a CCV (AR1660) at least every 10 field samples for TO4A/TO10A. The laboratory does not perform a CCV for the remaining Aroclors unless requested for the project or by regulatory requirement.

A CCV (AR1660) must be analyzed at least every 12 hours of operation.

Aliquot 100uL of the needed standard into a vial. Add 4uL of the IS solution, and crimp tightly. . Inject the CCV standard onto the instrument in the same manner as performed for the initial calibration standards.

The data system calculates an average calibration factor (CF) for each set of 5 quantitation peaks. The percent difference from the average calibration factor in the initial calibration is then calculated.

For 8082A, the percent difference or drift must be within ±20% for the average of the quantitation peaks and the retention time (RT) must be within the established RT window. Acceptance criteria must be met on both columns.

For TO4A/TO10A, the percent difference or drift must be within ±15% for the average of the quantitation peaks and the retention time (RT) must be within the established RT window. Acceptance criteria must be met on both columns.

The AR1660 CCV standard must meet a resolution criteria of <75% for the triplet near the end of the AR1260 pattern on at least one column. The resolution may be calculated per the equation in Appendix C.

If the CCV fails, it may be repeated once. If repeat analysis fails, corrective action must be taken. See Table 3.

10.3.4 Retention Time Updates

For 8082A analysis, all target analytes must have at least one CCV per 24 hours to update the retention time. If the samples have been screened and the Aroclors present in the samples are known, only those Aroclors must have the retention times updated daily.

For TO4A and TO10A analysis, only Aroclor 1660 is required to be analyzed every 24 hours. Update retention times of the other Aroclors as necessary.

Company Confidential & Proprietary
This is a Controlled Document. When Printed it Becomes Uncontrolled.

10.4 Troubleshooting

Check the following items in case of calibration failures:

- ICAL Failure – Perform injection port maintenance, install new guard column, check detector ends to see if detector jet has slipped. In extreme cases, install new columns, particularly if the chromatography has degraded as evidenced by peak shapes.
- CCV Failure – Perform Injection port maintenance; if injection port maintenance does not result in acceptable performance install a new guard column and remove one or more loops from each analytical column.
- Needle crushed during injection - Replace the needle and check the injection port for obstructions and check the autosampler for misalignment. Remove and clean the needle guide if necessary.
- Auto-sampler failure - Reset the auto-sampler and GC system. Replace the z-axis belt or clean the needle guide as necessary.
- Power failure - Reset run in ChemStation and re-acquire or re-initiate run sequence.

10.5 Sample Analysis

It is recommended that samples are screened to determine dilutions, Aroclor identifications, and the potential need for further sample cleanup prior to analysis.

Samples are typically screened at a 10x dilution against a single-point calibration curve. Screen data is not uploaded to TALS and is not reported.

10.6 Sample Analysis

Remove the extract from refrigerated storage and warm to room temperature.

Transfer 100 µL of extract to an autosampler vial. Add 4uL of IS solution, and crimp the vial tightly.

Place the vials in the autosampler in a sequence that begins with the calibration standards followed by the analysis of an ICV, QC samples, field samples and continuing calibration verification standards (CCVs).

Enter the sample ID's into the data acquisition program in the order that the samples were placed in the autosampler tray and initiate the analytical sequence.

Example analytical sequences follow:

Full Calibration Sequence	
Injection Number	**Lab Description**
1-2	Conditioning Blank
3-7	AR1221/1254 Calibration Block
8-12	AR1232/1262 Calibration Block
13-17	AR1242/1268 Calibration Block

18-22	AR1248 Calibration Block
23-27	AR1660 and Surrogate Calibration Block
28-32	Initial Calibration Verifications

Example Sample Analysis Sequence	
Injection Number	**Lab Description**
1-2	Conditioning Blank
4	AR1660 CCV
	CCVs for other Aroclors, as needed
5-24	Field Sample Injections*
	Repeat sample/CCV blocks as necessary*

* Injection sequence is dependent on method requirements (See Table 3).

Cleaning blanks (PIBLK) consisting of hexane may be analyzed after high-level samples at the discretion of the analyst for samples which contain large concentrations of late-eluting compounds.

11.0 Corrective Action

When an out-of-control situation occurs that is not delineated in this corrective action table or the corrective actions listed do not adequately address the circumstances, a Corrective Action Report (CAR) (NCM), etc., must be developed (see SOP BR-QA-016) and the analyst must use his/her best analytical judgment and available resources to determine the corrective action to be taken. The out-of-control situation may be caused by more than one variable. The analyst should seek the assistance of his/her immediate supervisor, QA manager or other experienced staff if they are uncertain of the cause of the out-of-control situation. The analysis must not be resumed until the source of the problem and an in-control status is re-established. All samples associated with the out-of-control situation must be reanalyzed after in-control status has been re-established or if authorization is received from the supervisor or QA Manager for release with data qualification.

12.0 Calculations / Data Reduction

12.1 Qualitative Identification

The data processing system identifies the target analytes by comparing the retention time of the peaks to the established retention time windows.

Review and accept or reject the qualitative identifications made by the data processing system using the following guidelines:

Compare the retention time of the peak to the established RT window, taking into account the shift of the surrogate peaks. If the surrogate peaks have shifted, open the retention time window in the direction of the shift. The processing system identifies the peak in the retention time window that is closest to the expected retention time set in the Chrom method, so the peak may need to be re-identified if a shift has occurred. The data system does not recognize Aroclor

patterns. The analyst manually identifies Aroclors by comparing the pattern in the samples to the patterns in the initial calibration standards. Weathering of PCB's in the environment may alter the PCB's to the point that the pattern no longer matches the pattern established for that Aroclor in the initial calibration. The laboratory takes the best pattern match approach to the identification and quantification of weathered PCB's.

Look for shoulders on the side of large peaks that may be peaks of interest. The processing system does not always automatically integrate shoulders from larger peaks, so manual integration (split) of the shoulder may be necessary.

Each target analyte must be detected on both columns for qualitative identification to be made.

12.2 Quantitative Identification

Using an average of the chosen quantification peaks per Aroclor the data system calculates the corrected concentration for each target analyte using the equations given in Appendix C. If sample interference is suspected, the laboratory may remove quantification peaks per column, keeping a minimum of 3 quantitation peaks per Aroclor on each column. The lower value between the two columns is reported as the primary result, unless the project specifies otherwise and the TALS formatter uses another formatting rule.

12.3 Calculations

See Appendix C.

12.4 Data Review

See laboratory SOP BR-QA-019 for detailed data review requirements.

12.4.1 Primary Review

Review project documents to ensure those project requirements were met. If project requirements were not met, immediately notify the project manager (PM) to determine an appropriate course of action.

Confirm qualitative and quantitative identification criteria using the criteria provided in Sections 11.1 and 11.2. If the data system does not properly integrate the peaks, perform manual integration in accordance with corporate SOP CA-Q-S-002.

Upload the data files from the data processing system (Chrom) to the laboratory information management system (TALS). Complete the batch information for standards and reagents and verify ICAL and QC sample associations. Review the results and set results to primary, secondary, acceptable or rejected as appropriate. Dilute and reanalyze samples whose average of peak results exceed the calibration range. The dilution analysis should result in a determination within the calibration range, preferably in the upper half of the calibration range. A more concentrated analysis is not necessary unless the project requires it. Dilution analyses may be performed to minimize matrix interference.

If a sample was analyzed immediately following a high concentration sample, review the results of the sample for any sign of carryover. If carryover is suspected, reanalyze the sample.

Company Confidential & Proprietary
This is a Controlled Document. When Printed it Becomes Uncontrolled.

Create a non-conformance memo (NCM) for any calibration, QC and sample data that is reported outside established acceptance criteria and/or schedule necessary corrective action. Set batch to 1st level review and complete the data review checklist.

12.4.2 Secondary Data Review

Verify quantitative and qualitative identification in the initial calibration standards and spot check such for ~15% of the remaining data in the batch.

If manual integrations were performed, review each integration to verify that the integration meets the requirements for manual integration as specified in corporate SOP CA-Q-S-002. If an error is suspected or found consult with the analyst that performed the integration and request correction or notify the Department Supervisor, Operations Manager, or QA Manager. Do not "fix" the integration. Reintegration by a secondary data reviewer must not be performed except in limited circumstances as approved by the department supervisor or other laboratory management. In those instances where the secondary reviewer performs the integration, this person is now considered the primary analyst and each integration performed by the secondary reviewer must be subsequently reviewed by a peer analyst or the department supervisor to verify the integration is consistent and compliant with the requirements specified CA-Q-S-002.

Review project documents to ensure those project requirements were met. If project requirements were not met, immediately notify the project manager (PM) to determine an appropriate course of action.

Verify that the acceptance criteria for the calibration and QC items listed in Table 1 were met. If the results do not fall within the established limits verify the recommended corrective actions were performed. If not, initiate corrective actions and/or verify an NCM was created to document the criteria exception. Verify analytical results are qualified accordingly. Set batch to 2nd level review and complete the data review checklists.

Run and review the deliverable. Fix any problems found. When complete set the method chain to lab complete and forward any paperwork to report/project management.

13.0 Method Performance

13.1 Method Detection Limit Study (MDL)

The method detection limit (MDL) is the lowest concentration that can be detected for a given analytical method and sample matrix with 99% confidence that the analyte is present. MDLs reflect a calculated (statistical) value determined under ideal laboratory conditions in a clean matrix, and may not be achievable in all environmental matrices. An initial method detection limit study is performed in accordance with BR-QA-005. The laboratory maintains MDL studies for analyses performed; these are verified at least annually unless method or program requirements require a greater frequency.

13.2 Demonstration of Capabilities

All personnel are required to perform an initial demonstration of proficiency (IDOC) on the instrument they will be using for analysis prior to testing samples. On-going proficiency must be

demonstrated annually. IDOCs and on-going proficiency demonstrations are conducted as follows.

13.2.1 Four aliquots of the QC check sample are analyzed using the same procedures used to analyze samples, including sample preparation. The concentration of the QC check sample can be equivalent to a mid- level calibration.

13.2.2 Calculate the average recovery and standard deviation of the recovery for each analyte of interest.

13.2.3 If any analyte does not meet the acceptance criteria, the test must be repeated. Only those analytes that did not meet criteria in the first test need to be evaluated. TNI 2016 requires consecutive passing results. Repeated failure for any analyte indicates the need for the laboratory to evaluate the analytical procedure and take corrective action.

13.2.4 Until the IDOC is approved by the QA Manager (or designee); the trainer and trainee must be identified in the batch record.

13.3 Training Requirements

The Group Leader is responsible for ensuring that this procedure is performed by an associate who has been properly trained in its use and has the required experience. A new analyst must be working under documented supervision prior to approval of the IDOC. Documentation that a new analyst is performing under supervision must be entered into the batch record (View Batch Information) until that analyst's IDOC has been approved by the QA Manager (or designee). See requirements for demonstration of analyst proficiency in BR-QA-011.

14.0 Pollution Control

It is Eurofins TestAmerica's policy to evaluate each method and look for opportunities to minimize waste generated (i.e., examine recycling options, ordering chemicals based on quantity needed, preparation of reagents based on anticipated usage and reagent stability). Employees must abide by the policies in Section 13 of the NDSC Eurofins TestAmerica Laboratories Environmental Health and Safety Manual (CW-E-M-001) for "Waste Management and Pollution Prevention."

15.0 Waste Management

Waste management practices are conducted consistent with all applicable rules and regulations. Excess reagents, samples and method process wastes are disposed of in an accepted manner. Waste description rules and land disposal restrictions are followed. Waste disposal procedures are incorporated by reference to BR-EH-001. The following waste streams are produced when this method is carried out.

- Vials containing sample extracts: Satellite container: 15 gallon bucket connected to a fume hood.
- Solvent Waste: Satellite container: 1 L glass bottle located in fume hood.

17.0 Method Modifications

Method Reference	Modification
TO4A 13.1/TO10A 12.1	The laboratory uses five-point calibration curves for all Aroclors instead of the three-point curves required in the reference method
	The laboratory calibrates with all Aroclors, not only 1242 and 1254 or 1260
	The use of internal standards has been incorporated with this method based on guidance from method 8082A section 11.6.8. Per that guidance, bracketing CCVs are not required.
	Continuing calibration verification is performed using Aroclor 1016 and 1260, in place of Aroclor 1242 and 1260
	Due to the relative height of target peaks, only 3 peaks are used for the quantitation of Aroclor 1221

19.0 Revision History

BR-GC-005, Rev 15 effective date 06/30/2021

- Revision incorporates finding from 2021 TNI audit.
- Title Page: Updated headers, footers, signatories and copyright date
- Section 10.3.1: Added language to better identify TNI Standard requirement for calibration standard read back evaluation.
- Section 10.3.3: Changed language to correct that CCV is analyzed ever 10 samples for TO4A and TO10A.
- Sections 5.0 and 14.0: Updated to include required NDSC reference and language.
- Section 17.0: Added method modification for CCV and three 1221 peaks.
- Section 19.0: Added effective dates
- Throughout: Added clarifying language, fixed minor typographical errors.

BR-GC-005, Rev 14 effective date 04/10/2020

- Title page: Updated Approval Signatures and Copyright Date.
- Section 6.1/6.2: Alternative equipment used listed.
- Section 10.1: Added minor clarifying statement pertaining to chromatographic conditions and added the type of injection port liner used.
- Section 10.3.2: Clarified the ICV requirements for TO-4A/TO-10A and 8082A.
- Section 10.6: Deleted “Retention Time Update Standard” line in Full Calibration Sequence Table.
- Throughout: Added clarifying language, fixed minor typographical errors.

Previous Revisions are retained by the QA department.

Table 1: Routine Target Analyte List & Reporting Limits (RL)

ANALYTE	Routine Reporting Limit (RL)[1,2]				
	Water (ug/L)	Solid (ug/Kg)	Air (ug/m^3 TO10A)[3]	Air (ug/m^3 TO4A)[4]	Air (ug/PUF)
AR1016	0.50	17	0.10	0.00033	0.10
AR1221	0.50	17	0.10	0.00033	0.10
AR1232	0.50	17	0.10	0.00033	0.10
AR1242	0.50	17	0.10	0.00033	0.10
AR1248	0.50	17	0.10	0.00033	0.10
AR1254	0.50	17	0.10	0.00033	0.10
AR1260	0.50	17	0.10	0.00033	0.10
AR1262	0.50	17	0.10	0.00033	0.10
AR1268	0.50	17	0.10	0.00033	0.10

[1]The routine RL is the unadjusted value that can be achieved in a blank matrix.
[2]The RL for tissue matrix is project defined.
[3]RL based on a collection volume of 1m^3 or 1,000L
[4]RL based on a collection volume of 300m^3 or 300,000L

Table 1A: Routine Accuracy and Precision Limits[1]

Analyte	In-House Limits (%R)			Precision (RPD) (≤)
	Water	Solid	Air	
AR1016	55-120	55-120	65-125	30
AR1260	60-125	55-125	65-125	30
Surrogate: Decachlorobiphenyl (DCB)	30-150	45-125	60-120	NA
Surrogate:TCX (Advisory)[2]	55-120	30-130	60-120	NA

[1] The limits in this table are those used as of the effective date of this SOP. Current limits are stored in the LIMS database.
[2] The control limits for TCX (Tetrachloro-m-xylene) are advisory. Corrective action is not performed when recovery is outside limits.

Table 2: Primary Materials Used

Material[1]	Hazards	Exposure Limit[2]	Signs and symptoms of exposure
Hexane	Flammable Irritant	500 ppm-TWA	Inhalation of vapors irritates the respiratory tract. Overexposure may cause lightheadedness, nausea, headache, and blurred vision. Vapors may cause irritation to the skin and eyes.

[1] Always add acid to water to prevent violent reactions.
[2] Exposure limit refers to the OSHA regulatory exposure limit.

Table 3: QC Summary, Frequency, Acceptance Criteria and Recommended Corrective Action (8082A)

QC Item	Frequency	Acceptance Criteria	Recommended Corrective Action[1]
ICAL	Before sample analysis, when CCVs indicate calibration is no longer valid; after major instrument maintenance	RSD for each analyte ≤ 20% -OR- Linear Regression: r ≥ 0.995	Correct problem, reanalyze, and repeat calibration.
ICV	After each initial calibration	(% R) ± 20% from expected value	Correct problem and verify second source standard. If that fails, repeat initial calibration.
CCV	8082:Daily before sample analysis, every 20 field samples or 12 hours (whichever is sooner). TO4/TO10:Daily before sample analysis, every 10 field samples.	% Difference or Drift ≥20%	See Section 10.3. Perform maintenance such as Injection Port maintenance, check for leaks, and change the lines / septa.
MB	One per extraction batch of 20 or fewer field samples	Target Analyte < RL	Examine project DQO's and take appropriate corrective action, which may include re-analysis of MB, re-extraction of batch, and/or non-conformance memo (NCM). If there are no detects in samples, or if all detects are > 10 X MB level, re-prep and reanalysis may not be required.
LCS	One per extraction batch of 20 or fewer field samples	See Table 1A	Examine project DQO's and take appropriate corrective action, which may include re-analysis of LCS, re-extraction of batch, and/or non-conformance memo (NCM). Flag all reported values outside of control limits
LCSD	One per extraction batch of 20 or field fewer samples, when MS/MSD is not present	See Table 1A	Examine project DQO's and take appropriate corrective action, which may include re-analysis of LCS, re-extraction of batch, and/or non-conformance memo (NCM). Flag all reported values outside of control limits.
MS/MSD	One per extraction batch of 20 or fewer field samples	See Table 1A	Evaluate data and determine if a matrix effect or analytical error is indicated. If analytical error, re-analyze and/or re-extract. Flag all reported values outside of control limits.
SD	Per client request	See Table 1A	Evaluate data and determine if a matrix effect or analytical error is indicated. If analytical error, re-analyze and/or re-extract. Flag all reported values outside of control limits.
Internal Standard	All field and QC samples	Area between 50-200% of area of daily calibration internal standard area	Evaluate data and determine if a matrix effect or analytical error is indicated. If analytical error, re-analyze and/or re-extract. Flag all reported values outside of control limits.
Surrogate	All field and QC samples	See Table 1A	Evaluate data and determine if a matrix effect or analytical error is indicated. If analytical error, re-analyze or re-extract. If matrix effect, review project DQOs to determine if a matrix effect must be confirmed by re-analysis. Flag all reported values outside of control limits.

[1]The recommended corrective action may include some or all of the items listed in this column. The corrective action taken may be dependent on project data quality objectives and/or analyst judgment but must be sufficient to ensure that results will be valid. If corrective action is not taken or is not successful, data must be flagged with appropriate qualifiers.

Table 3A: QC Summary, Frequency, Acceptance Criteria and Recommended Corrective Action (EPA TO4 & TO10)

QC Item	Frequency	Acceptance Criteria	Recommended Corrective Action[1]
ICAL	Before sample analysis, when CCVs indicate calibration is no longer valid; after major instrument maintenance	Option 1: RSD for each analyte ≤ 20%- OR- Linear Regression: r ≥ 0.995	Correct problem, reanalyze, repeat calibration.
ICV	After each initial calibration	(% R) ± 15 % from expected value	Correct problem and verify second source standard. If that fails, repeat initial calibration.
CCV	Daily before sample analysis, every 10 field samples or 12 hours (whichever is sooner).	% Difference or Drift ±15%	Re-analyze once, if still outside criteria perform corrective action, sequence can be re-started if two successive CCVs pass, otherwise repeat ICAL and all associated samples since last successful CCV, unless CCV is high and bracketed samples are non-detects.
Method Blank	One per extraction batch of 20 or fewer field samples	Target Analyte < RL	Examine project DQO's and take appropriate corrective action, which may include re-analysis of MB, re-extraction of batch, and/or NCM. Corrective action must be documented in an NCM. If there are no detects in samples, or if all detects are > 10 X MB level, re-prep and reanalysis may not be required.
Field Blank	One per sampling event	Target Analyte < RL	Notify client.
LCS	One per extraction batch of 20 or fewer field samples	See Table 1A	Examine project DQO's and take appropriate corrective action, which may include re-analysis of LCS, re-extraction of batch, and/or non-conformance memo (NCM). Flag all reported values outside of control limits
LCSD	One per extraction batch of 20 or fewer field samples, when MS/MSD is not present	See Table 1A	Examine project DQO's and take appropriate corrective action, which may include re-analysis of LCS, re-extraction of batch, and/or non-conformance memo (NCM). Flag all reported values outside of control limits.
Field Spike	One per sampling event	%R (65-125)	Evaluate data and determine if a matrix effect or analytical error is indicated. If analytical error, re-analyze and/or re-extract.
Internal Standard	All field and QC samples	Area between 50-200% of area of daily calibration internal standard area	Evaluate data and determine if a matrix effect or analytical error is indicated. If analytical error, re-analyze and/or re-extract. Flag all reported values outside of control limits.
Surrogate	All field and QC samples	%R (60-120)	Evaluate data and determine if a matrix effect or analytical error is indicated. If analytical error, re-analyze or re-extract. If matrix effect, review project DQOs to determine if a matrix effect must be confirmed by re-analysis. Flag all reported values outside of control limits.

[1]*The recommended corrective action may include some or all of the items listed in this column. The corrective action taken may be dependent on project data quality objectives and/or analyst judgment but must be sufficient to ensure that results will be valid. If corrective action is not taken or is not successful, data must be flagged with appropriate qualifiers.*

Appendix A: Terms and Definitions

Acceptance Criteria: specified limits placed on characteristics of an item, process or service defined in requirement documents.

Accuracy: the degree of agreement between an observed value and an accepted reference value. Accuracy includes a combination of random error (precision) and systematic error (bias) components which are due to sampling and analytical operations; a data quality indicator.

Analyte: The specific chemicals or components for which a sample is analyzed. (EPA Risk Assessment Guide for Superfund, OSHA Glossary).

Batch: environmental samples that are prepared and/or analyzed together with the same process, using the same lot(s) of reagents. A preparation/digestion batch is composed of one to 20 environmental samples of similar matrix, meeting the above criteria. An analytical batch is composed of prepared environmental samples (extracts, digestates and concentrates), which are analyzed together as a group.

Calibration: a set of operations that establish, under specified conditions, the relationship between values of quantities indicated by a measuring instrument or measuring system, or values represented by a material measure or a reference material and the corresponding values realized by the standards.

Calibration Curve: the graphical relationship between the known values or a series of calibration standards and their instrument response.

Calibration Standard: A substance or reference used to calibrate an instrument.

Continuing Calibration Verification (CCV): a single or multi-parameter calibration standard used to verify the stability of the method over time. Usually from the same source as the calibration curve.

Corrective Action: the action taken to eliminate the cause of an existing nonconformity, defect or other undesirable occurrence in order to prevent recurrence.

Data Qualifier: a letter designation or symbol appended to an analytical result used to convey information to the data user. (Laboratory)

Demonstration of Capability (DOC): procedure to establish the ability to generate acceptable accuracy and precision.

Holding Time: the maximum time that a sample may be held before preparation and/or analysis as promulgated by regulation or as specified in a test method.

Initial Calibration: Analysis of analytical standards for a series of different specified concentrations used to define the quantitative response, linearity and dynamic range of the instrument to target analytes.

Company Confidential & Proprietary
This is a Controlled Document. When Printed it Becomes Uncontrolled.

Intermediate Standard: a solution made from one or more stock standards at a concentration between the stock and working standard. Intermediate standards may be certified stock standard solutions purchased from a vendor and are also known as secondary standards.

Laboratory Control Sample (LCS): a blank matrix spiked with a known amount of analyte(s) processed simultaneously with and under the same conditions as samples through all steps of the procedure.

Matrix Spike (MS): a field sample to which a known amount of target analyte(s) is added.

Matrix Spike Duplicate (MSD): a second replicate matrix spike

Method Blank (MB): a blank matrix processed simultaneously with and under the same conditions as samples through all steps of the procedure. Also known as the preparation blank (PB).

Method Detection Limit (MDL): the minimum amount of a substance that can be measured with a specified degree of confidence that the amount is greater than zero using a specific measurement system. The MDL is a statistical estimation at a specified confidence interval of the concentration at which relative uncertainty is ±100%. The MDL represents a range where qualitative detection occurs. Quantitative results are only produced in this range and qualified with the proper data reporting flag when a project requires this type of data reporting.

Non-conformance: an indication, judgment, or state of not having met the requirements of the relevant specification, contract or regulation.

Precision: the degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves.

Preservation: refrigeration and/or reagents added at the time of sample collection to maintain the chemical, physical, and/or biological integrity of the sample.

Quality Control Sample (QC): a sample used to assess the performance of all or a portion of the measurement system.

Reporting Limit (RL): the level to which data is reported for a specific test method and/or sample.

Stock Standard: a solution made with one or more neat standards usually with a high concentration. Also known as a primary standard. Stock standards may be certified solutions purchased from a vendor.

Surrogate: a substance with properties that mimic the analyte of interest but that are unlikely to be found in environmental samples.

Company Confidential & Proprietary

Appendix B: Standard Preparation Tables

The standard formulations contained in this Appendix are recommended and are subject to change. If the concentration of the stock standard is different than those noted in this table, adjust the standard preparation formulation accordingly. Unless otherwise specified, prepare the standard solutions in hexane using Class A volumetric glassware and Hamilton syringes. Unless otherwise specified for a standard solution, assign an expiration date of 1 year from date of preparation unless the parent standard expires sooner in which case use the earliest expiration date. Store the prepared solutions under refrigeration at a temperature of 4ºC (±2) and protect from light. See laboratory SOP BR-QA-002 *Traceability, Handling, & Storage of Standards & Reagents* for further guidance.

The standards presented below are prepared for the calibration of 8082A to satisfy DoD calibration requirements. For Non-DoD sample analysis pairs of Aroclors can be combined by spiking the defined volume into the defined Final Volume. The following Aroclors can be combined into a single calibration; 1221 & 1254, 1232 & 1260, 1242 & 1262, 1248 & 1268. Aroclor 1242 is prepared by itself.

Intermediate Calibration Standards (10 mg/L)

Parent Standard	Vendor	Component	Stock Standard Concentration (mg/L)	Volume Added (mL)	Final Volume (mL)	Final Concentration (mg/L)
AR1660[1]	Restek #32039	Aroclor 1016 Aroclor 1260	1000	0.40	40	10
AR1254	Restek #32011	Aroclor 1254	1000	0.40	40	10
AR1248	Restek #32010	Aroclor 1248	1000	0.40	40	10
AR1242	Restek #32009	Aroclor 1242	1000	0.40	40	10
AR1232	Restek #32008	Aroclor 1232	1000	0.40	40	10
AR1221	Restek #32007	Aroclor 1221	1000	0.40	40	10
AR1262	Restek #32409	Aroclor 1262	1000	0.40	40	10
AR1268	Restek #32410	Aroclor 1268	1000	0.40	40	10

[1] Standard is a mix of AR1016/AR1260. Concentration shown is the concentration of each Aroclor in the mixed standard.

Intermediate ICV Standard (10 mg/L)

Parent Standard	Vendor	Component	Stock Standard Concentration (mg/L)	Volume Added (mL)	Final Volume (mL)	Final Concentration (mg/L)
AR1660	Restek	Aroclor 1016 Aroclor 1260	1000	0.40	40	10

Surrogate Solution (10 mg/L)

Parent Standard	Vendor	Component	Stock Standard Concentration (mg/L)	Volume Added (mL)	Final Volume (mL)	Final Concentration (mg/L)
Pesticide Surrogate	Restek #3200	TCX DCB	1000	0.40	40	10

Working ICV Standard (200 ug/L)

Appendix C: Equations

Relative Response Factor Calculation

$$RRF = \frac{A_x}{A_{is}} \times \frac{C_{is}}{C_x}$$

Where:
AX =Peak height for the Aroclor peak to be measured.
Ais = Peak height for specified internal standard.
Cis = Amount of the internal standard injected (ng).
Cx = Amount of the target compound or DMC injected (ng).

Mean Relative Response Factor Calculation

$$\overline{RRF} = \frac{\sum_{i=1}^{n} RRF_i}{n}$$

Where:
n = The number of calibration standards

Percent Relative Standard Deviation Calculation

$$\%RSD = \frac{Standard\ Deviation}{Mean} \times 100$$

$$Standard\ Deviation = \sqrt{\frac{\sum_{i=1}^{n} \left(x_i - \overline{x}\right)^2}{n-1}}$$

Where:
xi = Each individual value used to calculate the mean
$\overline{x}$ = The mean of n values
n = The total number of values

Company Confidential & Proprietary
This is a Controlled Document. When Printed it Becomes Uncontrolled.

Relative Response Factor Percent Difference Calculation

$$\%Difference_{RRF} = \frac{RRF_C - \overline{RRF_i}}{\overline{RRFi}} x100$$

Where:

$\overline{RRF_i}$ = Mean Relative Response Factor from the most recent initial calibration meeting
technical acceptance criteria
RRFc = Relative Response Factor from CCV standard.

Percent Drift = Calculated Concentration – Theoretical Concentration X 100%
Theoretical Concentration

Percent Recovery

$$\%R = \frac{C_s}{C_n} \times 100\%$$

Cs = Concentration of the Spiked Field or QC Sample
Cn = Nominal Concentration of Spike Added

Percent Recovery (%R) for MS/MSD

$$\%R = \frac{C_s - C_u}{C_n} \times 100\%$$

Cs = Concentration of the Spiked Sample
Cu = Concentration of the Unspiked Sample
Cn = Nominal Concentration of Spike Added

Relative Percent Difference

$$RPD = \frac{|C_1 - C_2|}{\left(\frac{C_1 + C_2}{2}\right)} \times 100\%$$

C1 = Measured Concentration of First Sample
C2 = Measured Concentration of Second Sample

Sample Concentration
Note: The concentrations of the 3-5 peaks chosen for quantification, determined by peak height, are calculated and the average is then taken for final calculation.

Concentration of Water Samples

$$Concentration\ ug/L = \frac{(A_x)(I_s)(V_t)(DF)(GPC)}{(A_{is})(\overline{RRF})(V_o)(V_i)}$$

Where:
Ax = Peak height for the peak to be measured.
Ais = Peak height for the internal standard.
Is = Amount of internal standard injected in nanograms (ng).
Vo = Volume of water extracted in milliliters (mL).
Vi = Volume of extract injected in microliters (µL).
Vt = Volume of the concentrated extract in microliters (µL)
$\overline{RRF}$ = Mean Relative response factor determined from the initial calibration standard.
DF = Dilution Factor (If no dilution is performed, DF = 1.0)
GPC = GPC Factor (If no GPC cleanup is performed, GPC = 1.0)

Concentration of Soil and Sediment Samples

$$Concentration\ ug/Kg\ (Dry\ Weight\ Basis) = \frac{(A_x)(I_s)(V_t)(DF)(GPC)}{(A_{is})(\overline{RRF})(V_i)(W_s)(D)}$$

Where:
Ax = Peak height for the peak to be measured.
Ais = Peak height for the internal standard.
Is = Amount of internal standard injected in nanograms (ng).
Ws = Weight of sample extracted in grams (g)
Vi = Volume of extract injected in microliters (µL).
Vt = Volume of the concentrated extract in microliters (µL)
$\overline{RRF}$ = Mean Relative response factor determined from the initial calibration standard.
DF = Dilution Factor (If no dilution is performed, DF = 1.0)
D = $\frac{100 - \%Moisture}{100}$
GPC = GPC Factor (If no GPC cleanup is performed, GPC = 1.0)

Concentration of Air Samples (ug/PUF)

$$\text{Concentration ug/PUF} = \frac{(A_x)(I_s)(1PUF)(DF)}{(A_{is})(\overline{RRF})(V_o)(V_i)}$$

Where:
Ax = Peak height for the peak to be measured.
Ais = Peak height for the internal standard.
Is = Amount of internal standard injected in nanograms (ng).
Vo = Volume of water extracted in milliliters (mL).
Vi = Volume of extract injected in microliters (µL).
Vt = Volume of the concentrated extract in microliters (µL)
$\overline{RRF}$ = Mean Relative response factor determined from the initial calibration standard.
DF = Dilution Factor (If no dilution is performed, DF = 1.0)

Concentration of Air Samples (ug/m3)

$$\text{Concentration ug/m3} = \frac{(A_x)(I_s)(V_t)(DF)}{(A_{is})(\overline{RRF})(V_o)(V_i)}$$

Where:
Ax = Peak height for the peak to be measured.
Ais = Peak height for the internal standard.
Is = Amount of internal standard injected in nanograms (ng).
Vo = Volume of air sampled via PUF apparatus (m3).
Vi = Volume of extract injected in microliters (µL).
Vt = Volume of the concentrated extract in microliters (µL)
$\overline{RRF}$ = Mean Relative response factor determined from the initial calibration standard.
DF = Dilution Factor (If no dilution is performed, DF = 1.0)

Resolution

(Height of Valley / Average of the Two Peak Heights)*100%

1.0 Scope and Application

This SOP describes the laboratory procedure for the determination of particle size distribution in soils.

2.0 Summary of Method

A portion of sample is soaked in a dispersing agent then partitioned into separate portions: material retained on a #10 sieve and material passing the #10 sieve. The material retained on the #10 sieve is dried to constant weight then passed through a large size sieve stack; the material retained on each sieve is measured and recorded. Material passing the #10 sieve is subject to hydrometer analysis then passed through a small size sieve stack; the material retained on each sieve is measured and recorded. All measurements: large and small sieves and hydrometer readings, and the hygroscopic moisture are used to establish the particle size distribution of the sample.

This SOP is based on the following reference methods:

- ASTM Standard D2217-8585 (Re-approved 1998) "Standard Practice for Wet Preparation of Soil Samples for Particle-Size Analysis and Determination of Soil Constants", ASTM International, West Conshohocken, PA 2003, DOI: 10.1520/C0033-03, www.astm.org

- ASTM Standard D422-63 (Re-approved 2007) "Standard Test Method for Particle-Size Analysis of Soils", ASTM International, West Conshohocken, PA 2003, DOI: 10.1520/C0033-03, www.astm.org

- ASTM Standard D6913-17 "Standard Test Methods for Particle-Size Distribution (Gradation) of Soils Using SieveAnalysis"

- ASTM Standard D7928-17 "Standard Test Method for Particle-Size Distribution (Gradation) of Fine-Grained SoilsUsing the Sedimentation (Hydrometer) Analysis"

NOTE: ASTM D2217 was withdrawn without replacement by ASTM in 2007. A withdrawn standard is an ASTM standard that has been discontinued by the ASTM Sponsoring Committee responsible for the standard.

NOTE: ASTM D422-63 was withdrawn by ASTM in January 2016. Individual methods for gradation by sieve analysis (ASTM D6913-17) and gradation by sedimentation/hydrometer analysis (ASTM D7928-17) were promulgated as replacement approaches. At the time of this writing, ASTM has not yet developed a combined sieve/hydrometer approach. The laboratory's procedure will utilize elements of these two new methods into a combined approach, effectively equivalent to ASTM D422.

If the laboratory has modified the procedure from the reference method(s) a list of modifications will be provided in Section 16.0.

3.0 Definitions

Not Applicable

4.0 Interferences

Not Applicable

5.0 Safety

Employees must abide by the policies and procedures in the NDSC Eurofins TestAmerica Laboratories Environmental Health and Safety Manual (CW-E-M-001), and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe, nonabsorbent shoes are a minimum.

5.1 Specific Safety Concerns or Requirements

None

5.2 Primary Materials Used

There are no materials with a health rating of 3 or 4 used in this procedure. A complete list of materials used in the method can be found in Section 7.0. If a chemical material is listed, employees must review the information in the SDS for each material before using it for the first time or when there are major changes to the SDS.

6.0 Equipment and Supplies

Catalog numbers listed in this SOP are subject to change at the discretion of the vendor. Analysts are cautioned to be sure equipment used meets the specification of this SOP.

- Top-Loading Balance, capable of weight measurement to 0.01 g
- Mechanical Stirring Device and Dispersion Cup
- Thermometer: Accurate to 0.5°C
- Mortar and Rubber Tipped Pestle
- Sedimentation Cylinder(s) 1000 mL
- Hydrometer: ASTM 151H in specification E 100.
- Sieves, of the following size(s): Gilson Company, Inc. or equivalent
  3.0” (75.00 mm)
  2.0” (50.00 mm)
  1.5” (37.50 mm)
  1.0” (25.00 mm)
  3/4" (19.00 mm)
  3/8” (9.50 mm)
  # 4 (4.75 mm)
  #10 (2.00 mm)
  #20 (850.0 um)
  #40 (425 um)
  #60 (250.0 um)
  #80 (180.0 um)
  #100 (150.0 um)

#200 (75.0 um)
- Drying Oven with temperature range of 60-110°C
- Stainless Steel Spatulas & Spoons
- Metal & Bristle Brushes
- Ro-Tap Sieve Shaker, W. S. Tyler or equivalent.
- Timing Device with second hand and capable of counting up to 25 hours

7.0 Reagents and Standards

- Reverse Osmosis (RO) water: In-House System
- Sodium Hexametaphosphate: ELE International or equivalent.

Sodium Hexametaphosphate Solution: Add 120 g of sodium hexametaphosphate and 2940 g of reagent water to a 1-gallon bottle. Add a stir rod to the container and place on a stir plate. Mix the solution until it is homogeneous. Assign an expiration date of 30 days from the date made unless the parent reagent expires sooner, in which case use the earlier expiration date. Store the prepared solution at ambient temperature.

8.0 Sample Collection, Preservation, Shipment and Storage

The laboratory does not perform sample collection, so these procedures are not included in this SOP. Sampling requirements may be found in the published reference method.

Sample container, preservation techniques and holding times may vary and are dependent on sample matrix, method of choice, regulatory compliance, and/or specific contract or client requests. Listed below are the holding times and the references that include preservation requirements.

Matrix	Sample Container	Minimum Sample Size	Preservation	Holding Time	Reference
Solid	Glass Jar w/ Teflon Lid	500 g	None	None	ASTM D422-63

Unless otherwise specified by client or regulatory program, after analysis, samples are retained for a minimum of 30 days after provision of the project report and then disposed of in accordance with applicable regulations.

9.0 Quality Control

Not Applicable

10.0 Procedure

10.1 Equipment Calibration

Check the calibration of the balance prior to use, using at least two Class S weights that bracket the range of use. Record in the logbook designated for this purpose.

Check the temperature of the drying oven(s) each day of use, prior to use. Record in the logbook designated for this purpose.

NOTE: The QA Manager or their designee checks the calibration of liquid in glass thermometers annually against a NIST-traceable thermometer following the procedures given in laboratory SOP BR-QA-004. Electronic / digital thermometers that are battery-operated are checked quarterly using the same procedure.

Calibrate the hydrometers every two years following the procedure given in BR-QA-012.

Calibrate the sieves six months following the procedure given in BR-QA-012.

10.2 Hygroscopic Moisture Determination

Label an aluminum pan with the Lab ID for each sample. Tare the balance, weigh each pan, and record the weight measurement in spreadsheet FSL024.

Mix the sample with a stainless steel spatula. Measure at least 10-15 g of each sample into the labeled aluminum pan and record the weight of sample in the spreadsheet.

Place the pan + sample in an oven maintained at a temperature of 110ºC and dry the sample for at least 16 hours. Reweigh each pan and record the weight measurement in the spreadsheet.

Percent solids are calculated using the equation given in Section 12.0.

10.3 Sample Preparation

Use the calculated percent solids and the sample characteristics for each sample to determine the amount needed for analysis. The target mass for dry clay samples is ~60g of material, and for dry sandy/gravel material the target mass is ~125g. For very wet samples (lower %Solids), use a larger sample mass. See Table 2 for guidance on sample masses. If there is an insufficient amount of sample available, initiate a nonconformance memo (NCM) and contact the PM for further instruction.

Place a 1000 mL plastic beaker on the balance and enter the weight measurement in the worksheet as the tare weight. Weigh the amount of sample for analysis and record the weight in the bench sheet.

Add 125 mL of sodium hexametaphosphate solution to each beaker. Stir to mix and soak the sample in this solution for 16 hours

10.4 Sample Partition

Rinse the sample slurry into a dispersion vessel using reagent water. Fill the dispersion vessel ½ full with reagent water and disaggregate well using a combination of agitation and homogenization.

NOTE: If the sample is not amenable to disaggregation, initiate a NCM to notify the PM of the anomaly and proceed to the next step without dispersing the sample.

Place a #10 sieve in a funnel above a 1000 mL graduated cylinder. Pour the sample through the sieve. Rinse the dispersion vessel with reagent water and pour the rinse through the sieve. Repeat until transfer is complete. Bring the volume in the graduated cylinder to 1000 mL with

reagent water. Cover the cylinder with a rubber stopper and equilibrate the sample to ambient temperature in preparation for hydrometer analysis.

Label a medium size aluminum dish with the sample's LAB ID, then transfer the sample material that was retained on the #10 sieve to the dish. Place the aluminum dish in the drying oven set at 110 ± 5° C and dry the sample material for at least 16 hours or until constant weight. Set aside for sieve analysis.

10.5 Hydrometer Analysis

Prepare a hydrometer rinse bath by adding 1000 mL of reagent water to a 1000 mL graduated cylinder.

Record the hydrometer ID and start time on the worksheet. Set the timer for the elapsed time and perform each task as listed in Table 1: Hydrometer Reading Table.

To shake the cylinder, rotate the flask up and down for one minute approximating at least 60 turns. One turn down and one turn up equals two turns.

To take a hydrometer reading, gently insert the hydrometer into the graduated cylinder and wait ~ 20 seconds. Read the hydrometer from the top of the meniscus to the nearest 0.0005. Enter the reading on the worksheet. After each reading, clean the hydrometer by twisting and dropping the hydrometer into the hydrometer rinse bath.

Insert a temperature probe into the cylinder to the same depth as the hydrometer reading. Read the temperature to the nearest 0.5°C and enter the temperature measurement on the worksheet. Rinse the temperature probe in the hydrometer rinse bath.

Repeat the above process taking hydrometer readings every 2, 5, 15, 30, 60, 250 and 1440 minutes as per Table 1 then proceed to small sieve analysis.

10.6 Sieve Analysis

Inspect the sample material in the aluminum pan and record a description of the non-soil material (e.g.- sticks, grass, wood, plastic), hardness of material, and shape of material in the worksheet.

Hardness qualifiers include hard, soft, and brittle. Shape qualifiers include well rounded, rounded, subrounded, subangular, and angular.

<u>Large Sieves</u>

Weigh the 3/4", 3/8", #4 and #10 sieves and enter the weight measurements in the worksheet as the tare weight.

Stack the sieves and then transfer the sample material from the aluminum dish to the sieve stack. If the sample material is less than 30 g, manually shake the sieve stack for 2 minutes. If the sample material is greater than 30 g, place the sieve stack into the Ro-tap machine and shake the sieve stack for 10 minutes.

Weigh each sieve and record these measurements in the worksheet.

Small Sieves

Quantitatively transfer the sample from the graduated cylinder to a #200 wet wash sieve. Ensure the entire sample has been transferred to the #200 wet wash sieve by rinsing the graduated cylinder several time with RO water. Using RO water, wash the sample through the #200 sieve until the water runs clear, then transfer the material retained on the sieve into a 250 mL glass beaker labeled with the sample's LAB ID.

Place the beaker in the drying oven and dry at a temperature of 110ºC for at least 16 hours. After 16 hours, remove the beaker from the oven and allow it to cool.

Gently mix the dried contents of the beaker with a rubber-tipped pestle to break up any soil aggregates that may have formed during the drying stage.

Tare the balance and weigh the sieve stack sized between #20 and #200 and record the tare weights.

Transfer the sample to the sieve stack and ensure complete transfer. Use hair or wire brushes to clean the beaker. Place the sieve stack on the RoTap machine and shake for ten minutes.

Weigh each sieve and record these measurements in the worksheet.

11.0 Corrective Action

When an out-of-control situation occurs, a Corrective Action Report (CAR) (NCM), etc., must be developed (see SOP BR-QA-016) and the analyst must use his/her best analytical judgment and available resources to determine the corrective action to be taken. The out-of-control situation may be caused by more than one variable. The analyst should seek the assistance of his/her immediate supervisor, QA manager or other experienced staff if they are uncertain of the cause of the out-of-control situation. The analysis must not be resumed until the source of the problem and an in-control status is re-established. All samples associated with the out-of-control situation must be reanalyzed after in-control status has been re-established or if authorization is received from the supervisor or QA Manager for release with data qualification.

12.0 Calculations / Data Reduction

12.1 Calculations

Sample Used (SU): Dry Preparation

$$SU = (pan + dry\ sample - pan) - (pan + non - soil\ material - pan) \otimes HMCF$$

Where:
HMCF = Hygroscopic moisture correction factor.

Sieve Analysis (Percent Finer = PF)

Large Sieves:

3 inch: PF = 100-100 (Sieve and Sample (3 inch) - Sieve (3 inch))/SU*

2 inch: PF = PF (3 inch) - 100(Sieve and Sample (2 inch) - Sieve (2 inch))/SU and so on through the #10 Sieve.*

Small Sieves:

#20: PF = PF(#10) - 100(mass passing #10/sample mass (Hyd))*(sieve and sample (#20) - sieve(#20))/sample used*

#40: PF = PF (#20) - 100(mass passing #10/sample mass (Hyd))*(sieve and sample (#40) - sieve (#40))/sample used and so on up through #10 sieve.*

Hydrometer Analysis

Particle size, Micron

1000*sqrt [930*viscosity/980*(SG-1))*(effective depth/time)]

Viscosity at sample temperature, poises
Effective Depth, cm = 16.29-264.5*(actual Hydrometer reading - 1) above equation for effective depth based on equation found with table 2 in method, in which 16.29 = 0.5*(14.0-67.0/27.8)+10.5 and 264.5 = (10.5-2.3)/0.031
Time, minutes = Time of hydrometer reading from beginning of sedimentation
Sqrt - square root
SG - Specific Gravity of soil
Viscosity - is the resistance of a liquid to flow
Percent Finer (PF):

PF = Constant*(actual hydrometer reading - hydrometer correction factor - 1)

Where:
Constant = (100,000/W)*SG/(SG-1)
W = (Total sample used *sample used for hydrometer analysis*HMCF)/Amount of total sample passing #10 sieve
Hydrometer Correction = slope*sample temperature + Intercept
Slope = ((low temp. reading -1)-(high temp. reading -1)/(low temp. - high temp.))
Intercept = (low temp. reading -1) - (low temp. * slope)

12.2 Data Reduction

12.2.1 Primary Data Review

Review project documents such as the Project Plan (PP), Project Memo or any other document/process used to communicate project requirements to ensure those project requirements were met. If project requirements were not met, immediately notify the project manager (PM) to determine an appropriate course of action.

Upload the batch information into LIMS and complete the batch editor and worksheet. Initiate NCMs for any anomalies observed during the preparation process. Set the status of the batch to first level review.

12.2.2 Secondary Data Review

Review project documents such as the Project Plan (PP), Project Memo or any other document/process used to communicate project requirements and verify those project requirements were met. If project requirements were not met, immediately notify the project manager (PM) to determine an appropriate course of action.

Check the batch editor and worksheet to verify the batch is complete and any outages are documented with an NCM along with the results of any corrective actions taken. Set the status of the batch to second level review. Review the deliverable and set the job to lab complete.
Sample results are reported from the laboratory's LIMS system using the formatter specified by the Project Manager.

13.0 Method Performance

13.1 Method Detection Limit Study (MDL)

Not applicable

13.2 Demonstration of Capabilities

All personnel are required to perform an initial demonstration of proficiency (IDOC) on the method they will be using for analysis prior to testing samples. On-going proficiency must be demonstrated when changes are made to the method. IDOCs and on-going proficiency demonstrations are conducted by analyzing a sample in quadruplicate. Use FQA053 to document results and verify if DOC meets acceptance criteria.

13.3 Training Requirements

The Group Leader is responsible for ensuring that this procedure is performed by an associate who has been properly trained in its use and has the required experience. A new analyst must be working under documented supervision prior to approval of the IDOC. Documentation that a new analyst is performing under supervision must be entered into the batch record (View Batch Information) until that analyst's IDOC has been approved by the QA Manager (or designee). See requirements for demonstration of analyst proficiency in SOP No. BR-QA-011.

14.0 Pollution Control

It is Eurofins TestAmerica's policy to evaluate each method and look for opportunities to minimize waste generated (i.e., examine recycling options, ordering chemicals based on quantity needed, preparation of reagents based on anticipated usage and reagent stability). Employees must abide by the policies in Section 13 of the NDSC Eurofins TestAmerica Laboratories Environmental Health and Safety Manual (CW-E-M-001) for "Waste Management and Pollution Prevention."

15.0 Waste Management

Waste management practices are conducted consistent with all applicable rules and regulations. Excess reagents, samples and method process wastes are disposed of in an accepted manner.

Waste description rules and land disposal restrictions are followed. Waste disposal procedures are incorporated by reference to BR-EH-001. The following waste streams are produced when this method is carried out.

- Solid Waste-Satellite Container: Solid Waste 5 Gallon Plastic Bucket (inside fume hood)
- Liquid Waste- 55 gallon poly drum

16.0 References / Cross-References

- ASTM Standard D2217-8585 (Re-approved 1998) "Standard Practice for Wet Preparation of Soil Samples for Particle-Size Analysis and Determination of Soil Constants", ASTM International, West Conshohocken, PA 2003, DOI: 10.1520/C0033-03, www.astm.org

- ASTM Standard D422-63 (Re-approved 2007) "Standard Test Method for Particle-Size Analysis of Soils", ASTM International, West Conshohocken, PA 2003, DOI: 10.1520/C0033-03, www.astm.org

- ASTM Standard D6913-17 "Standard Test Methods for Particle-Size Distribution (Gradation) of Soils Using SieveAnalysis"

- ASTM Standard D7928-17 "Standard Test Method for Particle-Size Distribution (Gradation) of Fine-Grained SoilsUsing the Sedimentation (Hydrometer) Analysis"

- Eurofins TestAmerica Corporate Safety Manual, current version.

- Laboratory SOPs as referenced, current version.

Note: ASTM D2217 was withdrawn without replacement by ASTM in 2007. A withdrawn standard is an ASTM standard that has been discontinued by the ASTM Sponsoring Committee responsible for the standard. ASTM D422-63 was withdrawn by ASTM in January 2016

Note: ASTM D422-63 was withdrawn by ASTM in January 2016. Individual methods for gradation by sieve analysis (ASTM D6913-17) and gradation by sedimentation/hydrometer analysis (ASTM D7928-17) were promulgated as replacement approaches. At the time of this writing, ASTM has not yet developed a combined sieve/hydrometer approach. The laboratory's procedure will utilize elements of these two new methods into a combined approach, effectively equivalent to ASTM D422.

17.0 Method Modifications

- The laboratory prepares samples for ASTM D422 using ASTM method D2217 rather then the suggested method ASTM D421.
- The laboratory does not use Apparatus A or B defined in ASTM D422-63 for dispersion of samples due to the difficulty that many samples present using apparatus A and the unavailability of apparatus B. Instead the laboratory manually disaggregates the samples.
- The laboratory does not provide for the hydrometer readings at 1 minute and 8 minutes that are referenced in ASTM D7928-17.

18.0 Attachments

- Table 1: Hydrometer Reading Table (For up to 12 Sedimentation Cylinders)
- Table 2: Percent Solids Table for Weight Determination for D422.

19.0 Revision History

BR-GT-006, Revision 9.0:
- Title Page: Updated approval signatures, Copyright info, Branding, and Dates.
- Section 2.0: Added references to ASTM D6913-17 and D7928-17
- Section 2.0: Added Note that ASTM D 422-63 was withdrawn by ASTM in January 2016
- Section 5.2: Removed not applicable and added guidance language required by ETA corporate policy.
- Section 11.0: Added section as required by ETA corporate policy.
- Section 12.2: Updated to current practice and remove use of QC checker.
- Section 13.0: Updated language and guidance as required by ETA corporate policy.
- Section 16.0: Added references to ASTM D6913-17 and D7928-17
- Section 16.0: Added Note that ASTM D 422-63 was withdrawn by ASTM in January 2016
- Section 17.0: Added the modification that the laboratory does not perform the hydrometer readings at 1 minute and 8 minutes as referenced in ASTM D7928-17.

BR-GT-006, Revision 8.1:
- Title Page: Updated approval signatures, Copyright info, branding, and Dates.
- Section 10.3: added guidance for visual evaluation of sample for mass to use.

Previous revisions are retained by the QA department

1.0 Scope and Application

This SOP gives the procedures for the determination of polychlorinated biphenyls (PCBs) by gas chromatography/mass spectrometry (GC/MS). PCBs are reported as homologues by the level of chlorination: monochlorobiphenyls, dichlorobiphenyls, trichlorobiphenyls, etc., up to decachlorobiphenyl.

1.1 Analytes, Matrix(s), and Reporting Limits

The routine matrices for this procedure are waters and soils; however, this procedure may be adapted to accommodate other matrices.

A complete target analyte list, the reporting limits (RL), the method detection limits (MDL), and the accuracy and precision criteria associated with this procedure are provided in the TALS Method Limit Groups (MLGs).

On occasion clients may request modifications to this SOP. These modifications are handled following the procedures outlined in Section xx in the Quality Assurance Manual.

2.0 Summary of Method

A measured volume or weight of sample is spiked with surrogate and extracted using an appropriate extraction procedure. The extract is concentrated to a volume of 1.0mL, and analyzed by GC/MS operated in the Selected Ion Monitoring Mode (SIM), using windows to monitor for the characteristic masses of the various PCB homologues. Qualitative identification of the target compounds in the extract is based on the presence of the peak within the SIM window and the mass ratio between the primary and confirmation ions. Quantitative analysis is performed using the internal standard technique. Results are reported as homologue groups (e.g., monochlorobiphenyls).

This SOP is based on EPA method 680.

3.0 Definitions

Refer to the Glossary Section of the Quality Assurance Manual (QAM) for a complete listing of applicable definitions and acronyms.

Congener – a member of a family or class of compounds such as polychlorinated biphenyls (PCBs). There are 209 congeners of PCBs

Homologue – a PCB isomer with the same level of chlorination; e.g., the monochlorobiphenyl isomers, the dichlorobiphenyl isomers, etc.

4.0 Interferences

4.1 Procedural Interferences

Interferences may be caused by contaminants in solvents, reagents, glassware, and other sample processing apparatus and can make identification and/or quantification of the target analytes difficult.

All sample collection containers are single-use disposable containers which limits the potential for contamination. All non-disposable labware must be scrupulously cleaned in accordance with BR-EX-017 Glassware Cleaning to ensure it is free from contaminants and does not contribute artifacts.

High purity reagents and solvents are used to help minimize interference problems. Acetone, hexane, and methylene chloride must be verified prior to use in accordance with the TestAmerica Solvent Lot Testing Program.

Instrument and/or method blanks are routinely used to demonstrate all reagents and apparatus are free from interferences under the conditions of the analysis.

4.2 Matrix Interferences

The sample may require dilution prior to analysis to reduce or eliminate the interferences.

Interfering contamination may occur when a sample containing low concentrations of analytes is analyzed immediately following a sample containing relatively high concentrations of analytes. As such, samples known to be clean should be analyzed first. To prevent carryover into subsequent samples, analysis of reagent blanks may be needed after the analysis of a sample containing high concentrations of analytes. Sulfuric Acid clean-up may be utilized.

5.0 Safety

Employees must abide by the policies and procedures in the Corporate Environmental Health and Safety Manual (CW-E-M-001) and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats, and closed-toe, nonabsorbent shoes are a minimum.

5.1 Specific Safety Concerns or Requirements

The toxicity or carcinogenicity of chemicals used in this method has not been precisely defined; each chemical should be treated as a potential health hazard, and exposure to these chemicals should be minimized.

Acetone is a flammable solvent. It can cause irritation to the respiratory tract. Overexposure can cause fatigue, lightheadedness, headache, dizziness, and blurred vision.

Hexane is a flammable solvent. It can cause irritation to the respiratory tract. Overexposure can cause fatigue, lightheadedness, headache, dizziness, and blurred vision.

Methylene chloride is a carcinogen and an irritant. It causes irritation to the respiratory tract and has a strong narcotic effect with symptoms of mental confusion, light-headedness, fatigue, nausea, vomiting, and headache. May be absorbed through the skin and can cause irritation and pain to the skin and eyes.

The gas chromatograph and mass spectrometer contain zones that have elevated temperatures. The analyst needs to be aware of the locations of those zones, and must cool them to room temperature prior to working on them.

The mass spectrometer is under deep vacuum. The mass spectrometer must be brought to atmospheric pressure prior to working on the source.

There are areas of high voltage in both the gas chromatograph and the mass spectrometer. Depending on the type of work involved, either turn the power to the instrument off, or disconnect it from its source of power.

5.2 Primary Materials Used

Table 1 lists materials used in this method which have a serious or significant hazard rating. **Note: This list does not include all materials used in the method. The table contains a**

summary of the primary hazards listed in the SDS for each of the materials listed in the table. A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the SDS for each material before using it for the first time or when there are major changes to the SDS.

6.0 Equipment and Supplies

CHROM and Chemstation software are used to acquire, store, reduce, and output mass spectral data. The software allows integration of the ion abundance of any specific ion between specified time or scan number limits, calculation of response factors as or construction of a linear regression calibration curve, calculation of response factor statistics (mean and standard deviation), and calculation of concentrations of analytes using either the calibration curve or the response factors.

GC/MS System with compatible data system, autosampler, splitless injector, and direct capillary interface.

- Gas chromatograph – Agilent 5890, 6890, 7890, or equivalent with compatible autosampler, split/splitless injector, and direct capillary interface.
- Mass spectrometer – Agilent 5973, 5975, or equivalent
- Recommended Capillary Column – Restek Rxi-5MS, 30m x 0.25mm ID, 0.5um film thickness. Equivalent columns can be used.

7.0 Reagents and Standards

7.1 Reagents

Hexane – reagent grade

Acetone – reagent grade

Methylene Chloride- reagent grade

7.2 Standards

Purchase stock standard solutions from commercial vendors and from these prepare calibration and working standards by diluting a known volume of stock standard in an appropriate solvent to the final volume needed to achieve the desired concentration. The recommended formulation for each standard used in this procedure is provided in Appendix A along with the recommended source materials, expiration dates and storage conditions.

8.0 Sample Collection, Preservation, Shipment, and Storage

The laboratory does not perform sample collection, so these procedures are not included in this SOP. Sampling requirements may be found in the published reference method. Sample container, preservation techniques and holding times may vary and are dependent on sample matrix, method of choice, regulatory compliance, and/or specific contract or client requests. Listed below are the holding times and the references that include preservation requirements.

Matrix	Sample Container	Minimum Sample Size	Preservation	Extract Holding Time	Reference
Water	Amber Glass	1 L	Chilled to 4°C	40 Days	USEPA 680
Solid	Glass	50 g	Chilled to 4°C	40 Days	USEPA 680

[1]Analytical holding time is determined from date of initiation of extraction.

Unless otherwise specified by client or regulatory program, after analysis, samples and extracts are retained for a minimum of 30 days after provision of the project report and then disposed of in accordance with applicable regulations.

9.0 Quality Control

9.1 Sample QC

The laboratory prepares the following quality control samples with each batch of samples.

QC Item	Frequency	Acceptance Criteria
Method Blank (MB)	1 in 20 or fewer samples	See Table 3
Laboratory Control Sample (LCS)	1 in 20 or fewer samples	See Table 3
Laboratory Control Sample Duplicate (LCSD)	1 in 20 or fewer samples, when volume is not available for MS/MSD	See Table 3
Matrix Spike(s) MS/MSD	1 in 20 or fewer samples	See Table 3
Sample Duplicate (SD)	Client Request	See Table 3

9.2 Instrument QC

The following instrument QC is performed:

QC Item	Frequency	Acceptance Criteria
Initial Calibration (ICAL)	Initially, when CCV fails and after major instrument maintenance	See Table 3
GC/MS Mass Calibration (Tune) and Ion Abundance Check (DFTPP)	To begin a calibration sequence or to open a new 12 hour analytical window for sample analysis	See Table 3
Second Source Verification (ICV)	Immediately after ICAL	See Table 3
Window Defining Solution (WDM)	Daily, following DFTPP	
Continuing Calibration Verification (CCV)	Daily, every 12 hour window before the analysis of samples	See Table 3

10.0 Procedure

10.1 Instrument Operating Conditions

The instrument conditions listed in this SOP are provided for guidance purposes. The actual conditions used by the laboratory may be slightly different from those listed here and must be documented in the instrument maintenance log, data system, and/or run log.

Instrument maintenance must be performed in accordance with Attachment 4 of this SOP.

The goal is to have maximum separation between the target compounds in the shortest run time while maintaining sufficient sensitivity to detect the target compounds at the MDL.

Instrument conditions may vary according to the sensitivity of each instrument. The following conditions are provided for guidance. The laboratory must document the conditions used for the analysis of SVOC by GC/MS.

Recommended Column:

Rxi-5MS 30m x 0.25mm ID, 0.50um film thickness or equivalent

Column Flow:

Approximately 1mL/min helium

GC Oven Temperatures:

Initial column temperature: 60°C for 1 minute

Column temperature program 1: 20°C per minute to 150°C, hold 1 minute

Column temperature program 2: 10°C per minute to 310°C, hold until DCB and 13C12-DCB elute

GC Injector Parameters:

Injector temperature: 280°C

Injector: splitless

Inlet purge time: 0.5 minutes

Injector liner: 4mm ID quartz or 4mm glass, deactivated

Sample injection volume: 1μL

Mass Spectrometer and Interface Parameters:

Mass spectrometer interface: 300°C

Mass spectrometer source temperature: 230°C

Mass range: SIM (see Table 5for ions to monitor)

Mass range for DFTPP analysis: 35-500amu at >1 scan per second.

10.2 Internal Standard (ISTD)

Prior to analysis, internal standards must be added to all standards, samples, and QC items. The concentration of the internal standard must be the same in all calibration samples, field samples, and QC samples: 0.75 ug/mL.

Chrysene-d10 is used as the internal standard unless matrix interferences are encountered. Alternatively, phenanthrene-d10 may be used. If phenanthrene-d10 must be used, the calibration must be re-evaluated and verified using the second internal standard. An NCM must be generated to denote this situation.

The response of the ISTD in the ICV/CCV must be within 30% of the response in the most recent CCV or within 50% of the mean response of the ISTD in the ICAL. If the response is outside of this range, the analysis of the CCV must be repeated and any samples associated with the CCV must also be re-analyzed. Repeated failure of the ISTD response will require re-calibration.

The response of the ISTD in the samples and batch QC items must be within 30% of the response of the opening CCV or within 50% of the mean response of the ISTDs in the ICAL.

If these criteria are not met, corrective action must be taken and the associated sample extracts re-analyzed.

10.3 Tune Evaluation (DFTPP)

A solution containing DFTPP (difluorotriphenyl phosphate) must be analyzed at the beginning of each 12-hour acquisition period as a check on the "tune" of the mass spectrometer. The DFTPP analysis is performed using scan analysis. The same tune parameters are used for the SIM analysis of the calibration standards and samples.

Meeting the DFTPP tuning criteria demonstrates that the instrument is measuring the proper masses in the proper ratios.

Inject a 1uL aliquot of the 10ng/uL DFTPP/column evaluation solution.

The spectrum of the DFTPP must meet the criteria listed in Table 4. Background subtraction must be straightforward, that is, no scan within the elution window of DFTPP may be subtracted from another scan within the elution window, and designed only to eliminate column bleed or instrumental background. Scans $\pm$ 2 scans from the apex can be evaluated for the DFTPP criteria. Consecutive scans within this range may be averaged to meet the criteria.

Note: The DFTPP analysis should be evaluated as to the relative size of the DFTPP peak under the m/z 198 profile. A benchmark area window should be established for each instrument and data system. Area outside of this window suggests instrumental problems such as a bad injection, clogged autosampler syringe, leaking injector, reduced or elevated detector sensitivity, improper electron multiplier voltage selection, wrong tune method or tune file selected for this analysis, PFTBA valve left open, etc.

If the DFTPP fails to meet the criteria, the instrument may require tuning (manually or automatically with PFTBA). Depending on the nature of the results from the DFTPP analysis, other corrective measures may include remaking the DFTPP standard, cleaning the mass spectrometer source, etc.

10.4 Window Defining Solution (WDM)

Analyze a 1uL aliquot of the window-defining solution in the scan mode from 7.35 amu to 500amu at >1 scan per second or in SIM mode using the quant ions identifying each chlorobiphenyl group. Use the same temperature program that will be used for the SIM analysis of ICAL, CCV, QC, samples and DFTPP.

Determine the retention times of the first and last eluting congeners at each level of chlorination. The quantitation and confirmation masses are Attachment 12.

Set the SIM parameters in the Chemstation method used for the analysis of ICAL, CCV, QC and samples as follows. Refer to Attachment 7 for the ion sets.

- Begin data acquisition with ion set #1 before the elution of PCB congener #1, the first eluting CL-1-PCB
- Stop the acquisition of ion set #1 and begin acquisition of ion set #2 approximately 10 seconds before the elution of PCB congener #104, the first eluting CL5-PCB.
- Stop the acquisition of ion set #2 and begin the acquisition of ion set #3 approximately 10 seconds after the elution of PCB congener #77, the last eluting CL4-PCB.
- Stop the acquisition of ion set #3 and begin the acquisition of ion set #4 approximately 10 seconds after the elution of 4,4'-DDT. (The retention time of 4,4'-DDT is determined from the scan analysis of the DFTPP solution that is analyzed at the beginning of each 12-hour clock.)

- Stop the acquisition of ion set #4 and begin the acquisition of ion set #5 approximately 10 seconds before the elution of PCB congener #208, the first eluting CL9-PCB.

10.5 Initial and Continuing Calibration

Calibrate the instrument prior to analysis using a minimum of 5 standards. The lowest level calibration standard must be at or below the reporting limit, and the remaining standards will define the working range of the analytical system. Note that a single PCB congener of each chlorination level is used for calibration and quantitation using the standards and criteria given in Section 10.6. Once the calibration has been established and verified with an ICV in accordance with Section 10.7, sample analysis may proceed.

Verify the calibration curve with a Continuing Calibration Verification (CCV) at the beginning and end of each 12 hour clock.

The initial calibration standard concentrations currently in use in the laboratory are listed in Appendix B. Refer to Section 7.2 for the standard preparation instructions.

10.6 Initial Calibration Criteria

Each peak utilized in the Initial calibration must meet identification criteria as listed in Section 11.0.

The preferred method of quantitation is the average response factor. The relative standard deviation (%RSD) of the calibration standards must be <20%.

In addition to meeting the calibration criteria, the following performance criteria must also be met for the mid-level standard.

1. mass abundance ratios of all calibration congeners within acceptance range (Refer to Attachment 8.)
2. baseline separation of PCB congener #87 from congeners #154 and #77, which may coelute.
3. signal-to-noise ratio of >=5 for decachlorobiphenyl ion 499 and chrysene-d12 ion 241
4. decachlorobiphenyl mass abundance: mass 500 >=70% but <=95% of mass 498

10.7 Second Source Initial Calibration Verification (ICV)

The calibration curve must be verified after the initial calibration is established, prior to any sample analyses, with a standard obtained from a second source.

The initial calibration verification standard concentration currently in use in the laboratory is equivalent to Level 3 of the ICAL. Refer to Appendix B for the standard preparation instructions.

The ICV must be within ±20% of the true value.

10.8 Continuing Calibration Verification (CCV)

The calibration must be verified at the beginning and end of each 12-hour clock with a mid-level standard.

The CCV standard concentration currently in use in the laboratory is equivalent to level 4 of the ICAL. Refer to Appendix B for the standard preparation instructions.

10.9 Instrument Blanks (ICB/CCB)

The instrument must be shown to be free from contamination by the analysis of calibration blanks. Instrument blanks are analyzed after each ICV or CCV.

Initial and continuing calibration blanks must be <1/2RL.

10.10 Surrogates

This procedure uses surrogates to evaluate the extraction process.
Tetrachloro-m-xylene and 13C12-Decachlorobiphenyl are used as the surrogates. 13C6-gamma-BHC (lindane) may also be used.

Prior to preparation, the surrogates are added to all samples and QC items. The concentration of the surrogate is the same in all field samples and QC samples. A concentration of 2.5ug/mL is used.

Recovery limits are listed in Table 3. If the percent recovery is outside of this range, the analysis of the sample must be repeated. Repeated failure of the surrogate percent recovery may indicate re-extraction is necessary.

10.11 Sample Analysis

Remove the extracts from the refrigerator and allow them to come to room temperature. Prior to analysis spike the ISTD and set up the instrument sequence.

The sample extract must be injected using the same injection volume used for the calibration standards. Samples that are known to be relatively clean should be analyzed first. Samples suspected of containing high concentrations should be analyzed last. Instrument blanks may be analyzed after suspected high concentration samples to allow the detector response to stabilize.

10.12 Example Analytical Sequence

Description	Comments
DFTPP	12-hour clock begins
WDM	Window Defining Mix
Initial Calibration	
ICV	Second Source
Blank	
Samples & Batch QC Items	
CCV (Capping)	Level 3 Not to exceed12 hours.
DFTPP	12-hour clock begins
WDM	Window Defining Mix
CCV	Level three
Samples & Batch QC Items	
CCV (Capping)	Level 3 Not to exceed12 hours.

11.0 Corrective Action

When an out-of-control situation occurs that is not delineated in this corrective action table or the corrective actions listed do not adequately address the circumstances, a Corrective Action Report (CAR) (NCM), etc., must be developed (see SOP BR-QA-016) and the analyst must use his/her best analytical judgment and available resources to determine the corrective action to be taken. The out-of-control situation may be caused by more than one variable. The analyst should seek the assistance of his/her immediate supervisor, QA manager or other experienced staff if they are uncertain of the cause of the out-of-control situation. The analysis must not be resumed until the source of the problem and an in-control status is re-established. All samples associated with the out-of-control situation must be reanalyzed after in-control status has been re-established or if authorization is received from the supervisor or QA Manager for release with data qualification.

12.0 Calculations / Data Reduction

12.1 Qualitative Identification

The default procedure will be to use only the quantitation and confirmation ions for identification and quantification of PCB congeners. Interference check ions will not be used routinely to evaluate peaks as PCB congeners unless specified in a client QAPP or agency requirement or the sample concentration is near a critical quantitation limit.

Examine the Selected Ion Current Profiles (SICP) for the internal standards. Confirm that the RT and response of the internal standards are within the acceptance criteria specified in the QC Summary. If the internal standard retention times have changed significantly or the peaks cannot be located, stop and analysis and correct the problem. Reanalyze any associated samples.

Evaluate the peaks for candidates to be identified as PCBs. A peak is tentatively identified as a PCB if:

- The peak falls within the retention time range bordered by the first and last eluting isomer of that chlorination level
- The quantitation and confirmation ions are present and the area ratios fall within the acceptance criteria in Table 5 and the peaks maximize within one scan of each other. Examine the data for the presence of a coeluting PCB of higher chlorination if both ions and the M-70 ions are present and the ratio does not fall within the acceptance limits.
- The calculated on-column amount must be greater then the MDL.
- At least one ion in the M-70 cluster must be present

Evaluate the internal standard and the surrogates to check for shifts in retention times and to evaluate for ISTD response and the surrogate recovery. The recovery criteria for surrogates are given in the TALS MLG.

Evaluate each peak that corresponds to a target compound. Observe the general appearance of the chromatogram for possible dilutions, matrix interferences, and the overall shapes of the peaks.

12.2 Quantitative Identification

The data system quantifies the concentration of the target compound based on the integrated abundance of the characteristic ion from the EICP using the equations given in Appendix B. If there is matrix interference with the primary ion, a secondary ion may be used for quantification by calculating a mean RF factor for that ion and using that ion to quantify the analyte in the sample. When secondary ion calculations are performed, initiate a nonconformance memo (NCM) to ensure the quantitation approach is reported in the project narrative.

This method reports the homologue group. As such, there may be multiple peaks identified that meet criteria. The individual peaks are summed to report a total for the homologue group.

12.3 Dilutions

Unless otherwise specified by a client QAPP, results from a single analysis are reported as long as the largest target analyte (when multiple analytes are present) is in the upper half of the calibration range.

For clients who require we provide lower detection limits, a general guide would be to report the dilution detailed above and one additional run at a dilution factor 1/10 of the dilution with the highest target in the upper half of the calibration curve. For example, if samples analyzed at a 1/50 dilution resulted in a target in the upper half of the calibration curve, the sample would be analyzed at a dilution factor of 1/5 to provide lower reporting limits.

Note: If samples are analyzed at a dilution factor of 1:6 or greater, report the surrogate result as 0%D, to denote a dilution above the Dilution Threshold. Control limits will not apply to samples analyzed at dilutions of 1:6 or greater.

12.4 Calculations

See Appendix B.

12.5 Troubleshooting

Troubleshooting: the following items can be checked in case of calibration, QC or instrument failures:

- Loss of sensitivity for higher boiling compounds and internal standards may be indicative of a leak at the inlet. Replace septa and/or re-tighten lower inlet connection.
- Carryover contamination may indicate empty rinse vials.

12.6 Data Review

12.7 Primary Review

Review the chromatography and quantitation in the data processing system to confirm quantitative and qualitative identification of each target analyte.

Upload the data files to TALS. Enter batch editor information and add the standards and reagents to the TALS batch. Review the results against acceptance criteria. If acceptance criteria are not met, make arrangements to perform corrective action.

Check the results of samples analyzed immediately after high concentration samples for signs of carry-over. Reanalyze the sample if carry over is suspected.

Dilute and reanalyze samples whose results exceed the calibration range. The diluted analysis should result in a determination within the upper half of the calibration curve.

Set results to primary, secondary, acceptable or rejected as appropriate.

Verify corrective action was taken for all results not within acceptance criteria. If corrective action is not taken, or was unsuccessful, record all instances where criteria are not met with a nonconformance memo (NCM). Be sure to provide explanation of your decision making in the internal comment section of the NCM. The internal comment section should list the reason the

NCM is suspected, which action (if any) was taken and why and the outcome of the action taken.

Review project documents such as the Project Plan (PP), Project Memo or any other document/process used to communicate project requirements to ensure those project requirements were met. If project requirements were not met, immediately notify the project manager (PM) to determine an appropriate course of action.

Set the batch to 1st level review.

12.8 Secondary Review

Review the project documents such as the Project Plan (PP), Project Memo or any other document/process used to communicate project requirements and verify project requirements were met. If project requirements were not met, immediately notify the project manager (PM) to determine an appropriate course of action.

Review the TALS batch editor to verify information is complete. Review the batch to verify that the procedures in this SOP were followed. If discrepancy is found, resolve the discrepancy and verify any modifications to the SOP are documented and approved.

Spot-check 15% of samples minimally in the batch to verify quantitative and qualitative identification.

If manual integrations were performed:

- Review each manual integration to verify that the integration is consistent and compliant with the requirements specified in corporate SOP CA-Q-S-002.
- Check to ensure an appropriate technical reason code is provided for each manual integration. Acceptable technical reason codes are provided in corporate SOP CA-Q-S-002.
- Generate a “before” and “after” chromatogram for every manual integration performed on an instrument performance check standard (Tune, ICAL, ICV, CCV), QC sample (MB, LCS) and for any manual integration performed on any surrogate or internal standard in any field sample.
- Generate the Manual Integration Summary Report. Document your review of manual integrations on the summary report and obtain any review signatures of integrations performed during secondary review as required.

  If the reviewer disagrees with the integration performed by the primary analyst, the secondary data reviewer should not change the integration. Instead, he/she should consult with the primary analyst that performed the integration and both the reviewer and the primary analyst should agree the integration should be changed. If consensus between the primary analyst and the peer reviewer cannot be achieved; both should consult with the Technical Manager or department management for resolution. Any changes to the integration should be performed by the primary analyst. If it is necessary for the secondary reviewer to perform the manual integration because the primary analyst is out of the office; the integration made by the peer reviewer must be reviewed by another peer reviewer or by department management to verify the integration was performed and documented in compliance to corporate SOP CA-Q-S-002. If the original analyst that performed the integration is out of the office, the data reviewer may consult with the Department Manager (DM), Department Supervisor (DS) or the Technical Manager (TM) to verify the change he/she thinks is needed is warranted and should be made.

Verify that the performance criteria for the QC items listed in Table 1 were met. If the results do not fall within the established limits verify that corrective actions were performed. If corrective action was not performed; verify the reason is provided and that the situation is properly documented with an NCM. Set samples to 2nd level review.

Run the QC checker and fix any problems found. Run and review the deliverable. Fix any problems found. When complete set the method chain to lab complete and forward any paperwork to report/project management.

12.9 Data Reporting

The report format, application of data qualifiers and creation of the data deliverable is performed by the LIMS using the formatter set by the project manager during log-in.

Records of electronic and hardcopy data are maintained as described in laboratory SOP BR-QA-014.

13.0 Method Performance

13.1 Method Detection Limit Study (MDL)

The method detection limit (MDL) is the lowest concentration that can be detected for a given analytical method and sample matrix with 99% confidence that the analyte is present. MDLs reflect a calculated (statistical) value determined under ideal laboratory conditions in a clean matrix, and may not be achievable in all environmental matrices. An initial method detection limit study is performed in accordance with SOP No. BR-QA-005. The laboratory maintains MDL studies for analyses performed; these are verified at least annually unless method or program requirements require a greater frequency.

13.2 Demonstration of Capabilities

All personnel are required to perform an initial demonstration of proficiency (IDOC) on the instrument they will be using for analysis prior to testing samples. On-going proficiency must be demonstrated annually. IDOCs and on-going proficiency demonstrations are conducted as follows.

13.2.1 Four aliquots of the QC check sample are analyzed using the same procedures used to analyze samples, including sample preparation. The concentration of the QC check sample can be equivalent to a mid- level calibration.

13.2.2 Calculate the average recovery and standard deviation of the recovery for each analyte of interest.

13.2.3 If any analyte does not meet the acceptance criteria, the test must be repeated. Only those analytes that did not meet criteria in the first test need to be evaluated. TNI 2016 requires consecutive passing results. Repeated failure for any analyte indicates the need for the laboratory to evaluate the analytical procedure and take corrective action.

13.2.4 Until the IDOC is approved by the QA Manager (or designee); the trainer and trainee must be identified in the batch record.

13.3 Training Requirements

The Group Leader is responsible for ensuring that this procedure is performed by an associate who has been properly trained in its use and has the required experience. A new analyst must be working under documented supervision prior to approval of the IDOC. Documentation that a new analyst is performing under supervision must be entered into the batch record (View Batch Information) until that analyst's IDOC has been approved by the QA Manager (or designee). See requirements for demonstration of analyst proficiency in SOP No. BR-QA-011.

14.0 Pollution Control

It is TestAmerica's policy to evaluate each method and look for opportunities to minimize waste generated (i.e., examine recycling options, ordering chemicals based on quantity needed, preparation of reagents based on anticipated usage and reagent stability). Employees must abide by the policies in Section 13 of the Environmental Health and Safety Manual (corporate SOP CW-E-M-001) for "Waste Management and Pollution Prevention."

15.0 Waste Management

Waste management practices are conducted consistent with all applicable rules and regulations. Excess reagents, samples and method process wastes are disposed of in an accepted manner. Waste description rules and land disposal restrictions are followed. Waste disposal procedures are incorporated by reference to BR-EH-001. The following waste streams are produced when this method is carried out.

- Vials containing sample extracts: Satellite container: 15 gallon bucket connected to a fume hood.
- Solvent Waste: Satellite container: 1 L glass bottle located in fume hood.

16.0 References / Cross-References

- TestAmerica Environmental Health and Safety Manual (CW-E-M-001)
- TestAmerica Burlington Addendum to the Environmental Health and Safety Manual
- *Method 680: Determination of Pesticides and PCBs in Water and Soils/Sediment by Gas Chromatography/Mass Spectrometry*. November 1985. Physical and Chemical Methods Branch, Environmental Monitoring and Support Laboratory, Office of Research and Development, USEPA, Cincinnati, OH

17.0 Method Modifications and Clarifications

- The reference method was written specifically for drinking water and source water samples; however, the laboratory may perform other types of water samples using this procedure.
- This SOP contains preparation and sample evaluation procedures for soils and tissues, which are not included in EPA Method 680. The holding times in use for soil(tissue?) samples (i.e., 14 days from collection to preparation and 40 days from preparation to analysis) have been adopted from EPA 8270 and associated prep methods.
- EPA SW-846 Update IV Chapter 4 re-defined the holding times for PCBs as "NONE". Additionally, the EPA Methods Update Rule re-defined holding times for PCBs as one year from collection to extraction and one year from extraction to analysis. Some states/agencies allow a 1 year holding time from collection to extraction, with 40 days extraction to analysis. Where allowed by the project, this extended holding time is incorporated by the laboratory via the use of HT-specific TALS methods.
- This procedure may be modified to analyze other matrices (e.g., waste samples) based on the needs of the client. This will need to be arranged by the Project Manager at the initiation of the project.
- Waste matrices are non-routine, and the laboratory is not certified for these matrices. The laboratory uses its routine soil RLs (converted for initial and final volumes, etc.), and soil QC limits to evaluate waste samples. Soil DOCs can be used to satisfy analyst demonstrations of capability for these types of non-routine matrices. Ottawa sand is used as the blank matrix for waste samples. The holding times in use for waste samples (i.e., one year from

collection to preparation and one year from preparation to analysis) have been adopted from the EPA Methods Update Rule (MUR).

- The method has been modified to include the use of a carbon-13 labeled analogue of decachlorobiphenyl (13C12-DCB) and tetrachloro-m-xylene as the surrogate in place of the labeled BHC and DDT compounds. 13C12-DCB can be subjected to the optional acid cleanup (the unlabeled analogue, decachlorobiphenyl, is routinely used in SW-846 Method 8082). A window-defining mix containing the first and last eluting isomers of each level of chlorination is used as an aid to establish and verify that the SIM windows are properly set.
- EPA Method 680 requires the analysis of a reagent blank (method blank) for each new batch of solvents or reagents. The laboratory only performs this with each batch of samples. EPA method 680 requires the analysis of a solvent blank (method blank without surrogates or internals) for each new batch of solvents or reagents in order to verify the solvent does not contain any impurities that could lead to “false positives”.
- EPA Method 680 uses both chrysene-d10 and phenanthrene-d10 as internal standards (and provides identification criteria for both). The laboratory only uses chrysene-d10 unless there is matrix interference.
- The default identification and quantitation procedure will be to use only the quantitation and confirmation ions for the PCB homologues. Interference check ions, as described in Section 11.2.3, will not be used routinely to evaluate peaks as PCB homologues unless specified in a client QAPP or agency requirement or the sample concentration is near a critical quantitation limit. Samples evaluated according to the default quantitation procedures may be slightly high biased.
- EPA Method 680 states that if samples are not going to be prepared within 72 hours the pH must be adjusted with NaOH or H2SO4 to a range of 5-9 and the preservation recorded (including volume used). The laboratory verifies sample pH prior to preparation, and adjusts the sample as needed into the 5-9 pH range at that time.

19.0 Revision History

Revision 1:

- Updated cover page signatures, dates, copyright info, and branding
- Throughout: minor typographical corrections and formatting updates
- Throughout: Updated headers and sections to include corporate formatting and language.

Revision 0:

- New SOP

Table 1: Primary Materials Used

Material	Hazards	Exposure Limit[1]	Signs and Symptoms of Exposure
Acetone	Flammable	1000ppm TWA	Inhalation of vapors irritates the respiratory tract. May cause coughing, dizziness, dullness, and headache.
Hexane	Flammable Irritant	500ppm TWA	Inhalation of vapors irritates the respiratory tract. Overexposure may cause lightheadedness, nausea, headache, and blurred vision. Vapors may cause irritation to the skin and eyes.
Methylene Chloride	Carcinogen Irritant	25ppm TWA 125ppm STEL	Causes irritation to respiratory tract. Has a strong narcotic effect with symptoms of mental confusion, light-headedness, fatigue, nausea, vomiting and headache. Causes irritation, redness and pain to the skin and eyes. Prolonged contact can cause burns. Liquid degreases the skin. May be absorbed through skin.

[1]Exposure limit refers to the OSHA regulatory exposure limit.

Table 2: Sample QC Recovery Limits

Sample QC Recovery Limits				
Surrogate Recovery				
	Tetrachloro-m-xylene		**Decachlorobiphenyl-13C12**	
	Lower Limit (%)	**Upper Limit (%)**	**Lower Limit (%)**	**Upper Limit (%)**
Soil/Tissue	30	130	10	134
Water	30	130	25	113
Laboratory Control Sample and Matrix Spike Recovery and RPD Limits				
	Soil/Tissue		**Water**	
	Lower Limit (%)	**Upper Limit (%)**	**Lower Limit (%)**	**Upper Limit (%)**
Monochlorobiphenyls	30	130	42	130
Dichlorobiphenyls	30	130	49	130
Trichlorobiphenyls	30	130	51	130
Tetrachlorobiphenyls	40	140	54	130
Pentachlorobiphenyls	40	140	63	130
Hexachlorobiphenyls	40	140	62	130
Heptachlorobiphenyls	40	140	62	130
Octachlorobiphenyls	40	140	64	130
Nonachlorobiphenyls	30	130	70	195
Decachlorobiphenyl	30	130	59	130
RPD Limits:	50		40	

Table 3: Routine QC Summary, Frequency, Acceptance Criteria and Recommended Corrective Action

QC Item	Frequency	Criteria	Corrective Action
Clock Time	12 hours	Clock time starts with the injection of the DFTPP. Analysis of samples and QC items must conclude within expiration of clock time. Subsequent analysis requires new DFTPP.	Not applicable
Tune (DFTPP)	At beginning of each clock	See Table 4	Re-analyze, retune mass spectrometer
Initial Calibration (ICAL)	Upon instrument set-up, and after unsuccessful CCV	Minimum of 5 calibration points. Meets mid-Level Standard Performance Criteria. %RSD < 20%.	Correct problem and repeat calibration.
Performance Criteria	Each mid-level standard	Mass abundance ratios of all calibration congeners within acceptance range (see attachment XXX). Baseline separation of PCB congener #87 from congeners #154 and #77. Signal-to-noise ratio of >=5 for decachlorobiphenyl ion 499 and chrysene-d12 ion 241. Decachlorobiphenyl mass abundance: mass 500 >=70% but <=95% of mass 498	Recalibrate, performing maintenance as necessary.
Initial Calibration Verification (ICV)	After each ICAL	%D<20	Correct problem and verify second source standard. If that fails, repeat initial calibration.
Continuing Calibration Verification (CCV)	12 hours, following instrument tune and Window Defining Mix	%D<20%	Re-prepare standard and re-analyze once, if still outside criteria perform corrective action, sequence can be re-started if two successive CCVs at different concentrations pass, otherwise repeat ICAL and all associated samples since last successful CCV, unless CCV is high and samples are non-detects.
Instrument Blank (ICB/CCB)	After ICV and every CCV	<1/2RL	Terminate the analysis, correct problem and reanalyze the previous 10 samples.
Internal Standards (ISTD)	Spiked in all standards, samples, and batch QC items	Area ± 50% of ICAL or ± 30% of previous CCV	Evaluate chromatogram, spectra, and integrations. Reanalyzed extract to confirm. Perform instrument maintenance as necessary. if sufficient sample is available, initiate a Re-extract request.

Surrogate Compounds	All samples and batch QC item.	See Table 2	Evaluate chromatogram, spectra, and integrations; Reanalyze extracts(s); Re-extract and reanalyze if sufficient sample available
Method Blank (MB)	One per extraction batch	<1/2RL	Examine project DQO's and take appropriate corrective action, which may include re-analysis of MB, re-extraction of batch, and/or non-conformance report (NCR). Corrective action must be documented on NCR. If there are no detects in samples, or if all detects are > 10 X MB level, re-prep and reanalysis may not be required.
Laboratory Control Sample (LCS)	One per extraction batch	See Table 2	Examine project DQO's and take appropriate corrective action, which may include re-analysis of LCS, re-extraction of batch, and/or non-conformance memo (NCM). Corrective action must be documented on NCM. Flag all reported values outside of control limits.
Laboratory Control Sample Duplicate (LCSD)	One per extraction batch, when insufficient sample is provided for MS/MSD/SD	See Table 2	Examine project DQO's and take appropriate corrective action, which may include re-analysis of LCSD, re-extraction of batch, and/or non-conformance report (NCR). Corrective action must be documented on NCR. Flag all reported values outside of control limits.
Matrix Spike (MS)/Matrix Spike Duplicate (MSD)	One per extraction batch	See Table 2	Evaluate data and determine if a matrix effect or analytical error is indicated. If analytical error, re-analyze and/or re-extract. Flag all reported values outside of control limits.

Table 4: DFTPP Key Ions and Abundance Criteria

m/z	Ion Abundance Criteria
127	40-60% of mass 198
197	<1.0% of mass 198
198	Base peak, 100% relative abundance
199	5-9% of mass 198
275	10-30% of mass 198
365	>1% of mass 198
441	Present but less than mass 443
442	>40% of mass 198
443	17-23% of mass 442

$^{13}C_{12}$-DCB (surrogate)	510	512					

Appendix A: Standard Preparation Tables

The standard formulations contained in this Appendix are recommended and are subject to change. If the concentration of the stock standard is different than those noted in this table, adjust the standard preparation formulation accordingly. Depending on the extraction solvent, repare the standard solutions in methylene chloride or hexane using Class A volumetric glassware and Hamilton syringes. Unless otherwise specified for a standard solution, assign an expiration date of 1 year from date of preparation unless the parent standard expires sooner in which case use the earliest expiration date. See laboratory SOP BR-QA-002 *Reagents & Standards Handling* for further guidance.

Appendix B: Equations

Equation 1: Relative Response Factor Calculation

$$RRF = \frac{A_x}{A_{is}} \times \frac{C_{is}}{C_x}$$

Where:
A_X = Area of the characteristic ion for the compound to be measured (Table 6).
A_{is} = Area of the characteristic ion for specified internal standard (Table 5).
C_{is} = Amount of the internal standard injected (ng).
C_x = Amount of the target compound or DMC injected (ng).

Equation 2: Mean Relative Response Factor Calculation

$$\overline{RRF} = \frac{\sum_{i=1}^{n} RRF_i}{n}$$

Where:
n = The number of calibration standards

Equation 3: Percent Relative Standard Deviation Calculation

$$\%RSD = \frac{Standard\ Deviation}{Mean} \times 100$$

$$Standard\ Deviation = \sqrt{\frac{\sum_{i=1}^{n} \left(x_i - \bar{x}\right)^2}{n-1}}$$

Where:
x_i = Each individual value used to calculate the mean
$\bar{x}$ = The mean of n values
n = The total number of values

Equation 4: Relative Response Factor Percent Difference Calculation

$$\%Difference_{RRF} = \frac{RRF_C - \overline{RRF_i}}{\overline{RRFi}} x100$$

Where:
$\overline{RRF_i}$ = Mean Relative Response Factor from the most recent initial calibration meeting technical acceptance criteria
RRF_c = Relative Response Factor from CCV standard.

Equation 6: Percent Moisture Calculation

$$\%Moisture = \frac{grams\ of\ wet\ sample - grams\ of\ dry\ sample}{grams\ of\ wet\ sample} \times 100$$

Company Confidential & Proprietary

Equation 7: Relative Retention Time Calculation

$$Relative\,Retention\,Time(RRT) = \frac{Retention\,Time_{compound}}{Retention\,Time_{internal\ standard}}$$

Equation 8: GPC Factor Calculation

$$GPC\ Factor\ (GPC) = \frac{Volume_{in}}{Volume_{out}}$$

Equation 9: Concentration of Water Samples Calculation

$$Concentration\ ug/L = \frac{(A_x)(I_s)(V_t)(DF)(GPC)}{(A_{is})(\overline{RRF})(V_o)(V_i)}$$

Where:
A_x = Area of the characteristic ion for the compound to be measured.
A_{is} = Area of the characteristic ion for the internal standard.
I_s = Amount of internal standard injected in nanograms (ng).
V_o = Volume of water extracted in milliliters (mL).
V_i = Volume of extract injected in microliters (µL).
V_t = Volume of the concentrated extract in microliters (µL)
$\overline{RRF}$ = Mean Relative response factor determined from the initial calibration standard.
DF = Dilution Factor (If no dilution is performed, DF = 1.0)
GPC = GPC Factor (If no GPC cleanup is performed, GPC = 1.0)

Equation 10: Concentration of Soil and Sediment Samples Calculation

$$Concentration\ ug/Kg\ (Dry\ Weight\ Basis) = \frac{(A_x)(I_s)(V_t)(DF)(GPC)}{(A_{is})(\overline{RRF})(V_i)(W_s)(D)}$$

Where:
A_x = Area of the characteristic ion for the compound to be measured.
A_{is} = Area of the characteristic ion for the internal standard.
I_s = Amount of internal standard injected in nanograms (ng).
W_s = Weight of sample extracted in grams (g)
V_i = Volume of extract injected in microliters (µL).
V_t = Volume of the concentrated extract in microliters (µL)
$\overline{RRF}$ = Mean Relative response factor determined from the initial calibration standard.
DF = Dilution Factor (If no dilution is performed, DF = 1.0)
D = $\frac{100 - \%Moisture}{100}$
GPC = GPC Factor (If no GPC cleanup is performed, GPC = 1.0)

Equation 11: Adjusted LOQ Calculations for Water Samples

$$Adjusted\ LOQ = LOQ \times \frac{(V_x)(V_t)(DF)}{(V_o)(V_c)}$$

Where:
LOQ = The LOQ value reported in Table 1 (µg/L)
V_x = Routine sample volume (1000mL)
V_o = Volume of water extracted in milliliters (mL).
V_t = Volume of the concentrated extract in microliters (µL)
V_c = Routine concentrated extract volume (1000 µL)
DF = Dilution Factor (If no dilution is performed, DF = 1.0)

Equation 12: Adjusted LOQ Calculations for Soil and Sediment Samples

$$Adjusted\ LOQ = LOQ \times \frac{(W_x)(V_t)(DF)}{(W_s)(V_c)(D)}$$

Where:
LOQ = The LOQ value reported in Table 1 (µg/Kg)
W_x = Routine sample weight (40g)
W_s = Weight of sample extracted in grams (g)
V_c = Routine concentrated extract volume (2000 µL)
V_t = Volume of the concentrated extract in microliters (µL)
D = $\frac{100 - \%Moisture}{100}$
DF = Dilution Factor (If no dilution is performed, DF = 1.0)

Equation 13: LCS and Surrogate Percent Recovery Calculation

$$\%\ Recovery = \frac{SSR}{SA} \times 100$$

Where:
SSR = Spike Sample Result
SA = Spike Added

Equation 14: Matrix Spike Percent Recovery Calculation

$$\%\ Recovery = \frac{SSR - SR}{SA} \times 100$$

Where:
SSR = Spike Sample Result
SR = Sample Result
SA = Spike Added

Equation 16: Relative Percent Difference Calculation

$$RPD = \frac{|MSR - MSDR|}{\frac{1}{2}(MSR + MSDR)} \times 100$$

Where:

RPD = Relative Percent Difference
MSR = Matrix Spike Recovery
MSDR = Matrix Spike Duplicate Recovery

3.0 INTRODUCTION, SCOPE AND APPLICABILITY

3.1 Introduction and Compliance References

Eurofins TestAmerica Burlington's Quality Assurance (QA) Manual is a document prepared to define the overall policies, organization objectives and functional responsibilities for achieving the laboratory's QA Program. Governing SOPS are in place within the organization to ensure the proper execution of this QA Manual (refer to Appendix 1). This manual and referenced documents are required reading for all personnel.

The laboratory is a team of people who work together to serve the health and environmental needs of society through science and technology. We offer comprehensive expertise in environmental laboratory applications and client relations and maintain a national perspective in terms of quality.

As such, this QA Manual has been prepared to assure compliance with The NELAC Institute (TNI) Standard, dated 2009 and 2016; ISO/IEC Guide 17025:2005 and 2017; and the Department of Defense (DoD)/Department of Energy (DOE) Quality Systems Manaual (QSM). Policies and procedures listed in Appendix 1 are compliant with the National Divisional Support Center (NDSC) Quality Management Plan (QMP) for Eurofins TestAmerica; Eurofins (define) and the various accreditation and certification programs which are held by the laboratory to support environmental work (Appendix 2). The QMP provides a summary of Eurofins TestAmerica's quality and data integrity system. It contains requirements and general guidelines under which all Eurofins TestAmerica facilities shall conduct their operations.

Refer to Appendix 3 for a list of additional references for which this QA Manual is compliant; and Appendix 4 for the compliance crosswalk of this manual to the TNI & ISO/IEC Guide 17025 requirements.

3.2 Terms and Definitions

A QA Program is a system designed to ensure that data produced by the laboratory conforms to the standards set by state and/or federal regulations. The program functions at the local management level through company goals, from guidance at the executive management level, and at the analytical level through Standard Operating Procedures (SOPs) and quality control. Our program is designed to minimize systematic error, encourage constructive, documented problem solving, and provide a framework for continuous improvement within the organization to better serve our clients.

Refer to Appendix 5 for a list of Terms and Acronyms.

3.3 Scope / Fields of Testing

The laboratory analyzes a broad range of environmental and industrial samples. Sample matrices vary among air, drinking water, effluent water, groundwater, hazardous waste, sludge and soils. The QA Program contains specific procedures and methods to test samples of differing matrices for chemical, physical and biological parameters. The Program also contains guidelines on maintaining documentation of analytical processes, reviewing results, servicing clients and tracking samples through the laboratory. The technical and service requirements of all analytical requests are thoroughly evaluated before commitments are made to accept the work. Measurements are made using published reference methods or methods developed and validated by the laboratory.

The methods covered by this manual include the most frequently requested methodologies needed to provide analytical services in the United States and its territories. The specific list of test methods used by the laboratory can be found in the Laboratory Information Management System (TALS). Our areas of expertise include:

Standard Services	Specialty Services
• Volatiles • Semivolatiles • Metals • Pesticides/PCBs • Petroleum Hydrocarbons • Waste Characterization • Non-Potable Water Testing • Drinking Water Testing • Soil and Surface Water Testing • Vapor and Air Analysis • Sediment and Tissue Testing • Method Development	• Perchlorate • 1,4-Dioxane • Perchlorate • PCB Congeners • Explosives • Alkyl PAHs, Alkanes, Biomarkers • PFAS • CLP methodologies

NOTE: **All current certificates and scopes of accreditation are available on the laboratory's website at www.testamericainc.com**

The approach of this manual is to define the minimum level of quality assurance and quality control necessary to meet these requirements. All methods performed by the laboratory shall meet these criteria as appropriate. In some instances, quality assurance project plans (QAPPs), project specific data quality objectives (DQOs) or local regulations may require criteria other than those contained in this manual. In these cases, the laboratory will abide by the requested criteria following review and acceptance of the requirements by the Laboratory President, Laboratory Vice-President, Director of Operations, Laboratory Director and and the Quality Assurance (QA) Manager. In some cases, QAPPs and DQOs may specify less stringent requirements. The Laboratory President, Laboratory Vice-President, Director of Operations, Laboratory Director and the QA Manager must determine if it is in the lab's best interest to follow the less stringent requirements.

3.4 Management of the Manual

3.4.1 Review Process

The template on which this manual is based is reviewed annually by Eurofins National Divisional Support Center (NDSC) which houses the Quality Assurance leadership team for Eurofins Environment Testing America. NDSC QA will assure that the template remains in compliance with Section 3.1. This manual itself is reviewed every two years and annually for DoD/DOE Lab, by senior laboratory management to assure that it reflects current practices and meets the requirements of the laboratory's clients and regulators as well as the QMP. Occasionally, the manual may need changes in order to meet new or changing regulations and operations. The QA Manager will review the changes in the normal course of business and incorporate changes into revised sections of the document. All updates will be reviewed by the senior laboratory management staff. The laboratory updates and approves such changes according to our Document Control & Updating procedures (refer to SOP BR-QA-003, Document Control).

4.0 MANAGEMENT REQUIREMENTS

4.1 Overview

The laboratory is a local operating unit of Eurofins Environment Testing America. The laboratory's operational and support staff have the day-to-day independent operational authority under the direction of the Laboratory President, Laboratory Vice-President, Director of Operations, Laboratory Director and is supported by the NDSC QA team. The laboratory management staff includes managers and group supervisors. The organizational chart of the management staff are presented in Figure 4-1. Individual departmental staff lists are maintained in the laboratory's internal intranet.

4.2 Roles and Responsibilities

In order for the QA Program to function properly, all members of the staff must clearly understand and meet their individual responsibilities as they relate to the quality program. The responsibility for quality resides with every employee of the laboratory. All employees have access to the QA Manual, are trained to this manual, and are responsible for upholding the standards therein. Each person carries out his/her daily tasks impartially and in a manner consistent with the goals and in accordance with the procedures in this manual and the laboratory's SOPs. The following descriptions briefly define each role in its relationship to the Quality Assurance Program.

4.2.1 Vice President of Quality and Environmental Health and Safety (VP-QA/EHS)

The Vice President (VP) of QA/EHS reports directly to Eurofins Environment Testing America Chief Operating Officer (COO). With the aid of the NDSC Quality Team Members, Business Unit Managers, Laboratory Directors, the VP-QA/EHS has the responsibility for the establishment, general overview and maintenance of the Quality Assurance and EH&S Programs within Eurofins Environment Testing America. Additional responsibilities include:

- Review of QA/QC and EHS aspects of NDSC Official Document national projects and expansions or changes in services.
- Work with various organizations outside of the laboratory to further the development of quality standards and represent the laboratory at various trade meetings.
- Prepare monthly reports for quality and EH&S metrics across the environmental testing laboratories and a summary of any quality and EH&S related initiatives and issues.
- With the assistance of the Executive Management, and the EHS Managers, maintenance and implementation of the Eurofins Environment Testing America Environmental, Health and Safety Program.

4.2.2 Quality Directors

There are four (4) Quality Directors within NDSC that report directly to the VP-QA/EHS. These Quality Directors have oversight of the general overview and maintenance of the QA Program within the Eurofins Environment Testing America laboratories. Supported tasks include:

- Monitors laboratory internal audit findings;
- Identifies common laboratory weaknesses and monitors corrective action closures.

- Develops NDSC quality guidance documents and management tools for ensuring and improving compliance;
- Monitors and communicates DoD/DoE requirements;
- Monitors and communicates regulatory and certification requirements;
- Training and OnBoarding
- Laboratory assessments, mentoring, and interventions
- Track/drive root cause investigations and corrective action plans
- Builds knowledge base for preventive actions

4.2.3 Quality Information Manager

The Quality Information works directly with the NDSC Quality Directors and EHS Managers; and reports directly to the VP-QA/EHS. The Quality Information Manager is responsible for the management of:

- NDSC Official Documents
- TALS/LIMS Certification Module Data
- Company's Intranet website
- Company's Regulatory Limits Database
- Subcontract laboratory and approved vendor information
- Internal and External client support for various company groups (e.g., Client Services, EH&S, Legal, IT, Sales) for both quality and operational functions
- Communicate regulatory information and lists

4.2.4 Environmental Health and Safety (EH&S) Managers

There are 3 EH&S Managers within NDSC that report directly to the VP-QA/EHS. These EH&S Managers have oversight of the general overview and maintenance of the EH&S Program within the Eurofins Environment Testing America laboratories. Supported tasks include:

- Consolidation and tracking all safety and health-related information and reports for the company, and managing compliance activities for Eurofins Environment Testing America locations.
- Coordination/preparation of the Environmental, Health and Safety Manual Template that is used by each laboratory to prepare its own laboratory-specific Safety Manual/ CHP.
- Preparation of information and training materials for laboratory EHS Coordinators.
- Assistance in the coordination of employee exposure and medical monitoring programs to insure compliance with applicable safety and health regulations.
- Serving as Department of Transportation (D.O.T.) focal point and providing technical assistance to location management.
- Serving as Hazardous Waste Management main contact and providing technical assistance to location management.

4.2.5 Ethics and Compliance Officers (ECOs)

The NDSC VP-QA/EHS and Corporate Counsel are designated Ethics and Compliance Officer (ECO). Each ECO acts as a back-up to the other ECO and both are involved when data investigations occur. Each ECO has a direct line of communication to the entire executive management personnel and lab management staff.

The ECOs monitor and audit procedures to determine compliance with policies and to make recommendations for policy enhancements to the President, COO, Laboratory Director or other appropriate individuals within the laboratory. The ECO will assist the laboratory QA Manager in the coordination of internal auditing of ethical policy related activities and processes within the laboratory, in conjunction with the laboratory's regular internal auditing function.

The ECOs will also participate in investigations of alleged violations of policies and work with the appropriate internal departments to investigate misconduct, remedy the situation, and prevent recurrence of any such activity.

4.2.6 Laboratory Director

The Laboratory Director is responsible for the overall quality, safety, financial, technical, human resource and service performance of the whole laboratory and reports to their business unit President. The Laboratory Director is also responsible for any service centers connected with their laboratory that perform analytical tests, such as short holding time analyses for pH. The Laboratory Director provides the resources necessary to implement and maintain an effective and comprehensive Quality Assurance and Data Integrity Program.

Specific responsibilities include, but are not limited to:

- Provides one or more technical managers for the appropriate fields of testing. If the Technical Manager is absent for a period of time exceeding 15 consecutive calendar days, the Laboratory Director must designate another full time staff member meeting the qualifications of the Technical Manager to temporarily perform this function. If the absence exceeds 35 consecutive calendar days, the primary accrediting authority must be notified in writing.
- Ensures that all analysts and supervisors have the appropriate education and training to properly carry out the duties assigned to them and ensures that this training has been documented. Works with Eurofins Environment Testing Human Resources for hiring of new personnel.
- Ensures that personnel are free from any commercial, financial and other undue pressures which might adversely affect the quality of their work.
- Ensures company human resource policies are adhered to and maintained.
- Ensures that sufficient numbers of qualified personnel are employed to supervise and perform the work of the laboratory. Assesses laboratory capacity and workload.
- Ensures that appropriate corrective actions are taken to address analyses identified as requiring such actions by internal and external performance or procedural audits. Procedures that do not meet the standards set forth in the QA Manual or laboratory SOPs may be temporarily suspended by the Laboratory Director.
- Reviews and approves all SOPs prior to their implementation and ensures all approved SOPs are implemented and adhered to.

- Pursues and maintains appropriate laboratory certification and contract approvals. Supports ISO 17025 requirements.
- Ensures client specific reporting and quality control requirements are met.
- Contributes to the continuous improvement of the laboratory operations.
- Maintains an awareness of technical developments and regulatory requirements.
- Captains the management team, consisting of the QA Manager, the Technical Manager, and the Operations Manager as direct reports.

4.2.7 Quality Assurance (QA) Manager or Designee

The QA Manager has responsibility and authority to ensure the continuous implementation of the quality system at the laboratory where they work. The QA Manager is also responsible for any service centers connected with their laboratory that perform analytical tests, such as short holding time analyses for pH.

The QA Manager reports directly to the Laboratory Director and their NDSC Quality Director. This position is able to evaluate data objectively and perform assessments without outside (e.g., managerial) influence. The NDSC QA Team may be used as a resource in dealing with regulatory requirements, certifications and other quality assurance related items. The QA Manager directs the activities of the QA office to accomplish specific responsibilities, which include, but are not limited to:

- Serves as the focal point for QA/QC in the laboratory.
- Have functions independent from laboratory operations for which he/she has quality assurance oversight.
- Have documented training and/or experience in QA/QC procedures and the laboratory's Quality System.
- Have a general knowledge of the analytical test methods for which data audit/review is performed (and/or having the means of getting this information when needed).
- Arrange for or conducting internal audits on quality systems and the technical operation
- Notifying laboratory management of deficiencies in the quality system and ensuring corrective action is taken. Procedures that do not meet the standards set forth in the QA Manual or laboratory SOPs shall be investigated following procedures outlined in Section 14 and if deemed necessary may be temporarily suspended during the investigation.
- Maintaining and updating the QA Manual.
- Monitoring and evaluating laboratory certifications; scheduling proficiency testing samples.
- Monitoring and communicating regulatory changes that may affect the laboratory to management.
- Training and advising the laboratory staff on quality assurance/quality control procedures that are pertinent to their daily activities.
- The laboratory QA Manager will maintain records of all ethics-related training, including the type and proof of attendance.
- Maintain, improve, and evaluate the corrective action database and the corrective and preventive action systems.

- Objectively monitor standards of performance in quality control and quality assurance without outside (e.g., managerial) influence.
- Coordinating of document control of SOPs, MDLs, control limits, and miscellaneous forms and information.
- Performing technical data audits and method audits to ensure consistency and compliance with regulatory requirements.
- Review of external audit reports and data validation requests.
- Follow-up with audits to ensure client QAPP requirements are met.
- Establishment of reporting schedule and preparation of various quality reports for the Laboratory Director, clients and/or NDSC QA Team.
- Development of suggestions and recommendations to improve quality systems.
- Research of current state and federal requirements and guidelines.
- Participate in the vendor and supplier approval process, including subcontractors.
- Captains the QA team to enable communication and to distribute duties and responsibilities.
- Communication to the relevant regulatory authorities when there are management or facility changes that impact the laboratory.
- Ensuring communication & monitoring standards of performance to ensure that systems are in place to produce the level of quality as defined in this document.
- Evaluation of the thoroughness and effectiveness of training.
- Compliance with ISO 17025
- Compliance with the DoD/DOE QSM**.** (where applicable)

4.2.8 Technical Manager or Designee

The Technical Manager report directly to the Laboratory Director. He/she is accountable for all analyses and analysts under their experienced supervision and for compliance with the ISO 17025:2017 Standard. The scope of responsibility ranges from the new-hire process and existing technology through the ongoing training and development programs for existing analysts and new instrumentation. Specific responsibilities include, but are not limited to:

- Exercises day-to-day supervision of laboratory operations for the appropriate field of accreditation and reporting of results. Coordinating, writing, and reviewing preparation of all test methods, i. e., SOPs, with regard to quality, integrity, regulatory and optimum and efficient production techniques, and subsequent analyst training and interpretation of the SOPs for implementation and unusual project samples. He/she insures that the SOPs are properly managed and adhered to at the bench. He/she develops standard costing of SOPs to include supplies, labor, overhead, and capacity (design vs. demonstrated versus first-run yield) utilization.
- Reviewing and approving, with input from the QA Manager, proposals from marketing, in accordance with an established procedure for the review of requests and contracts. This procedure addresses the adequate definition of methods to be used for analysis and any limitations, the laboratory's capability and resources, the client's expectations. Differences are resolved before the contract is signed and work begins. A system documenting any

significant changes is maintained, as well as pertinent discussions with the client regarding their requirements or the results of the analyses during the performance of the contract. All work subcontracted by the laboratory must be approved by the client. Any deviations from the contract must be disclosed to the client. Once the work has begun, any amendments to the contract must be discussed with the client and so documented.

- Monitoring the validity of the analyses performed and data generated in the laboratory. This activity begins with reviewing and supporting all new business contracts, insuring data quality, analyzing internal and external non-conformances to identify root cause issues and implementing the resulting corrective and preventive actions, facilitating the data review process (training, development, and accountability at the bench), and providing technical and troubleshooting expertise on routine and unusual or complex problems.
- Providing training and development programs to applicable laboratory staff as new hires and, subsequently, on a scheduled basis. Training includes instruction on calculations, instrumentation management to include troubleshooting and preventive maintenance.
- Enhancing efficiency and improving quality through technical advances and improved LIMS utilization. Capital forecasting and instrument life cycle planning for second generation methods and instruments as well as asset inventory management.
- Coordinating sample management from “cradle to grave,” insuring that no time is lost in locating samples.
- Scheduling all QA/QC-related requirements for compliance, e.g., MDLs, etc.
- Captains department personnel to communicate quality, technical, personnel, and instrumental issues for a consistent team approach.
- Coordinates audit responses with the QA Manager.
- Compliance with ISO 17025.
- Compliance with the DoD/DOE QSM. (where applicable)

4.2.9 Operations Manager

The Operations Manager manages and directs the analytical production sections of the laboratory. He/She reports directly to the Laboratory Director. He/she assists the Technical Manager in determining the most efficient instrument utilization. More specifically, he/she:

- Evaluates the level of internal/external non-conformances for all departments.
- Continuously evaluates production capacity and improves capacity utilization.
- Continuously evaluates turnaround time and addresses any problems that may hinder meeting the required and committed turnaround time from the various departments.
- Develops and improves the training of all analysts in cooperation with the Technical Manager and QA Manager and in compliance with regulatory requirements.
- Works with the Preventive Maintenance Coordinator to ensure that scheduled instrument maintenance is completed.
- Is responsible for efficient utilization of supplies.
- Constantly monitors and modifies the processing of samples through the departments.

- Fully supports the quality system and, if called upon in the absence of the QA Manager, serves as his substitute in the interim.

4.2.10 Project Manager (PM)

Members of the laboratory Client Services/Project Management Group are responsible for organizing and managing client projects. Clients are assigned a project manager who serves as their primary contact at the laboratory. It is the PM's responsibility to act as the client advocate by communicating client requirements to laboratory personnel and ensuring that clients provide complete information needed by the laboratory to meet those requirements – including all verbal communications.

With the overall goal of total client satisfaction, the functions of this position are outlined below:

- Scheduling sample submissions, sample container orders and sample pick-up via the laboratory courier service.
- Confirming certification status
- Coordinating and communicating turnaround time (TAT) requirements for high priority samples/projects.
- Answering common technical questions, facilitating problem resolution and coordinating technical details with the laboratory staff.
- Ensuring that client specifications, when known, are met by communicating project and quality assurance requirements to the laboratory.
- Notifying the supervisors of incoming projects and sample delivery schedules.
- Accountable to clients for communicating sample status reports or results prior to receipt of the final report.
- Monitor the status of all data package projects in-house to ensure timely and accurate delivery of reports.
- Inform clients of data package-related problems and resolve service issues.

4.2.11 Department Supervisors

Supervisors report to the Operations Manager. Each one is responsible to:

- Ensure that analysts in their department adhere to applicable SOPs and the QA Manual. They perform frequent SOP and QA Manual review to determine if analysts are in compliance and if new, modified, and optimized measures are feasible and should be added to these documents.
- With regard to analysts, participates in the selection, training (as documented in Section 5.3), development of performance objectives and standards of performance, appraisal (measurement of objectives), scheduling, counseling, discipline, and motivation of analysts and documents these activities in accordance with systems developed by the QA and Personnel Departments. They evaluate staffing sufficiency and overtime needs. Training consists of familiarization with SOP, QC, Safety, and computer systems.

- Encourage the development of analysts to become cross-trained in various methods and/or operate multiple instruments efficiently while performing maintenance and documentation, self-supervise, and function as a department team.
- Provide guidance to analysts in resolving problems encountered daily during sample prep/analysis in conjunction with the Technical Manager, Operations Manager, and/or QA Manager. Each is responsible for 100% of the data review and documentation, non-conformance and *CPAR* issues, the timely and accurate completion of performance evaluation samples and MDLs, for his department.
- Ensure all logbooks are maintained, current, and properly labeled or archived.
- Report all non-conformance conditions to the QA Manager, Technical Manager, Operations Manager, and Laboratory Director.
- Ensure that preventive maintenance is performed on instrumentation as detailed in the QA Manual or SOPs. He/she is responsible for developing and implementing a system for preventive maintenance, troubleshooting, and repairing or arranging for repair of instruments.
- Maintain adequate and valid inventory of reagents, standards, spare parts, and other relevant resources required to perform daily analysis.
- Achieve optimum turnaround time on analyses and compliance with holding times.
- Conduct efficiency and cost control evaluations on an ongoing basis to determine optimization of labor, supplies, overtime, first-run yield, capacity (designed vs. demonstrated), second- and third-generation production techniques/instruments, and long-term needs for budgetary planning.
- Develop, implement, and enhance calibration programs.
- Provide written responses to external and internal audit issues.

4.2.12 Laboratory Analysts

Laboratory analysts are responsible for conducting analysis and performing all tasks assigned to them by the group leader or supervisor. The responsibilities of the analysts are listed below:

- Perform analyses by adhering to analytical and quality control protocols prescribed by current SOPs, this QA Manual, and project-specific plans honestly, accurately, timely, safely, and in the most cost-effective manner.
- Document standard and sample preparation, instrument calibration and maintenance, data calculations, sample matrix effects, and any observed non-conformance on worklists, benchsheets, lab notebooks and/or the Non-Conformance Database.
- Report all non-conformance situations, instrument problems, matrix problems and QC failures, which might affect the reliability of the data, to their supervisor, the Technical Manager, and/or the QA Manager or member of QA staff.
- Perform 100% review of the data generated prior to entering and submitting for secondary level review.
- Suggest method improvements to their supervisor, the Technical Manager, and the QA Manager. These improvements, if approved, will be incorporated. Ideas for the optimum

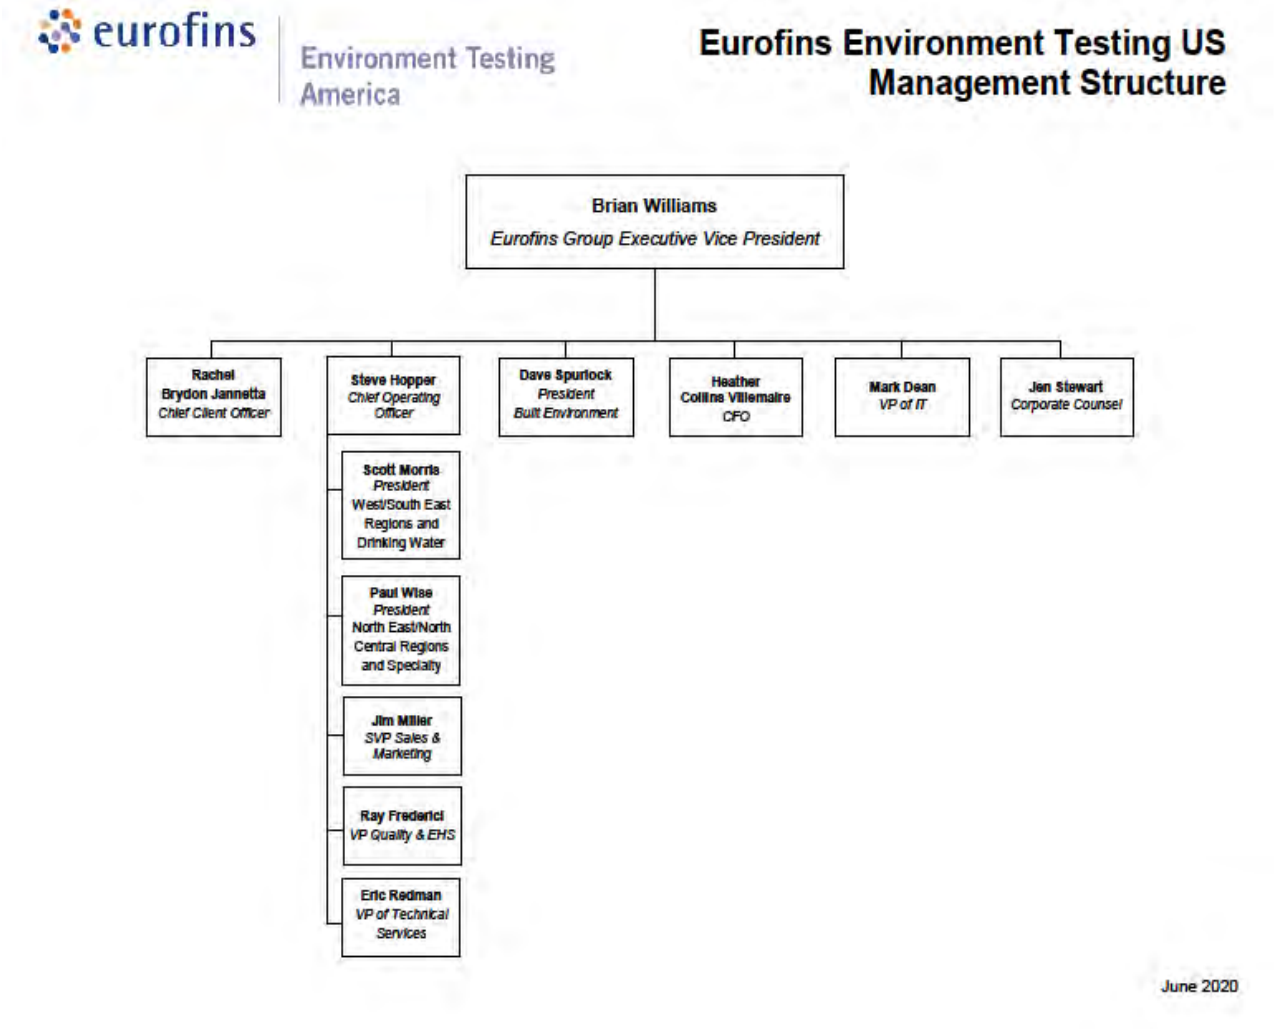
performance of their assigned area, for example, through the proper cleaning and maintenance of the assigned instruments and equipment, are encouraged.

- Work cohesively as a team in their department to achieve the goals of accurate results, optimum turnaround time, cost effectiveness, cleanliness, complete documentation, and personal knowledge of environmental analysis.

4.2.13 Environmental Health and Safety Coordinator

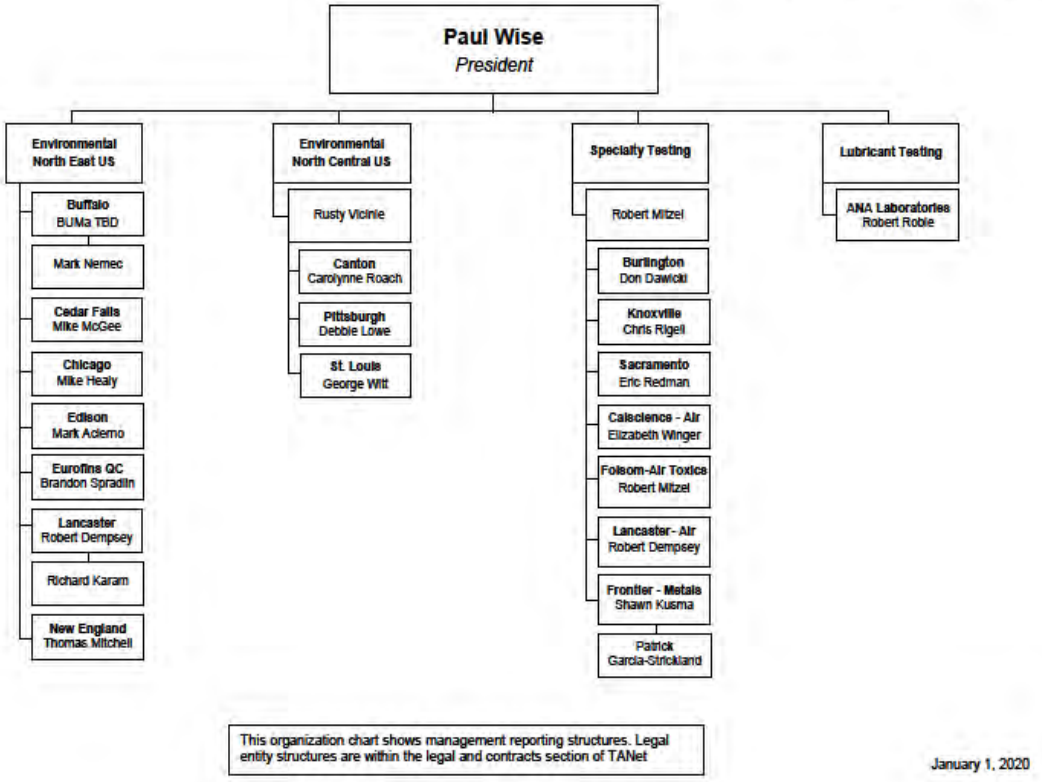
The Environmental Health and Safety Coordinator (EHSC) reports to the Laboratory Director and the Region NDSC Environmental Health and Safety Manager and ensures that systems are maintained for the safe operation of the laboratory. The EHSC is responsible to:

- Conduct ongoing, necessary safety training and conduct new employee safety orientation.
- Assist in developing and maintaining the Chemical Hygiene/Safety Manual.
- Administer dispersal of all Material Safety Data Sheet (MSDS) information.
- Perform regular chemical hygiene and housekeeping instruction.
- Give instruction on proper labeling and practice.
- Serve as chairman of the laboratory safety committee.
- Provide and train personnel on protective equipment.
- Oversee the inspection and maintenance of general safety equipment – fire extinguishers, safety showers, eyewash fountains, etc. and ensure prompt repairs as needed.
- Supervise and schedule fire drills and emergency evacuation drills.
- Determine what initial and subsequent exposure monitoring, if necessary to determine potential employee exposure to chemicals used in the laboratory.
- When determined necessary, conduct exposure monitoring assessments.
- Determine when a complaint of possible over-exposure is “reasonable” and should be referred for medical consultation.
- Assist in the internal and external coordination of the medical consultation/monitoring program conducted by Euronfins TestAmerica’s medical consultants.



4.3 Business Continuity and Contingency Plans

Various policies and practices are in place to address continuity of business and contingency plans to ensure continued operations or minimal disruption in operations should unplanned events (natural disasters, unexpected management changes, etc.) occur. Deputies are identified for all key management personnel. Deputies would temporarily fill a role if the primary is absent for more than 15 consecutive calendar days. The deputies must meet the same qualifications as the primary person should they be required to take on the responsibilities. The QA Manager communicates to the relevant regulatory authorities when there are management or facility changes that impact the laboratory. Changes in the technical director must be communicated within a period of time and in the manner dictated by each regulatory authority.



The following table defines who assumes the responsibilities of key personnel in their absence:

Key Personnel	Deputy
Don Dawicki Laboratory Director	Operations Manager Technical Manager
Kristine Dusablon Quality Manager	Laboratory Director Operations Manager
Kristine Dusablon Technical Manager	Laboratory Director Operations Manager
Ryan Hammond Operations Manager/EHS Coordinator	Laboratory Director Technical Manager
William Desjardins Specialty Organics Supervisor	Operations Manager Laboratory Director
Mark Fausel SVOA/LC Supervisor	Operations Manager Laboratory Director
OPEN Inorganic Supervisor	Operations Manager Laboratory Director
Mariah Witas Organic Extraction Supervisor	Operations Manager Laboratory Director
Scott Lavigne Sample Management/Geotechnical Supervisor	Operations Manager Laboratory Director
Dan Helfrich EHS Manager	Laboratory Director EHS Coordinator

•Remote Data Review Analysts are identified with an "*" after their name.

5.0 PERSONNEL

5.1 Overview

The laboratory's management believes that its highly qualified and professional staff is the single most important aspect in assuring a high level of data quality and service. The staff consists of professionals and support personnel.

All personnel must demonstrate competence in the areas where they have responsibility. Any staff that is undergoing training shall have appropriate supervision until they have demonstrated their ability to perform their job function on their own. Staff shall be qualified for their tasks based on appropriate education, training, experience and/or demonstrated skills as required.

The laboratory employs sufficient personnel with the necessary education, training, technical knowledge and experience for their assigned responsibilities.

All personnel are responsible for complying with all QA/QC requirements that pertain to the laboratory and their area of responsibility. Each staff member must have a combination of experience and education to adequately demonstrate a specific knowledge of their particular area of responsibility. Technical staff must also have a general knowledge of lab operations, test methods, QA/QC procedures and records management.

Laboratory management is responsible for formulating goals for lab staff with respect to education, training and skills and ensuring that the laboratory has a policy and procedures for identifying training needs and providing training of personnel. The training shall be relevant to the present and anticipated responsibilities of the lab staff.

The laboratory only uses personnel that are employed by or under contract to, the laboratory. Contracted personnel, when used, must meet competency standards of the laboratory and work in accordance to the laboratory's quality system.

5.2 Education and Experience Requirements for Technical Personnel

The laboratory makes every effort to hire analytical staffs that possess a college degree (AA, BA, BS) in an applied science with some chemistry in the curriculum. Exceptions can be made based upon the individual's experience and ability to learn. Selection of qualified candidates for laboratory employment begins with documentation of minimum education, training, and experience prerequisites needed to perform the prescribed task. Minimum education and training requirements for laboratory employees are outlined in job descriptions maintained by Eurofins Environment Testing America Human Resources.

Experience and specialized training are occasionally accepted in lieu of a college degree (basic lab skills such as using a balance or quantitation techniques, etc., are also considered).

As a general rule for analytical staff:

Specialty	Education	Experience
Extractions, Digestions, some electrode methods (pH, DO, Redox, etc.), or Titrimetric and Gravimetric Analyses	H.S. Diploma	On the job training (OJT)

Specialty	Education	Experience
ICP, ICPMS, Long List or complex chromatography (e.g., Pesticides, PCB, Herbicides, HPLC, etc.), GCMS	A college degree in an applied science or 2 years of college chemistry	or 5 years of prior analytical experience
Spectra Interpretation	A college degree in an applied science or 2 years of college chemistry	And 2 years relevant experience Or 5 years of prior analytical experience
Technical Managers – **General**	Bachelor's Degree in an applied science or engineering with 24 semester hours in chemistry An advanced (MS, PhD.) degree may substitute for one year of experience	And 2 years experience in environmental analysis of representative analytes for which they will oversee
Technical Managers – **Wet Chem** only (no advanced instrumentation)	Associates degree in an applied science or engineering or 2 years of college with 16 semester hours in chemistry	And 2 years relevant experience

When an analyst does not meet these requirements, they can perform a task under the direct supervision of a qualified analyst, peer reviewer, supervisor, or Technical Manager, and are considered an analyst in training. The person supervising an analyst in training is accountable for the quality of the analytical data and must review and approve data and associated corrective actions.

5.3 Training

The laboratory is committed to furthering the professional and technical development of employees at all levels.

Orientation to the laboratory's policies and procedures, in-house method training, and employee attendance at outside training courses and conferences all contribute toward employee proficiency. Below are examples of various areas of required employee training:

Required Training	Time Frame	Employee Type
Environmental Health & Safety	Prior to lab work	All
Ethics – New Hires	1 week of hire	All

Required Training	Time Frame	Employee Type
Ethics – Comprehensive	60 days of hire	All
Data Integrity	60 days of hire	Technical and PMs
Quality Assurance	90 days of hire	All
Ethics – Comprehensive Refresher	Annually	All
Initial Demonstration of Capability (DOC)	Prior to unsupervised method performance	Technical

The laboratory maintains records of relevant authorization/competence, education, professional qualifications, training, skills and experience of technical personnel (including contracted personnel) as well as the date that approval/authorization was given. These records are kept on file at the laboratory. Also refer to "Demonstration of Capability" in Section 19.

The training of technical staff is kept up to date by:

- Each employee must have documentation in their training file that they have read, understood and agreed to follow the most recent version of the laboratory QA Manual and SOPs in their area of responsibility. This documentation is updated as SOPs are updated.
- Documentation from any training courses or workshops on specific equipment, analytical techniques or other relevant topics.
- Documentation of proficiency (refer to Section 19).
- An Ethics Agreement signed by each staff member (renewed each year) and evidence of annual ethics training.
- A Confidentiality Agreement signed by each staff member signed at the time of employment.
- Human Resources maintains documentation and attestation forms on employment status and records; benefit programs; timekeeping/payroll; and employee conduct (e.g., ethics violations). This information is maintained in the employee's secured personnel file.

Evidence of successful training could include such items as:

- Adequate documentation of training within operational areas, including one-on-one technical training for individual technologies, and particularly for people cross-trained.
- Analysts knowledge to refer to QA Manual for quality issues.
- Analysts following SOPs, i.e., practice matches SOPs.
- Analysts regularly communicate to supervisors and QA if SOPs need revision, rather than waiting for auditors to find problems.

Further details of the laboratory's training program are described in the Laboratory Training SOP BR-QA-011.

5.4 Data Integrity and Ethics Training Program

The laboratory's Ethics and Data Integrity Program is discussed in Section 6.2. Employees are trained as to the legal and environmental repercussions that result from data misrepresentation. Key topics covered in the presentation include:

- Organizational mission and its relationship to the critical need for honesty and full disclosure in all analytical reporting.
- Ethics Policy
- How and when to report ethical/data integrity issues. Confidential reporting.
- Record keeping.
- Discussion regarding data integrity procedures.
- Specific examples of breaches of ethical behavior (e.g. peak shaving, altering data or computer clocks, improper macros, etc., accepting/offering kickbacks, illegal accounting practices, unfair competition/collusion)
- Internal monitoring. Investigations and data recalls.
- Consequences for infractions including potential for immediate termination, debarment, or criminal prosecution.
- Importance of proper written narration / data qualification by the analyst and project manager with respect to those cases where the data may still be usable but are in one sense or another partially deficient.

Additionally, a data integrity hotline (1-800-736-9407) is maintained by the NDSC.

6.0 ACCOMMODATIONS AND ENVIRONMENTAL CONDITIONS

6.1 Overview

The laboratory is a 25,000 ft^2 secure laboratory facility with controlled access and designed to accommodate an efficient workflow and to provide a safe and comfortable work environment for employees. All visitors sign in and are escorted by laboratory personnel. Access is controlled by various measures.

The laboratory is equipped with structural safety features. Each employee is familiar with the location, use, and capabilities of general and specialized safety features associated with their workplace. The laboratory provides and requires the use of protective equipment including safety glasses, protective clothing, gloves, etc., OSHA and other regulatory agency guidelines regarding required amounts of bench and fume hood space, lighting, ventilation (temperature and humidity controlled), access, and safety equipment are met or exceeded.

Traffic flow through sample preparation and analysis areas is minimized to reduce the likelihood of contamination. Adequate floor space and bench top area is provided to allow unencumbered sample preparation and analysis space. Sufficient space is also provided for storage of reagents and media, glassware, and portable equipment. Ample space is also provided for refrigerated sample storage before analysis and archival storage of samples after analysis. Laboratory HVAC and deionized water systems are designed to minimize potential trace contaminants.

The laboratory is separated into specific areas for sample receiving, sample preparation, volatile organic sample analysis, non-volatile organic sample analysis, inorganic sample analysis, and administrative functions.

6.2 Environment

Laboratory accommodation, test areas, energy sources, and lighting are adequate to facilitate proper performance of tests. The facility is equipped with heating, ventilation, and air

conditioning (HVAC) systems appropriate to the needs of environmental testing performed at this laboratory.

The environment in which these activities are undertaken does not invalidate the results or adversely affect the required accuracy of any measurements.

The laboratory provides for the effective monitoring, control and recording of environmental conditions that may affect the results of environmental tests as required by the relevant specifications, methods, and procedures. Such environmental conditions include humidity, voltage, temperature, and vibration levels in the laboratory.

When any of the method or regulatory required environmental conditions change to a point where they may adversely affect test results, analytical testing will be discontinued until the environmental conditions are returned to the required levels.

Environmental conditions of the facility housing the computer network and LIMS are regulated to protect against raw data loss.

When the laboratory performs laboratory activities at sites or facilities outside its permanent control, it shall ensure that the requirements related to facilities and environmental conditions of this document are met.

Specific requirements for facility and environmental conditions, as well as periodic monitoring of conditions, are given in the Environmental Health & Safety Manual plus each laboratory's Facility Addendum.

6.3 Work Areas

There is effective separation between neighboring areas when the activities therein are incompatible with each other. Examples include:

- Volatile organic chemical handling areas, including sample preparation and waste disposal, and volatile organic chemical analysis areas.

Access to and use of all areas affecting the quality of analytical testing is defined and controlled by secure access to the laboratory building as described below in the Building Security section.

Adequate measures are taken to ensure good housekeeping in the laboratory and to ensure that any contamination does not adversely affect data quality. These measures include regular cleaning to control dirt and dust within the laboratory. Work areas are available to ensure an unencumbered work area. Work areas include:

- Access and entryways to the laboratory.
- Sample receipt areas.
- Sample storage areas.
- Chemical and waste storage areas.
- Data handling and storage areas.
- Sample processing areas.
- Sample analysis areas.

6.4 Responding to Emergencies

Employees must be aware of procedures to respond to all emergencies that might occur in the workplace. Employees must be familiar with the location and proper operation of all emergency equipment, evacuation routes and designated assembly areas for all areas where they work. Refer to the NDSC EH&S Manual Document No. CW-E-M-001. Sec. 7 and the laboratory's local EH&S addendum for complete details. These documents provide direction for situations where normal operations of the laboratory are not possible (e.g., electrical failures, heating/air conditioning failures, fire/building evacuation, computer failures, hazardous material spills, injury to employees, pandemic flu, disruption of phone service, etc.)

In the event that the building or information technology (IT) systems would be severely challenged, a designated disaster recovery team, which includes Facility Management, Maintenance, Safety, Laboratory/Executive Management, Public Relations, IT, QA and other applicable personnel depending on the scope of the disaster, would assemble at a designated area to assess the situation and formulate a plan.

6.5 Building Security

The laboratory is considered a secure facility. All outside doors (except the main lobby entrance) are locked during normal business hours to prevent unauthorized entry. An attendant monitors this entrance at all times. Building key cards (or key fobs) are distributed to employees as necessary. All visitors to the laboratory must sign in and out in a visitor's logbook that is located in the lobby. A visitor is defined as any person who visits the laboratory who is not an employee of the laboratory. Both visitors and vendors must review and sign specific EH&S forms; and are escorted by laboratory personnel at all times, or the location of the visitor is noted in the visitor's logbook.

7.0 QUALITY SYSTEM

7.1 Quality Policy Statement

The Quality Policy statement gives employees clear requirements for the production of analytical data. As an organization, all personnel are committed to high quality professional practice, testing and data, and service to our clients.

We strive to provide the highest quality data achievable by:

- Reading and understanding all of the quality documents applicable to each position and implementing the process in our work.
- Following all recordkeeping requirements; describing clearly and accurately all activities performed; recording "real time" as the task is carried out; understanding that it is never acceptable to "back date" entries and should additional information be required at a later date, the actual date and by whom the notation is made must be documented.
- Ensuring data integrity through the completeness, consistency, impartiality and accuracy of the data generated. Data is attributable, legible, contemporaneously recorded, original or a true copy, and accurate (ALCOA). This applies to manual paper documentation and electronic records.
- Providing accountability and traceability for each sample analyzed through proper sample handling, labeling, preparation, instrument calibration/qualification/validation, analysis, and reporting; establishing an audit trail (the who, what, when, and why) that identifies date,

time, analyst, instrument used, instrument conditions, quality control samples (where appropriate and/or required by the method), and associated standard material.

- ❖ Emphasizing a total quality management process which provides impartiality, accuracy, and strict compliance with agency regulations and client requirements, giving the highest degree of confidence; understanding that meeting the requirements of the next employee in the work flow process is just as important as meeting the needs of the external client.
- ❖ Providing thorough documentation and explanation to qualify reported data that may not meet all requirements and specifications, but is still of use to the client; understanding this occurs only after discussion with the client on the data limitations and acceptability of this approach.
- ❖ Responding immediately to indications of questionable data, out-of-specification occurrences, equipment malfunctions, and other types of laboratory problems, with investigation and applicable corrective action; documenting these activities completely, including the reasons for the decisions made.
- ❖ Providing a work environment that ensures accessibility to all levels of management and encourages questions and expression of concerns on quality issues to management. Eurofins recognizes that the implementation of a quality assurance program requires management's commitment and support as well as the involvement of the entire staff
- ❖ Continually improve systems and manage risk to support quality improvement efforts in laboratory, administrative and managerial activities

7.2 Ethics and Data Integrity

Eurofins Environment Testing America is committed to ensuring the integrity of its data and meeting the quality needs of its clients. The laboratory operates our Ethics and Data Integrity program under the guidance of Eurofin's Key Guidance Document (KGD). The elements of the our program include:

- An Ethics Policy (NDSC Document No.CW-L-P-004) and Employee Ethics Statements.
- Ethics and Compliance Officer/s (ECOs).
- A Training Program.
- Self-governance through disciplinary action for violations.
- A confidential mechanism for anonymously reporting alleged misconduct and a means for conducting internal investigations of all alleged misconduct. (NDSC Document No. CW-L-S-002).
- Procedures and guidance for recalling data if necessary (NDSC Document No. CW-Q-S-005).
- Effective external and internal monitoring system that includes procedures for internal audits (Section 17).
- Produce results, which are accurate and include QA/QC information that meets client pre-defined Data Quality Objectives (DQOs).
- Present services in a confidential, honest and forthright manner.
- Provide employees with guidelines and an understanding of the Ethical and Quality Standards of our Industry.

- Provide procedures and guidance to ensure the impartiality and confidentiality of all data and customer information.
- Operate our facilities in a manner that protects the environment and the health and safety of employees and the public.
- Obey all pertinent federal, state and local laws and regulations and encourage other members of our industry to do the same.
- Educate clients as to the extent and kinds of services available.
- Assert competency only for work for which adequate personnel and equipment are available and for which adequate preparation has been made.
- Promote the status of environmental laboratories, their employees, and the value of services rendered by them.

7.3 Quality System Documentation

The laboratory's Quality System is communicated through a variety of documents.

- Quality Assurance (QA) Manual – Each laboratory has a lab-specific QA manual.
- NDSC Official Documents – Each laboratory may use the Guidance (instructional use) documents at their discretion. Template documents are process documents that the laboratory's need to implement locally by using the document as is or as an outline to define their internal practices that meet the minimum requirements of the template. Required documents need to be implemented as is and listed in the laboratory's document control list.
- Key Guidance Documents (KGDs) - Documents compiled at the Group Service Centre (GSC) level by Functional Leaders (document owners) aimed at providing specific Eurofins groups of employees with guidelines necessary for the good conduct of their respective work.
- Laboratory SOPs and Policies – General and Technical
- Work Instructions – A subset of procedural steps, tasks or forms associated with an operation of a management system (e.g., checklists, preformatted bench sheets, forms).

7.3.1 Order of Precedence

In the event of a conflict or discrepancy between policies, the order of precedence is as follows:

- Quality Management Plan (QMP)
- NDSC Guidance Documents
- KGDs
- Laboratory Quality Assurance Manual (QA Manual)
- Laboratory SOPs and Policies
- Other (Work Instructions (WI), memos, flow charts, etc.)

NOTE: The laboratory has the responsibility and authority to operate in compliance with regulatory requirements of the jurisdiction in which the work is performed. Where the QMP conflicts with those regulatory requirements, the regulatory requirements of the jurisdiction shall hold primacy. The laboratory's QA Manual shall take precedence over the QMP in those cases.

7.4 QA/QC Objectives for the Measurement of Data

Quality Assurance (QA) is responsible for developing planned activities whose purpose is to provide assurance to all levels of management that a quality program is in place within the laboratory, and that it is functioning in an effective manner that is consistent with the requirements of NELAP, ISO 17025, and DoD and any other regulatory agencies (i.e., states) in which the laboratory maintains accreditation.

Quality Control (QC) is generally understood to be limited to the analyses of samples and to be synonymous with the term *"analytical quality control"*. QC refers to the routine application of statistically based procedures to evaluate and control the accuracy of results from analytical measurements. The QC program includes procedures for estimating and controlling precision and bias and for determining reporting limits.

Request for Proposals (RFPs) and Quality Assurance Project Plans (QAPP) provide a mechanism for the client and the laboratory to discuss the data quality objectives in order to ensure that analytical services closely correspond to client needs. In order to ensure the ability of the laboratory to meet the Data Quality Objectives (DQOs) specified in the QAPP, clients are advised to allow time for the laboratory to review the QAPP before being finalized. The client is responsible for developing the QAPP; however, the laboratory will provide support to the client for developing the sections of the QAPP that concern laboratory activities.

Historically, laboratories have described their QC objectives in terms of precision, accuracy, representativeness, comparability, completeness, selectivity and sensitivity (PARCCSS). Each laboratory SOP defines the required QC indicators.

7.4.1 Precision

The objective is to meet the performance for precision demonstrated for the methods on similar samples and to meet DQOs of the EPA and/or other regulatory programs. Precision is defined as the degree of reproducibility of measurements under a given set of analytical conditions (exclusive of field sampling variability). Precision is documented on the basis of replicate analysis, usually duplicate or matrix spike (MS) duplicate samples.

7.4.2 Accuracy

The objective is to meet the performance for accuracy demonstrated for the methods on similar samples and to meet DQOs of the EPA and/or other regulatory programs. Accuracy is defined as the degree of bias in a measurement system. Accuracy may be documented through the use of laboratory control samples (LCS) and/or MS. A statement of accuracy is expressed as an interval of acceptance recovery about the mean recovery.

7.4.3 Representativeness

The objective is to provide data which is representative of the sampled medium. Representativeness is defined as the degree to which data represent a characteristic of a population or set of samples and is a measurement of both analytical and field sampling precision. The representativeness of the analytical data is a function of the procedures used in procuring and processing the samples. The representativeness can be documented by the relative percent difference between separately procured, but otherwise identical samples or sample aliquots.

The representativeness of the data from the sampling sites depends on both the sampling procedures and the analytical procedures. Refer to laboratory SOPs for subsampling and homogenization techniques appropriate to the analytical method.

7.4.4 Comparability

The objective is to provide analytical data for which the accuracy, precision, representativeness, and reporting limit statistics are similar to these quality indicators generated by other laboratories for similar samples, and data generated by the laboratory over time.

Comparability is documented by inter-laboratory studies carried out by regulatory agencies or carried out for specific projects or contracts, by comparison of periodically generated statements of accuracy, precision, and reporting limits with those of other laboratories.

7.4.5 Completeness

The completeness objective for data is 90% (or as specified by a particular project), expressed as the ratio of the valid data to the total data over the course of the project. Data will be considered valid if they are adequate for their intended use. Data usability will be defined in a QAPP, project scope, or regulatory requirement. Data validation is the process for reviewing data to determine its usability and completeness. If the completeness objective is not met, actions will be taken internally and with the data user to improve performance. This may take the form of an audit to evaluate the methodology and procedures as possible sources for the difficulty or may result in a recommendation to use a different method.

7.4.6 Selectivity

Selectivity is defined as the capability of a test method or instrument to respond to a target substance or constituent in the presence of non-target substances. Target analytes are separated from non-target constituents and subsequently identified/detected through one or more of the following, depending on the analytical method: extractions (separation), digestions (separation), interelement corrections (separation), use of matrix modifiers (separation), specific retention times (separation and identification), confirmations with different columns or detectors (separation and identification), specific wavelengths (identification), specific mass spectra (identification), and specific electrodes (separation and identification).

7.4.7 Sensitivity

Sensitivity refers to the amount of analyte necessary to produce a detector response that can be reliably detected (above the Method Detection Limit) or quantified (above the Reporting Limit).

7.5 Criteria for Quality Indicators

The laboratory maintains tables, housed in LIMS, that summarize the precision and accuracy acceptability limits for performed analyses. This summary includes an effective date, is updated each time new limits are generated, and are managed by the laboratory's QA department. Unless otherwise noted, limits within these tables are laboratory generated. Some acceptability limits are derived from US EPA methods when they are required. Where US EPA method limits are not required, the laboratory has developed limits from evaluation of data from similar matrices. Criteria for development of control limits is contained in BR-QA-013 or Section 26.

7.6 Statistical Quality Control

Statistically-derived precision and accuracy limits are required by selected methods (such as SW-846) and programs. The laboratory routinely utilizes statistically-derived limits to evaluate method performance and determine when corrective action is appropriate. The analysts use the current limits entered into LIMS. The QA department maintains an archive of all limits used within the laboratory. If a method defines the QC limits, the method limits are used.

If a method requires the generation of historical limits, the lab develops such limits from recent data in the QC database of the LIMS following the guidelines described in Section 26. All calculations and limits are documented and dated when approved and effective. On occasion, a client requests contract-specified limits for a specific project.

Current QC limits are entered and maintained in the LIMS analyte database. As sample results and the related QC are entered into LIMS, the sample QC values are compared with the limits in LIMS to determine if they are within the acceptable range. The analyst then evaluates if the sample needs to be rerun or re-extracted/rerun or if a comment should be added to the report explaining the reason for the QC outlier.

7.6.1 QC Charts

The laboratory's procedures for the creation of control charts are described in the laboratory SOP BR-QA-013. Control charts are created from data stored in the LIMS. The QA Manager or technical staff evaluates these to determine if adjustments need to be made or for corrective actions to methods. All findings are documented and kept on file.

7.7 Quality System Metrics

In addition to the QC parameters discussed above, the entire Quality System is evaluated on a monthly basis through the use of specific metrics (refer to Section 18). These metrics are used to drive continuous improvement in the laboratory's Quality System.

8.0 DOCUMENT CONTROL

8.1 Overview

The QA Department is responsible for the control of documents used in the laboratory to ensure that approved, up-to-date documents are in circulation and out-of-date (obsolete) documents are archived or destroyed. The following documents, at a minimum, must be controlled:

- Laboratory Quality Assurance (QA) Manual
- Laboratory Standard Operating Procedures (SOP)
- Laboratory Policies
- Work Instructions and Forms
- NDSC Documents[1]
- KGDs[1]

[1]Includes locally implemented documents that are document controlled within the laboratory's document control system. The NDSC and/or KGD documents are only considered controlled when they are read on the intranet site. Printed copies are considered uncontrolled unless the

laboratory physically distributes them as controlled documents. A detailed description of the procedure for issuing, authorizing, controlling, distributing, and archiving NDSC Official Document is found in Document No. CW-Q-S-001, NDSC Document Control and Archiving. KGD documents are controlled according to BR-QA-003, Document Control. The laboratory's internal document control procedure is defined in SOP No. BR-QA-003, Document Control.

The laboratory QA Department also maintains access to various references and document sources integral to the operation of the laboratory. This includes reference methods and regulations. Instrument manuals (hard or electronic copies) are also maintained by the laboratory.

The laboratory maintains control of records for raw analytical data and supporting records such as audit reports and responses, logbooks, standard logs, training files, MDL studies, Proficiency Testing (PT) studies, certifications and related correspondence, and corrective action reports. Raw analytical data consists of bound logbooks, instrument printouts, any other notes, magnetic media, electronic data, and final reports.

8.2 Document Approval and Issue

The pertinent elements of the document control system includes a unique document title and number, pagination, the total number of pages of the item or an 'end of document' page, the effective date, revision number, and the laboratory's name. The QA personnel are responsible for the maintenance of this system.

Controlled documents are authorized by the QA Department. In order to develop a new document, a responsible manager submits an electronic draft to the QA Department for suggestions and approval before use. Upon approval, QA personnel add the identifying version information to the document and retains that document as the official document on file. That document is then provided to all applicable operational units. Controlled documents are identified as such and records of their distribution are kept by the QA Department. Document control may be achieved by either electronic or hardcopy distribution.

The QA Department maintains a list of the official versions of controlled documents.

Quality System Policies and Procedures will be reviewed at a minimum of every two years, for DW and DOE/DoD every year, and revised as appropriate. Changes to documents occur when a procedural change warrants.

8.3 Procedures for Document Control Policy

For changes to the QA Manual, refer to SOP No. BR-QA-003, Document Control. Uncontrolled copies must not be used within the laboratory. Previous revisions and back-up data are stored by the QA department. Electronic copies are stored on the Public server in the QA folder (\\tafs\Lab\Burlington\Public\QA Public\SOPs Controlled Distribution\Quality Manual) for the applicable revision.

For changes to SOPs, refer to NDSC Document No. CW-Q-S-002, Writing a Standard Operating Procedure) or SOP No. BR-QA-003, Document Control.

Forms, worksheets, work instructions and information are organized by department in the QA office. There is a table of contents. Electronic versions are kept on a hard drive in the QA department; hard copies are kept in QA files. The procedure for the care of these documents is in SOP No. BR-QA-003, Document Control.

8.4 Obsolete Documents

All invalid or obsolete documents are removed, or otherwise prevented from unintended use. The laboratory has specific procedures as described above to accomplish this. In general, obsolete documents are collected from employees according to distribution lists and are marked obsolete on the cover or destroyed. At least one copy of the obsolete document is archived according to SOP No. BR-QA-003, Document Control.

9.0 SERVICE TO THE CLIENT

9.1 Overview

The laboratory has established procedures for the review of work requests and contracts, oral or written. The procedures include evaluation of the laboratory's capability and resources to meet the contract's requirements within the requested time period. All requirements, including the methods to be used, must be adequately defined, documented and understood. For many environmental sampling and analysis programs, testing design is site or program specific and does not necessarily fit into a standard laboratory service or product. It is the laboratory's intent to provide both standard and customized environmental laboratory services to our clients.

A thorough review of technical and QC requirements contained in contracts is performed to ensure project success. The appropriateness of requested methods, and the lab's capability to perform them must be established. Projects, proposals, and contracts are reviewed for adequately defined requirements and the laboratory's capability to meet those requirements. Alternate test methods that are capable of meeting the clients' requirements may be proposed by the lab. A review of the lab's capability to analyze non-routine analytes is also part of this review process.

All projects, proposals and contracts are reviewed for the client's requirements in terms of compound lists, test methodology requested, sensitivity (detection and reporting levels), accuracy, and precision requirements (% Recovery and RPD). The reviewer ensures that the laboratory's test methods are suitable to achieve these requirements and that the laboratory holds the appropriate certifications and approvals to perform the work. The laboratory and any potential subcontract laboratories must be certified, as required, for all proposed tests.

Electronic or hard copy deliverable requirements are evaluated against the laboratory's capacity for production of the documentation.

If the laboratory cannot provide all services but intends to subcontract such services, whether to another Eurofins facility on the same LIMS or to an outside firm, this will be documented and discussed with the client prior to contract approval. (Refer to Section 10 for Subcontracting Procedures.)

The laboratory informs the client of the results of the review if it indicates any potential conflict, deficiency, lack of accreditation, or inability of the lab to complete the work satisfactorily. Any discrepancy between the client's requirements and the laboratory's capability to meet those requirements is resolved in writing before acceptance of the contract. It is necessary that the contract be acceptable to both the laboratory and the client. Amendments initiated by the client and/or Eurofins TestAmerica Burlington are documented in writing.

All contracts, QAPPs, Sampling and Analysis Plans (SAPs), contract amendments, and documented communications become part of the project record.

The same contract review process used for the initial review is repeated when there are amendments to the original contract by the client, and the participating personnel are informed of the changes.

9.2 Review Sequence and Key Personnel

Appropriate personnel will review the work request at each stage of evaluation.

For routine projects and other simple tasks, a review by the Project Manager (PM) is considered adequate. The PM confirms that the laboratory has any required certifications, that it can meet the clients' data quality and reporting requirements and that the lab has the capacity to meet the clients turn around needs. It is recommended that, where there is a sales person assigned to the account, an attempt should be made to contact that sales person to inform them of the incoming samples.

For new, complex or large projects, the proposed contract is given to the Client Relationship Manager or Proposal Team, who will decide which lab will receive the work based on the scope of work and other requirements, including certification, testing methodology, and available capacity to perform the work. The contract review process is outlined in NDSC Document No. CA-L-P-002**,** Contract Compliance Policy.

This review encompasses all facets of the operation. The scope of work is distributed to the appropriate personnel, as needed based on scope of contract, to evaluate all of the requirements shown above (not necessarily in the order below)

- Contract Administrator
- Laboratory Project Manager
- Laboratory Director and/or Technical Manager
- Account Executive
- Quality Manager
- Laboratory Environmental Health and Safety Manager

The Laboratory Director reviews the formal laboratory quote and makes final acceptance for their facility.

The Sales Director, Contract Administrator, Account Executive or Proposal Coordinator then submits the final proposal to the client.

In the event that one of the above personnel is not available to review the contract, his or her back-up will fulfill the review requirements.

9.3 Balancing Laboratory Capacity and Workload

Evaluating laboratory capacity to perform specific projects is the responsibility of the Vice-President, Laboratory Director and Managers, and the Client Services director. Many analysts are cross-trained to perform a variety of tests, and there is redundant equipment available in case of malfunctions. This minimizes the need to evaluate small and medium size projects against capacity available to complete them. Large and complex projects are reviewed against capacity estimates before bids are submitted to ensure that the client's analysis schedule is met. Regularly scheduled meetings are held between laboratory management, PMs, and QA to review progress with current projects, as well as special requirements of new work scheduled for the laboratory. Laboratory capacity and backlog is tracked on a continuous basis using

information from the Laboratory Sample Information System (LIMS) including turnaround time, and work in-house.

9.4 Documentation

The Contracts Department maintains copies of all signed contracts**.** A copy is also retained by the Customer Relations Manager or at the facility by the Project Manager.

Appropriate records are maintained for every contract or work request. All stages of the contract review process are documented and include records of any significant changes. These records are maintained in the LIMS project or other file by CSO if no project ID exists.

The contract will be distributed to and maintained by the appropriate sales/marketing personnel and the Account Executive. A copy of the contract and formal quote will be filed with the laboratory PM and the Laboratory Director.

Records are maintained of pertinent discussions with a client relating to the client's requirements or the results of the work during the period of execution of the contract. The PM keeps a phone log of conversations with the client.

9.4.1 Project-Specific Quality Planning

Communication of contract specific technical and QC criteria is an essential activity in ensuring the success of site specific testing programs. To achieve this goal, a PM is assigned to each client. It is the PM's responsibility to ensure that project-specific technical and QC requirements are effectively evaluated and communicated to the laboratory personnel before and during the project. QA department involvement may be needed to assist in the evaluation of custom QC requirements.

PM's are the primary client contact and they ensure resources are available to meet project requirements, they coordinate opportunities and work with laboratory management and supervisory staff to ensure available resources are sufficient to perform work for the client's project.

Prior to work on a new project, the dissemination of project information and/or project opening meetings may occur to discuss schedules and unique aspects of the project. Items to be discussed may include the project technical profile, turnaround times, holding times, methods, analyte lists, reporting limits, deliverables, sample hazards, or other special requirements. The PM introduces new project information to maximize production and client satisfaction, while maintaining quality. Project notes may be associated with each sample batch as a reminder upon sample receipt and analytical processing.

~~A~~ny change that may occur within an active project is agreed upon between the client/regulatory agency and the PM/laboratory. These changes (e.g., use of a non-standard method or modification of a method) and approvals must be documented prior to implementation. Documentation pertains to any document (e.g., letter, e-mail, variance, contract addendum), which has been signed by both parties.

Such changes are also communicated to the laboratory during production and status meeting. The laboratory staff is then introduced to the modified requirements via the PM, supervisor or the individual laboratory Technical Manager. After the modification is implemented into the laboratory process, documentation of the modification is made in the case narrative of the data report(s).

The laboratory strongly encourages client visits to the laboratory and for formal/informal information sharing session with employees in order to effectively communicate ongoing client needs as well as project specific details for customized testing programs.

9.5 Special Services

The laboratory cooperates with clients and their representatives to monitor the laboratory's performance in relation to work performed for the client. It is the laboratory's goal to meet all client requirements in addition to statutory and regulatory requirements. The laboratory has procedures to ensure confidentiality to clients (Section 17 and 25).

The laboratory's standard procedures for reporting data are described in Section 25. Special services are also available and provided upon request. These services include:

- Reasonable access for our clients or their representatives to the relevant areas of the laboratory for the witnessing of tests performed for the client.
- Assisting client-specified third party data validators as specified in the client's contract.
- Supplemental information pertaining to the analysis of their samples. Note: An additional charge may apply for additional data/information that was not requested prior to the time of sample analysis or previously agreed upon.

When the client requests a statement of conformity to a specification or standard based on the analysis performed by the laboratory (e.g., pass/fail, in-tolerance/out-of-tolerance), the decision rule shall be clearly defined. Unless inherent in the requested specification or standard, the decision rule selected shall be communicated to the client. Associated reporting requirements are addressed in Section 25.2.18.

9.6 Client Communication

PMs are the primary communication link to the clients. They shall inform their clients of any delays in project completion as well as any non-conformances in either sample receipt or sample analysis. Project management will maintain ongoing client communication throughout the entire client project.

Technical Managers are available to discuss any technical questions or concerns that the client may have.

9.7 Reporting

The laboratory works with our clients to produce any special communication reports required by the contract.

9.8 Client Feedback and Surveys

The laboratory assesses both positive and negative client feedback. The results are used to improve overall laboratory quality and client service. Eurofins Sales and Marketing teams periodically develop lab and client specific surveys to assess client satisfaction. Client satisfaction surveys are sent by Sales and Marketing teams periodically. They develop lab and client specific surveys to assess client satisfaction.

When a complaint is received, we determine, to the best of our ability, the extent of the issue and what data is in question. The person receiving the complaint documents this information and promptly forwards it to the appropriate management personnel where the work in question was performed. If a data reporting error is discovered, the final report and/or data must be regenerated with the correct value(s).

The QA Manager is responsible for entering client concerns into iCAT. In some cases, an ICAT / ICAR (Investigation and Corrective Action Report) is initiated to address and document the

situation. While an individual issue may not warrant a formal investigation, QA monitors these issues for potential trends and will issue an ICAR/ICAT if a trend is evident.

10.0 SUBCONTRACTING OF TESTS

The laboratory may subcontract tests to other laboratories if the requested testing is not routinely performed in our laboratory. To a lesser extent, samples may need to be subcontracted to an overflow laboratory to ensure hold times and/or turn-around-times (TAT) are met.

Testing is only subcontracted with the client's knowledge and approval. The Project Manager must notify the client in writing when any of their requested analyses will be subcontracted to another lab. Client approval must be obtained in writing before samples are shipped.

Subcontract laboratories are selected based on their qualifications and accreditations. The subcontractor is requested to sign a Laboratory Analytical Services Subcontract. See form Q-EQA-FRM6867 to review details of the contract terms and information requested from the subcontract laboratory. If projects require a specific agency certification (i.e. individual state agencies, NELAP, DoD, PALA, ISO 17025), only an appropriately accredited laboratory is used. The client may also have a list of laboratories to be used for subcontracting. In these cases, the evaluation of the subcontract laboratory is made by the client.

Data obtained from subcontract laboratories is clearly marked as such when reported by the laboratory. The data are submitted to the client in the format obtained from the subcontractor.

10.1 Overview

For the purpose of this quality manual, the phrase subcontract laboratory refers to a laboratory external to the Eurofins laboratories. The phrase "work sharing" refers to internal transfers of samples between the Eurofins TestAmerica laboratories. The term outsourcing refers to the act of subcontracting tests.

When contracting with our clients, the laboratory makes commitments regarding the services to be performed and the data quality for the results to be generated. When the need arises to outsource testing for our clients because project scope, changes in laboratory capabilities, capacity, or unforeseen circumstances, we must be assured that the subcontractors or work sharing laboratories understand the requirements and will meet the same commitments we have made to the client. Refer to the NDSC Documents on Subcontracting Procedures (CW-L-S-004) and the Work Sharing Process (CA-C-S-001).

When outsourcing analytical services, the laboratory will assure, to the extent necessary, that the subcontract or work sharing laboratory maintains a program consistent with the requirements of this document, the requirements specified in TNI/ISO 17025 and/or the client's Quality Assurance Project Plan (QAPP). All QC guidelines specific to the client's analytical program are transmitted to the subcontractor and agreed upon before sending the samples to the subcontract facility. Additionally, work requiring accreditation will be placed with an appropriately accredited laboratory. The laboratory performing the subcontracted work will be identified in the final report, as will non-TNI accredited work where required.

PMs or other responsible Client Service members, for the Export Lab (i.e., the Eurofins TestAmerica Burlington laboratory that transfers samples to another laboratory) are responsible for obtaining client approval prior to subcontracting any samples. The laboratory will advise the client of a subcontract arrangement in writing and when possible approval from the client shall be obtained and retained in the project folder. Standard Eurofins TestAmerica Burlington Terms

& Conditions include the flexibility to subcontract samples within the Eurofins Burlington TestAmerica laboratories. Therefore, additional advance notification to clients for intra-laboratory subcontracting is not necessary unless specifically required by a client contract.

Note: In addition to the client, some regulating agencies (e.g., USDA) or contracts (e.g., DoD and DOE projects) require notification prior to placing such work**.**

10.2 Qualifying and Monitoring Subcontractors

Whenever a PM, Account Executive (AE) or Client Relationship Manager becomes aware of a client requirement or laboratory need where samples must be outsourced to another laboratory, the other laboratory(s) shall be selected based on the following:

- Subcontractors specified by the client - In these circumstances, the client assumes responsibility for the quality of the data generated from the use of a subcontractor.
- Subcontractors reviewed by Eurofins TestAmerica Burlington – Firms which have been reviewed by the company and are known to meet standards for accreditations (e.g., State, TNI and DoD/DOE); technical specifications; legal and financial information.

A listing of vendors is available on the Eurofins TestAmerica intranet site.

All Eurofins TestAmerica Burlington laboratories are pre-qualified for work sharing provided they hold the appropriate accreditations and can adhere to the project/program requirements. Client approval is not necessary unless specifically required by the contract. In these cases, the client must provide acknowledgement that the samples can be sent to that facility (an e-mail is sufficient documentation or if acknowledgement is verbal, the date, time, and name of person providing acknowledgement must be documented). The originating laboratory is responsible for communicating all technical, quality, and deliverable requirements as well as other contract needs. (NDSC Document No. CA-C-S-001, Work Sharing Process).

10.2.1 When the potential subcontract laboratory has not been previously approved, Account Executives or PM may nominate a laboratory as a subcontractor based on need. The decision to nominate a laboratory must be approved by the Client Relations Manager (CRM) or Laboratory Director***]***. The CRM or Laboratory Director requests that the QA Manager or PM begin the process of approving the subcontract laboratory. Refer to the NDSC Document No. CW-L-S-004, Subcontracting Procedures.

Once the appropriate accreditation and legal information is received by the laboratory, it is evaluated for acceptability and forwarded to the NDSC Quality Information Manager (QIM) for review. After the NDSC QIM reviews the documents for completeness, the information is forwarded to the Finance Department for formal signature and contracting with the laboratory. The approved vendor will be added to the approved subcontractor list on the intranet site, and the finance group is concurrently notified.

The client will assume responsibility for the quality of the data generated from the use of a subcontractor they have requested the lab to use. The qualified subcontractors on the intranet site are known to meet minimal standards. Eurofins TestAmerica Burlington Laboratory does not certify laboratories. The subcontractors on our approved list can only be recommended to the extent that we would use them.

10.3 Oversight and Reporting

The status and performance of qualified subcontractors will be monitored by NDSC and includes an annual review process (NDSC Document No. SOP CW-L-S-004). Any problems

identified will be brought to the attention of NDSC and Procurement personnel.

- Complaints shall be investigated. Documentation of the complaint, investigation, and corrective action will be maintained in the subcontractor's file on the intranet site. Complaints are posted using the Vendor Performance Report.
- Information shall be updated on the intranet when new information is received from the subcontracted laboratories.
- Subcontractors in good standing will be retained on the intranet listing. Client Service personnel will notify all Eurofins TestAmerica Burlington laboratories, NDSC, and Corporate Contracts if any laboratory requires removal from the intranet site. This notification will be posted on the intranet site and e-mailed to all Client Service Personnel, Laboratory Directors, QA Managers, and Sales Personnel.

Prior to initially sending samples to the subcontracted laboratory, the PM confirms their certification status to determine if it's current and scope-inclusive. The information is documented within the project records.

The laboratory's certifications can be viewed on the company's website @ **www.testamericainc.com**

10.3.1 All subcontracted samples must be accompanied by a Eurofins TestAmerica Burlington Chain of Custody (COC). A copy of the original COC sent by the client must be available in LIMS for all samples workshared within Eurofins TestAmerica Burlington Client COCs are only forwarded to external subcontractors when samples are shipped directly from the project site to the subcontractor lab. Under routine circumstances, client COCs are not provided to external subcontractors.

Through communication with the subcontracted laboratory, the PM monitors the status of the subcontracted analyses, facilitates successful execution of the work, and ensures the timeliness and completeness of the analytical report.

Non-TNI accredited work must be identified in the subcontractor's report as appropriate. If TNI accreditation is not required, the report does not need to include this information.

Reports submitted from subcontractor laboratories are not altered and are included in their original form in the final project report. This clearly identifies the data as being produced by a subcontractor facility. If subcontract laboratory data is incorporated into the laboratory's EDD (i.e., imported), the report must explicitly indicate which lab produced the data for which methods and samples.

Note: The results submitted by a Eurofins TestAmerica Burlington work sharing laboratory may be transferred electronically and the results reported by the Eurofins TestAmerica Burlington work sharing lab are identified on the final report. The report must explicitly indicate which lab produced the data for which methods and samples. The final report must include a copy of the completed COC for all work sharing reports.

10.4 Contingency Planning

The full qualification of a subcontractor may be waived to meet emergency needs. This decision and justification must be documented in the project files, and the 'Purchase Order Terms And Conditions For Subcontracted Laboratory Services' must be sent with the samples and COC.

In the event this provision is utilized, the laboratory (e.g., PM) will be required to verify and document the applicable accreditations of the subcontractor. All other quality and accreditation requirements will still be applicable, but the subcontractor need not have signed a subcontract agreement with Eurofins TestAmerica Burlington at this time.

The use of any emergency subcontractor will require the PM to complete a New Vendor Add Form in order to process payment to the vendor and add them to LIMS. This form requires the user to define the subcontractor's category/s of testing and the reason for testing.

10.5 Use of NELAP and A2LA Logo

It is not laboratory policy to use these logos on any company letterhead, including analytical reports.

11.0 PURCHASING SERVICES AND SUPPLIES

11.1 Overview

Evaluation and selection of suppliers and vendors is performed, in part, on the basis of the quality of their products, their ability to meet the demand for their products on a continuous and short term basis, the overall quality of their services, their past history, and competitive pricing. This is achieved through evaluation of objective evidence of quality furnished by the supplier, which can include certificates of analysis, recommendations, and proof of historical compliance with similar programs for other clients. To ensure that quality critical consumables and equipment conform to specified requirements, which may affect quality, all purchases from specific vendors are approved by a member of the supervisory or management staff. Capital expenditures are made in accordance with NDSC Document No. CW-F-S-007, Eurofins TestAmerica's Fixed Asset Acquisition, Retention and Safeguarding.

Contracts will be signed in accordance with the laboratory's authorization matrix in the NDSC Document No. CW-F-P-002, Company-Wide Authorization Matrix Policy. Request for Proposals (RFP's) will be issued where more information is required from the potential vendors than just price. Process details are available in the NDSC Document No. CW-F-P-004, Guidance on Procurement and Contracts Policy. RFP's allow the laboratory to determine if a vendor is capable of meeting requirements such as supplying all of the laboratory facilities, meeting required quality standards and adhering to necessary ethical and environmental standards. The RFP process also allows potential vendors to outline any additional capabilities they may offer.

11.2 Glassware

Glassware used for volumetric measurements must be Class A or verified for accuracy according to laboratory procedure. Pyrex (or equivalent) glass should be used where possible. For safety purposes, thick-wall glassware should be used where available.

11.3 Reagents, Standards & Supplies

Purchasing guidelines for equipment, consumables, and reagents must meet the requirements of the specific method and testing procedures for which they are being purchased. Solvents and acids are pre-tested in accordance with NDSC Document No. CA-Q-S-001, Solvent & Acid Lot Testing & Approval. Approval information for the solvents and acids tested under Document No. CA-Q-S-001 is stored on the laboratory's SharePoint site, under Solvent Approvals. A master list of all tested materials, as well as the certificates of analysis for the materials, is stored in the

same location.

11.3.1 Purchasing

Chemical reagents, solvents, glassware, and general supplies are ordered as needed to maintain sufficient quantities on hand. Materials used in the analytical process must be of a known quality. The wide variety of materials and reagents available makes it advisable to specify recommendations for the name, brand, and grade of materials to be used in any determination. This information is contained in the method SOP. The analyst completes the Material Request Sheet when requesting reagents, standards, or supplies. The analyst may check the item out of the on-site consignment system that contains items approved for laboratory use.

The analyst must provide the master item number (from the master item list that has been approved by the Technical Manager), item description, package size, catalogue page number, and the quantity needed. If an item being ordered is not the exact item requested, approval must be obtained from the Laboratory Directory or Technical Manager prior to placing the order. The purchasing manager places the order.

11.3.2 Receiving

It is the responsibility of the purchasing manager to receive the shipment. It is the responsibility of the analyst who ordered the materials to document the date materials were received. Once the ordered reagents or materials are received, the analyst compares the information on the label or packaging to the original order to ensure that the purchase meets the quality level specified. This is documented through the addition of the received date and initials to the information present on the daily order log.

The purchasing manager verifies the lot numbers of received solvents and acids against the pre-approval lists. If a received material is listed as unapproved, or is not listed, it is sequestered and returned to the vendor. Alternatively, the laboratory may test the material for the intended use, and if it is acceptable, document the approval on the approval list. Records of any testing performed locally are maintained on the shared “public” folder on the computer network.

Materials may not be released for use in the laboratory until they have been inspected, verified as suitable for use, and the inspection/verification has been documented.

Safety Data Sheets (SDSs) are available online through the Company’s intranet website. Anyone may review these for relevant information on the safe handling and emergency precautions of on-site chemicals.

11.3.3 Specifications

Methods used in the laboratory specify the grade of reagent that must be used in the procedure. If the quality of the reagent is not specified, analytical reagent grade will be used. It is the responsibility of the analyst to check the procedure carefully for the suitability of grade of reagent.

Chemicals must not be used past the manufacturer’s expiration date and must not be used past the expiration time noted in a method SOP. If expiration dates are not provided, the laboratory may contact the manufacturer to determine an expiration date.

The laboratory assumes a five year expiration date on inorganic dry chemicals and solvents unless noted otherwise by the manufacturer or by the reference source method.

Chemicals/solvents should not be used past the manufacturer's or SOP expiration date unless verified as outlined below.

- An expiration date **cannot** be extended if the dry chemical/solvent is discolored or appears otherwise physically degraded. In this case, the dry chemical/solvent must be discarded.
- Expiration dates can be extended if the dry chemical/solvent is found to be satisfactory based on acceptable performance of quality control samples (Continuing Calibration Verification (CCV), Blanks, Laboratory Control Sample (LCS), etc.).
- If the dry chemical/solvent is used for the preparation of standards, the expiration dates can be extended 6 months if the dry chemical/solvent is compared to an unexpired independent source in performing the method and the performance of the dry chemical/solvent is found to be satisfactory. The comparison must show that the dry chemical/solvent meets CCV limits. The comparison studies are maintained on-file and available for review by QA.

Wherever possible, standards must be traceable to national or international standards of measurement or to national or international reference materials. Records to that effect are available to the user.

Compressed gases in use are checked for pressure and secure positioning daily. To prevent a tank from going to dryness, or introducing potential impurities, the pressure should be closely watched as it decreases to approximately 15% of the original reading, at which point it should be replaced. For example, a standard sized laboratory gas cylinder containing 3,000 psig of gas should be replaced when it drops to approximately 500 psig. The quality of the gases must meet method or manufacturer specification or be of a grade that does not cause any analytical interference.

Water used in the preparation of samples, standards or reagents must have a specific conductivity of less than 1-µmho/cm (or specific resistivity of greater than 1.0 megohm-cm) at 25^{o}C. The specific conductivity is checked and recorded daily. If the water's specific conductivity is greater than the specified limit, the Facility Manager and appropriate Technical Managers must be notified immediately in order to notify all departments, decide on cessation (based on intended use) of activities, and make arrangements for correction.

The laboratory may purchase reagent grade (or other similar quality) water for use in the laboratory. This water must be certified clean by the supplier for all target analytes or otherwise verified by the laboratory prior to use. This verification is documented.

Standard lots are verified before first time use if the laboratory switches manufacturers or has historically had a problem with the type of standard.

Purchased bottleware used for sampling must be certified clean and the certificates must be maintained. If uncertified sampling bottleware is purchased, all lots must be verified clean prior to use. This verification must be maintained.

Records of manufacturer's certification and traceability statements are maintained in files or binders in each laboratory section. These records include date of receipt, lot number (when applicable), and expiration date (when applicable). Incorporation of the item into the record indicates that the analyst has compared the new certificate with the previous one for the same purpose and that no difference is noted, unless approved and so documented by the Technical Manager or QA Manager.

11.3.4 Storage

Reagent and chemical storage is important from the aspects of both integrity and safety. Light-sensitive reagents may be stored in brown-glass containers. Storage conditions are per the NDSC Environmental Health & Safety Manual, Document No. CW-E-M-001, the local laboratory EH&S manual addendum and method SOPs or manufacturer instructions.

11.4 Purchase of Equipment / Instruments / Software

When a new piece of equipment is needed, either for additional capacity or for replacing inoperable equipment, the analyst or supervisor makes a supply request to the Technical Manager and/or the Laboratory Director. If they agree with the request, the procedures outlined in NDSC Document No. CA-T-P-001**,** Qualified Products List are followed. A decision is made as to which piece of equipment can best satisfy the requirements. The appropriate written requests are completed and purchasing places the order.

Upon receipt of a new or used piece of equipment, an identification name is assigned and added to the equipment list. IT must also be notified so that they can synchronize the instrument for back-ups. Its capability is assessed to determine if it is adequate or not for the specific application. For instruments, a calibration curve is generated, followed by MDLs, Demonstration of Capabilities (DOCs), and other relevant criteria (refer to Section 20). For software, its operation must be deemed reliable and evidence of instrument verification must be retained by the IT Department or QA Department. Software certificates supplied by the vendors are filed with the LIMS Administrator. The manufacturer's operation manual is retained at the bench.

11.5 Services

Service to analytical instruments (except analytical balances) is performed on an as needed basis. Routine preventative maintenance is discussed in Section 22. The need for service is determined by analysts, department superiors, and/or Technical Manager. The service providers that perform the services are approved by the Laboratory Director and/or Technical Manager.

Analytical balances are serviced and calibrated annually in accordance with SOP No. BR-QA-012, Support Equipment Checks. The calibration and maintenance services are performed on-site, and the balances are returned to use immediately following successful calibration. Calibration certificates are filed for reference. If the calibration was unsuccessful, the balance is immediately removed from service and segregated pending either further maintenance or disposal.

Calibration services for support equipment such as thermometers, weight sets, autopipettors, etc., are obtained from vendors with current and valid ISO 17025 accreditation for calibration of the specific piece of equipment. Prior to utilizing the vendor's services, the vendor's accreditation status is verified. Once the equipment has been calibrated, the calibration certificates are reviewed by the QA department, and documentation of the review is filed with the calibration certificates. The equipment is then returned to service within the laboratory

11.6 Suppliers

The laboratory selects vendors through a competitive proposal / bid process, strategic business alliances or negotiated vendor partnerships (contracts)**.**

This process is defined in the NDSC Document No. CW-F-P-004, Procurement & Contracts

Policy. The level of control used in the selection process is dependent on the anticipated spending amount and the potential impact on the laboratory's business. Vendors that provide test and measuring equipment, solvents, standards, certified containers, instrument related service contracts or subcontract laboratory services shall be subject to more rigorous controls than vendors that provide off-the-shelf items of defined quality that meet the end use requirements. The purchasing system includes all suppliers/vendors that have been approved for use.

Evaluation of suppliers is accomplished by ensuring the supplier ships the product or material ordered and that the material is of the appropriate quality. This is documented by signing off on packing slips or other supply receipt documents. The purchasing documents contain the data that adequately describe the services and supplies ordered.

Any issues of vendor performance are to be reported immediately by the laboratory staff to the Purchasing Group by completing a Vendor Performance Report.

The Purchasing Group will work through the appropriate channels to gather the information required to clearly identify the problem and will contact the vendor to report the problem and to make any necessary arrangements for exchange, return authorization, credit, etc.

Suppliers are subject to re-evaluation, as deemed appropriate, through the use of Vendor Performance Reports used to summarize and review to determine corrective action necessary, or service improvements required by vendors.

The laboratory has access to a listing of all approved suppliers of critical consumables, supplies and services. This information is provided through the purchasing system.

11.6.1 New Vendor Procedure

Laboratory employees who wish to request the addition of a new vendor must complete a Vendor Add Request Form.

New vendors are evaluated based upon criteria appropriate to the products or services provided as well as their ability to provide those products and services at a competitive cost. Vendors are also evaluated to determine if there are ethical reasons or potential conflicts of interest with laboratory employees that would make it prohibitive to do business with them as well as their financial stability. The QA Department and/or the Technical Services Director are consulted with vendor and product selection that have an impact on quality.

12.0 COMPLAINTS

12.1 Overview

The laboratory considers an effective client complaint handling processes to be of significant business and strategic value. Listening to and documenting client concerns captures client knowledge that enables our operations to continually improve processes and client satisfaction. An effective client complaint handling process also provides assurance to the data user that the laboratory will stand behind its data, service obligations and products.

A client complaint is any expression of dissatisfaction with any aspect of our business services (e.g., communications, responsiveness, data, reports, invoicing and other functions) expressed by any party, whether received verbally or in written form. Client inquiries, complaints or noted discrepancies are documented, communicated to management, and addressed promptly and thoroughly.

The laboratory has procedures for addressing both external and internal complaints with the goal of providing satisfactory resolution to complaints in a timely and professional manner.

The nature of the complaint is identified, documented and investigated, and an appropriate action is determined and taken. In cases where a client complaint indicates that an established policy or procedure was not followed, the QA Department must evaluate whether a special audit must be conducted to assist in resolving the issue. A written confirmation or letter to the client, outlining the issue and response taken is recommended as part of the overall action taken.

The process of complaint resolution and documentation utilizes the procedures outlined in Section 14 (Corrective Actions) and is documented following SOP No. BR-QA-016, Non-Conformance and CAPA. A copy of this procedure will be made available to any interested party on request.

12.2 External Complaints

An employee that receives a complaint initiates the complaint resolution process by first documenting the complaint according to SOP No. BR-QA-016, Non-Conformance and CAPA.

Complaints fall into two categories: correctable and non-correctable. An example of a correctable complaint would be one where a report re-issue would resolve the complaint. An example of a non-correctable complaint would be one where a client complains that their data was repeatedly late. Non-correctable complaints should be reviewed for preventive action measures to reduce the likelihood of future occurrence and mitigation of client impact.

The general steps in the complaint handling process are:

- Receiving and documenting complaints
- Acknowledging receipt of complaint, whenever possible
- Complaint investigation and service recovery
- Process improvement

The laboratory shall inform the initiator of the complaint of the results of the investigation and the corrective action taken, if any.

12.3 Internal Complaints

Internal complaints include, but are not limited to: errors and non-conformances, training issues, internal audit findings, and deviations from methods. Corrective actions may be initiated by any staff member who observes a nonconformance and shall follow the procedures outlined in Section 14. In addition, Executive Management, Sales and Marketing and IT may initiate a complaint by contacting the laboratory or through the corrective action system described in Section 14.

12.4 Management Review

The number and nature of client complaints is reported by the QA Manager to the Laboratory Director and Quality Director in the QA Monthly report. Monitoring and addressing the overall level and nature of client complaints and the effectiveness of the solutions is part of the Annual Management Systems Review (Section 18).

13.0 CONTROL OF NON-CONFORMING WORK

13.1 Overview

When data discrepancies are discovered or deviations and departures from laboratory SOPs, policies and/or client requests have occurred, corrective action is taken immediately. First, the laboratory evaluates the significance of the nonconforming work. Then, a corrective action plan is initiated based on the outcome of the evaluation. If it is determined that the nonconforming work is an isolated incident, the plan could be as simple as adding a qualifier to the final results and/or making a notation in the case narrative. If it is determined that the nonconforming work is a systematic or improper practices issue, the corrective action plan could include a more in depth investigation and a possible suspension of an analytical method. In all cases, the actions taken are documented using the laboratory's corrective action system (refer to Section 14).

Due to the frequently unique nature of environmental samples, sometimes departures from documented policies and procedures are needed. When an analyst encounters such a situation, the problem is presented to the supervisor for resolution. The supervisor may elect to discuss it with the Technical Manager or have a representative contact the client to decide on a logical course of action. Once an approach is agreed upon, the analyst documents it using the laboratories corrective action system described in Section 14. This information can then be supplied to the client in the form of a footnote or a case narrative with the report.

Project Management may encounter situations where a client may request that a special procedure be applied to a sample that is not standard lab practice. Based on a technical evaluation, the lab may accept or opt to reject the request based on technical or ethical merit. An example might be the need to report a compound that the lab does not normally report. The lab would not have validated the method for this compound following the procedures in Section 21. The client may request that the compound be reported based only on the calibration. Such a request would need to be approved by the Technical Manager and QA Manager, documented and included in the project folder. Deviations **must** also be noted on the final report with a statement that the compound is not reported in compliance with TNI (or the analytical method) requirements and the reason. Data being reported to a non-TNI state would need to note the change made to how the method is normally run.

13.2 Responsibilities and Authorities

Under certain circumstances, the Laboratory Director, a Technical Manager, or QA Manager may authorize departures from documented procedures or policies. The departures may be a result of procedural changes due to the nature of the sample; a one-time procedure for a client; QC failures with insufficient sample to reanalyze, etc. In most cases, the client will be informed of the departure prior to the reporting of the data. Any departures must be well documented using the laboratory's corrective action procedures. This information may also be documented in logbooks and/or data review checklists as appropriate*.* Any impacted data must be referenced in a case narrative and/or flagged with an appropriate data qualifier.

Any misrepresentation or possible misrepresentation of analytical data discovered by any laboratory staff member must be reported to facility Senior Management within 24-hours. The Senior Management staff is comprised of the Laboratory Director, the QA Manager, and the Technical Managers. The reporting of issues involving alleged violations of the company's Data Integrity or Manual Integration procedures must be conveyed to an ECO (e.g., the VP-QA/EHS) and the laboratory's Quality Director within 24 hours of discovery.

Whether an inaccurate result was reported due to calculation or quantitation errors, data entry errors, improper practices, or failure to follow SOPs, the data must be evaluated to determine the possible effect.

The Laboratory Director, QA Manager, ECOs, VP of Operations and the Quality Directors have the authority and responsibility to halt work, withhold final reports, or suspend an analysis for due cause as well as authorize the resumption of work.

13.3 Evaluation of Significance and Actions Taken

For each nonconforming issue reported, an evaluation of its significance and the level of management involvement needed is made. This includes reviewing its impact on the final data, whether or not it is an isolated or systematic issue, and how it relates to any special client requirements.

The NDSC Document entitled Data Recalls (CW-Q-S-005) is the procedure to be followed when it is discovered that erroneous or biased data may have been reported to clients or regulatory agencies.

The NDSC Document entitled Internal Investigations (CW-L-S-002) is the procedure to be followed for investigation and correction of situations involved alleged incidents of misconduct or violation of the company's ethics policy.

Laboratory level decisions are documented and approved using the laboratory's standard nonconformance/corrective action reporting in lieu of the data recall determination form contained in NDSC Document No. CW-Q-S-005.

13.4 Prevention of Nonconforming Work

If it is determined that the nonconforming work could recur, further corrective actions must be made following the laboratory's corrective action system. Periodically as defined by the laboratory's preventive action schedule, the QA Department evaluates non-conformances to determine if any nonconforming work has been repeated multiple times. If so, the laboratory's corrective action process may be followed.

13.5 Method Suspension / Restriction (Stop Work Procedures)

In some cases, it may be necessary to suspend/restrict the use of a method or target analyte which constitutes significant risk and/or liability to the laboratory. Suspension/restriction procedures can be initiated by any of the persons noted in Section 13.2, Paragraph 5.

Prior to suspension/restriction, confidentiality will be respected, and the problem with the required corrective and preventive action will be stated in writing and presented to the Laboratory Director.

The Laboratory Director shall arrange for the appropriate personnel to meet with the QA Manager as needed. This meeting shall be held to confirm that there is a problem, that suspension/restriction of the method is required and will be concluded with a discussion of the steps necessary to bring the method/target or test fully back on line. In some cases, that may not be necessary if all appropriate personnel have already agreed there is a problem and there is agreement on the steps needed to bring the method, target or test fully back on line. The QA Manager will also initiate a corrective action report as described in Section 14 if one has not already been started. A copy of any meeting notes and agreed upon steps should be e-mailed

by the laboratory to their Business Unit President; VP-QA & EHS. This e-mail acts as notification of the incident.

After suspension/restriction, the lab will hold all reports to clients pending review. No faxing, mailing or distributing through electronic means may occur. The report must not be posted for viewing on the internet. It is the responsibility of the Laboratory Director to hold all reporting and to notify all relevant laboratory personnel regarding the suspension/restriction (e.g., Project Management, Log-in, etc.). Clients will NOT generally be notified at this time. Analysis may proceed in some instances depending on the non-conformance issue.

Within 72 hours, the QA Manager will determine if compliance is now met and reports can be released, OR determine the plan of action to bring work into compliance, and release work. A team, with all principals involved (e.g., Laboratory Director, Technical Manager, QA Manager) can devise a start-up plan to cover all steps from client notification through compliance and release of reports. Project Management and the Directors of Client Services and Sales and Marketing must be notified if clients must be notified or if the suspension/restriction affects the laboratory's ability to accept work. The QA Manager must approve start-up or elimination of any restrictions after all corrective action is complete.

14.0 CORRECTIVE ACTION

14.1 Overview

A major component of the laboratory's (QA) Program is the problem investigation and feedback mechanism designed to keep the laboratory staff informed on quality related issues and to provide insight to problem resolution. When nonconforming work or departures from policies and procedures in the quality system or technical operations are identified, the corrective action procedure provides a systematic approach to assess the issues, restore the laboratory's system integrity, and prevent reoccurrence. The laboratory employs two systems to manage non-conformances. Issues suspected of being systematic in nature and for which root cause analysis and a formal Corrective Action Report (CAR) are documented in the Incident Corrective Action Tracking (ICAT) database. Routine batch non-conformances, events that are understood to be isolated in nature, are documented in the LIMS non-conformance memo (NCM) system.

14.2 General

Problems within the quality system or within analytical operations may be discovered in a variety of ways, such as QC sample failures, internal or external audits, proficiency testing (PT) performance, client complaints, staff observation, etc.

The purpose of a corrective action system is to:

- Identify non-conformance events and assign responsibility for investigating.
- Resolve non-conformance events and assign responsibility for any required corrective action.
- Identify systematic problems before they become serious.
- Identify and track client complaints and provide resolution.

14.2.1 Non-Conformance Memo (NCM)

NCMs are used to document the following types of corrective actions:

- Deviations from an established procedure or SOP
- QC outside of limits
- Isolated reporting / calculation errors
- Client complaints
- Discrepancies in materials / goods received vs. manufacturer packing slips (Forms of documentation other than NCMs in LIMS are also acceptable)

14.2.2 Corrective Actions Documented In the ICAT Database

- Internal and external audit findings
- Failed or unacceptable PT results
- Identified poor process or method performance trends
- Systematic reporting / calculation errors
- Data recall investigations
- Questionable trends that are found in the review of NCMs.
- Client complaints
- Excessive revised reports

The ICAT database is used to document background information, track the results of corrective action investigations and root cause analysis, and to provide reports of corrective action plans.

14.3 Closed Loop Corrective Action Process

Any employee in the company can initiate a corrective action. There are four main components to a closed-loop corrective action process once an issue has been identified: Cause Analysis, Selection and Implementation of Corrective Actions (both short and long term), Monitoring of the Corrective Actions, and Follow-up.

14.3.1 Cause Analysis

- Upon discovery of a non-conformance event, the event must be defined and documented. An entry into the ICAT system must be initiated, someone is assigned to investigate the issue and the event is investigated for cause. Table 12-1 provides some general guidelines on determining responsibility for assessment.
- The cause analysis step is the key to the process as a long term corrective action cannot be determined until the cause is determined.
- If the cause is not readily obvious, the Technical Manager, Laboratory Director, or QA Manager (or QA designee) is consulted.

14.3.2 Selection and Implementation of Corrective Actions

- Where corrective action is needed, the laboratory shall identify potential corrective actions. The action(s) most likely to eliminate the problem and prevent recurrence are selected and implemented. Responsibility for implementation is assigned.
- Corrective actions shall be to a degree appropriate to the magnitude of the problem identified through the cause analysis.
- Whatever corrective action is determined to be appropriate, the laboratory shall document and implement the changes. The ICAT record is used for this documentation.

14.3.3 Root Cause Analysis

Root Cause Analysis is a class of problem solving (investigative) methods aimed at identifying the basic or causal factor(s) that underlie variation in performance or the occurrence of a significant failure. The root cause may be buried under seemingly innocuous events, many steps preceding the perceived failure. At first glance, the immediate response is typically directed at a symptom and not the cause. Typically, root cause analysis would be best with three or more incidents to triangulate a weakness. NDSC Document No. CA-Q-S-009, Root Cause Analysis, provides guidance on this procedure.

Systematically analyze and document the root causes of the more significant problems that are reported. Identify, track, and implement the corrective actions required to reduce the likelihood of recurrence of significant incidents. Trend the root cause data from these incidents to identify root causes that, when corrected, can lead to dramatic improvements in performance by eliminating entire classes of problems.

Identify the one event associated with problem and ask why this event occurred. Brainstorm the root causes of failures; for example, by asking why events occurred or conditions existed; and then why the cause occurred consecutive times until you get to the root cause. For each of these sub events or causes, ask why it occurred. Repeat the process for the other events associated with the incident.

Root cause analysis does not mean the investigation is over. Look at technique or other systems outside the normal indicators. Often creative thinking will find root causes that ordinarily would be missed and continue to plague the laboratory or operation.

14.3.4 Monitoring of the Corrective Actions

- The Technical Manager and QA Manager are responsible to ensure that the corrective action taken was effective.
- Ineffective actions are documented and re-evaluated until acceptable resolution is achieved. Technical Managers are accountable to the Laboratory Director to ensure final acceptable resolution is achieved and documented appropriately.
- The QA Manager reviews monthly NCM and ICAT records for trends. Highlights are included in the QA monthly report (refer to Section 18). If a significant trend develops that adversely affects quality, an audit of the area is performed and corrective action implemented.
- Any out-of-control situations that are not addressed acceptably at the laboratory level may be reported to the NDSC Quality Director by the QA Manager, indicating the nature of the out-of-control situation and problems encountered in solving the situation.

14.3.5 Follow-up Audits

- Follow-up audits may be initiated by the QA Manager and shall be performed as soon as possible when the identification of a nonconformance casts doubt on the laboratory's compliance with its own policies and procedures, or on its compliance with state or federal requirements.
- These audits often follow the implementation of the corrective actions to verify effectiveness. An additional audit would only be necessary when a critical issue or risk to business is discovered.

(Also refer to Section 17.1.4, Special Audits.)

14.4 Technical Corrective Actions

In addition to providing acceptance criteria and specific protocols for technical corrective actions in the method SOPs, the laboratory has general procedures to be followed to determine when departures from the documented policies and procedures and quality control have occurred (refer to Section 13). The documentation of these procedures is through the use of an NCM or record in the ICAT system.

Table 12-1 includes examples of general technical corrective actions. For specific criteria and corrective actions, refer to the analytical methods or specific method SOPs. The laboratory may also maintain Work Instructions on these items that are available upon request.

Table 12-1 provides some general guidelines for identifying the individual(s) responsible for assessing each QC type and initiating corrective action. The table also provides general guidance on how a data set should be treated if associated QC measurements are unacceptable. Specific procedures are included in Method SOPs, Work Instructions, QA Manual Sections 19 and 20. All corrective actions are reviewed monthly, at a minimum, by the QA Manager and highlights are included in the QA monthly report.

To the extent possible, samples shall be reported only if all quality control measures are acceptable. If the deficiency does not impair the usability of the results, data will be reported with an appropriate data qualifier and/or the deficiency will be noted in the case narrative. Where sample results may be impaired, the PM is notified by an NCM and appropriate corrective action (e.g., reanalysis) is taken and documented**.**

14.5 Basic Corrections

When mistakes occur in records, each mistake shall be crossed-out, [not obliterated (e.g. no white-out)], and the correct value entered alongside. All such corrections shall be initialed (or signed) and dated by the person making the correction. In the case of records stored electronically, the original uncorrected file must be maintained intact and a second corrected file is created. This same process applies to adding additional information to a record. All additions made later than the initial must also be initialed (or signed) and dated. When corrections are due to reasons other than obvious transcription errors, the reason for the corrections (or additions) shall also be documented.

Table 14-1. Example – General Corrective Action Procedures

QC Activity ***(Individual Responsible for Initiation/Assessment)***	**Acceptance Criteria**	**Recommended Corrective Action**
Initial Instrument Blank *(Analyst)*	- Instrument response < MDL.	- Prepare another blank. - If same response, determine cause of contamination: reagents, environment, instrument equipment failure, etc..
Initial Calibration Standards *(Analyst, Technical Manager(s))*	- Correlation coefficient > 0.99 or standard concentration value. - % Recovery within acceptance range. - See details in Method SOP.	- Reanalyze standards. - If still unacceptable, remake standards and recalibrate instrument.
Independent Calibration Verification (Second Source) *(Analyst, Technical Manager(s))*	- % Recovery within control limits.	- Remake and reanalyze standard. - If still unacceptable, then remake calibration standards or use new primary standards and recalibrate instrument.
Continuing Calibration Standards *(Analyst, Data Reviewer)*	% Recovery within control limits.	- Reanalyze standard. - If still unacceptable, then recalibrate and rerun affected samples.
Matrix Spike / Matrix Spike Duplicate (MS/MSD) *(Analyst, Data Reviewer)*	- % Recovery within limits documented in LIMS	- If the acceptance criteria for duplicates or matrix spikes are not met because of matrix interferences, the acceptance of the analytical batch is determined by the validity of the LCS. - If the LCS is within acceptable limits the batch is acceptable. - The results of the duplicates, matrix spikes and the LCS are reported with the data set. - For matrix spike or duplicate results outside criteria the data for that sample shall be reported with qualifiers.

QC Activity ***(Individual Responsible for Initiation/Assessment)***	**Acceptance Criteria**	**Recommended Corrective Action**
Laboratory Control Sample (LCS) *(Analyst, Data Reviewer)*	- % Recovery within limits specified in LIMS	- Batch must be re-prepared and re-analyzed. This includes any allowable marginal exceedance. When not using marginal exceedances, the following exceptions apply: 1) when the acceptance criteria for the positive control are exceeded high (i.e., high bias) and there are associated samples that are non-detects, then those non-detects may be reported with data qualifying codes; 2) when the acceptance criteria for the positive control are exceeded low (i.e., low bias), those sample results may be reported if they exceed a maximum regulatory limit/decision level with data qualifying codes. **Note:** If there is insufficient sample or the holding time cannot be met, contact client and report with flags.
Surrogates *(Analyst, Data Reviewer)*	- % Recovery within limits of method or within three standard deviations of the historical mean.	- Individual sample must be repeated. Place comment in LIMS. - Surrogate results outside criteria shall be reported with qualifiers.
Method Blank (MB) *(Analyst, Data Reviewer)*	< Reporting Limit [1]	- Reanalyze blank. - If still positive, determine source of contamination. If necessary, reprocess (i.e. digest or extract) entire sample batch. Report blank results. - Qualify the result(s) if the concentration of a targeted analyte in the MB is at or above the reporting limit AND is > 1/10 of the amount measured in the sample.
Proficiency Testing (PT) Samples *(QA Manager, Technical Manager(s))*	- Criteria supplied by PT Supplier.	- Any failures or warnings must be investigated for cause. Failures may result in the need to repeat a PT sample to show the problem is corrected.
Internal / External Audits *(QA Manager, Technical Manager(s), Laboratory Director)*	- Defined in Quality System documentation such as SOPs, QAM, etc.	- Non-conformances must be investigated through CAR system and necessary corrections must be made.

QC Activity ***(Individual Responsible for Initiation/Assessment)***	**Acceptance Criteria**	**Recommended Corrective Action**
Reporting / Calculation Errors (Depends on issue – possible individuals include: Analysts, Data Reviewers, Project Managers, Technical Managers, QA Manager, NDSCQA, Executive Management)	- NDSC Document No. CW-Q-S-005, Data Recall **or** local SOP No.	- Corrective action is determined by type of error. Follow the procedures in NDSC Document No. CW-L-S-002 **or** your lab's CA SOP.
Client Complaints *(Project Managers, Lab Director/Manager, Sales and Marketing)*	-	- Corrective action is determined by the type of complaint. For example, a complaint regarding an incorrect address on a report will result in the report being corrected and then follow-up must be performed on the reasons the address was incorrect (e.g., database needs to be updated).
QA Monthly Report (Refer to Section 16 for an example) (QA Manager, Lab Director/Manager, *Technical Manager(s)*)	- QAM, SOPs.	- Corrective action is determined by the type of issue. For example, CARs for the month are reviewed and possible trends are investigated.
Health and Safety Violation (Safety Officer, Lab Director/Manager, *Technical Manager(s)*)	- Environmental Health and Safety (EHS) Manual.	- Non-conformance is investigated and corrected through CAR system.

Note:
1. Except as noted below for certain compounds, the method blank should be below the detection limit, Concentrations up to five times the reporting limit will be allowed for the ubiquitous laboratory and reagent contaminants: methylene chloride, toluene, acetone, 2-butanone and phthalates **provided** they appear in similar levels in the reagent blank and samples. This allowance presumes that the detection limit is significantly below any regulatory limit to which the data are to be compared and that blank subtraction will not occur. For benzene and ethylene dibromide (EDB) and other analytes for which regulatory limits are extremely close to the detection limit, the method blank must be below the method detection limit.

15.0 PREVENTIVE ACTION / IMPROVEMENT

15.1 Overview

The laboratory's preventive action programs improve or eliminate potential causes of nonconforming product and/or nonconformance to the quality system. This preventive action process is a proactive and continuous process of improvement activities that can be initiated through feedback from clients, employees, business providers, and affiliates. The QA Department has the overall responsibility to ensure that the preventive action process is in place, and that relevant information on actions is submitted for management review.

Dedicating resources to an effective preventive action system emphasizes the laboratory's commitment to its QA Program. It is beneficial to identify and address negative trends before they develop into complaints, problems and corrective actions. Additionally, the laboratory continually strives to improve customer service and client satisfaction through continuous improvements to laboratory systems.

Opportunities for improvement may be discovered through any of the following:

- review of the monthly QA Metrics Report,
- trending NCMs,
- review of control charts and QC results,
- trending proficiency testing (PT) results,
- performance of management system reviews,
- trending client complaints,
- review of processing operations, or
- staff observations.

The monthly Management Systems Metrics Report shows performance indicators in all areas of the laboratory and quality system. These areas include revised reports, corrective actions, audit findings, internal auditing and data authenticity audits, client complaints, PT samples, holding time violations, SOPs, ethics training, etc. The metrics report is reviewed monthly by the laboratory management, NDSC QA Team Local and Executive Mangement. These metrics are used ~~to~~ in evaluating the management and quality system performance on an ongoing basis and provide a tool for identifying areas for improvement.

Items identified as continuous improvement opportunities to the management system may be issued as goals from the annual management systems review, recommendations from internal audits, white papers, Lessons Learned, Technical Services audit report, Technical Best Practices, or as Executive or management initiatives.

The laboratory's corrective action process is integral to implementation of preventive actions. A critical piece of the corrective action process is the implementation of actions to prevent further occurrence of a non-compliance event. Historical review of corrective action and non-conformances provides a valuable mechanism for identifying preventive action opportunities.

15.1.1 The following elements are part of a preventive action/process improvement system:

- Identification of an opportunity for preventive action or process improvement.
- Process for the preventive action or improvement.

- Define the measurements of the effectiveness of the process once undertaken.
- Execution of the preventive action or improvement.
- Evaluation of the plan using the defined measurements.
- Verification of the effectiveness of the preventive action or improvement.
- Close-Out by documenting any permanent changes to the Quality System as a result of the Preventive Action or Process Improvement. Documentation of Preventive Action/process Improvement is incorporated into the monthly QA reports, corrective action process and management review.

15.1.2 Any preventive actions/process improvement undertaken or attempted shall be taken into account during the annual Management Systems Review (Section 16). A highly detailed report is not required; however, a summary of successes and failures within the preventive action program is sufficient to provide management with a measurement for evaluation.

16.0 CONTROL OF RECORDS

The laboratory maintains a records management system appropriate to its needs and that complies with applicable standards or regulations as required. The system produces unequivocal, accurate records that document all laboratory activities. The laboratory retains all original observations, calculations and derived data, calibration records and a copy of the analytical report for a minimum of five years after it has been issued. Exceptions for programs with longer retention requirements are discussed in Section 14.1.2.

16.1 Overview

The laboratory has established procedures for identification, collection, indexing, access, filing, storage, maintenance and disposal of quality and technical records. A record index is listed in Table 14-1. More detailed information on retention of specific records is provided in NDSC Document Nos. CW-L-P-001, Records Retention Policy and CW-L-WI-001, Records Retention/Storage Schedule. Quality records are maintained by the QA department in a database, which is backed up as part of the regular laboratory backup. Records are of two types; either electronic or hard copy paper formats depending on whether the record is computer or hand generated (some records may be in both formats). Technical records are maintained by QA Department

Table 16-1. Record Index

	Record Types [1]:	Retention Time:
Technical Records	- Raw Data - Logbooks[2] - Standards - Certificates - Analytical Records - MDLs/IDLs/DOCs - Lab Reports	5 Years from analytical report issue*
Official Documents	- Quality Assurance Manual (QAM) - Work Instructions - Policies - SOPs - Policy Memorandums - Manuals - Published Methods	Indefinitely
QA Records	- Certifications - Method and Software Validation / Verification Data	Indefinitely
QA Records	- Internal & External Audits/Responses - Corrective/Preventive Actions - Management Reviews - Data Investigation	5 Years from archival* **Data Investigation:** 5 years or the life of the affected raw data storage whichever is greater (beyond 5 years if ongoing project or pending investigation)
Project Records	- Sample Receipt & COC Documents - Contracts and Amendments - Correspondence - QAPP - SAP - Telephone Logbooks - Lab Reports	5 Years from analytical report issue*
Administrative Records	Financial and Business Operations	Refer to NDSC Doc. No. CW-L-WI-001
	EH&S Manual, Permits	Indefinitely
	Disposal Records	Indefinitely
	Employee Handbook	Indefinitely
	Personnel files, Employee Signature & Initials, Administrative Training Records (e.g., Ethics)	Refer to HR Manual
	Administrative Policies	Indefinitely
	Technical Training Records	7 years
	Legal Records	Indefinitely
	HR Records	Refer to NDSC Doc. No. CW-L-WI-001
	IT Records	Refer to NDSC Doc. No. CW-L-WI-001
	NDSC Governance Records	Refer to NDSC Doc. No. CW-L-WI-001
	Sales & Marketing	5 years
	Real Estate	Indefinitely

[1] Record Types encompass hardcopy and electronic records.

[2] Examples of Logbook types: Maintenance, Instrument Run, Preparation (standard and samples), Standard and Reagent Receipt, Archiving, Balance Calibration, Temperature (hardcopy or electronic records).
* Exceptions listed in Table 16-2.

16.1.1 All records are stored and retained in such a way that they are secure and readily retrievable at the laboratory facility or the Iron Mountain data storage facility that provides a suitable environment to prevent damage or deterioration and to prevent loss. All records shall be protected against fire, theft, loss, environmental deterioration, and vermin. In the case of electronic records, electronic or magnetic sources, storage media are protected from deterioration caused by magnetic fields and/or electronic deterioration.

Access to the data is limited to laboratory and company employees and shall be documented with an access log**.** Records archived off-site are stored in a secure location where a record is maintained of any entry into the storage facility. Whether on-site or off-site storage is used, logs are maintained in each storage box to note removal and return of records. Retention of records are maintained on-site at the laboratory for at least 1 year after their generation and moved offsite for the remainder of the required storage time. Records are maintained for a minimum of five years unless otherwise specified by a client or regulatory requirement.

For raw data and project records, record retention shall be calculated from the date the project report is issued. For other records, such as NDSC and/or KGD Documents, QA, or Administrative Records, the retention time is calculated from the date the record is formally retired. Records related to the programs listed in Table 16-2 have lengthier retention requirements and are subject to the requirements in Section 16.1.3.

16.2 Programs with Longer Retention Requirements

Some regulatory programs have longer record retention requirements than the standard record retention time. These are detailed in Table 16-2 with their retention requirements. In these cases, the longer retention requirement is enacted. If special instructions exist such that client data cannot be destroyed prior to notification of the client, the container or box containing that data is marked as to who to contact for authorization prior to destroying the data.

Table 16-2. Example: Special Record Retention Requirements

Program	**[1]Retention Requirement**
Drinking Water – All States	10 years (lab reports and raw data) 10 years - Radiochemistry (project records)
Drinking Water Lead and Copper Rule	12 years (project records)
DOE Hanford	5 years, Written approval must be received from DOE Hanford prior to disposal of analytical data
Commonwealth of MA – All environmental data 310 CMR 42.14	10 years
FIFRA – 40 CFR Part 160	Retain for life of research or marketing permit for pesticides regulated by EPA
Housing and Urban Development (HUD) Environmental Lead Testing	10 years
Alaska	10 years
Louisiana – All	10 years

Program	[1]Retention Requirement
Michigan Department of Environmental Quality – all environmental data	10 years
Navy Facilities Engineering Service Center (NFESC)	10 years
Ohio VAP	10 years and State contacted prior to disposal
OSHA	30 years

[1]Note: Extended retention requirements must be noted with the archive documents or addressed in facility-specific records retention procedures.

16.2.1 The laboratory has procedures to protect and back-up records stored electronically and to prevent unauthorized access to or amendment of these records. All analytical data is maintained as hard copy or in a secure readable electronic format. For analytical reports that are maintained as copies in PDF format, refer to Section 19.15.1 for more information. Also see SOP BR-QA-021, Electronic Data Archive Burlington.

16.2.2 The record keeping system allows for historical reconstruction of all laboratory activities that produced the analytical data, as well as rapid recovery of historical data. Records stored off site should be accessible within 2 days of a request for such records. The history of the sample from when the laboratory took possession of the samples must be readily understood through the documentation. This shall include inter-laboratory transfers of samples and/or extracts.

- The records include the identity of personnel involved in sampling, sample receipt, preparation, or testing. All analytical work contains the initials (at least) of the personnel involved. The laboratory's copy of the COC is stored with the invoice and the work order sheet generated by LIMS. The chain of custody would indicate the name of the sampler. If any sampling notes are provided with a work order, they are kept with this package.
- All information relating to the laboratory facilities' equipment, analytical test methods, and related laboratory activities, such as sample receipt, sample preparation, or data verification are documented.
- The record keeping system facilitates the retrieval of all working files and archived records for inspection and verification purposes (e.g., set format for naming electronic files, set format for what is included with a given analytical data set in laboratory method SOPs. Instrument data is stored sequentially by instrument. A given day's analyses are maintained in the order of the analysis. Run logs are maintained for each instrument or method; a copy of each day's run log or instrument sequence is stored with the data to aid in re-constructing an analytical sequence. Where an analysis is performed without an instrument, bound logbooks or bench sheets are used to record and file data. Standard and reagent information is recorded in logbooks or entered into LIMS for each method as required.
- Changes to hardcopy records shall follow the procedures outlined in Section 12 and 19. Changes to electronic records in LIMS or instrument data are recorded in audit trails.
- The reason for a signature or initials on a document is clearly indicated in the records such as "sampled by," "prepared by," "reviewed by", or "analyzed by".
- All generated data except those that are generated by automated data collection systems, are recorded directly, promptly and legibly in permanent dark ink.
- Hard copy data may be scanned into PDF format for record storage as long as the scanning

process can be verified in order to ensure that no data is lost and the data files and storage media must be tested to verify the laboratory's ability to retrieve the information prior to the destruction of the hard copy that was scanned. The procedure for this verification can be found in SOP BR-QA-003, Document Control.

- Also refer to Section 19.15.1 'Computer and Electronic Data Related Requirements'.

16.3 Technical and Analytical Records

16.3.1 The laboratory retains records of original observations, derived data and sufficient information to establish an audit trail, calibration records, staff records and a copy of each analytical report issued, for a minimum of five years unless otherwise specified by a client or regulatory requirement. The records for each analysis shall contain sufficient information to enable the analysis to be repeated under conditions as close as possible to the original. The records shall include the identity of laboratory personnel responsible for the sampling, performance of each analysis and reviewing results.

16.3.2 Observations, data and calculations are recorded real-time and are identifiable to the specific task.

16.3.3 Changes to hardcopy records shall follow the procedures outlined in Section 12 and 19. Changes to electronic records in LIMS or instrument data are recorded in audit trails.

The essential information to be associated with analysis, such as strip charts, tabular printouts, computer data files, analytical notebooks, and run logs, include:

- Laboratory sample ID code;
- Date of analysis; time of analysis is also required if the holding time is seventy-two (72) hours or less, or when time critical steps are included in the analysis (e.g., drying times, incubations, etc.); instrumental analyses have the date and time of analysis recorded as part of their general operations. Where a time critical step exists in an analysis, location for such a time is included as part of the documentation in a specific logbook or on a benchsheet.
- Instrumentation identification and instrument operating conditions/parameters. Operating conditions/parameters are typically recorded in instrument maintenance logs where available.
- analysis type;
- all manual calculations and manual integrations;
- analyst's or operator's initials/signature;
- sample preparation including cleanup, separation protocols, incubation periods or subculture, ID codes, volumes, weights, instrument printouts, meter readings, calculations, reagents;
- test results;
- standard and reagent origin, receipt, preparation, and use;
- calibration criteria, frequency and acceptance criteria;
- data and statistical calculations, review, confirmation, interpretation, assessment and reporting conventions;
- quality control protocols and assessment;

- electronic data security, software documentation and verification, software and hardware audits, backups, and records of any changes to automated data entries; and
- Method performance criteria including expected quality control requirements. These are indicated both in LIMS and on specific analytical report formats**.**

16.3.4 All logbooks used during receipt, preparation, storage, analysis, and reporting of samples or monitoring of support equipment shall undergo a periodic, documented supervisory or peer review.

16.4 Laboratory Support Activities

In addition to documenting all the above-mentioned activities, the following are retained QA records and project records (previous discussions in this section relate where and how these data are stored):

- all original raw data, whether hard copy or electronic, for calibrations, samples and quality control measures, including analysts' work sheets and data output records (chromatograms, strip charts, and other instrument response readout records)**;**
- a written description or reference to the specific test method used which includes a description of the specific computational steps used to translate parametric observations into a reportable analytical value**;**
- copies of final reports**;**
- archived SOPs**;**
- correspondence relating to laboratory activities for a specific project**;**
- all corrective action reports, audits and audit responses**;**
- proficiency test results and raw data; and
- results of data review, verification, and crosschecking procedures

16.4.1 Sample Handling Records

Records of all procedures to which a sample is subjected while in the possession of the laboratory are maintained. These include but are not limited to records pertaining to:

- sample preservation including appropriateness of sample container and compliance with holding time requirement;
- sample identification, receipt, acceptance or rejection and login;
- sample storage and tracking including shipping receipts, sample transmittal / COC forms; and
- procedures for the receipt and retention of samples, including all provisions necessary to protect the integrity of samples.

16.5 Administrative Records

The laboratory also maintains the administrative records in either electronic or hard copy form. Refer to Table 16-1.

16.6 Records Management, Storage and Disposal

All records (including those pertaining to test equipment), certificates and reports are safely stored, held secure and in confidence to the client. Certification related records are available upon request.

All information necessary for the historical reconstruction of data is maintained by the laboratory. Records that are stored only on electronic media must be supported by the hardware and software necessary for their retrieval.

Records that are stored or generated by computers or personal computers have hard copy, write-protected backup copies, or an electronic audit trail controlling access**.**

The laboratory has a record management system (a.k.a., document control) for control of laboratory notebooks, instrument logbooks, standards logbooks, and records for data reduction, validation, storage and reporting. Laboratory notebooks are issued on a per analysis basis, and are numbered sequentially. All data are recorded sequentially within a series of sequential notebooks. Bench sheets are filed sequentially. Standards are maintained in LIMS – no logbooks are used to record that data**.** Records are considered archived when noted as such in the records management system (a.k.a., document control.)

16.6.1 Transfer of Ownership

In the event that the laboratory transfers ownership or goes out of business, the laboratory shall ensure that the records are maintained or transferred according to client's instructions. Upon ownership transfer, record retention requirements shall be addressed in the ownership transfer agreement and the responsibility for maintaining archives is clearly established. In addition, in cases of bankruptcy, appropriate regulatory and state legal requirements concerning laboratory records must be followed. In the event of the closure of the laboratory, all records will revert to the control of NDSC. Should the entire company cease to exist, as much notice as possible will be given to clients and the accrediting bodies who have worked with the laboratory during the previous 5 years of such action.

16.6.2 Records Disposal

Records are removed from the archive and destroyed after 5 years unless otherwise specified by a client or regulatory requirement. On a project specific or program basis, clients may need to be notified prior to record destruction. Records are destroyed in a manner that ensures their confidentiality such as shredding, mutilation or incineration. (Refer to Tables 14-1 and 14-2).

Electronic copies of records must be destroyed by erasure or physically damaging off-line storage media so no records can be read.

If a third party records management company is hired to dispose of records, a "Certificate of Destruction" is required.

17.0 AUDITS

17.1 Internal Audits

Internal audits are performed to verify that laboratory operations comply with the requirements of the lab's quality system and with the external quality programs under which the laboratory operates. Audits are planned and organized by the QA staff. Personnel conducting the audits should be independent of the area being evaluated. Auditors will have sufficient authority,

access to work areas, and organizational freedom necessary to observe all activities affecting quality and to report the assessments to laboratory management and, when requested, to Executive Management.

Audits are conducted and documented as described in the NDSC Document No. on performing Internal Auditing, SOP No. CW-Q-S-003. The types and frequency of routine internal audits are described in Table 17-1. Special or ad hoc assessments may be conducted as needed under the direction of the QA staff.

Table 17-1. Types of Internal Audits and Frequency

Description	Performed by	Frequency
Quality Systems Audits	QA Department, QA approved designee, or NDSC QA	All areas of the laboratory annually
Method Audits QA Technical Audits	Joint responsibility: a) QA Manager or designee b) Technical Manager or Designee (Refer to NDSC CW-Q-S-003)	QA Technical Audits Frequency: 50% of methods annually
SOP Method Compliance	Joint responsibility: a) QA Manager or designee b) Technical Manager or Designee (Refer to NDSC CW-Q-S-003)	SOP Compliance Review Frequency: • Every 2 years • Every 1 year (Drinking Water Methods) • 100% of SOPs annually (DoD/DOE Labs)
Special	QA Department or Designee	Surveillance or spot checks performed as needed, e.g., to confirm corrective actions from other audits.
Performance Testing	Analysts with QA oversight	Two successful per year for each TNI-field of testing or as dictated by regulatory requirements

17.1.1 Annual Quality Systems Audit

An annual quality systems audit is required to ensure compliance to analytical methods and SOPs, Eurofins Data Integrity and Ethics Policies (see Sec. 7.2), TNI quality systems, client and state requirements, and the effectiveness of the internal controls of the analytical process, including but not limited to data review, quality controls, preventive action and corrective action. The completeness of earlier corrective actions is assessed for effectiveness & sustainability. The audit is divided into sections for each operating or support area of the lab, and each section is comprehensive for a given area. The area audits may be performed on a rotating schedule throughout the year to ensure adequate coverage of all areas. This schedule may change as situations in the laboratory warrant.

17.1.2 QA Technical Audits

QA technical audits assess data authenticity and analyst integrity. These audits are based on client projects, associated sample delivery groups, and the methods performed. Reported results are compared to raw data to verify the authenticity of results. The validity of calibrations and QC results are compared to data qualifiers, footnotes, and case narratives. Documentation is assessed by examining run logs and records of manual integrations. Manual calculations are checked. Where possible, electronic audit miner programs (e.g., Chrom AuditMiner) are used to identify unusual manipulations of the data deserving closer scrutiny. QA technical audits will include all methods within a two-year period.

17.1.3 SOP Method Compliance

Compliance of all SOPs with the source methods and compliance of the operational groups with the SOPs will be assessed by the Technical Manager or qualified designee at least every two years. (Annually for methods and administrative SOPs related to DoD/DOE programs and DW compliance methods. - where applicable) It is also recommended that the work of each newly hired analyst is assessed within 3 months of working independently, (e.g., completion of method IDOC). In addition, as analysts add methods to their capabilities, (new IDOC) reviews of the analyst work products will be performed within 3 months of completing the documented training.

17.1.4 Special Audits

Special audits are conducted on an as needed basis, generally as a follow up to specific issues such as client complaints, corrective actions, PT results, data audits, system audits, validation comments, regulatory audits or suspected ethical improprieties. Special audits are focused on a specific issue, and report format, distribution, and timeframes are designed to address the nature of the issue.

17.1.5 Performance Testing

The laboratory participates semi-annually in performance audits conducted through the analysis of PT samples provided by a third party. The laboratory generally participates in the following types of PT studies: Drinking Water, Nonpotable Water, Soil, and Air.

It is Eurofins policy that PT samples be treated as typical samples in the production process. Furthermore, where PT samples present special or unique problems, in the regular production process they may need to be treated differently, as would any special or unique request submitted by any client. The QA Manager must be consulted and in agreement with any decisions made to treat a PT sample differently due to some special circumstance.

Written investigations for unacceptable PT results are required. In some cases it may be necessary for blind QC samples to be submitted to the laboratory to show a return to control.

17.1.6 Good Laboratory Practice Critical Phase Inspection

Any project that is subject to Good Laboratory Practice (GLP) regulations is audited by the QA Department, as required by the regulations, at intervals adequate to ensure the integrity of the study. Inspections of a GLP project include direct observation of analysts as they perform various phases of the study. Data documentation is reviewed as part of the inspection. The purpose of this type of audit is to ensure that there are no deviations from written methods, procedures, or study protocols.

Results of inspections are documented in a report format and distributed to applicable management personnel responsible for the area(s) under audit. Management is responsible to address all non-conformances found during an inspection. Inspection reports and responses are circulated to applicable laboratory management and an off-site study director, as applicable, to communicate the outcome of the inspection and the proposed plan(s) for corrective action, if warranted.

All records maintained as part of an inspection are kept on file.

17.2 External Audits

External audits are performed when certifying agencies or clients conduct on-site inspections or submit performance testing samples for analysis. It is Eurofins policy to cooperate fully with regulatory authorities and clients. The laboratory makes every effort to provide the auditors with access to personnel, documentation, and assistance. Laboratory supervisors are responsible for providing corrective actions to the QA Manager who coordinates the response. Audit responses are due in the time allotted by the client or agency performing the audit.

The laboratory cooperates with clients and their representatives to monitor the laboratory's performance in relation to work performed for the client. The client may only view data and systems related directly to the client's work. All efforts are made to keep other client information confidential.

17.2.1 Confidential Business Information (CBI) Considerations

During on-site audits, auditors may come into possession of information claimed as business confidential. A business confidentiality claim is defined as "a claim or allegation that business information is entitled to confidential treatment for reasons of business confidentiality or a request for a determination that such information is entitled to such treatment." When information is claimed as business confidential, the laboratory must place on (or attach to) the information at the time it is submitted to the auditor, a cover sheet, stamped or typed legend or other suitable form of notice, employing language such as "trade secret", "proprietary" or "company confidential". Confidential portions of documents otherwise non-confidential must be clearly identified. CBI may be purged of references to client identity by the responsible laboratory official at the time of removal from the laboratory. However, sample identifiers may not be obscured from the information. Additional information regarding CBI can be found in within the 2009 and 2016 TNI standards.

17.3 Audit Findings

Audit findings are documented using the corrective action process and database (see Section 14). The laboratory's corrective action responses may include action plans that could not be completed within a predefined timeframe. In these instances, a completion date must be set and agreed to by operations management and the QA Manager.

Developing and implementing corrective actions to findings is the responsibility of operations management or Technical Manager where the finding originated. Findings that are not corrected by specified due dates are reported monthly to management in the QA monthly report.

If any audit finding casts doubt on the effectiveness of the operations or on the correctness or validity of the laboratory's test results, the laboratory shall take timely corrective action, and shall notify clients in writing if the investigations show that the laboratory results have been

affected. Once corrective action is implemented, a follow-up audit is scheduled to ensure that the problem has been corrected.

Clients must be notified promptly in writing of any event such as the identification of defective measuring or test equipment that casts doubt on the validity of results given in any test report or amendment to a test report. The investigation must begin within 24 hours of discovery of the problem and all efforts are made to notify the client within two weeks after the completion of the investigation.

18.0 MANAGEMENT REVIEWS

18.1 Quality Assurance Report

The QA Department is responsible for preparing a comprehensive monthly metrics report to Management to keep them apprised of current quality issues. This report fosters communication, review, and refinement of the QA system to evaluate the suitability of policies and procedures to meet both regulatory and laboratory quality objectives.

The NDSC QA team compiles information from all of the Environment Testing laboratories monthly metrics reports for the Executive Management team. This report includes notable information and concerns regarding the laboratories QA program and a listing of new regulations that may potentially impact the laboratories.

18.2 Annual Management Review

The Laboratory Management team (Laboratory Director, Operation Manager, Technical Managers, and QA Manager) conducts a review annually of its quality systems to ensure its continuing suitability and effectiveness in meeting client and regulatory requirements and to introduce any necessary changes or improvements. It will also provide a platform for defining goals, objectives and action items that feed into the laboratory planning system. NDSC personnel is be included in this meeting at the discretion of the Laboratory Director. The LIMS review consists of examining any audits, complaints or concerns that have been raised through the year that are related to LIMS. The laboratory will summarize any critical findings that cannot be solved by the lab and report them to Corporate IT.

This management systems review (NDSC Document No. CW-Q-S-004 and Work Instruction No. CW-Q-WI-003) uses information generated during the preceding year to assess the “big picture” by ensuring that routine actions taken and reviewed on a monthly basis are not components of larger systematic concerns. The monthly review should keep the quality systems current and effective, therefore, the annual review is a formal senior management process to review specific existing documentation. Significant issues from the following documentation are compiled or summarized by the QA Manager prior to the review meeting:

- Matters arising from the previous annual review.
- Prior Monthly QA Reports issues.
- Laboratory QA Metrics.
- Review of report reissue requests.
- Review of client feedback and complaints.
- Issues arising from any prior management or staff meetings.

- Minutes from prior senior lab management meetings. Issues that may be raised from these meetings include:
  - Adequacy of staff, equipment and facility resources.
  - Adequacy of policies and procedures.
  - Future plans for resources and testing capability and capacity.
- The annual internal double blind PT program sample performance (if performed),
- Compliance to the Ethics Policy and Data Integrity Plan. Including any evidence/incidents of inappropriate actions or vulnerabilities related to data Integrity.
- For labs analyzing radioactive samples, also include the following:
  - Radiation health and safety
  - Radioactive hazardous waste management
  - Radioactive materials management
- Evaluation of overall risk, including risks to impartiality, confidentiality, reporting statements of conformity, and nonconforming work.

A report is generated by the QA Manager and management. The report is distributed to the Laboratory Director and Corporate Quality Director. The report includes, but is not limited to:

- The date of the review and the names and titles of participants.
- A reference to the existing data quality related documents and topics that were reviewed.
- Quality system or operational changes or improvements that will be made as a result of the review [e.g., an implementation schedule including assigned responsibilities for the changes (Action Table)].

Changes to the quality systems requiring update to the laboratory QA Manual shall be included in the next revision of the QA Manual.

18.3 Potential Integrity Related Managerial Reviews

Potential integrity issues (data or business related) must be handled and reviewed in a confidential manner until such time as a follow-up evaluation, full investigation, or other appropriate actions have been completed and issues clarified. The NDSC Document No. CW-L-S-002, Internal Investigations, shall be followed. All investigations that result in finding of inappropriate activity are documented and include any disciplinary actions involved, corrective actions taken, and all appropriate notifications of clients.

The Eurofins Environment Testing America Presidents, Business Unit Managers, Laboratory Directors, and NDSC Team are informed of any current data integrity or data recall investigations via the monthly metrics report.

19.0 TEST METHODS AND METHOD VALIDATION

19.1 Overview

The laboratory uses methods that are appropriate to meet our clients' requirements and that are within the scope of the laboratory's capabilities. These include sampling, handling, transport,

storage and preparation of samples, and, where appropriate, an estimation of the measurement of uncertainty as well as statistical techniques for analysis of environmental data.

Instructions are available in the laboratory for the operation of equipment as well as for the handling and preparation of samples. All instructions, Standard Operating Procedures (SOPs), reference methods and manuals relevant to the working of the laboratory are readily available to all staff. Deviations from published methods are documented (with justification) in the laboratory's approved SOPs. SOPs are submitted to clients for review at their request. Significant deviations from published methods require client approval and regulatory approval where applicable.

19.2 Standard Operating Procedures (SOPs)

The laboratory maintains SOPs that accurately reflect all phases of the laboratory such as assessing data integrity, corrective actions, handling customer complaints as well as all analytical methods and sampling procedures. The method SOPs are derived from the most recently promulgated/approved, published methods and are specifically adapted to the laboratory facility. Modifications or clarifications to published methods are clearly noted in the SOPs. All SOPs are controlled in the laboratory.

- All SOPs contain a revision number, effective date, and appropriate approval signatures. Controlled copies are available to all staff.
- Procedures for writing an SOP are incorporated by reference to NDSC Document No. CW-Q-S-002, Writing a Standard Operating Procedure.
- SOPs are reviewed at a minimum of every 2 years (annually for Drinking Water and DoD/DOE SOPs), and where necessary, revised to ensure continuing suitability and compliance with applicable requirements.

19.3 Laboratory Methods Manual

For each test method, the laboratory shall have available the published referenced method as well as the laboratory developed SOP.

Note: If more stringent standards or requirements are included in a mandated test method or regulation than those specified in this manual, the laboratory shall demonstrate that such requirements are met. If it is not clear which requirements are more stringent, the standard from the method or regulation is to be followed. Any exceptions or deviations from the referenced methods or regulations are noted in the specific analytical SOP.

The laboratory maintains an SOP Index for both technical and non-technical SOPs. Technical SOPs are maintained to describe a specific test method. Non-technical SOPs are maintained to describe functions and processes not related to a specific test method.

19.4 Selection of Methods

Since numerous methods and analytical techniques are available, continued communication between the client and laboratory is imperative to assure the correct methods are utilized. Once client methodology requirements are established, this and other pertinent information is summarized by the PM. These mechanisms ensure that the proper analytical methods are applied when the samples arrive for log-in. For non-routine analytical services (e.g., special matrices, non-routine compound lists), the method of choice is selected based on client needs and available technology. The methods selected should be capable of measuring the specific

parameter of interest, in the concentration range of interest, and with the required precision and accuracy.

19.4.1 Sources of Methods

Routine analytical services are performed using standard EPA-approved methodology. In some cases, modification of standard approved methods may be necessary to provide accurate analyses of particularly complex matrices. When the use of specific methods for sample analysis is mandated through project or regulatory requirements, only those methods shall be used.

When clients do not specify the method to be used or methods are not required, the methods used will be clearly validated and documented in an SOP and available to clients and/or the end user of the data. Refer to Appendix 6 for a list of the currently accepted U.S. EPA analytical method references used by the laboratory.

The laboratory reviews updated versions to all the aforementioned references for adaptation based upon capabilities, instrumentation, etc., and implements them as appropriate. As such, the laboratory strives to perform only the latest versions of each approved method as regulations allow or require.

Other reference procedures for non-routine analyses may include methods established by specific states (e.g., Underground Storage Tank methods), ASTM or equipment manufacturers. Sample type, source, and the governing regulatory agency requiring the analysis will determine the method utilized.

The laboratory shall inform the client when a method proposed by the client may be inappropriate or out of date. After the client has been informed, and they wish to proceed contrary to the laboratory's recommendation, it will be documented.

19.4.1.1 Client Supplied Methods

Most of the client-supplied method requirements presented to us involve achieving specific quality control criteria, limits of quantitation (LOQ), and/or method detection limits (MDL) using standard EPA methods. These requirements are communicated to the appropriate technical groups prior to the project start up. Each technical group evaluates the scope of work and the requirements to ensure the criteria can be met using the standard EPA method. The data is monitored to ensure the criteria are met throughout the project. The PM notifies the client if there is a more appropriate method available or if the client's criteria cannot be achieved on a certain sample matrix (i.e., due to matrix or dilutions).

Occasionally, we are asked to transfer a non-standardized method from a client into our lab or to develop a new method, when one is not available. In the case of a method transfer, we set up the client's method and perform some initial evaluation. After the initial evaluation, we may make recommendations on how to improve method performance. If the method appears to be adequate, we determine linearity, specificity, precision, accuracy, MDL, and LOQ by performing calibrations, analyzing method blanks, and carrying out method detection limit and IDOC studies.

In the case of method development, we work with the client and/or data user to determine the level of validation required ensuring that the method meets its intended purpose. In addition to the elements above, we also determine standard and sample stability and robustness depending on the scope of the project. Typically, a standard operating procedure is written and submitted to the client with the results of the validation. These steps are completed prior to analysis of field samples. Data related to the setup of the method are archived.

19.4.1.2 Procedural Deviations

Analysts are required to follow a documented method for all tests performed; and any deviations from analytical methods must be documented, approved, and justified in an appropriate and consistent manner. We classify method deviations as either being a planned deviation or an unplanned deviation. In general, the following information is captured to document both types of situations:

- Description of the situation
- Reason or justification for the deviation
- Impact the deviation had on the testing
- Signature/date of analyst performing the test
- Signature/date of QA and Laboratory management approving the deviation
- Signature/date of client approval, if necessary

Deviations to written procedures are documented in raw data records, ICAT or through the ICAR (Investigation and Corrective Action Report) system. Both types of documentation require management and QA review and approval.

NOTE: Deviations to analytical methods are not permitted by PALA. If samples are analyzed for compliance to a regulatory program, deviations may be allowed with approval from the appropriate compliance officer and/or program.

19.4.2 Demonstration of Capability

Before the laboratory may institute a new method and begin reporting results, the laboratory shall confirm that it can properly operate the method. In general, this demonstration does not test the performance of the method in real world samples, but in an applicable and available clean matrix sample. If the method is for the testing of analytes that are not conducive to spiking, demonstration of capability may be performed on quality control samples.

A demonstration of capability (DOC, Lab SOP BR-QA-011) is performed whenever there is a change in instrument type (e.g., new instrumentation), matrix, method or personnel (e.g., analyst has not performed the test within the last 12 months).

Note: The laboratory shall have a DOC for all analytes included in the methods that the laboratory performs, and proficiency DOCs for each analyst shall include all analytes that the laboratory routinely performs. Addition of non-routine analytes does not require new DOCs for all analysts if those analysts are already qualified for routine analytes tested using identical chemistry and instrument conditions.

The initial demonstration of capability must be thoroughly documented and approved by the Technical Manager and QA Manager prior to independently analyzing client samples. All associated documentation must be retained in accordance with the laboratory's archiving procedures.

The laboratory must have an approved SOP, demonstrate satisfactory performance, and conduct an MDL study (when applicable). There may be other requirements as stated within the published method or regulations (e.g., retention time window study).

Note: In some instances, a situation may arise where a client requests that an unusual analyte be reported using a method where this analyte is not normally reported. If the analyte is being reported for regulatory purposes, the method must meet all procedures outlined within this QA

Manual (SOP, MDL, and Demonstration of Capability). If the client states that the information is not for regulatory purposes, the result may be reported as long as the following criteria are met:

- The instrument is calibrated for the analyte to be reported using the criteria for the method and ICV/CCV criteria are met (unless an ICV/CCV is not required by the method or criteria are per project DQOs).
- The laboratory's nominal or default reporting limit (RL) is equal to the quantitation limit (QL), must be at or above the lowest non-zero standard in the calibration curve and must be reliably determined. Project RLs are client specified reporting levels which may be higher than the QL. Results reported below the QL must be qualified as estimated values. Also see Section 19.6.1.3, Relationship of Limit of Detection (LOD) to Quantitation Limit (QL).
- The client request is documented and the lab informs the client of its procedure for working with unusual compounds. The final report must be footnoted: *Reporting Limit based on the low standard of the calibration curve.*

19.4.3 Initial Demonstration of Capability (IDOC) Procedures

The spiking standard used must be prepared independently from those used in instrument calibration.

The analyte(s) shall be diluted in a volume of clean matrix sufficient to prepare four aliquots at the concentration specified by a method or the laboratory SOP.

19.4.3.1 At least four aliquots shall be prepared (including any applicable clean-up procedures) and analyzed according to the test method (either concurrently or over a period of days).

19.4.3.2 Using all of the results, calculate the mean recovery in the appropriate reporting units and the standard deviations for each parameter of interest.

19.4.3.3 When it is not possible to determine the mean and standard deviations, such as for presence, absence and logarithmic values, the laboratory will assess performance against criteria described in the Method SOP.

19.4.3.4 Compare the information obtained above to the corresponding acceptance criteria for precision and accuracy in the test method (if applicable) or in laboratory generated acceptance criteria (LCS or interim criteria) if there is no mandatory criteria established. If any one of the parameters do not meet the acceptance criteria, the performance is unacceptable for that parameter.

19.4.3.5 When one or more of the tested parameters fail at least one of the acceptance criteria, the analyst must proceed according to either option listed below:

- Locate and correct the source of the problem and repeat the test for all parameters of interest beginning with 19.4.3.3 above.
- Beginning with 19.4.3.3 above, repeat the test for all parameters that failed to meet criteria. Repeated failure, however, will confirm a general problem with the measurement system. If this occurs, locate and correct the source of the problem and repeat the test for all compounds of interest beginning with 19.4.3.1 above.

Note: Results of successive LCS analyses can be used to fulfill the DOC requirement.

Methods on line prior to the effective date of this Section shall be updated to the procedures outlined above as new analysts perform their demonstration of capability. A copy of the new record will replace that which was used for documentation in the past. At a minimum, the

precision and accuracy of four mid-level laboratory control samples must have been compared to the laboratory's quality control acceptance limits.

19.5 Laboratory Developed Methods and Non-Standard Methods

Any new method developed by the laboratory must be fully defined in an SOP and validated by qualified personnel with adequate resources to perform the method. Method specifications and the relation to client requirements must be clearly conveyed to the client if the method is a non-standard method (not a published or routinely accepted method). The client must also be in agreement to the use of the non-standard method.

19.6 Validation of Methods

Validation is the confirmation by examination and the provision of objective evidence that the particular requirements for a specific intended use are fulfilled.

All non-standard methods, laboratory designed/developed methods, standard methods used outside of their scope, and major modifications to published methods must be validated to confirm they are fit for their intended use. The validation will be as extensive as necessary to meet the needs of the given application. The results are documented with the validation procedure used and contain a statement as to the fitness for use.

19.6.1 Method Validation and Verification Activities for All New Methods

While method validation can take various courses, the following activities can be required as part of method validation. Method validation records are designated QC records and are archived accordingly.

When changes are made to any validated methods, the influence of such changes shall be documented and, if appropriate, a new validation shall be performed.

19.6.1.1 **Determination of Method Selectivity** – Method selectivity is the demonstrated ability to discriminate the analyte(s) of interest from other compounds in the specific matrix or matrices from other analytes or interference. In some cases to achieve the required selectivity for an analyte, a confirmation analysis is required as part of the method.

19.6.1.2 **Determination of Method Sensitivity** – Sensitivity can be both estimated and demonstrated. Whether a study is required to estimate sensitivity depends on the level of method development required when applying a particular measurement system to a specific set of samples. Detection limit studies are conducted as described in Section 19.7. Where other protocols for estimations and/or demonstrations of sensitivity are required by regulation or client agreement, these shall be followed.

19.6.1.3 **Relationship of Limit of Detection (LOD) to the Limit of Quantitation (LOQ)** – An important characteristic of expression of sensitivity is the distinction between the LOD and the LOQ. The LOD is the minimum level at which the presence of an analyte can be reliably concluded. The LOQ is the minimum concentration of analyte that can be quantitatively determined with acceptable precision and bias, equivalent to the laboratory's routine reporting limit (RL). For most instrumental measurement systems, there is a region where semi-quantitative data is generated around the LOD (both above and below the estimated MDL or LOD) and below the LOQ. In this region, detection of an analyte may be confirmed but quantification of the analyte is unreliable within the accuracy and precision guidelines of the measurement system. When an analyte is detected below the LOQ, and the presence of the analyte is confirmed by meeting the qualitative identification criteria for the analyte, the analyte

can be reliably reported, but the amount of the analyte can only be estimated. If data is to be reported in this region, it must be done so with a qualification that denotes the semi-quantitative nature of the result.

19.6.1.4 **Determination of Interferences** – A determination that the method is free from interferences in a blank matrix is performed.

19.6.1.5 **Determination of Range** – Where appropriate to the method, the quantitation range is determined by comparison of the response of an analyte in a curve to established or targeted criteria. Generally the upper quantitation limit is defined by highest acceptable calibration concentration. The lower quantitation limit or QL cannot be lower than the lowest non-zero calibration level, and can be constrained by required levels of bias and precision.

19.6.1.6 **Determination of Accuracy and Precision** – Accuracy and precision studies are generally performed using replicate analyses, with a resulting percent recovery and measure of reproducibility (standard deviation, relative standard deviation) calculated and measured against a set of target criteria.

19.6.1.7 **Documentation of Method** – The method is formally documented in an SOP. If the method is a minor modification of a standard laboratory method that is already documented in an SOP, an SOP Attachment describing the specific differences in the new method is acceptable in place of a separate SOP.

19.6.1.8 **Continued Demonstration of Method Performance** – Continued demonstration of method performance is addressed in the SOP. Continued demonstration of method performance is generally accomplished by batch specific QC samples such as LCS, method blanks or PT samples.

19.7 Method Detection Limit (MDL) / Limits of Detection (LOD)

The MDL is the minimum measured quantity of a substance that can be reported with 99% confidence that the concentration is distinguishable from method blank results, consistent with 40CFR Part 136 Appendix B, August, 2017. The MDL is equivalent to the TNI LOD or DL, and is also equivalent to the DoD/DOE Quality Systems Manual (QSM) DL. The working or final MDL is the higher of the MDL value determined from spikes (MDLs) and the MDL value determined from blanks (MDLb). An initial MDL study shall be performed during the method validation process and when the method is altered in a way that can reasonably be expected to change its sensitivity. On-going data are collected during each quarter in which samples are being analyzed. At least once every 13 months the MDLs and MDLb are re-calculated and re-evaluated using data collected during the preceding period. Details of the laboratory's procedure for conducting MDL studies are given in NDSC Document No. CA-Q-S-006.

19.8 Verification of Detection Limits

If it is found during the re-evaluation of detection limit results that more than 5% of the spiked samples do not return positive numeric results that meet all method qualitative identification criteria, then then spiking level shall be increased and the initial MDL study pre-performed at the new spiking concentration. For DoD/DOE labs, additional guidance provided in NDSC Document No. No. CA-Q-S-006 - Attachment 2.

19.9 Instrument Detection Limits (IDL)

The IDL is sometimes used to assess the reasonableness of the MDL or in some cases required by the analytical method or program requirements. IDLs are most commonly used in metals analyses but may be useful in demonstration of instrument performance in other areas.

IDLs are calculated to determine an instrument's sensitivity independent of any preparation method. IDLs are calculated either using 7 replicate spike analyses, like MDL but without sample preparation, or by the analysis of 10 instrument blanks and calculating 3 x the absolute value of the standard deviation.

19.10 Limit of Quantitation

The LOQ shall be at a concentration equivalent to the lowest calibration standard concentration, with the exception of methods using a single-point calibration, and shall be greater than the MDL. The LOQ is verified by preparing and analyzing spikes at concentrations 1-2X the selected LOQ, employing the complete analytical process. For DoD/DOE labs, additional requirements provided in NDSC Document No. CA-Q-S-006.

When the laboratory establishes a quantitation limit, it must be initially verified by the analysis of a low level standard or QC sample at 1-2 times the reporting limit or by a DL check samples at or below the LOQ. The LOQ is verified annually thereafter. The annual requirement is waived for methods that have an annually verified MDL. The laboratory will comply with any regulatory requirements.

19.11 Retention Time Windows

Most organic analyses and some inorganic analyses use chromatography techniques for qualitative and quantitative determinations. For every chromatography analysis or as specified in the reference method, each analyte will have a specific time of elution from the column to the detector. This is known as the analyte's retention time. The variance in the expected time of elution is defined as the retention time window. As the key to analyte identification in chromatography, retention time windows must be established on every column for every analyte used for that method. These records are kept on-file and available for review. Complete details are available in the laboratory SOPs.

19.12 Evaluation of Selectivity

The laboratory evaluates selectivity by following the checks within the applicable analytical methods, which include mass spectral tuning, second column confirmation, ICP interelement interference checks, chromatography retention time windows, sample blanks, and spectrochemical.

19.13 Estimation of Uncertainty of Measurement

19.13.1 Uncertainty is "a parameter associated with the result of a measurement, that characterizes the dispersion of the values that could reasonably be attributed to the measurand" (as defined by the International Vocabulary of Basic and General Terms in Metrology, ISO Geneva, 1993, ISBN 92-67-10175-1). Knowledge of the uncertainty of a measurement provides additional confidence in a result's validity. Its value accounts for all the factors which could possibly affect the result, such as adequacy of analyte definition, sampling, matrix effects and interferences, climatic conditions, variances in weights, volumes, and standards, analytical procedure, and random variation. Some national accreditation organizations require the use of

an “expanded uncertainty” defined as the range within which the value of the measurand is believed to lie within at least a 95% confidence level with the coverage factor k=2.

19.13.2 Uncertainty is not error. Error is a single value (i.e., the difference between the true result and the measured result). On environmental samples, the true result is never known. The measurement is the sum of the unknown true value and the unknown error. Unknown error is a combination of systematic error, or bias, and random error. Bias varies predictably, constantly, and independently from the number of measurements. Random error is unpredictable, assumed to be Gaussian in distribution, and reducible by increasing the number of measurements.

19.13.3 The minimum uncertainty associated with results generated by the laboratory can be determined by using the Laboratory Control Sample (LCS) accuracy range for a given analyte. The LCS limits are used to assess the performance of the measurement system since they take into consideration all of the laboratory variables associated with a given test over time (except for variability associated with the sampling and the variability due to matrix effects). The percent recovery of the LCS is compared either to the method-required LCS accuracy limits or to the statistical, historical, in-house LCS accuracy limits.

19.13.4 To calculate the uncertainty for the specific result reported, multiply the result by the decimal of the lower end of the LCS range percent value for the lower end of the uncertainty range, and multiply the result by the decimal of the upper end of the LCS range percent value for the upper end of the uncertainty range. These calculated values represent uncertainties at approximately the 99% confidence level with a coverage factor of k = 3. As an example, for a reported result of 1.0 mg/L with an LCS recovery range of 50 to 150%, the estimated uncertainty in the result would be 1.0 +/- 0.5 mg/L.

19.13.5 In the case where a well-recognized test method specifies limits to the values of major sources of uncertainty of measurement (e.g., 524.2, 525, etc.) and specifies the form of presentation of calculated results, no further discussion of uncertainty is required.

19.14 Sample Reanalysis Guidelines

Because there is a certain level of uncertainty with any analytical measurement, a sample re-preparation (where appropriate) and subsequent analysis (hereafter referred to as ‘reanalysis’) may result in either a higher or lower value from an initial sample analysis. There are also variables that may be present (e.g., sample homogeneity, analyte precipitation over time, etc.) that may affect the results of a reanalysis. Based on the above comments, the laboratory will reanalyze samples at a client’s request with the following caveats. **Client specific Contractual Terms & Conditions for reanalysis protocols may supersede the following items.**

Homogenous samples: If a reanalysis agrees with the original result to within the RPD limits for MS/MSD or Duplicate analyses, or within $\pm$ 1 reporting limit for samples $\leq$ 5x the reporting limit, the original analysis will be reported. At the client’s request, both results may be reported on the same report but not on two separate reports.

- If the reanalysis does not agree (as defined above) with the original result, then the laboratory will investigate the discrepancy and reanalyze the sample a third time for confirmation if sufficient sample is available.
- Any potential charges related to reanalysis are discussed in the contract terms and conditions or discussed at the time of the request. The client will typically be charged for reanalysis unless it is determined that the lab was in error.

- Due to the potential for increased variability, reanalysis may not be applicable to Non-homogenous, Encore, and Sodium Bisulfate preserved samples. See the Area Supervisor or Laboratory Director if unsure.

19.15 Control of Data

The laboratory has policies and procedures in place to ensure the authenticity, integrity, and accuracy of the analytical data generated by the laboratory.

19.15.1 Computer and Electronic Data Related Requirements

The three basic objectives of our computer security procedures and policies are shown below.

The laboratory is currently using the Eurofins LIMS system, which has been highly customized to meet the needs of the laboratory.

19.15.1.1 Maintain the Database Integrity – Assurance that data is reliable and accurate through data verification (review) procedures, password-protecting access, anti-virus protection, data change requirements, as well as an internal LIMS permissions procedure.

- LIMS Database Integrity is achieved through data input validation, internal user controls, documentation of system failures and corrective actions taken, and data change requirements.
- Spreadsheets and other software developed in-house must be verified with documentation through hand calculations prior to use. Cells containing calculations must be lock-protected and controlled.
- Instrument hardware and software adjustments are safeguarded through maintenance logs, audit trails and controlled access.

19.15.1.2 Ensure Information Availability – Protection against loss of information or service is ensured through scheduled back-ups, stable file server network architecture, secure storage of media, line filter, Uninterruptible Power Supply (UPS), and maintaining older versions of software as revisions are implemented.

19.15.1.3 Maintain Confidentiality – Ensure data confidentiality through physical access controls such as password protection or website access approval when electronically transmitting data.

19.15.2 Data Reduction

The complexity of the data reduction depends on the analytical method and the number of discrete operations involved (e.g., extractions, dilutions, instrument readings and concentrations). The analyst calculates the final results from the raw data or uses appropriate computer programs to assist in the calculation of final reportable values.

For manual data entry, e.g., Wet Chemistry and Geotechnical, the data is reduced by the analyst and then verified by the Department Manager or alternate analyst prior to updating the data in LIMS. The spreadsheets, or any other type of applicable documents, are signed by both the analyst and alternate reviewer to confirm the accuracy of the manual entry(s).

Manual integration of peaks will be documented and reviewed and the raw data will be flagged using NDSC Document No. CA-Q-S-002, Acceptable Manual Integration Practices as the guideline for our internal laboratory SOPs.

Analytical results are reduced to appropriate concentration units specified by the analytical method, taking into account factors such as dilution, sample weight or volume, etc. Blank correction will be applied only when required by the method or per manufacturer's indication; otherwise, it should not be performed. Calculations are independently verified by appropriate laboratory staff. Calculations and data reduction steps for various methods are summarized in the respective analytical SOPs or program requirements.

19.15.2.1 All raw data must be retained in the worklist folder, computer file (if appropriate), and/or runlog. All criteria pertinent to the method must be recorded. The documentation is recorded at the time observations or calculations are made and must be signed or initialed/dated (month/day/year). It must be easily identifiable who performed which tasks if multiple people were involved.

19.15.2.2 In general, concentration results are reported in milligrams per liter (mg/l) or micrograms per liter (µg/l) for liquids and milligrams per kilogram (mg/kg) or micrograms per kilogram (µg/kg) for solids. For values greater than 10,000 mg/l, results can be reported in percent, i.e., 10,000 mg/l = 1**%.** Units are defined in each lab SOP.

19.15.2.3 In reporting, the analyst or the instrument output records the raw data result using values of known certainty plus one uncertain digit. If final calculations are performed external to LIMS, the results should be entered in LIMS with at least three significant figures. In general, results are reported to 2 significant figures on the final report.

19.15.2.4 For those methods that do not have an instrument printout or an instrumental output compatible with the LIMS, the raw results and dilution factors are entered directly into LIMS by the analyst, and the software calculates the final result for the analytical report. LIMS has a formatter for significant figure criterion for each analyte.

19.15.2.5 The laboratory strives to import data directly from instruments or calculation spreadsheets to ensure that the reported data are free from transcription and calculation errors. For those analyses with an instrumental output compatible with the LIMS, the raw results and dilution factors are transferred into LIMS, electronically after reviewing the quantitation report, and removing unrequested or poor spectrally-matched compounds. The analyst prints a copy of what has been entered to check for errors. This printout and the instrument's printout of calibrations, concentrations, retention times, chromatograms, and mass spectra, if applicable, are retained with the data file. The data file is stored in a monthly folder on the instrument computer; periodically, this file is transferred to the server and, eventually, to a tape file.

19.15.3 Logbook / Worksheet Use Guidelines

Logbooks and worksheets are filled out 'real time' and have enough information on them to trace the events of the applicable analysis/task. (e.g. calibrations, standards, analyst, sample ID, date, time on short holding time tests, temperatures when applicable, calculations are traceable, etc.)

- Corrections are made following the procedures outlined in Section 14.
- Logbooks are controlled by the QA department. A record is maintained of all logbooks in the lab.
- Unused portions of pages must be "Z"'d out, signed and dated.
- Worksheets are created with the approval of the Technical Manager/QA Manager at the facility. The QA Manager controls all worksheets following the procedures in Section 6.

19.15.4 Review / Verification Procedures

Review procedures are outlined in several SOPs (*Sample Control, Data Review, Project Management, etc.)* to ensure that reported data are free from calculation and transcription errors, that QC parameters have been reviewed and evaluated before data is reported. The laboratory also has an SOP discussing Manual Integrations to ensure the authenticity of the data, NDSC Document No. CA-Q-S-002. The general review concepts are discussed below, more specific information can be found in the SOPs.

19.15.4.1 Log-In Review - The data review process starts at the sample receipt stage. Sample control personnel review chain-of-custody forms and project instructions from the project management group. This is the basis of the sample information and analytical instructions entered into the LIMS. The log-in instructions are reviewed by the personnel entering the information, and a second level review is conducted by the project management staff.

19.15.4.2 First Level Data Review - The next level of data review occurs with the analysts. As data are generated, analysts review their work to ensure that the results meet project and SOP requirements. First level reviews include inspection of all raw data (e.g., instrument output for continuous analyzers, chromatograms, spectra, and manual integrations), evaluation of calibration/calibration verification data in the day's analytical run, evaluation of QC data, and reliability of sample results. The analyst transfers data into LIMS, data qualifiers are added as needed. All first level reviews are documented.

19.15.4.3 Second Level Data Review – All analytical data are subject to review by a second qualified analyst or supervisor. Second level reviews include inspection of all raw data (e.g., instrument output, chromatograms, and spectra) including 100% of data associated with any changes made by the primary analyst, such as manual integrations or reassignment of peaks to different analytes, or elimination of false negative analytes. The second review also includes evaluation of initial calibration/calibration verification data in the day's analytical run, evaluation of QC data, reliability of sample results, qualifiers and NCM narratives. Manual calculations are checked in second level review. All second level reviews are documented.

Issues that deem further review include the following:

- QC data are outside the specified control limits for accuracy and precision
- Reviewed sample data does not match with reported results
- Unusual detection limit changes are observed
- Samples having unusually high results
- Samples exceeding a known regulatory limit
- Raw data indicating some type of contamination or poor technique
- Inconsistent peak integration
- Transcription errors
- Results outside of calibration range

19.15.4.4 Unacceptable analytical results may require reanalysis of the samples. Any problems are brought to the attention of the Laboratory Director, Project Manager, Quality Director/Manager, Technical Manager, or Supervisor for further investigation. Corrective action is initiated whenever necessary.

19.15.4.5 The results are then entered or directly transferred into the computer database and a (.pdf) is printed for the client.

19.15.4.6 As a final review prior to the release of the report, the Project Manager reviews the results for appropriateness and completeness. This review and approval ensures that client requirements have been met and that the final report has been properly completed. The process includes, but is not limited to, verifying that the COC is followed, cover letters / narratives are present, flags are appropriate, and project specific requirements are met. The Project Manager may also evaluate the validity of results for different test methods given expected chemical relationships.

19.15.4.7 Any project that requires a data package is subject to a tertiary data review for transcription errors and acceptable quality control requirements. The Project Manager then signs the final report. The PM also checks the report for any clerical or invoicing errors. When complete, the report is sent out to the client.

19.15.4.8 A brief overview of sample flow and information through the laboratory, as well as data review and validation, is presented in Figure 19-1.

19.15.5 Manual Integrations

Computerized data systems provide the analyst with the ability to re-integrate raw instrument data in order to optimize the interpretation of the data. Though manual integration of data is an invaluable tool for resolving variations in instrument performance and some sample matrix problems, when used improperly, this technique would make unacceptable data appear to meet quality control acceptance limits. Improper re-integrations lead to legally indefensible data, a poor reputation, or possible laboratory decertification. Because guidelines for re-integration of data are not provided in the methods and most methods were written prior to widespread implementation of computerized data systems, the laboratory trains all analytical staff on proper manual integration techniques using NDSC Document No. CA-Q-S-002, Acceptable Manual Integration Practices, as the guideline for our internal laboratory SOPs.

19.15.5.1 The analyst must adjust baseline or the area of a peak in some situations, for example when two compounds are not adequately resolved or when a peak shoulder needs to be separated from the peak of interest. The analyst must use professional judgment to determine when manual integrating is required. Analysts are encouraged to ask for assistance from a senior analyst or manager when in doubt.

19.15.5.2 Analysts shall not increase or decrease peak areas for the sole purpose of achieving acceptable QC recoveries that would have otherwise been unacceptable. The intentional recording or reporting of incorrect information (or the intentional omission of correct information) is against company principles and policy and is grounds for immediate termination.

19.15.5.3 Client samples, performance evaluation samples, and quality control samples are all treated equally when determining whether or not a peak area or baseline should be manually adjusted.

19.15.5.4 All manual integrations receive a second level review. Manual integrations must be indicated on ~~an~~ expanded scale “before” and “after” chromatograms such that the integration performed can be easily evaluated during data review. Expanded scale “before” chromatograms are also required for all manual integrations on QC parameters (calibrations, calibration verifications, laboratory control samples, internal standards, surrogates, etc.) unless the laboratory has another documented NDSC approved procedure in place that can demonstrate an active process for detection and deterrence of improper integration practices.

Figure 19-1. Example – Work Flow

Action	Personnel Involved
Bottle orders generated upon request - Bottles packed and shipped to the client under CoC	- Client Service Personnel / PM - Bottle Preparation Personnel
Samples received at laboratory - Unpacked and reconciled against client paperwork or CoC - Samples acceptance documented against completed (CoC)[1]	Sample Login Personnel
Samples are entered into LIMS - Job # assigned - Methods/Analytes linked from project - Sample labels generated - LIMS backlogs updated immediately	Sample Login Personnel
Sample Storage - Short TATs and hold-time samples are delivered directly to the laboratory for analysis - Samples stored in assigned locations (refrigerated walk-in coolers, freezers, VOA refrigerators; etc.)	Sample Login Personnel
Sample Receipt Acknowledgement sent to client (when requested)	Project Management Personnel
Sample Acquisition/Testing - Analysts collect samples from assigned storage. - Legal CoC samples are signed in-and-out of storage - Remaining sample returned to storage.	Analysts / Login Personnel
Preparation and analysis is performed according to selected analytical method and applicable Project notes - Raw data recorded/reviewed[2] - Data imported to LIMS	Analysts
LIMS performs calculations: - Data reviewed by primary/secondary analyst - Data approved as final	Data Process (LIMS / Analyst)
Generation/review/release of reports (automated through LIMS) - Electronic copy saved in LIMS	Project Management Personnel
Electronic Data Deliverables (EDDs) generated (as applicable)	Project Management Personnel
Hard copy and electronic batch raw data is archived according to data archiving procedures.	Project Management Personnel Analysts / IT

[1]Refer to Sec. 23.3.
[2]Analyses requiring the analyst's interpretation may involve manual data reduction before entry into LIMS.

20.0 EQUIPMENT and CALIBRATIONS

20.1 Overview

The laboratory purchases the most technically advanced analytical instrumentation for sample analyses. Instrumentation is purchased on the basis of accuracy, dependability, efficiency and sensitivity. Each laboratory is furnished with all items of sampling, preparation, analytical testing and measurement equipment necessary to correctly perform the tests for which the laboratory has capabilities. Each piece of equipment is capable of achieving the required accuracy and

complies with specifications relevant to the method being performed. Before being placed into use, the equipment (including sampling equipment) is calibrated and checked to establish that it meets its intended specification. The calibration routines for analytical instruments establish the range of quantitation. Calibration procedures are specified in laboratory SOPs. A list of available laboratory instrumentation is presented in Table 20-1.

Equipment is only operated by authorized and trained personnel. Manufacturer's instructions for equipment use are readily accessible to all appropriate laboratory personnel.

20.2 Preventive Maintenance

The laboratory follows a well-defined maintenance program to ensure proper equipment operation and to prevent the failure of laboratory equipment or instrumentation during use. This program of preventive maintenance helps to avoid delays due to instrument failure.

Routine preventive maintenance procedures and frequency, such as cleaning and replacements, should be performed according to the procedures outlined in the manufacturer's manual. Qualified personnel must also perform maintenance when there is evidence of degradation of peak resolution, a shift in the calibration curve, loss of sensitivity, or failure to continually meet one of the quality control criteria.

Scheduled routine maintenance is defined in each method SOP. It is the responsibility of each Department Manager/Supervisor to ensure that instrument maintenance logs are kept for all equipment in his/her department. Preventative maintenance procedures are also outlined in analytical SOPs or instrument manuals. (Note: for some equipment, the log used to monitor performance is also the maintenance log. Multiple pieces of equipment may share the same log as long as it is clear as to which instrument is associated with an entry.)

Instrument maintenance logs are controlled and are used to document instrument problems, instrument repair and maintenance activities. Maintenance logs shall be kept for all major pieces of equipment. Instrument maintenance logs may also be used to specify instrument parameters.

- Documentation must include all major maintenance activities such as contracted preventive maintenance and service and in-house activities such as the replacement of electrical components, lamps, tubing, valves, columns, detectors, cleaning and adjustments.
- Each entry in the instrument log includes the analyst's initials, the date, a detailed description of the problem (or maintenance needed/scheduled), a detailed explanation of the solution or maintenance performed, and a verification that the equipment is functioning properly (state what was used to determine a return to control. e.g. CCV run on *'date'* was acceptable, or instrument recalibrated on 'date' with acceptable verification, etc.) must also be documented in the instrument records.
- When maintenance or repair is performed by an outside agency, service receipts detailing the service performed can be affixed into the logbooks adjacent to pages describing the maintenance performed. This stapled in page must be signed across the page entered and the logbook so that it is clear that a page is missing if only half a signature is found in the logbook.

If an instrument requires repair (subjected to overloading or mishandling), gives suspect results, or otherwise has shown to be defective or outside of specified limits it shall be taken out of operation and tagged as out-of-service or otherwise isolated until such a time as the repairs have been made and the instrument can be demonstrated as operational by calibration and/or verification or other test to demonstrate acceptable performance. The laboratory shall examine the effect of this defect on previous analyses.

In the event of equipment malfunction that cannot be resolved, service shall be obtained from the instrument vendor manufacturer, or qualified service technician, if such a service can be tendered. If on-site service is unavailable, arrangements shall be made to have the instrument shipped back to the manufacturer for repair. Back up instruments, which have been approved, for the analysis shall perform the analysis normally carried out by the malfunctioning instrument. If the back-up is not available and the analysis cannot be carried out within the needed timeframe, the samples shall be subcontracted.

At a minimum, if an instrument is sent out for service or transferred to another facility, it must be recalibrated and the laboratory MDL verified (using an MDLV) prior to return to lab operations.

20.3 Support Equipment

This section applies to all devices that may not be the actual test instrument, but are necessary to support laboratory operations. These include but are not limited to: balances, ovens, refrigerators, freezers, water baths, field sampling devices, temperature measuring devices, thermal/pressure sample preparation devices and volumetric dispensing devices if quantitative results are dependent on their accuracy, as in standard preparation and dispensing or dilution into a specified volume. All raw data records associated with the support equipment are retained to document instrument performance.

20.3.1 Weights and Balances

The accuracy of the balances used in the laboratory is checked every working day, before use. All balances are placed on stable counter tops.

Each balance is checked prior to initial serviceable use with at least two certified ASTM type 1 weights spanning its range of use (weights that have been calibrated to ASTM type 1 weights may also be used for daily verification). ASTM type 1 weights used only for calibration of other weights (and no other purpose) are inspected for corrosion, damage or nicks at least annually and if no damage is observed, they are calibrated at least every 5 years by an outside calibration laboratory. Any weights (including ASTM Type 1) used for daily balance checks or other purposes are recalibrated/recertified annually to NIST standards (this may be done internally if laboratory maintains “calibration only” ASTM type 1 weights).

All balances are serviced annually by a qualified service representative, who supplies the laboratory with a certificate that identifies traceability of the calibration to the NIST standards.

All of this information is recorded in logs, and the recalibration/recertification certificates are kept on file.

20.3.2 pH, Conductivity, and Turbidity Meters

The pH meters used in the laboratory are accurate to $\pm$ 0.1 pH units, and have a scale readability of at least 0.05 pH units. The meters automatically compensate for the temperature, and are calibrated with at least two working range buffer solutions before each use.

Conductivity meters used in the laboratory are capable or measuring conductivity with an error not exceeding 1% or one umhos/cm, whichever is greater. The meters are also calibrated before each use with a known standard.

Turbidity meters are also calibrated before each use. All of this information is documented in logs.

Consult pH, Conductivity, and Turbidity SOPs for further information.

20.3.3 Thermometers

All thermometers are calibrated on an annual basis with a NIST-traceable thermometer.

- If the temperature measuring device is used over a range of 10°C or less, then a single point verification within the range of use is acceptable;
- If the temperature measuring device is used over a range of greater than 10°C, then the verification must bracket the range of use.

IR thermometers, digital probes and thermocouples are calibrated quarterly. IR Thermometers are calibrated over the full range of use, including ambient, iced (4°C) and frozen (0°C to -5°C), per the Drinking Water Manual.

The digital NIST thermometer is recalibrated every year (unless thermometer has been exposed to temperature extremes or apparent separation of internal liquid) by an approved outside service and the provided certificate of traceability is kept on file. The NIST thermometer(s) have increments of 1 degree, and have ranges applicable to method and certification requirements. The NIST traceable thermometer is used for no other purpose than to calibrate other thermometers.

All of this information is documented in logbooks. Monitoring method-specific temperatures, including heating blocks, water baths, and ovens, is documented in method-specific logbooks. More information on this subject can be found in the method-specific SOPs.

20.3.4 Refrigerators/Freezer Units, Water baths, Ovens and Incubators

The temperatures of all refrigerator units and freezers used for sample and standard storage are monitored each working day. (Sample storage is monitored 7 days a week for DoD/DOE labs).

Ovens, water baths and incubators are monitored on days of use.

All of this equipment has a unique identification number, and is assigned a thermometer for monitoring.

Sample storage refrigerator temperatures are kept between > 0ºC and $\leq$ 6 ºC.

Specific temperature settings/ranges for other refrigerators, ovens, and water baths can be found in method specific SOPs.

All of this information is documented in Daily Temperature Logbooks and method-specific logbooks and discussed in SOP No. BR-QA-012, Support Equipment.

20.3.5 Autopipettors, Dilutors, and Syringes

Mechanical volumetric dispensing devices including burettes (except Class A Glassware and glass microliter syringes) are given unique identification numbers and the delivery volumes are verified gravimetrically, at a minimum, on a quarterly basis.

For those dispensers that are not used for measurements, a label shall be applied to the device stating that it is not calibrated. Any device not regularly verified cannot be used for any quantitative measurements.

Micro-syringes are purchased from Hamilton Company. Each syringe is traceable to NIST. The laboratory keeps on file an “Accuracy and Precision Statement of Conformance” from Hamilton attesting established accuracy.

20.4 Instrument Calibrations

Calibration of analytical instrumentation is essential to the production of quality data. Strict calibration procedures are followed for each method. These procedures are designed to determine and document the method detection limits, the working range of the analytical instrumentation and any fluctuations that may occur from day to day.

Sufficient raw data records are retained to allow an outside party to reconstruct all facets of the initial calibration. Records contain, but are not limited to, the following: calibration date, method, instrument, analyst(s) initials or signatures, analysis date, analytes, concentration, response, and type of calibration (Avg RF, curve, or other calculations that may be used to reduce instrument responses to concentration.)

Sample results must be quantitated from the initial calibration and may not be quantitated from any continuing instrument calibration verification unless otherwise required by regulation, method or program.

If the initial calibration results are outside of the acceptance criteria, corrective action is performed and any affected samples are reanalyzed if possible. If the reanalysis is not possible, any data associated with an unacceptable initial calibration will be reported with appropriate data qualifiers (refer to Section 14).

Note: Instruments are calibrated initially and as needed after that and at least annually ***(the annual requirement does not apply to Isotope dilution).***

20.4.1 Calibration Standards

Calibration standards are prepared using the procedures indicated in the Reagents and Standards section of the determinative method SOP. If a reference method does not specify the number of calibration standards, a minimum of 3 calibration points will be used.

Standards for instrument calibration are obtained from a variety of sources. All standards are traceable to national or international standards of measurement, or to national or international standard reference materials.

The lowest concentration calibration standard that is analyzed during an initial calibration must be at or below the stated reporting limit for the method based on the final volume of extract (or sample).

The other concentrations define the working range of the instrument/method or correspond to the expected range of concentrations found in actual samples that are also within the working range of the instrument/method. Results of samples not bracketed by initial instrument calibration standards (within calibration range to at least the same number of significant figures used to report the data) must be reported as having less certainty, e.g., defined qualifiers or flags (additional information may be included in the case narrative). The exceptions to these rules. ICP and ICPMS methods which define the working range with periodic linear dynamic range studies, rather than through the range of concentrations of daily calibration standards.

All initial calibrations are verified with a standard obtained from a second source and traceable to a national standard, when available (or vendor certified different lot if a second source is not available). For unique situations, such as air analysis where no other source or lot is available, a standard made by a different analyst at a different time or a different preparation would be considered a second source. This verification occurs immediately after the calibration curve has been analyzed, and before the analysis of any samples.

20.4.1.1 Calibration Verification

The calibration relationship established during the initial calibration must be verified initially and at least daily as specified in the laboratory method SOPs in accordance with the referenced analytical methods and in the 2009 and 2016 TNI Standard. The process of calibration verification applies to both external standard and internal standard calibration techniques, as well as to linear and non-linear calibration models. Initial calibration verification (ICV) is with a standard source secondary (second source standard) to the calibration standards, but continuing calibration verifications (CCV) may use the same source standards as the calibration curve.

Note: The process of calibration verification referred to here is fundamentally different from the approach called "calibration" in some methods. As described in those methods, the calibration factors or response factors calculated during calibration are used to update the calibration factors or response factors used for sample quantitation. This approach, while employed in other EPA programs, amounts to a daily single-point calibration.

All target analytes and surrogates, including those reported as non-detects, must be included in periodic calibration verifications for purposes of retention time confirmation and to demonstrate that calibration verification criteria are being met, i.e., RPD, per 2009 and 2016 TNI Std. EL-V1M4 Sec. 1.7.2.

All samples must be bracketed by periodic analyses of standards that meet the QC acceptance criteria (e.g., calibration and retention time). The frequency is found in the determinative methods or SOPs.

Note: If an internal standard calibration is being used then bracketing calibration verification standards may not be are not required, only daily verifications are needed. The results from these verification standards must meet the calibration verification criteria and the retention time criteria (if applicable).

Generally, the calibrations must be verified by an ICV analyzed immediately following initial calibration and before sample analysis. The ICV may be used as the first bracketing CCV, if criteria for both are met.

A continuing instrument calibration verification (CCV) is generally analyzed at the beginning of each 12-hour analytical shift during which samples are analyzed. The 12-hour analytical shift begins with the injection of the calibration verification standard (or the MS tuning standard in MS methods). The shift ends after the completion of the analysis of the last sample, QC, or standard that can be injected within 12-hours of the beginning of the shift. For methods that have quantitation by external calibration models, a CCV is analyzed at the end of each analytical sequence. Some methods have more frequent CCV requirements. See specific SOPs. Most inorganic methods require the CCV to be analyzed after ever 10 samples or injections, including matrix or batch QC samples.

Note: If an internal standard calibration is being used (e.g., GCMS) then bracketing standards are not required, only daily verifications are needed, except as specified by program or method requirements.

If the results of a CCV are outside the established acceptance criteria and analysis of a second consecutive (and immediate) CCV fails to produce results within acceptance criteria, corrective action shall be performed. Once corrective actions have been completed and documented, the laboratory shall demonstrate acceptable instrument / method performance by analyzing two consecutive CCVs, or a new initial instrument calibration shall be performed.

Sample analyses and reporting of data may not occur or continue until the analytical system is calibrated or calibration verified. However, data associated with an unacceptable calibration verification may be fully useable reported based upon discussion and approval of the client under the following special conditions:

a). when the acceptance criteria for the CCV are exceeded high (i.e., high bias) and the associated samples within the batch are non-detects, then those non-detects may be reported case narrative comment explaining the high bias. Otherwise the samples affected by the unacceptable CCV shall be re-analyzed after a new calibration curve has been established, evaluated and accepted; or

b). when the acceptance criteria for the CCV are exceeded low (i.e., low bias), those sample results may be reported if they exceed a maximum regulatory limit/decision level. Otherwise the samples affected by the unacceptable CCV shall be re-analyzed after a new calibration curve has been established, evaluated and accepted.

Samples reported by the 2 conditions identified above will be appropriately flagged.

20.4.1.2 Verification of Linear and Non-Linear Calibrations

Calibration verification for calibrations involves the calculation of the percent drift or the percent difference of the instrument response between the initial calibration and each subsequent analysis of the verification standard. (These calculations are available in the laboratory method SOPs.) Verification standards are evaluated based on the % Difference from the average CF or RF of the initial calibration or based on % Drift or % Recovery if a linear or quadratic curve is used.

Regardless of whether a linear or non-linear calibration model is used, if initial verification criterion is not met, then no sample analyses may take place until the calibration has been verified or a new initial calibration is performed that meets the specifications listed in the method SOPs. If the calibration cannot be verified after the analysis of a single verification standard, then adjust the instrument operating conditions and/or perform instrument maintenance, and analyze another aliquot of the verification standard. If the calibration cannot be verified with the second standard, then a new initial calibration is performed.

- When the acceptance criteria for the calibration verification are exceeded high, i.e., high bias, and there are associated samples that are non-detects, then those non-detects may be reported. Otherwise, the samples affected by the unacceptable calibration verification shall be reanalyzed after a new calibration curve has been established, evaluated and accepted.
- When the acceptance criteria for the calibration verification are exceeded low, i.e., low bias, those sample results may be reported if they exceed a maximum regulatory limit/decision level. Otherwise, the samples affected by the unacceptable verification shall be reanalyzed after a new calibration curve has been established, evaluated and accepted. Alternatively, a reporting limit standard may be analyzed to demonstrate that the laboratory can still support non-detects at their reporting limit.

20.5 Tentatively Identified Compounds (TICs) – GC/MS Analysis

For samples containing components not associated with the calibration standards, a library search may be made for the purpose of tentative identification. The necessity to perform this type of identification will be determined by the purpose of the analyses being conducted. For example, the RCRA permit or waste delisting requirements may require the reporting of non-

target analytes. Only after visual comparison of sample spectra with the nearest library searches may the analyst assign a tentative identification. Data system library search routines should not use normalization routines that would misrepresent the library or unknown spectra when compared to each other. Additional details are provided in NDSC Document No. CA-Q-QM-001, Tentatively Identified Compounds (TICS) - GCMS Analysis.

Note: If the TIC compound is not part of the client target analyte list but is calibrated by the laboratory and is both qualitatively and/or quantitatively identifiable, it should not be reported as a TIC. If the compound is reported on the same form as true TICs, it should be qualified and/or narrated that the reported compound is qualitatively and quantitatively (if verification in control) reported compared to a known standard that is in control (where applicable).

20.6 GC/MS Tuning

Prior to any GC/MS analytical sequence, including calibration, the instrument parameters for the tune and subsequent sample analyses within that sequence must be set.

Prior to tuning/auto-tuning the mass spectrometer, the parameters may be adjusted within the specifications set by the manufacturer or the analytical method. These generally do not need any adjustment but it may be required based on the current instrument performance. If the tune verification does not pass it may be necessary to clean the source or perform additional maintenance. Any maintenance is documented in the maintenance log.

21.0 MEASUREMENT TRACEABILITY

21.1 Overview

Traceability of measurements shall be assured using a system of documentation, calibration, and analysis of reference standards. Laboratory equipment that are peripheral to analysis and whose calibration is not necessarily documented in a test method analysis or by analysis of a reference standard shall be subject to ongoing certifications of accuracy. At a minimum, these must include procedures for checking specifications of ancillary equipment: balances, thermometers, temperature, Deionized (DI) and Reverse Osmosis (RO) water systems, automatic pipettes and other volumetric measuring devices. (Refer to Section 20.3). With the exception of Class A Glassware and glass microliter syringes, quarterly accuracy checks are performed for all mechanical volumetric devices. Wherever possible, subsidiary or peripheral equipment is checked against standard equipment or standards that are traceable to national or international standards. Class A Glassware and glass microliter syringes should be routinely inspected for chips, acid etching or deformity (e.g., bent needle). If the Class A glassware or syringe is suspect, the accuracy of the glassware will be assessed prior to use.

21.2 NIST-Traceable Weights and Thermometers

Reference standards of measurement shall be used for calibration only and for no other purpose, unless it can be shown that their performance as reference standards would not be invalidated.

For NIST-traceable weights and thermometers, the laboratory requires that all calibrations be conducted by a calibration laboratory accredited by A2LA, NVLAP (National Voluntary Laboratory Accreditation Program), or another accreditation organization that is a signatory to a MRA (Mutual Recognition Arrangement) of one or more of the following cooperations – ILAC (International Laboratory Accreditation Cooperation) or APLAC (Asia–Pacific Laboratory Accreditation Cooperation). A calibration certificate and scope of accreditation is kept on file at the laboratory.

21.3 Reference Standards / Materials

Reference standards/materials, where commercially available, are traceable to certified reference materials. Commercially prepared reference standards, to the extent available, are purchased from vendors that are accredited to ISO Guide 34 and ISO/IEC Guide 17025. All reference standards from commercial vendors shall be accompanied with a certificate that includes at least the following information:

- Manufacturer
- Analytes or parameters calibrated
- Identification or lot number
- Calibration method
- Concentration with associated uncertainties
- Purity

If a standard cannot be purchased from a vendor that supplies a Certificate of Analysis, the purity of the standard is documented by analysis. The receipt of all reference standards must be documented. Reference standards are labeled with a unique Standard Identification Number

and expiration date. All documentation received with the reference standard is retained as a QC record and references the Standard Identification Number.

All reference, primary and working standards/materials, whether commercially purchased or laboratory prepared, must be checked regularly to ensure that the variability of the standard or material from the true value does not exceed method requirements. The accuracy of calibration standards is checked by comparison with a standard from a second source. In cases where a second standard manufacturer is not available, a vendor certified different lot is acceptable for use as a second source. For unique situations, such as air analysis where no other source or lot is available, a standard made by a different analyst would be considered a second source. The appropriate Quality Control (QC) criteria for specific standards are defined in laboratory SOPs. In most cases, the analysis of an Initial Calibration Verification (ICV) or LCS (where there is no sample preparation) is used as the second source confirmation. These checks are generally performed as an integral part of the analysis method (e.g. calibration checks, laboratory control samples).

All standards and materials must be stored and handled according to method or manufacturer's requirements in order to prevent contamination or deterioration. Refer to the Environmental Health & Safety Manual or laboratory SOPs. For safety requirements, please refer to method SOPs and the laboratory's Environmental Health and Safety Manual.

Standards and reference materials shall not be used after their expiration dates unless their reliability is verified by the laboratory and their use is approved by the Quality Assurance Manager. The laboratory must have documented contingency procedures for re-verifying expired standards.

21.4 Documentation and Labeling of Standards, Reagents, and Reference Materials

Reagents must be at a minimum the purity required in the test method. The date of reagent receipt and the expiration date are documented. The lots for most of the common solvents and acids are tested for acceptability prior to company-wide purchase. Refer to NDSC Document No. CA-Q-S-001, Solvent and Acid Lot Testing and Approval.

All manufacturer or vendor supplied Certificate of Analysis or Purity must be retained, stored appropriately, and readily available for use and inspection. These records are maintained in the LIMS. Records must be kept of the date of receipt and date of expiration of standards, reagents and reference materials. In addition, records of preparation of laboratory standards, reagents, and reference materials must be retained, stored appropriately, and be readily available for use and inspection. For detailed information on documentation and labeling, please refer to method specific SOPs.

Commercial materials purchased for preparation of calibration solutions, spike solutions, etc.., are usually accompanied with an assay certificate or the purity is noted on the label. If the assay purity is 96% or better, the weight provided by the vendor may be used without correction. If the assay purity is less than 96% a correction will be made to concentrations applied to solutions prepared from the stock commercial material. Blended gas standard cylinders use a nominal concentration if the certified value is within +/-15%, otherwise the certified values is used for the canister concentration.

21.4.1 All standards, reagents, and reference materials must be labeled in an unambiguous manner. Standards are logged into the laboratory's LIMS, and are assigned a unique identification number. The following information is typically recorded in the electronic database within the LIMS.

- Standard ID
- Description of Standard
- Department
- Preparer's name
- Final volume and number of vials prepared
- Solvent type and lot number
- Preparation Date
- Expiration Date
- Standard source type (stock or daughter)
- Standard type (spike, surrogate, other)
- Parent standard ID (if applicable)
- Parent Standard Analyte Concentration (if applicable)
- Parent Standard Amount used (if applicable)
- Component Analytes
- Final concentration of each analyte
- Comment box (text field)

Records are maintained electronically for standard and reference material preparation. These records show the traceability to purchased stocks or neat compounds. These records also include method of preparation, date of preparation, expiration date and preparer's name or initials. Preparation procedures are provided in the Method SOPs.

21.4.2 All standards, reagents, and reference materials must be clearly labeled with a minimum of the following information:

- Expiration Date (include prep date for reagents)
- Standard ID (from LIMS or logbook)
- Special Health/Safety warnings if applicable

Records must also be maintained of the date of receipt for commercially purchased items or date of preparation for laboratory prepared items. Special Health/Safety warnings must also be available to the analyst. This information is maintained in LIMS.

21.4.3 In addition, the following information may be helpful:

- Date opened (for multi-use containers, if applicable)
- Description of standard (if different from manufacturer's label or if standard was prepared in the laboratory)
- Recommended Storage Conditions
- Concentration (if applicable)
- Initials of analyst preparing standard or opening container

All containers of prepared reagents must include an expiration date and an ID number to trace back to preparation.

Procedures for preparation of reagents can be found in the Method SOPs.

Standard ID numbers must be traceable through associated logbooks, worksheets and preparation/analytical batch records.

All reagents and standards must be stored in accordance to the following priority: 1) with the manufacturer's recommendations; 2) with requirements in the specific analytical methods as specified in the laboratory SOP.

22.0 SAMPLING

22.1 Overview

The laboratory does not provide sampling services. The laboratory's responsibility in the sample collection process lies in supplying the sampler with the necessary coolers, reagent water, sample containers, preservatives, sample labels, custody seals, COC forms, ice, and packing materials required to properly preserve, pack, and ship samples to the laboratory

22.2 Sampling Containers

The laboratory offers clean sampling containers for use by clients. These containers are obtained from reputable container manufacturers and meet EPA specifications as required. Certificates of cleanliness for bottles and preservatives are provided by the supplier and are maintained at the laboratory. Alternatively, the certificates may be maintained by the supplier and available to the laboratory on-line.

22.2.1 Preservatives

Upon request, preservatives are provided to the client in pre-cleaned sampling containers. In some cases containers may be purchased pre-preserved from the container supplier. Whether prepared by the laboratory or bought pre-preserved, the grades of the preservatives are at a minimum:

- Hydrochloric Acid – Reagent ACS (Certified VOA Free) or equivalent
- Methanol – Purge and Trap grade
- Nitric Acid – Instra-Analyzed or equivalent
- Sodium Bisulfate – ACS Grade or equivalent
- Sodium Hydroxide – Instra-Analyzed or equivalent
- Sulfuric Acid – Instra-Analyzed or equivalent
- Sodium Thiosulfate – ACS Grade or equivalent

22.3 Definition of Holding Time

The date and time of sampling documented on the COC form establishes the day and time zero. As a general rule, when the maximum allowable holding time is expressed in days (e.g., 14 days, 28 days), the holding time is based on calendar day measured. Holding times expressed in hours (e.g., 6 hours, 24 hours, etc.) are measured from date and time zero. Holding times for analysis include any necessary reanalysis. However, there are some programs that determine holding time compliance based on the date and specific time of analysis compared to the time of sampling regardless of how long the holding time is.

22.4 Sampling Containers, Preservation Requirements, Holding Times

The preservation and holding time criteria specified in the laboratory SOPs are derived from the source documents for the methods. If method required holding times or preservation requirements are not met, the reports will be qualified using a flag, footnote or case narrative. As soon as possible or "ASAP" is an EPA designation for tests for which rapid analysis is advised, but for which neither EPA nor the laboratory have a basis for a holding time.

22.5 Sample Aliquots / Subsampling

Taking a representative sub-sample from a container is necessary to ensure that the analytical results are representative of the sample collected in the field. The size of the sample container, the quantity of sample fitted within the container, and the homogeneity of the sample need consideration when sub-sampling for sample preparation. It is the laboratory's responsibility to take a representative subsample or aliquot of the sample provided for analysis.

Analysts should handle each sample as if it is potentially dangerous. At a minimum, safety glasses, gloves, and lab coats must be worn when preparing aliquots for analysis.

Guidelines on taking sample aliquots and subsampling are located in method-specific SOPs or SOP BR-QA-020, Subsampling.

23.0 HANDLING OF SAMPLES

It is the responsibility of the client to send us representative and/or homogeneous and properly preserved samples of the system from which they are drawn. The laboratory assumes that all multiple sample containers with the same designator/description and bottle type contain a homogeneous, representative sample.

The laboratory provides the appropriate sample containers, required preservative, chain-of-custody (COC) forms, shipping containers, labels, and custody seals. The laboratory also provides trip blanks and analyte-free water for field blanks. Preparation of methanol containers for field preservation of volatile soil samples is available.

Sample management procedures at the laboratory ensure that sample integrity and custody are maintained and documented from sampling/receipt through disposal.

23.1 Chain of Custody (COC)

The COC form is the written documented history of any sample and is initiated when bottles are sent to the field, or at the time of sampling. This form is completed by the sampling personnel and accompanies the samples to the laboratory where it is received and stored under the laboratory's custody. The purpose of the COC form is to provide a legal written record of the handling of samples from the time of collection until they are received at the laboratory. It also serves as the primary written request for analyses from the client to the laboratory. The COC form acts as a purchase order for analytical services when no other contractual agreement is in effect.

23.1.1 Field Documentation

The information the sampler needs to provide at the time of sampling on the container label is:

- Sample identification
- Date and time

- Preservative

During the sampling process, the COC form is completed and must be legible. This form includes information such as:

- Client name, address, phone number and fax number (if available)
- Project name and/or number
- The sample identification
- Date, time and location of sampling
- Sample collectors name
- The matrix description
- The container description
- The total number of each type of container
- Preservatives used
- Analysis requested
- Requested turnaround time (TAT)
- Any special instructions
- Purchase Order number or billing information (e.g. quote number) if available
- The date and time that each person received or relinquished the sample(s), including their signed name.

When the sampling personnel deliver the samples directly to the laboratory personnel, the samples are stored in a cooler with ice, as applicable, and remain solely in the possession of the client's field technician until the samples are delivered to the laboratory personnel. The sample collector must assure that each container is in his/her physical possession or in his/her view at all times, or stored in such a place and manner to preclude tampering. The field technician relinquishes the samples in writing on the COC form to the sample control personnel at the laboratory or to a laboratory courier. When sampling personnel deliver the samples through a common carrier (Fed-Ex, UPS), the CoC relinquished date/time is completed by the field personnel and samples are released to the carrier. Samples are only considered to be received by the laboratory when personnel at the fixed laboratory facility have physical contact with the samples.

Note: Independent couriers are not required to sign the COC form. The COC is usually kept in the sealed sample cooler. The receipt from the courier is stored in log-in by date; it lists all receipts each date.

23.1.2 Legal / Evidentiary Chain-of-Custody

Samples being tested for litigation may require locked storage and documentation of the time and personnel responsible when the sample was not in storage. This level of documentation is available upon client request and procedures to define these activities are in place and include the following:

- A chain-of-custody document is initiated for each bottle type submitted by the client.

- The chain of custody is signed each time the sample is stored, removed from storage, or changes hands.
- Clients requesting legal internal chain-of-custody documentation receive the completed forms after the analysis is complete.

23.2 Sample Receipt

Samples are received at the laboratory by designated sample receiving personnel and a unique laboratory project identification number is assigned. Each sample container shall be assigned a unique sample identification number that is cross-referenced to the client identification number such that traceability of test samples is unambiguous and documented. Each sample container is affixed with a durable sample identification label. Sample acceptance, receipt, tracking and storage procedures are detailed in the laboratory's SOP No. BR_SM-001, Sample Management and summarized in the following sections.

23.2.1 Laboratory Receipt

When samples arrive at the laboratory, sample receiving personnel inspect the coolers and samples. The integrity of each sample must be determined by comparing sample labels or tags with the COC and by visual checks of the container for possible damage. Any non-conformance, irregularity, or compromised sample receipt must be documented on a NCM (Non Conformance Form) and brought to the immediate attention of the client. The COC, shipping documents, documentation of any non-conformance, irregularity, or compromised sample receipt, record of client contact, and resulting instructions become part of the project record.

Sample Registration personnel check and document preservation of non-volatile liquid samples after the samples have been entered into the LIMS and before they are released to the laboratory for testing or placed into storage. Any checks of volatile samples are performed and documented at the time of analysis.

23.3 Sample Acceptance Policy

The laboratory has a written sample acceptance policy (Figure 23-1) that clearly outlines the circumstances under which samples shall be accepted or rejected. These include:

- a COC filled out completely;
- samples must be properly labeled;
- proper sample containers with adequate volume for the analysis (Sampling Guide) and necessary QC;
- samples must be preserved according to the requirements of the requested analytical method (Sampling Guide);
- sample holding times must be adhered to (Sampling Guide);
- the project manager will be notified if any sample is received in damaged condition.

Data from samples which do not meet these criteria are flagged and the nature of the variation from policy is defined.

23.3.1 After inspecting the samples, the sample receiving personnel sign and date the COC form, make any necessary notes of the samples' conditions and store them in appropriate refrigerators or storage locations.

23.3.2 Any deviations from these checks that question the suitability of the sample for analysis, or incomplete documentation as to the tests required will be resolved by consultation with the client. If the sample acceptance policy criteria are not met, the laboratory shall either:

- Retain all correspondence and/or records of communications with the client regarding the disposition of rejected samples, or
- Fully document any decision to proceed with sample analysis that does not meet sample acceptance criteria.

Note: North Carolina requires that they be notified when samples are processed that do not meet sample acceptance criteria.

Once sample acceptance is verified, the samples are logged into LIMS according SOP No. BR-SM-001, Sample Management.

23.4 Sample Storage

In order to avoid deterioration, contamination or damage to a sample during storage and handling, from the time of receipt until all analyses are complete, samples are stored in refrigerators, freezers or protected locations suitable for the sample matrix. In addition, samples to be analyzed for volatile organic parameters are stored in separate refrigerators designated for volatile organic parameters only. Samples are never to be stored with reagents, standards or materials that may create contamination.

To ensure the integrity of the samples during storage, refrigerator blanks are maintained in the volatile sample refrigerators and analyzed at least every two weeks in project logins.

Analysts and technicians retrieve the sample container allocated to their analysis from the designated refrigerator and place them on carts, analyze the sample, and return the remaining sample or empty container to the refrigerator from which it originally came. All unused portions of samples, including empty sample containers, are returned to the secure sample control area. All samples are kept in the refrigerators for two to four weeks after analysis, which meets or exceeds most sample holding times. After two to four weeks the samples can be moved to dry room temperature, sample archive area where they are stored for an additional four weeks before they are disposed of. This eight week holding period allows samples to be checked if a discrepancy or question arises. Special arrangements may be made to store samples for longer periods of time. This extended holding period allows additional metal analyses to be performed on the archived sample and assists clients in dealing with legal matters or regulatory issues.

Access to the laboratory is controlled such that sample storage need not be locked at all times unless a project specifically demands it. Samples are accessible to laboratory personnel only. Visitors to the laboratory are prohibited from entering the refrigerator and laboratory areas unless accompanied by an employee of Eurofins TestAmerica Burlington.

23.5 Hazardous Samples and Foreign Soils

To minimize exposure to personnel and to avoid potential accidents, hazardous and foreign soil samples are stored in an isolated area designated for hazardous waste only. For any sample that is known to be hazardous at the time of receipt or, if after completion of analysis the result

exceeds the acceptable regulatory levels, a Hazardous Sample Notice must be completed by the analyst. This form may be completed by Sample Control, Project Managers, or analysts and must be attached to the report. The sample itself is clearly marked with a red stamp, stamped on the sample label reading “HAZARDOUS” or “FOREIGN SOIL” and placed in a colored and/or marked bag to easily identify the sample. The date, log number, lab sample number, and the result or brief description of the hazard are all written on the Hazardous & Foreign Soil Sample Notice. A copy of the form must be included with the original COC and Work Order and the original must be given to the Sample Control Custodian. Analysts will notify Sample Control of any sample determined to be hazardous after completion of analysis by completing a Hazardous Sample Notice. All hazardous samples are either returned to the client or disposed of appropriately through a hazardous waste disposal firm that lab-packs all hazardous samples and removes them from the laboratory. Foreign soil samples are sent out for incineration by a USDA-approved waste disposal facility.

23.6 Sample Shipping

In the event that the laboratory needs to ship samples, the samples are placed in a cooler with enough ice to ensure the samples remain just above freezing and at or below 6.0°C transit. The samples are carefully surrounded by packing material to avoid breakage (yet maintain appropriate temperature). A trip blank is enclosed for those samples requiring water/solid volatile organic analyses (see Note). The chain-of-custody form is signed by the sample control technician and attached to the shipping paperwork. Samples are generally shipped overnight express or hand-delivered by a Eurofins TestAmerica Burlington courier to maintain sample integrity. All personnel involved with shipping and receiving samples must be trained to maintain the proper chain-of-custody documentation and to keep the samples intact and on ice. The laboratory’s Environmental, Health and Safety Manual contains additional shipping requirements.

Note: If a client does not request trip blank analysis on the COC or other paperwork, the laboratory will not analyze the trip blanks that were supplied. However, in the interest of good client service, the laboratory will advise the client at the time of sample receipt that it was noted that they did not request analysis of the trip blank; and that the laboratory is providing the notification to verify that they are not inadvertently omitting a key part of regulatory compliance testing.

23.7 Sample Disposal

Samples should be retained for a minimum of 30 days after the project report is sent, however, provisions may be made for earlier disposal of samples once the holding time is exceeded. Some samples are required to be held for longer periods based on regulatory or client requirements (e.g., 60 days after project report is sent). The laboratory must follow the longer sample retention requirements where required by regulation or client agreement. Several possibilities for sample disposal exist: the sample may be consumed completely during analysis, the sample may be returned to the customer or location of sampling for disposal, or the sample may be disposed of in accordance with the laboratory’s waste disposal procedures (SOP: BR_EH-001). All procedures in the laboratory’s Environmental Health and Safety Manual are followed during disposal. Samples are normally maintained in the laboratory no longer than two months from receipt unless otherwise requested. Unused portions of samples found or suspected to be hazardous according to state or federal guidelines may be returned to the client upon completion of the analytical work.

If a sample is part of a known litigation, the affected legal authority, sample data user, and/or submitter of the sample must participate in the decision about the sample's disposal. All documentation and correspondence concerning the disposal decision process must be kept on file. Pertinent information includes the date of disposal, nature of disposal (such as sample depletion, hazardous waste facility disposal, return to client), names of individuals who conducted the arrangements and physically completed the task. The laboratory will remove or deface sample labels prior to disposal unless this is accomplished through the disposal method (e.g., samples are incinerated). A Waste Disposal Record should be completed.

Figure 23-1. Example: Sample Acceptance Policy

All incoming work will be evaluated against the criteria listed below. Where applicable, data from any samples that do not meet the criteria listed below will be noted on the laboratory report defining the nature and substance of the variation. In addition the client will be notified either by telephone, fax or e-mail ASAP after the receipt of the samples.

Per State and/or Federal Regulation, the client is responsible to ensure that samples are shipped in accordance with DOT/IATA requirements, and that radioactive materials may only be delivered to licensed facilities. Any samples containing (or suspected to contain) Source, Byproduct, or Special Nuclear Material as defined by 10 CFR should be delivered directly to facilities licensed to handle such radioactive material. Natural material or ores containing naturally occurring radionuclides may be delivered to any Eurofins TestAmerica Burlington facility or courier as long as the activity concentration of the material does not exceed 270 pCi/g alpha or 2700 pCi/g beta (49 CFR Part 173).

1) Samples must arrive with labels intact with a Chain of Custody filled out completely. The following information must be recorded.
    - Client name, address, phone number and fax number (if available)
    - Project name and/or number
    - The sample identification
    - Date, time and location of sampling
    - The collectors name
    - The matrix description
    - The container description
    - The total number of each type of container
    - Preservatives used
    - Analysis requested
    - Requested turnaround time (TAT)
    - Any special instructions
    - Purchase Order number or billing information (e.g. quote number) if available
    - The date and time that each person received or relinquished the sample(s), including their signed name.
    - The date and time of receipt must be recorded between the last person to relinquish the samples and the person who receives the samples in the lab, and they must be

exactly the same.

- Information must be legible

2) Samples must be properly labeled.
   - Use durable labels (labels provided by Eurofins TestAmerica Burlington are preferred)
   - Include a unique identification number
   - Include sampling date and time & sampler ID
   - Include preservative used.
   - Use indelible ink
   - Information must be legible
3) Proper sample containers with adequate volume for the analysis and necessary QC are required for each analysis requested. See Lab Sampling Guide.
4) Samples must be preserved according to the requirements of the requested analytical method (See Sampling Guide**.**
5) Most analytical methods require chilling samples to 4^{o} C (other than water samples for metals analysis). For these methods, the criteria are met if the samples are chilled to below 6^{o} C and above freezing (0^{o}C). For methods with other temperature criteria (e.g. some methods require $\leq$ 10 ^{o}C), the samples must arrive within $\pm$ 2^{o} C of the required temperature or within the method specified range.

   5i.) Samples that are delivered to the laboratory on the same day they are collected may not meet the requirements of Section 5. In these cases, the samples shall be considered acceptable if the samples were received on ice.

   5ii.)If sample analysis is begun within fifteen (15) minutes of collection, thermal preservation is not required.

   5iii.)Thermal preservation is not required in the field if the laboratory receives and refrigerates the sample within fifteen (15) minutes of collection.

   - Chemical preservation (pH) will be verified prior to analysis and documented, either in sample control or at the analyst's level. The project manager will be notified immediately if there is a discrepancy. If analyses will still be performed, all affected results will be flagged to indicate improper preservation.
   - For Organic analyses in drinking water, Residual chlorine must be neutralized prior to preservation. If there is prior knowledge that the samples are not chlorinated, state it on the COC and use the VOA vials pre-preserved with HCl. The following are other options for a sampler and laboratory where the presence of chlorine is not known:
     - 1. Test for residual chlorine in the field prior to sampling.
       - If no chlorine is present, the samples are to be preserved using HCl as usual.
       - If chlorine is present, add either ascorbic acid or sodium thiosulfate prior to adding HCl.

- 2. Use VOA vials pre-preserved with sodium thiosulfate or ascorbic acid and add HCl after filling the VOA vial with the sample.

Sample Holding Times

- Eurofins TestAmerica Burlington will make every effort to analyze samples within the regulatory holding time. Samples must be received in the laboratory with enough time to perform the sample analysis. Except for short holding time samples (< 48hr HT) sample must be received with at least 48 hrs (2 working days) remaining on the holding time for us to ensure analysis.
- Analyses that are designated as "field" analyses (Odor, pH, Dissolved Oxygen, Disinfectant Residual; a.k.a. Residual Chlorine, and Redox Potential) should be analyzed ASAP by the field sampler prior to delivering to the lab (within 15 minutes). However, if the analyses are to be performed in the laboratory, Eurofins TestAmerica Burlington will make every effort to analyze the samples within 24 hours from receipt of the samples in the testing laboratory. Samples for "field" analyses received after 4:00 pm on Friday or on the weekend will be analyzed no later than the next business day after receipt (Monday unless a holiday). Samples will remain refrigerated and sealed until the time of analysis. The actual times of all "field" sample analyses are noted on the "Short Hold Time Detail Report" in the final report. Samples analyzed in the laboratory will be qualified on the final report with an 'H' to indicate holding time exceedance.

6) All samples submitted for Volatile Organic analyses must have a Trip Blank submitted at the same time. Eurofins TestAmerica Burlington will supply a blank with the bottle order.
7) The project manager will be notified if any sample is received in damaged condition. Eurofins TestAmerica Burlington will request that a sample be resubmitted for analysis.
8) Recommendations for packing samples for shipment.
   - Pack samples in Ice rather than "Blue" ice packs.
   - Soil samples should be placed in plastic zip-lock bags. The containers often have dirt around the top and do not seal very well and are prone to intrusion from the water from melted ice.
   - Water samples would be best if wrapped with bubble-wrap or paper (newspaper, or paper towels work) and then placed in plastic zip-lock bags.
   - Fill extra cooler space with bubble wrap.

24.0 ASSURING THE QUALITY OF TEST RESULTS

24.1 Overview

In order to assure our clients of the validity of their data, the laboratory continuously evaluates the quality of the analytical process. The analytical process is controlled not only by instrument calibration as discussed in Section 20, but also by routine process quality control measurements (e.g. Blanks, Laboratory Control Samples (LCS), Matrix Spikes (MS), duplicates (DUP), surrogates, Internal Standards (IS)). These quality control checks are performed as required by the method or regulations to assess precision and accuracy. Quality control samples are to be treated in the exact same manner as the associated field samples being tested. In addition to

the routine process quality control samples, Proficiency Testing (PT) Samples (concentrations unknown to laboratory) are analyzed to help ensure laboratory performance.

24.2 Controls

Sample preparation or pre-treatment is commonly required before analysis. Typical preparation steps include homogenization, grinding, solvent extraction, sonication, acid digestion, distillation, reflux, evaporation, drying and ashing. During these pre-treatment steps, samples are arranged into discreet manageable groups referred to as preparation (prep) batches. Prep batches provide a means to control variability in sample treatment. Control samples are added to each prep batch to monitor method performance and are processed through the entire analytical procedure with investigative/field samples.

24.3 Negative Controls

Table 24-1. Example – Negative Controls

Control Type	Details
Method Blank (MB)	are used to assess preparation and analysis for possible contamination during the preparation and processing steps.
	The specific frequency of use for method blanks during the analytical sequence is defined in the specific standard operating procedure for each analysis. Generally it is 1 for each batch of samples; not to exceed 20 environmental samples.
	The method blank is prepared from a clean matrix similar to that of the associated samples that is free from target analytes (e.g., Reagent water, Ottawa sand, glass beads, etc.) and is processed along with and under the same conditions as the associated samples. The method blank goes through all of the steps of the process (including as necessary: filtration, clean-ups, etc.).
	Reanalyze or qualify associated sample results when the concentration of a targeted analyte in the blank is at or above the reporting limit as established by the method or by regulation, AND is greater than 1/10 of the amount measured in the sample.
Calibration Blanks	are prepared and analyzed along with calibration standards where applicable. They are prepared using the same reagents that are used to prepare the standards. In some analyses the calibration blank may be included in the calibration curve.
Instrument Blanks	are blank reagents or reagent water that may be processed during an analytical sequence in order to assess contamination in the analytical system. In general, instrument blanks are used to differentiate between contamination caused by the analytical system and that caused by the sample handling or sample prep process. Instrument blanks may also be inserted throughout the analytical sequence to minimize the effect of carryover from samples with high analyte content.
Trip Blank [1]	are required to be submitted by the client with each shipment of samples requiring aqueous and solid volatiles analyses (or as specified in the client's project plan). Additionally, trip blanks may be prepared and analyzed for volatile analysis of air samples, when required by the client. A trip blank may be purchased (certified clean) or is prepared by the laboratory by filling a clean container with pure deionized water that has been purged to remove any volatile compounds. Appropriate preservatives are also added to the container. The trip blank is sent with the bottle order and is intended to reflect the environment that the containers are subjected to throughout shipping and handling and help identify possible sources if contamination is found. The field sampler returns the trip blank in the cooler with the field samples.

Table 24-1. Example – Negative Controls

Control Type	Details
Field Blanks [1]	are sometimes used for specific projects by the field samplers. A field blank prepared in the field by filling a clean container with pure reagent water and appropriate preservative, if any, for the specific sampling activity being undertaken. (EPA OSWER)
Equipment Blanks [1]	are also sometimes created in the field for specific projects. An equipment blank is a sample of analyte-free media which has been used to rinse common sampling equipment to check effectiveness of decontamination procedures. (TNI)
Holding Blanks	also referred to as refrigerator or freezer blanks, are used to monitor the sample storage units for volatile organic compounds during the storage of VOA samples in the laboratory

[1] When known, these field QC samples should not be selected for matrix QC as it does not provide information on the behavior of the target compounds in the field samples. Usually, the client sample ID will provide information to identify the field blanks with labels such as "FB", "EB", or "TB."

Evaluation criteria and corrective action for these controls are defined in the specific standard operating procedure for each analysis.

24.4 Positive Controls

Control samples (e.g., QC indicators) are analyzed with each batch of samples to evaluate data based upon (1) Method Performance (Laboratory Control Sample (LCS) or Blank Spike (BS)), which entails both the preparation and measurement steps; and (2) Matrix Effects (Matrix Spike (MS) (Matrix spikes are not applicable to air) or Sample Duplicate (MD, DUP), which evaluates field sampling accuracy, precision, representativeness, interferences, and the effect of the matrix on the method performed. Each regulatory program and each method within those programs specify the control samples that are prepared and/or analyzed with a specific batch

Note that frequency of control samples vary with specific regulatory, methodology and project specific criteria. Complete details on method control samples are as listed in each analytical SOP.

24.4.1 Method Performance Control - Laboratory Control Sample (LCS)

The LCS measures the accuracy of the method in a blank matrix and assesses method performance independent of potential field sample matrix affects in a laboratory batch.

The LCS is prepared from a clean matrix similar to that of the associated samples that is free from target analytes (for example: Reagent water, Ottawa sand, glass beads, etc.) and is processed along with and under the same conditions as the associated samples. The LCS is spiked with verified known amounts of analytes or is made of a material containing known and verified amounts of analytes, taken through all preparation and analysis steps along with the field samples. Where there is no preparation taken for an analysis (such as in aqueous volatiles), or when all samples and standards undergo the same preparation and analysis process, a calibration verification standard is reported as the LCS. In some instances where there is no practical clean solid matrix available, aqueous LCS's may be processed for solid matrices; final results may be calculated as mg/kg or ug/kg, assuming 100% solids and a weight equivalent to the aliquot used for the corresponding field samples, to facilitate comparison with the field samples.

Certified pre-made reference material purchased from a NIST/A2LA accredited vendor may also be used for the LCS when the material represents the sample matrix or the analyte is not easily spiked (e.g. solid matrix LCS for metals, TDS, etc.).

The specific frequency of use for LCS during the analytical sequence is defined in the specific standard operating procedure for each analysis. It is generally 1 for each batch of samples; not to exceed 20 environmental samples.

If the mandated or requested test method, or project requirements, do not specify the spiking components, the laboratory shall spike all reportable components to be reported in the Laboratory Control Sample (and Matrix Spike) where applicable (e.g. no spike of pH). However, in cases where the components interfere with accurate assessment (such as simultaneously spiking chlordane, Toxaphene and PCBs in Method 608), the test method has an extremely long list of components or components are incompatible, at a minimum, a representative number of the listed components (see below) shall be used to control the test method. The selected components of each spiking mix shall represent all chemistries, elution patterns and masses, permit specified analytes and other client requested components. However, the laboratory shall ensure that all reported components are used in the spike mixture within a two-year time period.

- For methods that have 1-10 target analytes, spike all components.
- For methods that include 11-20 target analytes, spike at least 10 or 80%, whichever is greater.
- For methods with more than 20 target analytes, spike at least 16 components.
- Exception: Due to analyte incompatibility in pesticides, Toxaphene and Chlordane are only spiked at client request based on specific project needs.
- Exception: Due to analyte incompatibility between the various PCB aroclors, aroclors 1016 and 1260 are used for spiking as they cover the range of all of the aroclors. Specific aroclors may be used by request on a project specific basis.

24.5 Sample Matrix Controls

Table 24-3. Sample Matrix Control

Control Type	Details	
Matrix Spikes (MS)	Use	used to assess the effect sample matrix of the spiked sample has on the precision and accuracy of the results generated by the method used;
	Typical Frequency [1]	At a minimum, with each matrix-specific batch of samples processed, an MS is carried through the complete analytical procedure. Unless specified by the client, samples used for spiking are randomly selected and rotated between different client projects. If the mandated or requested test method does not specify the spiking components, the laboratory shall spike all reportable components to be reported in the Laboratory Control Sample and Matrix Spike. Refer to the method SOP for complete details
	Description	essentially a sample fortified with a known amount of the test analyte(s).
Surrogate	Use	Measures method performance to sample matrix (organics only).

Table 24-3. Sample Matrix Control

Control Type	Details	
	Typical Frequency [1]	Are added to all samples, standards, and blanks, for all organic chromatography methods except when the matrix precludes its use or when a surrogate is not available. The recovery of the surrogates is compared to the acceptance limits for the specific method. Poor surrogate recovery may indicate a problem with sample composition and shall be reported, with data qualifiers, to the client whose sample produced poor recovery.
	Description	Are similar to matrix spikes except the analytes are compounds with properties that mimic the analyte of interest and are unlikely to be found in environment samples.
Duplicates[2]	Use	For a measure of analytical precision, with each matrix-specific batch of samples processed, a matrix duplicate (MD or DUP) sample, matrix spike duplicate (MSD), or LCS duplicate (LCSD) is carried through the complete analytical procedure.
	Typical Frequency [1]	Duplicate samples are usually analyzed with methods that do not require matrix spike analysis.
	Description	Performed by analyzing two aliquots of the same field sample independently or an additional LCS.
Internal Standards	Use	Are spiked into all environmental and quality control samples (including the initial calibration standards) to monitor the qualitative aspect of organic and some inorganic analytical measurements.
	Typical Frequency [1]	All organic and ICP methods as required by the analytical method.
	Description	Used to correct for matrix effects and to help troubleshoot variability in analytical response and are assessed after data acquisition. Possible sources of poor internal standard response are sample matrix, poor analytical technique or instrument performance.

[1] See the specific analytical SOP for type and frequency of sample matrix control samples.
[2] LCSD's are normally not performed except when regulatory agencies or client specifications require them. The recoveries for the spiked duplicate samples must meet the same laboratory established recovery limits as the accuracy QC samples. If an LCSD is analyzed both the LCS and LCSD must meet the same recovery criteria and be included in the final report. The precision measurement is reported as "Relative Percent Difference" (RPD). Poor precision between duplicates (except LCS/LCSD) may indicate non-homogeneous matrix or sampling.

24.6 Acceptance Criteria (Control Limits)

As mandated by the test method and regulation, each individual analyte in the LCS, MS, or Surrogate Spike is evaluated against the control limits published in the test method. Where there are no established acceptance criteria, the laboratory calculates in-house control limits with the use of control charts or, in some cases, utilizes client project specific control limits. When this occurs, the regulatory or project limits will supersede the laboratory's in-house limits.

Note: For methods, analytes and matrices with very limited data (e.g., unusual matrices not analyzed often), interim limits are established using available data or by analogy to similar methods or matrices.

Once control limits have been established, they are verified, reviewed, and updated if necessary on an annual basis unless the method requires more frequent updating. Control limits are established per method (as opposed to per instrument) regardless of the number of instruments utilized.

Laboratory generated % Recovery acceptance (control) limits are generally established by taking $\pm$ 3 Standard Deviations (99% confidence level) from the average recovery of a minimum of 20-30 data points (more points are preferred).

- Regardless of the calculated limit, the limit should be no tighter than the Calibration Verification (ICV/CCV). (Unless the analytical method specifies a tighter limit).
- In-house limits cannot be any wider than those mandated in a regulated analytical method. Client or contract required control limits are evaluated against the laboratory's statistically derived control limits to determine if the data quality objectives (DQOs) can be achieved. If laboratory control limits are not consistent with DQOs, then alternatives must be considered, such as method improvements or use of an alternate analytical method.
- The lowest acceptable recovery limit will be 10% (the analyte must be detectable and identifiable). Exception: The lowest acceptable recovery limit for Benzidine will be 5% and the analyte must be detectable and identifiable.
- The maximum acceptable recovery limit will be 150%.
- The maximum acceptable RPD limit will be 35% for waters and 40% for soils. The minimum RPD limit is 10%.
- If either the high or low end of the control limit changes by $\leq$ 5% from previous, the control chart is visually inspected and, using professional judgment, they may be left unchanged if there is no affect on laboratory ability to meet the existing limits.

24.6.1 The lab must be able to generate a current listing of their control limits and track when the updates are performed. In addition, the laboratory must be able to recreate historical control limits, SOP No BR-QA-013, Control Chart.

The QA department or department supervisor generates a Quality Control Limit Summary that contains tables that summarize the precision and accuracy acceptability limits for analyses performed at Eurofins TestAmerica Burlington. This summary includes an effective date, is updated each time new limits are generated and is located in LIMS. Unless otherwise noted, limits within these tables are laboratory generated. The analysts are instructed to use the current limits in the laboratory (dated and approved by the Technical Manager and QA Manager) and entered into LIMS. The Quality Assurance department maintains an archive of all limits used within the laboratory.

24.6.2 A LCS that is within the acceptance criteria establishes that the analytical system is in control and is used to validate the process. Samples that are analyzed with an LCS with recoveries outside of the acceptance limits may be determined as out of control and should be reanalyzed if possible. If reanalysis is not possible, then the results for all affected analytes for samples within the same batch must be qualified when reported. The internal corrective action process (see Section 12) is also initiated if an LCS exceeds the acceptance limits. Sample results may be qualified and reported without reanalysis if:

- The analyte results are below the reporting limit and the LCS is above the upper control limit.
- If the analytical results are above the relevant regulatory limit and the LCS is below the lower control limit.

For TNI and DoD/DOE work, there are an allowable number of Marginal Exceedances (ME):

<11 analytes	0 marginal exceedances are allowed.
11 – 30 Analytes	1 marginal exceedance is allowed
31-50 Analytes	2 marginal exceedances are allowed

51-70 Analytes	3 marginal exceedances are allowed
71-90 Analytes	4 marginal exceedances are allowed
> 90 Analytes	5 marginal exceedances are allowed

- Marginal exceedances are recovery exceedances between 3 SD and 4 SD from the mean recovery limit (TNI).
- Marginal exceedances must be random. If the same analyte exceeds the LCS control limit repeatedly, it is an indication of a systematic problem. The source of the error must be located and corrective action taken. The laboratory has a system to monitor marginal exceedances to ensure that they are random.

Though marginal exceedences may be allowed, the data must still be qualified to indicate it is outside of the normal limits.

24.6.3 If the MS/MSDs do not meet acceptance limits, the MS/MSD and the associated spiked sample is reported with a qualifier for those analytes that do not meet limits. If obvious preparation errors are suspected, or if requested by the client, unacceptable MS/MSDs are reprocessed and reanalyzed to prove matrix interference. A more detailed discussion of acceptance criteria and corrective action can be found in the lab's method SOPs and in Section 12.

24.6.4 If a surrogate standard falls outside the acceptance limits, and if there is not obvious chromatographic matrix interference, reanalyze the sample to confirm a possible matrix effect. If the recoveries confirm or there was obvious chromatographic interference, results are reported from the original analysis and a qualifier is added. If the reanalysis meets surrogate recovery criteria, the second run is reported (or both are reported if requested by the client). Under certain circumstances, where all of the samples are from the same location and share similar chromatography, the reanalysis may be performed on a single sample rather than all of the samples and if the surrogate meets the recovery criteria in the reanalysis, all of the affected samples would require reanalysis.

24.7 Additional Procedures to Assure Quality Control

The laboratory has written and approved method SOPs to assure the accuracy of the test method including calibration (see Section 20), use of certified reference materials (see Section 21) and use of PT samples (see Section 17).

A discussion regarding MDLs, Limit of Detection (LOD) and Limit of Quantitation (LOQ) can be found in Section 19.

- Use of formulae to reduce data is discussed in the method SOPs and in Section 20.
- Selection of appropriate reagents and standards is included in Section 11 and 21.
- A discussion on selectivity of the test is included in Section 7.
- Constant and consistent test conditions are discussed in Section 6.
- The laboratories sample acceptance policy is included in Section 23.

25.0 REPORTING RESULTS

25.1 Overview

The results of each test are reported accurately, clearly, unambiguously, and objectively in accordance with State and Federal regulations as well as client requirements. Analytical results are issued in a format that is intended to satisfy customer and laboratory accreditation requirements as well as provide the end user with the information needed to properly evaluate the results. Where there is conflict between client requests and laboratory ethics or regulatory requirements, the laboratory's ethical and legal requirements are paramount, and the laboratory will work with the client during project set up to develop an acceptable solution. Refer to Section 9.

A variety of report formats are available to meet specific needs.

In cases where a client asks for simplified reports, there must be a written request from the client. There still must be enough information that would show any analyses that were out of conformance (QC out of limits) and there should be a reference to a full report that is made available to the client. Review of reported data is included in Section 19.

25.2 Test Reports

Analytical results are reported in a format that is satisfactory to the client and meets all requirements of applicable accrediting authorities and agencies. A variety of report formats are available to meet specific needs. The report is printed on laboratory letterhead, reviewed, and signed by the appropriate project manager. At a minimum, the standard laboratory report shall contain the following information:

25.2.1 A report title (e.g., Analytical Report)

25.2.2 The cover page shall include the laboratory name, address and telephone number.

25.2.3 A unique identification of the report (e.g., Eurofins TestAmerica Burlington Job ID #) and on each page an identification in order to ensure the page is recognized as part of the report and a clear identification of the end.

Note: Page numbers of report are represented as page # of ##. Where the first number is the page number and the second is the total number of pages.

25.2.4 A copy of the chain of custody (COC).

- Any COCs involved with Subcontracting are included.

25.2.5 The name and address of client and a project name/number, if applicable.

25.2.6 Client project manager or other contact

25.2.7 Description and unambiguous identification of the tested sample(s) including the client identification code.

25.2.8 Date of receipt of sample, date and time of collection, and date(s) of test preparation and performance, and time of preparation or analysis if the required holding time for either activity is less than or equal to 72 hours.

25.2.9 Date reported or date of revision, if applicable.

25.2.10 Method of analysis including method code (EPA, Standard Methods, etc.).

25.2.11 Practical quantitation limits or reporting limit.

25.2.12 Method detection limits (if requested)

25.2.13 Definition of Data qualifiers and reporting acronyms (e.g. ND).

25.2.14 Sample results.

25.2.15 QC data consisting of method blank, surrogate, LCS, and MS/MSD recoveries and control limits.

25.2.16 Condition of samples at receipt including temperature. This may be accomplished in a narrative or by attaching sample login sheets (Refer to Sec. 25.2.4 – Item 3 regarding additional addenda).

25.2.17 A statement expressing the validity of the results, that the source methodology was followed and all results were reviewed for error.

25.2.18 A statement to the effect that the results relate only to the items tested and the sample as received by the laboratory, except when information is provided by the client. When data is provided by the client there shall be a clear identification of it, and a disclaimer shall be put in the report when the client supplied data can affect the validity of the test.

25.2.19 A statement that the report shall not be reproduced except in full, without prior express written approval by the laboratory coordinator.

25.2.20 A signature and title of the person(s) accepting responsibility for the content of the report and date of issue. Authorized signatories are qualified Project Managers appointed by the Manager of Project Managers.

25.2.21 When TNI accreditation is required, the lab shall certify that the test results meet all requirements of TNI or provide reasons and/or justification if they do not.

25.2.22 The laboratory includes a cover letter.

25.2.23 Where applicable, a narrative to the report that explains the issue(s) and corrective action(s) taken in the event that a specific accreditation or certification requirement was not met.

25.2.24 When soil samples are analyzed, a specific identification as to whether soils are reported on a “wet weight” or “dry weight” basis.

25.2.25 Appropriate laboratory certification number for the state of origin of the sample, if applicable.

25.2.26 If only part of the report is provided to the client (client requests some results before all of it is complete), it must be clearly indicated on the report (e.g., partial report, or how your lab identifies it). A complete report must be sent once all of the work has been completed.

25.2.27 Any non-Euronfins TestAmerica Burlington subcontracted analysis results are provided as a separate report on the official letterhead of the subcontractor. All Euronfins TestAmerica Burlington subcontracting is clearly identified on the report as to which laboratory performed a specific analysis.

25.2.28 A Certification Summary Report, where required, will document that, unless otherwise noted, all analytes tested and reported by the laboratory were covered by the noted certifications.

Note: Refer to the NDSC Document No. CA-I-P-002, Electronic Reporting and Signature Policy, for details on internally applying electronic signatures of approval.

25.2.29 Reports for Ohio VAP work require a VAP affidavit be completed and included with the report.

25.2.30 Where the laboratory is responsible for the sampling stage, in addition to the requirements listed above, reports containing the results of sampling shall include the following, where necessary for the interpretation of test results:

- the date of sampling;
- unambiguous identification of the material sampled;
- the location of sampling plan and procedures, and deviations, addition to or exclusions from the sample procedures;
- a reference to the sampling plan and procedure, and deviations, additions to or exclusions from the sample procedures;
- details of any environmental conditions during sampling that affect the interpretation of test results;
- information required to evaluate measurement uncertainty for subsequent testing

25.3 Reporting Level or Report Type

The laboratory offers four levels of quality control reporting. Each level, in addition to its own specific requirements, contains all the information provided in the preceding level. The packages provide the following information in addition to the information described above:

- Level 1 is a report with all of the elements outlined in Section 25.2 above, excluding 25.2.15 (QC data).
- Level II is a Level I report plus summary information, including results for the method blank reported to the laboratory MDL, percent recovery for laboratory control samples and matrix spike samples, and the RPD values for all MSD and sample duplicate analyses.
- Level III contains all the information supplied in Level II, but presented on the CLP-like summary forms, and relevant calibration information. A Level II report is not included, unless specifically requested. No raw data is provided.
- Level IV is the same as Level III with the addition of all raw supporting data.

In addition to the various levels of QC packaging, the laboratory also provides reports in EDD (see below). Initial reports may be provided to clients by facsimile. Procedures used to ensure client confidentiality are outlined in Section 25.6.

25.4 Electronic Data Deliverables (EDDs)

EDDs are routinely offered as part of Eurofins TestAmerica Burlington services in addition to the test report as described in Section 25.2. When NELAP accreditation is required and both a test report and EDD are provided to the client, the official version of the test report will be the combined information of the report and the EDD. Eurofins TestAmerica Burlington offers a variety of EDD formats including Environmental Restoration Information Management System (ERPIMS), Staged Electronic Data Deliverable (SEDD) Environmental Quality Information System (EQuIS), Electronic Deliverable Format (EDF), Excel and custom files.

EDD specifications are submitted to the IT department by the PM for review and undergo the contract review process. Once the facility has committed to providing data in a specific electronic format, the coding of the format may need to be performed. This coding is documented and validated. The validation of the code is retained by the IT staff coding the EDD.

EDDs shall be subject to a review to ensure their accuracy and completeness. If EDD generation is automated, review may be reduced to periodic screening if the laboratory can demonstrate that it can routinely generate that EDD without errors. Any revisions to the EDD format must be reviewed until it is demonstrated that it can routinely be generated without errors. If the EDD can be reproduced accurately and if all subsequent EDDs can be produced error-free, each EDD does not necessarily require a review.

25.5 Supplemental Information for Test

The lab identifies any unacceptable QC analyses or any other unusual circumstances or observations such as environmental conditions and any non-standard conditions that may have affected the quality of a result. This is typically in the form of a footnote or a qualifier and/or a narrative explaining the discrepancy in the front of the report.

Numeric results with values outside of the calibration range, either high or low are qualified as estimated.

Where quality system requirements are not met, a statement of compliance/non-compliance with requirements and/or specifications is required, including identification of test results derived from any sample that did not meet TNI sample acceptance requirements such as improper container, holding time, or temperature.

Where applicable, a statement on the estimated uncertainty of measurements; information on uncertainty is needed when a client's instructions so require.

When, as requested by the client and agreed to by Eurofins TestAmerica Burlington the report includes a statement of conformity to specification or standard (see Special Services, Section 7.4), the report shall clearly identify:

- to which results the statement applies,
- which specifications, standard or parts thereof are met or not, and
- the decision rule that was applied (unless the decision rule is inherent in the requested specification or standard, taking into account the level of risk (such as false accept and false reject and statistical assumptions) associated with the decision rule.

Opinions and Interpretations - The test report contains objective information, and generally does not contain subjective information such as opinions and interpretations. If such information is required by the client, the Laboratory Director will determine if a response can be prepared. If so, the Laboratory Director will designate the appropriate member of the management team to prepare a response. The response will be fully documented, and reviewed by the Laboratory Director, before release to the client. There may be additional fees charged to the client at this time, as this is a non-routine function of the laboratory.

Note: Review of data deliverable packages for submittal to regulatory authorities requires responses to non-conforming data concerning potential impact on data quality. This necessitates a limited scope of interpretation, and this work is performed by the QA Department. This is the only form of "interpretation" of data that is routinely performed by the laboratory.

When opinions or interpretations are included in the report, the laboratory provides an explanation as to the basis upon which the opinions and interpretations have been made. Opinions and interpretations are clearly noted as such and where applicable, a comment should be added suggesting that the client verify the opinion or interpretation with their regulator.

25.6 Environmental Testing Obtained From Subcontractors

If the laboratory is not able to provide the client the requested analysis, the samples would be subcontracted following the procedures outlined in the NDSC Document No. CW-L-S-004, Subcontracting,

Data reported from analyses performed by a subcontractor laboratory are clearly identified as such on the analytical report provided to the client. Results from a subcontract laboratory outside of Eurofins TestAmerica Burlington are reported to the client on the subcontract laboratory's original report stationary and the report includes any accompanying documentation.

25.7 Client Confidentiality

The laboratory will ensure the highest standards of quality and integrity of the data and services provided to our clients

The laboratory is responsible for maintaining in confidence all client information obtained or created. In situations involving the transmission of environmental test results by telephone, facsimile or other electronic means, client confidentiality must be maintained.

The laboratory will not intentionally divulge to any person (other than the client or any other person designated by the client in writing) any information regarding the services provided by the laboratory or any information disclosed to the laboratory by the client. Furthermore, information known to be potentially endangering to national security or an entity's proprietary rights will not be released.

Information about the client obtained from sources other than the client (e.g., complainant, regulators) shall be confidential between client and the laboratory. The source of this information shall be confidential to the laboratory and shall not be shared with the client, unless agreed by the source.

Note: This shall not apply to the extent that the information is required to be disclosed by the laboratory under the compulsion of legal process. The laboratory will, to the extent feasible, provide reasonable notice to the client before disclosing the information.

Note: Authorized representatives of an accrediting authority are permitted to make copies of any analyses or records relevant to the accreditation process, and copies may be removed from the laboratory for purposes of assessment.

25.7.1 Report deliverable formats are discussed with each new client. If a client requests that reports be e-mailed, the reports are to meet all requirements of this document.

25.8 Format of Reports

The format of reports is designed to accommodate each type of environmental test carried out and to minimize the possibility of misunderstanding or misuse.

25.9 Amendments to Test Reports

Corrections, additions, or deletions to reports are only made when justification arises through supplemental documentation. Justification is documented using the laboratory's corrective action system (refer to Section 12).

The revised report is retained on the Archive data server, as is the original report. The revised report is stored in the Archive data server under the sample number followed by "R". The

revised report will have the word “revised” or “amended” next to the date rather than the word “reported”.

When the report is re-issued, a notation of “report re-issue“ is placed on the cover/signature page of the report *or at the top of the narrative page* with a brief explanation of reason for the re-issue and a reference back to the last final report generated. *For Example*: *Report was revised on 3/8/20 to include toluene in sample NQA1504 per client’s request. This final report replaces the final report generated on 1/27/20 at 10:47am.*

25.10 Policies on Client Requests for Amendments

25.10.1 Policy on Data Omissions or Reporting Limit Increases

Fundamentally, our policy is simply to not omit previously reported results (including data qualifiers) or to not raise reporting limits and report sample results as ND. This policy has few exceptions. Exceptions are:

- Laboratory error.
- Sample identification is indeterminate (confusion between COC and sample labels).
- An incorrect analysis (not analyte) was requested (e.g., COC lists 8315 but client wanted 8310). A written request for the change is required.
- Incorrect limits reported based on regulatory requirements.
- The requested change has absolutely ***no possible*** impact on the interpretation of the analytical results and there is ***no possibility*** of the change being interpreted as misrepresentation by anyone inside or outside of our company.

25.10.2 Multiple Reports

The laboratory does not issue multiple reports for the same work order where there is different information on each report (this does not refer to copies of the same report) unless required to meet regulatory needs and approved by QA.

Appendix 1. List of Governing Documents applicable to the QA Manual

(NDSC, KDG and Laboratory SOPs and Policies)

NDSC Doc. No.	Title
CA-C-S-001	Work Sharing Process
CA-I-P-002	Electronic Reporting and Signature Policy
CA-L-P-002	Contract Compliance Policy
CA-Q-M-002	Quality Management Plan
CA-Q-QM-001	Guidance on Tentatively Identified Compounds (TICs) – GC/MS Analysis
CA-Q-S-001	Acid and Solvent-Lot Testing and Approval Program
CA-Q-S-002	Manual Integrations
CA-Q-S-006	Detection and Quantitation Limits
CA-Q-S-009	Root Cause Analysis
CA-T-P-001	Qualified Products List
CW-E-M-001	Environmental Health & Safety Manual
CW-F-P-002	Company-Wide Authorization Matrix
CW-F-P-004	Procurement and Contracts Policy
CW-F-S-007	Fixed Asset Acquisition, Retention and Safeguarding
CW-I-M-001	IT Change Control Procedure Manual
CW-L-P-001	Records Retention Policy
CW-L-P-004	Ethics Policy
CW-L-S-002	Internal Investigation

Appendix 2. List of Laboratory Certifications, Accreditations, Validations

The laboratory maintains accreditations, certifications, and approvals with numerous state and national entities. Programs vary but may include on-site audits, reciprocal agreements with another entity, performance testing evaluations, review of the QA Manual, Standard Operating Procedures, Method Detection Limits, training records, etc. At the time of this QA Manual revision, the laboratory has accreditation/ certification/licensing with the following organizations:

Laboratory	Program	Authority	Lab ID
Burlington	DoD ELAP	ANAB	L2336
Burlington	NELAP	Florida	E87467
Burlington	NELAP	Minnesota	050-999-436
Burlington	NELAP	New Hampshire	2006
Burlington	NELAP	New Jersey	VT972
Burlington	NELAP	New York	10391
Burlington	NELAP	Pennsylvania	68-00489
Burlington	NELAP	Virginia	460209
Burlington	State Program	Connecticut	PH-0751
Burlington	State Program	DE Haz. Subst. Cleanup Act (HSCA)	NA
Burlington	State Program	Rhode Island	LAO00298
Burlington	State Program	Vermont	VT-4000
Burlington	State Program	Wisconsin	399133350

The certificates and accredited parameter lists are available for each State/Program at www.testamericainc.com under Analytical Services Search – Certifications.

Appendix 3. References used to prepare the QA Manual

The QAM has been prepared to be consistent with the requirements of the following documents:

- *ANSI/ASQC, E4-1994, "Specifications and Guidelines for Quality Management Systems for Environmental Data Collection and Environmental Technology Programs" (American National Standard, January 5, 1995, or most recent version)*
- *"EPA Requirements for Quality Management Programs" (QA/R-2) (EPA/240/B-01/002, May 31, 2006).*
- *EPA 600/4-88/039, Methods for the Determination of Organic Compounds in Drinking Water, EPA, Revised July 1991.*
- *EPA 600/R-95/131, Methods for the Determination of Organic Compounds in Drinking Water, Supplement III, EPA, August 1995.*
- *EPA 600/4-79-019, Handbook for Analytical Quality Control in Water and Wastewater Laboratories, EPA, March 1979.*
- *Test Methods for Evaluating Solid Waste Physical/Chemical Methods (SW846), Third Edition, September 1986, Final Update I, July 1992, Final Update IIA, August 1993, Final Update II, September 1994; Final Update IIB, January 1995; Final Update III, December 1996; Final Update IV, January 2008; Final Update V, August 2015.*
- *U.S. Department of Defense (DoD)/Department of Energy (DOE) Consolidated Quality Systems Manual (QSM) for Environmental Laboratories, Version 5.1.1, dated 2017*
- *Federal Register, 40 CFR Parts 136, 141, 172, 173, 178, 179 and 261.*
- *Manual for the Certification of Laboratories Analyzing Drinking Water (EPA 815-R-05-004, January 2005) (DW labs only)*
- *Statement of Work for Inorganics & Organics Analysis, SOM and ISM, current versions, USEPA Contract Laboratory Program Multi-media, Multi-concentration.*
- *APHA, Standard Methods for the Examination of Water and Wastewater, 18th Edition, 19th, 20th, 21st, 22nd and on-line Editions.*
- *U.S. Department of Energy Order 414.1B, Quality Assurance, Approved April 29, 2004.*
- *U.S. Department of Energy Order 414.1C, Quality Assurance, June 17, 2005.*
- *U.S. Department of Energy Order 414.1D, Quality Assurance, April, 25, 2011.*
- *Nuclear Regulatory Commission (NRC) Quality Assurance Requirements.*
- *Marine Protection, Research, and Sanctuaries Act (MPRSA).*
- *Toxic Substances Control Act (TSCA).*

Appendix 5. Terms/Glossary and Acronyms (EL-V1M2 Sec. 3.1)

Terms/Glossary:

Acceptance Criteria: Specified limits placed on characteristics of an item, process, or service defined in requirement documents. (ASQC)

Accreditation: The process by which an agency or organization evaluates and recognizes a laboratory as meeting certain predetermined qualifications or standards, thereby accrediting the laboratory.

Accuracy: The degree of agreement between an observed value and an accepted reference value. Accuracy includes a combination of random error (precision) and systematic error (bias) components which are due to sampling and analytical operations; a data quality indicator. (QAMS)

Analyst: The designated individual who performs the "hands-on" analytical methods and associated techniques and who is the one responsible for applying required laboratory practices and other pertinent quality controls to meet the required level of quality.

Analytical Uncertainty: A subset of Measurement Uncertainty that includes all laboratory activities performed as part of the analysis. (TNI)

Anomaly: A condition or event, other than a deficiency, that may affect the quality of the data, whether in the laboratory's control or not.

Assessment: The evaluation process used to measure or establish the performance, effectiveness, and conformance of an organization and/or its systems to defined criteria (to the standards and requirements of laboratory accreditation). (TNI)

Audit: A systematic and independent examination of facilities, equipment, personnel, training, procedures, record-keeping, data validation, data management, and reporting aspects of a system to determine whether QA/QC and technical activities are being conducted as planned and whether these activities will effectively achieve quality objectives. (TNI)

Batch: Environmental samples that are prepared and/or analyzed together with the same process and personnel, using the same lot(s) of reagents. A **preparation batch** is composed of one (1) to twenty (20) environmental samples of the same quality systems matrix, meeting the above mentioned criteria and with a maximum time between the start of processing of the first and last sample in the batch to be twenty-four (24) hours. An **analytical batch** is composed of prepared environmental samples (extracts, digestates or concentrates) which are analyzed together as a group. An analytical batch can include prepared samples originating from various quality system matrices and can exceed twenty (20) samples. (TNI)

Bias: The systematic or persistent distortion of a measurement process, which causes errors in one direction (i.e., the expected sample measurement is different from the sample's true value). (TNI)

Blank: A sample that has not been exposed to the analyzed sample stream in order to monitor contamination during sampling, transport, storage or analysis. The blank is subjected to the usual analytical and measurement process to establish a zero baseline or background value and is sometimes used to adjust or correct routine analytical results. (ASQC)

Calibration: A set of operations that establish, under specified conditions, the relationship between values of quantities indicated by a measuring instrument or measuring system, or values represented by a material measure or a reference material, and the corresponding values realized by standards. (TNI)

1) In calibration of support equipment the values realized by standards are established through the use of reference standards that are traceable to the International System of Units (SI).

2) In calibration according to methods, the values realized by standards are typically established through the use of Reference Materials that are either purchased by the laboratory with a certificate of analysis or purity, or prepared by the laboratory using support equipment that has been calibrated or verified to meet specifications.

Calibration Curve: The mathematical relationship between the known values, such as concentrations, of a series of calibration standards and their instrument response. (TNI)

Calibration Standard: A substance or reference material used to calibrate an instrument (QAMS)

Certified Reference Material (CRM): A reference material accompanied by a certificate, having a value, measurement uncertainty, and stated metrological traceability chain to a national metrology institute. (TNI)

Chain of Custody (COC) Form: Record that documents the possession of the samples from the time of collection to receipt in the laboratory. This record generally includes: the number and types of containers; the mode of collection; the collector; time of collection; preservation; and requested analyses. (TNI)

Compromised Samples: Those samples which are improperly sampled, insufficiently documented (chain of custody and other sample records and/or labels), improperly preserved, collected in improper containers, or exceeding holding times when delivered to a laboratory. Under normal conditions, compromised samples are not analyzed. If emergency situation require analysis, the results must be appropriately qualified.

Confidential Business Information (CBI): Information that an organization designates as having the potential of providing a competitor with inappropriate insight into its management, operation or products. TNI and its representatives agree to safeguard identified CBI and to maintain all information identified as such in full confidentiality.

Confirmation: Verification of the identity of a component through the use of an approach with a different scientific principle from the original method. These may include, but are not limited to Second Column Confirmation; Alternate wavelength; Derivatization; Mass spectral interpretation; Alternative detectors or Additional Cleanup procedures. (TNI)

Conformance: An affirmative indication or judgment that a product or service has met the requirements of the relevant specifications, contract, or regulation; also the state of meeting the requirements. (ANSI/ASQC E4-1994)

Correction: Actions necessary to correct or repair analysis specific non-conformances. The acceptance criteria for method specific QC and protocols as well as the associated corrective actions. The analyst will most frequently be the one to identify the need for this action as a result of calibration checks and QC sample analysis**.** No significant action is taken to change behavior, process or procedure.

Corrective Action: The action taken to eliminate the causes of an existing nonconformity, defect or other undesirable situation in order to prevent recurrence. (ISO 8402)

Data Integrity: The condition that exists when data are sound, correct, and complete, and accurately reflect activities and requirements. (TNI)

Data Audit: A qualitative and quantitative evaluation of the documentation and procedures associated with environmental measurements to verify that the resulting data re of acceptable quality (i.e., that they meet specified acceptance criteria).

Data Reduction: The process of transforming the number of data items by arithmetic or statistical calculations, standard curves, and concentration factors, and collation into a more useable form. (TNI)

Deficiency: An unauthorized deviation from acceptable procedures or practices, or a defect in an item (ASQC), whether in the laboratory's control or not.

Demonstration of Capability: A procedure to establish the ability of the analyst to generate analytical results of acceptable accuracy and precision. (TNI)

Document Control: The act of ensuring that documents (and revisions thereto) are proposed, reviewed for accuracy, approved for release by authorized personnel, distributed properly, and controlled to ensure use of the correct version at the location where the prescribed activity if performed. (ASQC)

Duplicate Analyses: The analyses or measurements of the variable of interest performed identically on two subsamples of the same sample. The results from duplicate analyses are used to evaluate analytical or measurement precision but not the precision of sampling, preservation or storage internal to the laboratory. (EPA-QAD)

Equipment Blank: Sample of analyte-free media which has been used to rinse common sampling equipment to check effectiveness of decontamination procedures.

External Standard Calibration: Calibrations for methods that do not utilize internal standards to compensate for changes in instrument conditions.

Field Blank: Blank prepared in the field by filing a clean container with pure de-ionized water and appropriate preservative, if any, for the specific sampling activity being undertaken (EPA OSWER)

Field of Accreditation: Those matrix, technology/method, and analyte combinations for which the accreditation body offers accreditation.

Holding Times: The maximum time that samples may be held prior to analyses and still be considered valid or not compromised. (40 CFR Part 136)

Internal Standard: A known amount of standard added to a test portion of a sample as a reference for evaluating and controlling the precision and bias of the applied analytical test method. (TNI)

Internal Standard Calibration: Calibrations for methods that utilize internal standards to compensate for changes in instrument conditions.

Instrument Blank: A clean sample (e.g., distilled water) processed through the instrumental steps of the measurement process; used to determine instrument contamination. (EPA-QAD)

Instrument Detection Limit (IDL): The minimum amount of a substance that can be measured with a specified degree of confidence that the amount is greater than zero using a specific instrument. The IDL is associated with the instrumental portion of a specific method only, and sample preparation steps are not considered in its derivation. The IDL is a statistical estimation at a specified confidence interval of the concentration at which the relative uncertainty is ± 100%. The IDL represents a range where qualitative detection occurs on a specific instrument. Quantitative results are not produced in this range.

Laboratory Control Sample (however named, such as laboratory fortified blank, spiked blank, or QC check sample): A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes, taken through all preparation and analysis steps of the procedure unless otherwise noted in a reference method. It is generally used to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.

An LCS shall be prepared at a minimum of 1 per batch of 20 or less samples per matrix type per sample extraction or preparation method except for analytes for which spiking solutions are not available such as total suspended solids, total dissolved solids, total volatile solids, total solids, pH, color, odor, temperature, dissolved oxygen or turbidity. The results of these samples shall be used to determine batch acceptance.

Least Squares Regression (1st Order Curve): The least squares regression is a mathematical calculation of a straight line over two axes. The y axis represents the instrument response (or Response ratio) of a standard or sample and the x axis represents the concentration. The regression calculation will generate a correlation coefficient (r) that is a measure of the "goodness of fit" of the regression line to the data. A value of 1.00 indicates a perfect fit. In order to be used for quantitative purposes, r must be greater than or equal to 0.99 for organics and 0.995 for inorganics.

Limit(s) of Detection (LOD) [a.k.a., Method Detection Limit (MDL)]: The MDL is the minimum measured quantity of a substance that can be reported with 99% confidence that the concentration is distinguishable from method blank results, consistent with 40CFR Part 136 Appendix B, August, 2017.

Limit(s) of Quantitation (LOQ) [a.k.a., Reporting Limit]: The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence.

(QS) Matrix: The component or substrate that contains the analyte of interest. For purposes of batch and QC requirement determinations, the following matrix distinctions shall be used:

Aqueous: Any aqueous sample excluded from the definition of Drinking Water or Saline/Estuarine. Includes surface water, groundwater effluents, and TCLP or other extracts.

Drinking Water: Any aqueous sample that has been designated as a potable or potential potable water source.

Saline/Estuarine: Any aqueous sample from an ocean or estuary, or other salt water source such as the Great Salt Lake.

Non-Aqueous Liquid: Any organic liquid with <15% settleable solids.

Biological Tissue: Any sample of a biological origin such as fish tissue, shellfish, or plant material. Such samples shall be grouped according to origin.

Solids: Includes soils, sediments, sludges, and other matrices with >15% settleable solids.

Chemical Waste: A product or by-product of an industrial process that results in a matrix not previously defined.

Air & Emissions: Whole gas or vapor samples including those contained in flexible or rigid wall containers and the extracted concentrated analytes of interest from a gas or vapor that are collected with a sorbant tube, impinger solution, filter, or other device. (TNI)

Matrix Spike (spiked sample or fortified sample): A sample prepared, taken through all sample preparation and analytical steps of the procedure unless otherwise noted in a referenced method, by adding a known amount of target analyte to a specified amount of sample for which an independent test result of target analyte concentration is available. Matrix spikes are used, for example, to determine the effect of the matrix on a method's recovery efficiency.

Matrix Spike Duplicate (spiked sample or fortified sample duplicate): A replicate matrix spike prepared and analyzed to obtain a measure of the precision of the recovery for each analyte.

Method Blank: A sample of a matrix similar to the batch of associated samples (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences are present at concentrations that impact the analytical results for sample analyses.

Method Detection Limit: See Limit of Detection (LOD)

Negative Control: Measures taken to ensure that a test, its components, or the environment do not cause undesired effects, or produce incorrect test results.

Non-conformance: An indication, judgment, or state of not having met the requirements of the relevant specifications, contract, or regulation.

Observation: A record of phenomena that (1) may assist in evaluation of the sample data; (2) may be of importance to the project manager and/or the client, and yet not at the time of the observation have any known effect on quality.

Performance Audit: The routine comparison of independently obtained qualitative and quantitative measurement system data with routinely obtained data in order to evaluate the proficiency of an analyst or laboratory.

Positive Control: Measures taken to ensure that a test and/or its components are working properly and producing correct or expected results from positive test subjects.

Precision: The degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves; a data quality indicator. Precision is usually expressed as standard deviation, variance or range, in either absolute or relative terms. (TNI)

Preservation: Any conditions under which a sample must be kept in order to maintain chemical and/or biological integrity prior to analysis. (TNI)

Proficiency Testing: A means of evaluating a laboratory's performance under controlled conditions relative to a given set of criteria through analysis of unknown samples provided by an external source. (TNI)

Proficiency Testing Program: The aggregate of providing rigorously controlled and standardized environmental samples to a laboratory for analysis, reporting of results, statistical evaluation of the results and the collective demographics and results summary of all participating laboratories. (TNI)

Proficiency Test Sample (PT): A sample, the composition of which is unknown to the laboratory and is provided to test whether the laboratory can produce analytical results within specified acceptance criteria. (TNI)

Quality Assurance: An integrated system of management activities involving planning, implementation, assessment, reporting and quality improvement to ensure that a process, item or service is of the type of quality needed and expected by the client. (TNI)

Quality Assurance [Project] Plan (QAPP): A formal document describing the detailed quality control procedures by which the quality requirements defined for the data and decisions pertaining to a specific project are to be achieved. (EAP-QAD)

Quality Control: The overall system of technical activities that measures the attributes and performance of a process, item, or service against defined standards to verify that they meet the stated requirements established by the customer; operational techniques and activities that are used to fulfill requirements for quality; also the system of activities and checks used to ensure that measurement systems are maintained within prescribed limits, providing protection against "out of control" conditions and ensuring that the results are of acceptable quality. (TNI)

Quality Control Sample: A sample used to assess the performance of all or a portion of the measurement system. One of any number of samples, such as Certified Reference Materials, a quality system matrix fortified by spiking, or actual samples fortified by spiking, intended to demonstrate that a measurement system or activity is in control. (TNI)

Quality Manual: A document stating the management policies, objectives, principles, organizational structure and authority, responsibilities, accountability, and implementation of an agency, organization, or laboratory, to ensure the quality of its product and the utility of its product to its users. (TNI)

Quality System: A structured and documented management system describing the policies, objectives, principles, organizational authority, responsibilities, accountability, and implementation plan of an organization for ensuring quality in its work processes, products (items), and services. The quality system provides the framework for planning, implementing, and assessing work performed by the organization and for carrying out required QA and QC activities. (TNI)

Raw Data: The documentation generated during sampling and analysis. This documentation includes, but is not limited to, field notes, electronic data, magnetic tapes, untabulated sample results, QC sample results, print outs of chromatograms, instrument outputs, and handwritten records. (TNI)

Record Retention: The systematic collection, indexing and storing of documented information under secure conditions.

Reference Material: Material or substance one or more properties of which are sufficiently homogeneous and well established to be used for the calibration of an apparatus, the assessment of a measurement method, or for assigning values to materials. (TNI)

Reference Standard: Standard used for the calibration of working measurement standards in a given organization or a given location. (TNI)

Sampling: Activity related to obtaining a representative sample of the object of conformity assessment, according to a procedure.

Second Order Polynomial Curve (Quadratic): The 2^{nd} order curves are a mathematical calculation of a slightly curved line over two axis. The y axis represents the instrument response (or Response ratio) of a standard or sample and the x axis represents the concentration. The 2^{nd} order regression will generate a coefficient of determination (COD or r^2) that is a measure of the "goodness of fit" of the quadratic curvature the data. A value of 1.00 indicates a perfect fit. In order to be used for quantitative purposes, r^2 must be greater than or equal to 0.99.

Selectivity: The ability to analyze, distinguish, and determine a specific analyte or parameter from another component that may be a potential interferent or that may behave similarly to the target analyte or parameter within the measurement system. (TNI)

Sensitivity: The capability of a method or instrument to discriminate between measurement responses representing different levels (e.g., concentrations) of a variable of interest. (TNI)

Spike: A known mass of target analyte added to a blank, sample or sub-sample; used to determine recovery efficiency or for other quality control purposes.

Standard: The document describing the elements of laboratory accreditation that has been developed and established within the consensus principles of standard setting and meets the approval requirements of standard adoption organizations procedures and policies. (TNI)

Standard Operating Procedures (SOPs): A written document which details the method for an operation, analysis, or action, with thoroughly prescribed techniques and steps. SOPs are officially approved as the methods for performing certain routine or repetitive tasks. (TNI)

Storage Blank: A blank matrix stored with field samples of a similar matrix (volatiles only) that measures storage contribution to any source of contamination.

Surrogate: A substance with properties that mimic the analyte of interest. It is unlikely to be found in environment samples and is added to them for quality control purposes.

Surrogate compounds must be added to all samples, standards, and blanks, for all organic chromatography methods except when the matrix precludes its use or when a surrogate is not available. Poor surrogate recovery may indicate a problem with sample composition and shall be reported to the client whose sample produced poor recovery. (QAMS)

Systems Audit (also Technical Systems Audit): A thorough, systematic, qualitative on-site assessment of the facilities, equipment, personnel, training, procedures, record keeping, data validation, data management, and reporting aspects of a total measurement system. (EPA-QAD)

Technical Manager: A member of the staff of an environmental laboratory who exercises actual day-to-day supervision of laboratory operations for the appropriate fields of accreditation and reporting of results

Technology: A specific arrangement of analytical instruments, detection systems, and/or preparation techniques.

Traceability: The ability to trace the history, application, or location of an entity by means of recorded identifications. In a calibration sense, traceability relates measuring equipment to national or international standards, primary standards, basic physical constants or properties, or reference materials. In a data collection sense, it relates calculations and data generated throughout the project back to the requirements for the quality of the project. (TNI)

Trip Blank: A blank matrix placed in a sealed container at the laboratory that is shipped, held unopened in the field, and returned to the laboratory in the shipping container with the field samples.

Uncertainty: A parameter associated with the result of a measurement that characterizes the dispersion of the value that could reasonably be attributed to the measured value.

Acronyms:

CAR – Corrective Action Report

CCV – Continuing Calibration Verification

CF – Calibration Factor

CFR – Code of Federal Regulations

COC – Chain of Custody

DOC – Demonstration of Capability

1.0 Scope and Application

This SOP describes the laboratory procedure for the determination of total organic carbon (TOC) in soil and solid materials.

1.1 Analytes, Matrix(s), and Reporting Limits

This procedure may be used to determine total organic carbon in soil and solid materials. This procedure may not be amenable to oily matrices.

The routine reporting limit is 1000 mg/kg based on an initial sample weight of 10 mg.

On occasion clients may request modifications to this SOP. These modifications are handled following the procedures outlined in the Quality Assurance Manual.

2.0 Summary of Method

10 mg of dried sample is transferred to a tin capsule, treated with phosphoric acid and dried in an oven at a temperature 105°C for 30-60 minutes to separate the organic carbon from inorganic carbonates and bicarbonates. The sample is analyzed on an instrument where it is pyrolyzed in an inductive type furnace. The carbon is converted to carbon dioxide and measured by a differential thermal conductivity detector.

This procedure is based on the following reference documents:

- EPA Region II Document Determination of Total Organic Carbon in Sediment, July 27, 1988, authored by Lloyd Kahn, Quality Assurance Specialist.

If the laboratory's SOP has been modified from the above referenced document, a list of modifications is provided in Section 15.0 of this SOP.

3.0 Definitions

Refer to the Laboratory's Quality Assurance Manual (QAM) for the Glossary of Terms, Definitions and Acronyms except as follows:

A list of general laboratory terms and definitions are provided in Appendix A.

4.0 Interferences

Volatile organics in the sediments may be lost in the de-carbonation step resulting in a low bias.

5.0 Safety

Employees must abide by the policies and procedures in the Corporate Environmental Health and Safety Manual (CW-E-M-001) and this document. This procedure may involve hazardous material, operations and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the method to follow appropriate safety, waste disposal and health practices under the assumption that all samples and reagents are potentially hazardous. Safety glasses, gloves, lab coats and closed-toe,

nonabsorbent shoes are a minimum.

5.1 Specific Safety Concerns or Requirements

None

5.2 Primary Materials Used

Table 1 lists those materials used in this procedure that have a serious or significant hazard rating along with the exposure limits and primary hazards associated with that material as identified in the SDS. **Note: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the SDS for each of the materials listed in the table.** A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the SDS for each material before using it for the first time or when there are major changes to the SDS.

6.0 Equipment and Supplies

- Drying Oven: Capable of maintaining a temperature of 105 ±2°C.
- Carlo Erba Elemental Analyzer Model EA1108 and Model NA 1500 or equivalent.
- Costech Elemental Analyzer: Model 4010 or equivalent.
- Analytical Balance: Capable of weighing to the nearest 0.0001g.
- Aluminum Weigh Boats.
- Tweezers
- 5mm X 9mm tin capsules
- Quartz Columns: Costech Analytical or equivalent.
- Quartz wool: for segregating and containing column materials
- Copper Wire, Reduced: Costech Analytical or equivalent.
- Tungsten on Alumina: Costech Analytical or equivalent.
- High Temperature Gloves
- Clear Plastic Sample Trays: Costech Analytical or equivalent.
- 100ul Hamilton syringe or similar

7.0 Reagents and Standards

7.1 Reagents

- Reagent water
- Phosphoric Acid, Concentrated: Reagent Grade, J.T. Baker recommended.

Phosphoric Acid Solution (1:19): Add approximately 100 mL of reagent water to a 200 mL volumetric flask. Add 18.34 g of concentrated phosphoric acid to the volumetric flask then adjust

to volume with reagent water. Mix the solution well then transfer the solution to a 250 mL polyethylene bottle. Assign an expiration date of six months from date made and store the solution at room temperature.

7.2 Standards

- Potassium Hydrogen Phthalate (KHP) (Primary Standard Grade) Used to calibrate the instrument. 47.05% Carbon by weight

- Laboratory Control Samples (LCS) Material, Organic Material of known Carbon percentage: Purchased from LECO Corporation.

1% Carbon KHP Solution (10,000 mg Carbon/L): Add 50 mL of reagent water to a 100 mL volumetric flask. Add 2.128 g of KHP and dissolve completely. Adjust to final volume with reagent water. To mix the solution, cap the flask and invert. Allow the air bubble to reach the top of the flask. Repeat 9 times. Assign an expiration of 6 months from the date prepared and store at room temperature.

0.1% Carbon KHP Solution (1000mg Carbon/L): Add approximately 25 mL of reagent water to a 50 mL volumetric flask. Add 5 mL of 1 % Carbon KHP solution to the flask and adjust to final volume with reagent water. To mix the solution, cap the flask and invert. Allow the air bubble to reach the top of the flask. Repeat 9 times. Assign an expiration date of 6 months from the date prepared so long as the parent solution does not expire sooner, in which case use the earliest expiration date. Store the solution at room temperature.

0.01% Carbon KHP Solution (100mg Carbon/L): Add approximately 25 mL of reagent water to a 50 mL volumetric flask. Add 0.5 mL of 1% Carbon KHP Solution and adjust to final volume with reagent water. To mix the solution, cap the flask and invert. Allow the air bubble to reach the top of the flask. Repeat 9 times. Assign an expiration date of 6 months from the date prepared so long as the parent solution does not expire sooner, in which case use the earliest expiration date. Store the solution at room temperature.

Note: Alternatively a 10,000mg/L TOC standard may be purchased from a reputable vendor (Spex Certiprep, SCP Science or ERA) and diluted appropriately to prepare the intermediate solutions above.

8.0 Sample Collection, Preservation, Shipment and Storage

The laboratory does not perform sample collection so sampling procedures are not included in this SOP. Sampling requirements may be found in the published reference method. Sample container, preservation techniques and holding times may vary and are dependent on sample matrix, method of choice, regulatory compliance, and/or specific contract or client requests. Listed below are the holding times and the references that include preservation requirements.

Matrix	Sample Container	Minimum Sample Size	Preservation	Holding Time	Reference
Solids	Amber glass	10 g	Chilled to ≤ 4°C	14 Days	Lloyd Kahn Method

Holding time is calculated from date of sample collection. Unless otherwise specified by client or regulatory program, after analysis, samples and extracts are retained for a minimum of 30 days after provision of the project report and then disposed of in accordance with applicable regulations.

9.0 Quality Control

9.1 Sample QC

The following QC samples are analyzed with each batch:

QC Item	Frequency	Acceptance Criteria
Method Blank (MB)	1 in 20 or fewer samples	< RL
Laboratory Control Sample (LCS)	1 in 20 or fewer samples**	%R (75-125) **Quad RSD 18%
Sample Quadruplicate	1 in 20 or fewer samples (Only when site specific P&A has been requested)	SD (≤ 3x SD of site specific P&A study)
Matrix Spike	Client request	%R (75-125)
Duplicate/Matrix Spike Duplicate	Client request	RPD 20%

**If a site specific P&A study not requested analyze the LCS in quadruplicate as a measure of method precision.

9.2 Instrument QC

The laboratory analyzes the following instrument check standards:

QC Item	Frequency	Acceptance Criteria
Initial Calibration (ICAL)	Initial Method Set-Up, after combustion chamber is changed (approx. every 200 drops)	Correlation coefficient must be >0.995
Initial Calibration Verification (ICV)	Following Calibration	%R (75-125)
Calibration Verification (CCV)	Every 20 drops and at the end of the analytical sequence	%R (75-125)
Calibration Blank (CCB)	After every CCV	<RL

10.0 Procedure

10.1 Calibration

Analyze a calibration curve each time the combustion column is changed. Change the column after 200 drops or when you experience QC recovery issues, odd peak shapes or baseline issues. The column change procedure is provided in Appendix B.

The recommended formulations for each calibration level are provided in the following table:

Calibration Standards	1.0% C KHP uL	0.1% C KHP uL	0.01%C KHP uL	% Carbon KHP	Carbon (mg)	mg/Kg of Carbon (10mg sample)
Level 1	0	0	0	47.05	0	0
Level 2	0	0	100	47.05	0.010	1000
Level 3	0	40	0	47.05	0.040	4000
Level 4	25	0	0	47.05	0.25	25000
Level 5	50	0	0	47.05	0.500	50000
Level 6	75	0	0	47.05	1.000	75000

Using a volumetric Hamilton or similar syringe, measure the specified volume of standard into a tin capsule. Dry the calibration levels completely by placing in the oven at 105°C for 60 minutes. Fold the capsules. A blank (empty) tin must be dropped for the calibration blank. Proceed to Section 10.5 for analysis instructions.

The instrument software system plots peak area against mg of Carbon and calculates a correlation coefficient using standard linear regression. The correlation coefficient (r) must be $\geq$ 0.995 for the calibration to be considered acceptable. If it is not, repeat the calibration prior to analysis.

10.2 Troubleshooting

- Calibration passes at > 0.995 correlation, but LCS fails abnormally low: Re-calibrate.
- Large peak before Carbon peak; Indicates leak in system, perform leak test, isolate and repair leak.
- Carbon peak “maxes out” at instrument 1200mv (peak has flat top): Reanalyze sample at lower weight.
- No peaks on any chromatograms, no results: Gases to instrument may be off. Turn on all gasses at valve manifold.
- Autosampler will not work at all: Gasses to instrument may be off. Turn on all gasses at valve manifold.
- Carry over; Clean autosampler slide, if persists reduce sample mass. Note sample carryover in NCM. Oily samples may not be amenable to this test.
- Single chromatogram shows results at bottom of page, but no peak or baseline in chromatogram window: Re-print single chromatogram.
- Some or all chromatograms show carbon peak at same retention time as CCV, but peak is not identified as carbon, or is identified as another element: Retention time shifted. Adjust retention time in calibration window, and reprint chromatograms.
- Peaks shift later through the run, or reduced recovery of samples with known concentration. Check oxygen tank for sufficient pressure, and replace if necessary.
- Upon recalibration, peaks are not being identified as carbon: In calibration window, general tab, adjust retention time to match peaks. Starting at level 1, “Open Standard”, open level1

curve pt. in calibration directory, click “Add Peak” button, click on peak itself. Increase level #, opening standard for each curve pt and add each peak. Carbon Tab should have all five calibration points on curve, if done correctly.

- Peaks in chromatograms identified as carbon, but all results in summary table below chromatogram are zero: Current calibration not associated with run when started. Open current calibration, copy first two columns for all points (5 rows) in small table in general tab. Then, open calibration that was associated with run (should be empty) and paste into table in calibration tab. Reprint all chromatograms on run.
- Software crashes during analysis: Boot up software normally. Chromatograms already printed/analyzed are ok, but, sample that was analyzing during shutdown is lost. Restart table at next sample by un-checking “run” box for samples already run and sample that was lost.
- Autosampler error causes few samples to remain in autosampler tray after run has finished: Identify samples that got stuck. Create a new run and analyze stuck samples (with initial weights) with bracketing QC. No MB/LCS needed.
- Autosampler error causes many sequential samples to remain in autosampler tray after run has finished (usually end of run): Add rows onto existing table. Identify samples that did not get analyzed and repeat Ids and weights into added rows. Restart table. All analyzed samples’ status should be blue (analyzed), added rows should be green (not analyzed yet).

10.3 Sample Preparation

Homogenize the sample using the procedure described in SOP BR-QA-020. Refer to Appendix D for Marine Sediment Processing, and Appendix E for Black Carbon Processing

Dry approximately 5-10 g of sample in at 105 ^{o}C for 12-24 hrs. (The sample from the moisture fraction may be used for this step.) Disaggregate the sample to break up clumps to ensure exposure to acidification in next step. Do not grind the sample.
Due to the sample size required by the instrumentation, if the sample matrix contains particles that are too large for analysis, the sample will be sieved using a 200 micron (#35) sieve.

For each field sample prepare a tin for analysis. Using tweezers, and working directly from the box, place a tin capsule on the analytical balance and tare the balance. Using the small sample scoop, add approximately 10 mg (or the project specified sample weight) of sample to a tin capsule. Record the actual sample weight used on sample preparation log. Remove the capsule from the balance and place into one of the aluminum holding trays.

To prepare the method blank, set an empty tin capsule into an aluminum holding tray (this tin must be acidified with the remainder of the samples).

To prepare the LCS, weigh 9 to 11 mg of the LECO LCS material into two tin capsules and set them in sequence in an aluminum holding tray. Prepare the LCS in quadruplicate if site specific P&A study has not been requested in the project.

For the matrix spike, weigh out an additional sample aliquot and record its weight. Add 35 uL of 1% KHP calibration stock.

For the sample duplicate, weigh out an additional sample aliquot.

Add one to two drops of 1:19 phosphoric acid to each tin capsule (enough to sufficiently cover the sample until reaction ceases). Place the aluminum trays into a drying oven set to a temperature of 105 ±2 ºC for 30-60 minutes or until all samples appear dry.

Using tweezers pinch the top of each tin capsule closed and compress the capsule around the material inside. Work carefully so as not to tear the capsule, but crush it down to the smallest size. Set the prepared samples in line in a clear plastic sample tray for storage, or place directly into an autosampler tray for analysis. For the latter, leave positions open for the CCV check standards and associated calibration blanks.

Prepare the ICV, CCV standards and blanks as follows:

Prepare an ICV for each sequence. To prepare the ICV, weigh 9 to11 mg of the LECO LCS material into a tin capsule.

For each CCV, transfer 35uL of 1% KHP solution into a tin capsule. Dry the capsules in a drying oven set to a temperature of 105 ±2 ºC for 30-60 minutes or until all samples appear dry. Fold the capsule up and compress down to the smallest size possible. Prepare enough CCVs to ensure a frequency of every 20 drops and the end of the analytical sequence. For each associated calibration blank, leave an empty position in the auto-sampler tray (a tin must be analyzed for calibration blanks).

10.4 Preparation of the ICV, CCV and Blanks

For each ICV weigh ~9-11 mg of the LECO LCS material into a tin capsule.

For each CCV, transfer 35uL of 1% KHP to a tin capsule. Dry the capsules in a drying oven at 105 ^{o}C for 30-60 minutes or until dry. Fold the capsule and compress down to the smallest size possible. Prepare enough CCVs to ensure a CCV frequency of every 20 drops and at the beginning and end of the analytical sequence. Use a folded empty tin for each calibration blank(not acidified).

10.5 Software Set-up and Analysis of a Curve

If a there is not a valid curve or the valid curve is not listed in the software, create a calibration curve in the analytical software. Enter the standard type, level, and mg of KHP used for each calibration level. Enter each sample ID and their respective weights into the instrument software, enter a weight of 10 mg for the method blank and calibration blanks and save the sample table. Enter the weight for the LCS. Add the tin capsules to the autosampler tray in sequence and set the tray into the autosampler carriage.

An example analytical sequence that includes ICAL is as follows:

Initial Calibration (calibration blank and 5 calibration standards)
ICV
ICB(blank tin)
CCV
CCB(blank tin)
MB(acidified tin)
LCS (Routine=4 reps; Dixon=2reps)

Samples (Routine=1 rep; Dixon=2reps)
CCV
CCB(blank tin)
Samples (Routine=1 rep; Dixon=2reps)
CCV
CCB(blank tin)

Click the “start” icon to begin the analysis.

11.0 Corrective Action

When an out-of-control situation occurs that is not delineated in this corrective action table or the corrective actions listed do not adequately address the circumstances, a Corrective Action Report (CAR) (NCM), etc., must be developed (see SOP BR-QA-016) and the analyst must use his/her best analytical judgment and available resources to determine the corrective action to be taken. The out-of-control situation may be caused by more than one variable. The analyst should seek the assistance of his/her immediate supervisor, QA manager or other experienced staff if they are uncertain of the cause of the out-of-control situation. The analysis must not be resumed until the source of the problem and an in-control status is re-established. All samples associated with the out-of-control situation must be reanalyzed after in-control status has been re-established or if authorization is received from the supervisor or QA Manager for release with data qualification.

12.0 Calculations / Data Reduction

12.1 Calculations

The instrument software calculates TOC using the area response from the calibration curve and sample mass used. The determination of TOC is performed by the laboratory’s LIMS system. See Appendix C for equations for percent recovery and relative percent difference.

12.2 Data Review

12.2.1 Primary Data Review

Enter the results of the quadruplicate analysis into the EXCEL spreadsheet designated for this purpose. Compare the standard deviation derived from the quadruplicate sample or LCS against the standard deviation from the appropriate P&A study. If the SD of the sample quadruplicate is greater than 3 times the SD of the study, initiate a nonconformance memo and notify the PM to determine if further action is necessary.

Upload the instrument data to the laboratory information system (LIMS) “TALS”. Evaluate the sequence against the acceptance criteria given in Table 2. Perform the recommended corrective action as necessary. If corrective action is not taken or is not successful, initiate a nonconformance memo (NCM) to document the situation. Set the Batch to 1st level reviewed. For Dixon analysis, an additional 2 reps must be performed if the original reps yielded a RSD greater than 40. Then the four different replicates must be entered into the Dixon Outlier Template (FWC200A for 4 reps or FWC200B for 3 reps) from the lowest to the highest result.

Assemble supporting documents including the quad sample calculation spreadsheet and forward to secondary review staff.

12.2.2 Secondary Data Review

Spot-check the analytical results. Verify that acceptance criteria were met and if the results do not fall within the established limits verify the recommended corrective actions were performed. If corrective action was not taken or is unsuccessful, ensure the situation is documented with a nonconformance memo (NCM) and ensure data is qualified accordingly.

Set the batch to second level review. Scan and attach copies of supporting documentation such as; run logs, raw data and quad sample spreadsheet to the batch. Set the job to lab complete, review the form set, correct any problems then forward supporting documentation to report management.

12.2.3 Data Reporting

The report format, application of data qualifiers and creation of the data deliverable is performed by the LIMS using the formatter set by the project manager during log-in.

Retain, manage and archive electronic and hardcopy data as specified in laboratory SOP BR-QA-014 Laboratory Records.

13.0 Method Performance

13.1 Method Detection Limit Study (MDL)

The method detection limit (MDL) is the lowest concentration that can be detected for a given analytical method and sample matrix with 99% confidence that the analyte is present. MDLs reflect a calculated (statistical) value determined under ideal laboratory conditions in a clean matrix, and may not be achievable in all environmental matrices. An initial method detection limit study is performed in accordance with SOP No. BR-QA-005. The laboratory maintains MDL studies for analyses performed; these are verified at least annually unless method or program requirements require a greater frequency.

13.2 Demonstration of Capabilities

All personnel are required to perform an initial demonstration of proficiency (IDOC) on the instrument they will be using for analysis prior to testing samples. On-going proficiency must be demonstrated annually. IDOCs and on-going proficiency demonstrations are conducted as follows.

13.2.1 Four aliquots of the QC check sample are analyzed using the same procedures used to analyze samples, including sample preparation. The concentration of the QC check sample may be equivalent to a mid- level calibration.

13.2.2 Calculate the average recovery and standard deviation of the recovery for each analyte of interest.

13.2.3 If any analyte does not meet the acceptance criteria, the test must be repeated. Only those analytes that did not meet criteria in the first test need to be evaluated. TNI 2016 requires consecutive passing results. Repeated failure for any analyte indicates the need for the laboratory to evaluate the analytical procedure and take corrective action.

13.2.4 Until the IDOC is approved by the QA Manager (or designee); the trainer and trainee must be identified in the batch record.

13.3 Training Requirements

The Group Leader is responsible for ensuring that this procedure is performed by an associate who has been properly trained in its use and has the required experience. A new analyst must be working under documented supervision prior to approval of the IDOC. Documentation that a new analyst is performing under supervision must be entered into the batch record (View Batch Information) until that analyst's IDOC has been approved by the QA Manager (or designee). See requirements for demonstration of analyst proficiency in SOP No. BR-QA-011.

14.0 Pollution Control

It is TestAmerica's policy to evaluate each method and look for opportunities to minimize waste generated (i.e., examine recycling options, ordering chemicals based on quantity needed, preparation of reagents based on anticipated usage and reagent stability). Employees must abide by the policies in Section 13 of the Corporate Safety Manual for "Waste Management and Pollution Prevention."

15.0 Waste Management

Waste management practices are conducted consistent with all applicable rules and regulations. Excess reagents, samples and method process wastes are disposed of in an accepted manner. Waste description rules and land disposal restrictions are followed. Waste disposal procedures are incorporated by reference to BR-EH-001 *Hazardous Waste*.

The following waste streams are produced when this method is carried out.

- Caustic waste – 2.5 L glass satellite container.
- Acidic Waste - 2.5L glass satellite container

The satellite containers are labeled "Hazardous Waste" along with the type of waste category generated. Authorized personnel routinely transfer the contents of the satellite containers to the hazardous waste storage room for future disposal in accordance with Federal, State and Local regulations.

17.0 Method Modifications

The laboratory procedure is modified from the reference method as follows:

Modification Number	Method Reference	Modification
1	TOC by Lloyd Kahn	The Laboratory uses 1:19 (w/w) phosphoric acid to decarbonize the sample (to reduce sample loss from effervescence) and dries the sample in an oven at 105^{o}C.
2	TOC by Lloyd Kahn	Due to the small sample size the laboratory dries and disaggregates the sample prior to analysis. This step improves precision associated with high moisture or clay type matrices.
3	TOC by Lloyd Kahn	P&A studies are not performed per the reference method due to variability in project sites. See section 12.2 for the P&A procedure that the laboratory uses.

19.0 Revision History

BR-WC-008, Revision 17.0

- Updated Title Page
- Updated Headers and Footers Throughout
- Section 10.2: Updated troubleshooting section to add peaks shift later through the run, or reduced recovery of samples with known concentration. Check oxygen tank for sufficient pressure, and replace if necessary.

Previous revisions are retained by the QA Department.

Table 1: Primary Materials Used

Material (1)	Hazards	Exposure Limit (2)	Signs and symptoms of exposure
Phosphoric Acid	Corrosive	1 Mg/M3 TWA	Inhalation is not an expected hazard unless misted or heated to high temperatures. May cause redness, pain, and severe skin burns. May cause redness, pain, blurred vision, eye burns, and permanent eye damage.
1 – Always add acid to water to prevent violent reactions.			
2 – Exposure limit refers to the OSHA regulatory exposure limit.			

Table 2: QC Summary, Frequency, Acceptance Criteria and Recommended Corrective Action (TOC Lloyd Kahn)

QC Item	Frequency	Acceptance Criteria	Recommended Corrective Action[1]
ICAL	Following each column change and when CCV failure indicates calibration may no longer be valid.	correlation coefficient $\geq$ 0.995	Standards check, re-calibration
CCV	Every 20 drops and at the end of the analytical run	%R (75-125)	Re-prepare and reanalyze samples not bracketed by passing standard. If CCV fails high, and TOC is not detected in any of the bracketed samples, the samples without TOC may be reported without reanalysis.
CCB	Following each CCV	< RL	Re-prepare and reanalyze batch.
Method Blank (MB)	Once per batch of 20 samples	< RL	Re-prepare and reanalyze batch.
LCS	Once per batch of 20 samples. Prepared in quadruplicate unless site P&A study is performed, then analyze as single injection.	%R (75-125)	Re-prepare and reanalyze batch.
Sample Quadruplicate	When site specific P&A study is specified. If no quad specified for any jobs included in the batch analyze the LCS in quadruplicate.	SD ≤ 3X annual P&A SD	If sample quad, notify PM. If LCS quad, reanalyze the entire batch.

[1]*The recommended corrective action may include some or all of the items listed in this column. The corrective action taken may be dependent on project data quality objectives and/or analyst judgment but must be sufficient to ensure that results will be valid. If corrective action is not taken or is not successful, data must be flagged with appropriate qualifiers.*

Appendix A: Terms and Definitions

Batch: environmental samples, which are prepared and/or analyzed together with the same process, using the same lot(s) of reagents. A preparation/digestion batch is composed of one to 20 environmental samples of similar matrix, meeting the above criteria.

Calibration: the establishment of an analytical curve based on the absorbance, emission intensity or other measured characteristic of known standard.

Calibration Standards: a series of known standard solutions used to calibrate the instrument response with respect to analyte concentration.

Demonstration of Capability (DOC): procedure to establish the ability to generate acceptable accuracy and precision.

Holding Time: the maximum time that a sample may be held before preparation and/or analysis as promulgated by regulation or as specified in a test method.

Laboratory Control Sample (LCS): a blank matrix spiked with a known amount of analyte(s) processed simultaneously with and under the same conditions as samples through all steps of the procedure.

Method Blank (MB): a blank matrix processed simultaneously with and under the same conditions as samples through all steps of the procedure. Also known as the preparation blank (PB).

Non-conformance: an indication, judgment, or state of not having met the requirements of the relevant specification, contract or regulation.

Preservation: refrigeration and/or reagents added at the time of sample collection to maintain the chemical, physical, and/or biological integrity of the sample.

Reporting Limit (RL): the level to which data is reported for a specific test method and/or sample.

Appendix B: Column Change Procedure:

Turn off the helium and oxygen supplies to the instrument.

Dial the left furnace temperature to a reading of 052 (this equates to 520˚C). Wait until the temperature drops below 600˚C to remove the column.

Remove the panel covering the furnace and unscrew the autosampler connection from the top of the column.

Unscrew the fitting at the bottom of the column and remove.

Lift the column up and out of the furnace using high temperature gloves.

CAUTION: The column will still be 500-600˚C. Do not touch the center portion of the column. Place the spent column in the metal can designated for this purpose.

Lay a new quartz column on the bench top, measure and mark off for the following:

- One inch up from the bottom and add a ½ inch plug of quartz wool. Note: pack the quartz wool tightly enough for it to stay in place.
- Pour in 2 ½ inches of copper wire
- Pack another ½ inch quartz wool plug on top of the copper
- Pour in 3 inches of tungsten
- Pack a final ½ inch quartz wool plug on top of the tungsten

Place the new column into the furnace and reconnect the top and bottom fittings. Snug these up, but don't over tighten.
Replace the panel covering the furnace, dial the furnace temperature back to 102 (this equates to

1020˚C), and turn the helium and oxygen supplies back on.

When the instrument comes up to operating temperature, it is ready to calibrate.

Appendix C: Equations

Percent Recovery (%R) LCS and CCVs

$$\%R = \frac{SR}{SA} \times 100\%$$

Where:
SR= Sample Result
SA=Concentration of Spike Added

Relative Percent Difference (%RPD)

$$\%RPD = \frac{|D_1 - D_2|}{\frac{D_1 + D_2}{2}} \times 100$$

Where:
D1 = Sample result
D2 = Duplicate Result

Appendix D: Marine Sediments High in Inorganic Carbon

Sample Preparation

Transfer approximately 10 g of a thoroughly mixed sample to an aluminum weigh dish, and dry in the 105°C oven. Grind the sample with the pink mortar and pestle to a fine powder. Record the weight of a 250 mL Teflon beaker then transfer ~ 5 g of the ground sample to this beaker.

If the sample is to be spiked, weigh the beaker to the nearest 0.1mg and record the weight. Likewise determine and record the weight of the added sample. Add 0.1g of NIST 1632b Trace Elements in Coal (80.11% Carbon) to the sample. Record the weight added. Evenly distribute the spike over the sample and use a glass stir rod to mix the spike with the sample. Do not use that stir rod with any other sample.

Use Talc-free latex gloves from this point on to minimize the risk of acid burns. Add several drops of 1:1 HCL to each sample and stir each sample with its own glass stir rod. Carefully rinse the stir rod and beaker walls with DI water using a fine-tipped squirt bottle. Use only what is needed to bring the entire sample to the bottom of the beaker. ***When adding water to acid use necessary precautions to avoid splashing!*** Samples with high concentrations of inorganic carbon may effervesce to the point of overflowing the beaker, so take care to add the acid in small aliquots and stir vigorously. If the sample "boils over" it must be re-prepared. Continue to add 1:1 HCL in small aliquots until there is no further reaction, taking sample to dryness after each addition of acid in a 105-degree oven.

Dry the treated samples in the oven after each acid/water addition. Do not add more than a total of 200 mL of 1:1 HCL to any sample.

***NOTE**: Samples are hygroscopic and will absorb water if they are exposed to air for too long.*

Weigh beaker with residue and record the residue weight measurement. After the sample is thoroughly dry, scrape the sample residue from the beaker and grind to a powder using the pink mortar and pestle. Transfer the ground sample to a clean, dry 40-mL vial reserved for this analysis.

***NOTE:** Depending on the nature of the sample, it may be difficult to completely remove the dried residue from the beaker or to grind it to a homogenous powder. Where difficulties are encountered, make a note on the preparation worksheet.*

Analysis

Perform TOC analysis on processed sample material as outlined in section 10.0 of this SOP.

Appendix E: Determination of Black Carbon in Sediment Procedure

1. Obtain a representative subsample of the sediment. Weight 10 grams of sample into a clean pre-tared aluminum drying pan or equivalent.

2. Dry the sample at 105^{o}C for at least 12 hours.

3. Grind the sample using a mortar and pestle.

4. Sieve the sample using a number 35 sieve (500 um).

5. Treat the sample with phosphoric acid. Add acid drop wise until effervescence is no longer observed.

6. Dry the sample at 105^{o}C for 1 hour.

7. Set aside an aliquot of the sample at this stage for direct TOC analysis, reported without correction for the IN623 percent solids. Continue with the sample for Black Carbon.

8. Place the dried sample into a clean crucible and cover the sample.

9. Bake the samples at 375^{o}C in a muffle for 24 hours or until the LCS is +/- 50% of the true value.

10. Allow the samples to cool and transfer approximately 10.0 mg into each of two tin capsules.

11. Transfer the sample (in the tin capsules) to the TOC analyzer for analysis by the Lloyd Kahn Method.

12. The sample is pyrolyzed in an inductive type furnace, where the carbon is converted to carbon dioxide, which is measured using a differential thermal conductivity detector.

13. The results will be reported as mg/Kg Black Carbon.

Note: Black carbon LCS material: NIST Standard Reference Material 1944 New York-New Jersey Waterways Sediment.

3.0 INTRODUCTION, SCOPE AND APPLICABILITY

3.1 Introduction and Compliance References

Eurofins Knoxville's Quality Assurance (QA) Manual is a document prepared to define the overall policies, organization objectives and functional responsibilities for achieving the laboratory's QA Program. Governing SOPs are in place within the organization to ensure the proper execution of this QA Manual (refer to Appendix 1). This manual and referenced documents are required reading for all personnel.

The laboratory is a team of people who work together to serve the health and environmental needs of society through science and technology. We offer comprehensive expertise in environmental laboratory applications *OR* maintain a local perspective in its scope of services and client relations and maintain a national perspective in terms of quality.

As such, this QA Manual has been prepared to assure compliance with The NELAC Institute (TNI) Standard, dated 2009 and 2016; ISO/IEC Guide 17025:2005 and 2017; the Department of Defense (DoD)/Department of Energy (DOE) Quality Systems Manual (QSM). Policies and procedures listed in Appendix 1 are compliant with the National Divisional Support Center (NDSC) Quality Management Plan (QMP) for Eurofins TestAmerica and the various accreditation and certification programs which are held by the laboratory to support environmental work (Appendix 2). The QMP provides a summary of Eurofins TestAmerica's quality and data integrity system. It contains requirements and general guidelines under which all Eurofins TestAmerica facilities shall conduct their operations.

Refer to Appendix 3 for a list of additional references for which this QA Manual is compliant; and Appendix 4 for the compliance crosswalk of this manual to the TNI & ISO/IEC Guide 17025 requirements.

3.2 Terms and Definitions

A QA Program is a system designed to ensure that data produced by the laboratory conforms to the standards set by state and/or federal regulations. The program functions at the local management level through company goals, from guidance at the executive management level, and at the analytical level through Standard Operating Procedures (SOPs) and quality control. Our program is designed to minimize systematic error, encourage constructive, documented problem solving, and provide a framework for continuous improvement within the organization to better serve our clients.

Refer to Appendix 5 for a list of Terms and Acronyms.

3.3 Scope / Fields of Testing

The laboratory analyzes a broad range of environmental and industrial samples. Sample matrices vary among air (source and ambient), drinking water, effluent water, groundwater, soils, sediment, biological, hazardous waste, and sludge. The QA Program contains specific procedures and methods to test samples of differing matrices for chemical, physical and biological parameters. The Program also contains guidelines on maintaining documentation of analytical processes, reviewing results, servicing clients and tracking samples through the laboratory. The technical and service requirements of all analytical requests are thoroughly evaluated before

commitments are made to accept the work. Measurements are made using published reference methods or methods developed and validated by the laboratory.

The methods covered by this manual include the most frequently requested methodologies needed to provide analytical services in the United States and its territories. The specific list of test methods used by the laboratory can be found in Appendix 6. Our areas of expertise include:

Standard Services	Specialty Services
• Volatiles • Semivolatiles • Metals • Pesticides/PCBs/Herbicides • Waste Characterization • Non-Potable Water Testing • Drinking Water Testing • Soil and Surface Water Testing • Vapor and Air Analysis • Sediment and Tissue Testing • Method Development	• Dioxins & Furans • PCB Congeners • Alkyl PAHs • PFAS • Source Air Analysis including PFAS • Metals – Sequential Extraction Procedure

NOTE: All current certificates and scopes of accreditation are available on the laboratory's website at www.testamericainc.com

The approach of this manual is to define the minimum level of quality assurance and quality control necessary to meet these requirements. All methods performed by the laboratory shall meet these criteria as appropriate. In some instances, quality assurance project plans (QAPPs), project specific data quality objectives (DQOs) or local regulations may require criteria other than those contained in this manual. In these cases, the laboratory will abide by the requested criteria following review and acceptance of the requirements by the Laboratory Director and/or Business Unit Manager and the Quality Assurance (QA) Manager. In some cases, QAPPs and DQOs may specify less stringent requirements. The Laboratory Director and/or Business Unit Manager and the QA Manager must determine if it is in the lab's best interest to follow the less stringent requirements.

Note: Eurofins TestAmerica Knoxville must comply with the information provided in its VAP approved QA Manual and SOPs.

3.4 Management of the Manual

3.4.1 Review Process

The template on which this manual is based is reviewed annually by Eurofins National Divisional Support Center (NDSC) which houses the Quality Assurance leadership team for Eurofins Environment Testing America. NDSC QA will assure that the template remains in compliance with Section 3.1. This manual itself is reviewed annually by senior laboratory management to assure that it reflects current practices and meets the requirements of the laboratory's clients and regulators as well as the QMP. Occasionally, the manual may need changes in order to meet new or changing regulations and operations. The QA Manager will review the changes in the normal course of business and incorporate changes into revised sections of the document. All updates will be reviewed by the senior laboratory management staff. The laboratory updates

and approves such changes according to our Document Control and Distribution procedures (refer to SOP No. KNOX-QA-0011).

4.0 MANAGEMENT REQUIREMENTS

4.1 Overview

The laboratory is a local operating unit of Eurofins Environment Testing America. The laboratory's operational and support staff have the day-to-day independent operational authority under the direction of the Laboratory President and the Laboratory Director and/or Business Unit Manager and is supported by the NDSC QA team. The laboratory management staff includes directors, managers and group leaders. The organizational chart of the management staff are presented in Figure 4-1.

4.2 Roles and Responsibilities

In order for the QA Program to function properly, all members of the staff must clearly understand and meet their individual responsibilities as they relate to the quality program. The responsibility for quality resides with every employee of the laboratory. All employees have access to the QA Manual, are trained to this manual, and are responsible for upholding the standards therein. Each person carries out his/her daily tasks impartially and in a manner consistent with the goals and in accordance with the procedures in this manual and the laboratory's SOPs. The following descriptions briefly define each role in its relationship to the Quality Assurance Program.

4.2.1 Vice President of Quality and Environmental Health and Safety (VP-QA/EHS)

The Vice President (VP) of QA/EHS reports directly to Eurofins Environment Testing America Chief Operating Officer (COO). With the aid of the NDSC Quality Team Members, Business Unit Managers, Laboratory Directors, the VP-QA/EHS has the responsibility for the establishment, general overview and maintenance of the Quality Assurance and EH&S Programs within Eurofins Environment Testing America. Additional responsibilities include:

- Review of QA/QC and EHS aspects of NDSC Official Document, national projects and expansions or changes in services.
- Work with various organizations outside of the laboratory to further the development of quality standards and represent the laboratory at various trade meetings.
- Prepare monthly reports for quality and EH&S metrics across the environmental testing laboratories and a summary of any quality and EH&S related initiatives and issues.
- With the assistance of the Executive Management, Corporate Senior Management Teams and the EHS Managers, maintenance and implementation of the Eurofins Environment Testing America Environmental, Health and Safety Program.

4.2.2 Quality Directors

There are four (4) Quality Directors within NDSC that report directly to the VP-QA/EHS. These Quality Directors have oversight of the general overview and maintenance of the QA Program within the Eurofins Environment Testing America laboratories. Supported tasks include:

- Monitors laboratory internal audit findings;
- Identifies common laboratory weaknesses and monitors corrective action closures.
- Develops NDSC quality guidance documents and management tools for ensuring and improving compliance;

- Monitors and communicates DoD/DoE requirements;
- Monitors and communicates regulatory and certification requirements;
- Training and Onboarding
- Laboratory assessments, mentoring, and interventions
- Track/drive root cause investigations and corrective action plans
- Builds knowledge base for preventive actions

4.2.3 Quality Information Manager

The Quality Information works directly with the NDSC Quality Directors and EHS Managers; and reports directly to the VP-QA/EHS. The Quality Information Manager is responsible for the management of:

- NDSC Official Documents
- TALS/LIMS Certification Module Data
- Company's Intranet website
- Company's Regulatory Limits Database
- Subcontract laboratory and approved vendor information
- Internal and External client support for various company groups (e.g., Client Services, EH&S, Legal, IT, Sales) for both quality and operational functions
- Communicate regulatory information and lists

4.2.4 Environmental Health and Safety (EH&S) Managers

There are 3 EH&S Managers within NDSC that report directly to the VP-QA/EHS. These EH&S Managers have oversight of the general overview and maintenance of the EH&S Program within the Eurofins Environment Testing America laboratories. Supported tasks include:

- Consolidation and tracking all safety and health-related information and reports for the company, and managing compliance activities for Eurofins Environment Testing America locations.
- Coordination/preparation of the Environmental, Health and Safety Manual Template that is used by each laboratory to prepare its own laboratory-specific Safety Manual/ CHP.
- Preparation of information and training materials for laboratory EHS Coordinators.
- Assistance in the coordination of employee exposure and medical monitoring programs to insure compliance with applicable safety and health regulations.
- Serving as Department of Transportation (D.O.T.) focal point and providing technical assistance to location management.
- Serving as Hazardous Waste Management main contact and providing technical assistance to location management.

4.2.5 Ethics and Compliance Officers (ECOs)

The NDSC VP-QA/EHS and Corporate Counsel are designated Ethics and Compliance Officer (ECO). Each ECO acts as a back-up to the other ECO and both are involved when data investigations occur. Each ECO has a direct line of communication to the entire executive management personnel and lab management staff.

The ECOs monitor and audit procedures to determine compliance with policies and to make recommendations for policy enhancements to the President, COO, Laboratory Director or other

appropriate individuals within the laboratory. The ECO will assist the laboratory QA Manager in the coordination of internal auditing of ethical policy related activities and processes within the laboratory, in conjunction with the laboratory's regular internal auditing function.

The ECOs will also participate in investigations of alleged violations of policies and work with the appropriate internal departments to investigate misconduct, remedy the situation, and prevent recurrence of any such activity.

4.2.6 Laboratory Director

The Laboratory Director is responsible for the overall quality, safety, financial, technical, human resource and service performance of the whole laboratory and reports to their business unit President. The Laboratory Director provides the resources necessary to implement and maintain an effective and comprehensive Quality Assurance and Data Integrity Program.

Specific responsibilities include, but are not limited to:

- Implementing and ensuring adherence to the Quality System as described in this QAM and in the supporting laboratory policies and procedures.
- Provides one or more technical managers for the appropriate fields of testing. If the Technical Manager is absent for a period of time exceeding 15 consecutive calendar days, the Laboratory Director must designate another full time staff member meeting the qualifications of the Technical Manager to temporarily perform this function. If the absence exceeds 35 consecutive calendar days, the primary accrediting authority must be notified in writing.
- Ensures that all analysts and supervisors have the appropriate education and training to properly carry out the duties assigned to them and ensures that this training has been documented. Works with Eurofins Environment Testing Human Resources for hiring of new personnel.
- Ensures that personnel are free from any commercial, financial and other undue pressures which might adversely affect the quality of their work.
- Ensures company human resource policies are adhered to and maintained.
- Ensures that sufficient numbers of qualified personnel are employed to supervise and perform the work of the laboratory. Assesses laboratory capacity and workload.
- Ensures that appropriate corrective actions are taken to address analyses identified as requiring such actions by internal and external performance or procedural audits. Procedures that do not meet the standards set forth in the QA Manual or laboratory SOPs may be temporarily suspended by the Laboratory Director.
- Reviews and approves all SOPs prior to their implementation and ensures all approved SOPs are implemented and adhered to.
- Pursues and maintains appropriate laboratory certification and contract approvals. Supports ISO 17025 requirements.
- Ensures client specific reporting and quality control requirements are met.
- Contributes to the continuous improvement of the laboratory operations.
- Maintains an awareness of technical developments and regulatory requirements.
- Captains the management team, consisting of the QA Manager, the Technical Manager(s), and the Operations Manager as direct reports.

4.2.7 Quality Assurance (QA) Manager or Designee

The QA Manager has responsibility and authority to ensure the continuous implementation of the quality system at the laboratory where they work.

The QA Manager reports directly to the Laboratory Director and their NDSC Quality Director. This position is able to evaluate data objectively and perform assessments without outside (e.g., managerial) influence. The NDSC QA Team may be used as a resource in dealing with regulatory requirements, certifications and other quality assurance related items. The QA Manager directs the activities of the QA office to accomplish specific responsibilities, which include, but are not limited to:

- Serves as the focal point for QA/QC in the laboratory.
- Have functions independent from laboratory operations for which he/she has quality assurance oversight.
- Have documented training and/or experience in QA/QC procedures and the laboratory's Quality System.
- Maintaining and updating the QA Manual.
- Monitoring and evaluating laboratory certifications; scheduling proficiency testing samples.
- Monitoring and communicating regulatory changes that may affect the laboratory to management.
- Training and advising the laboratory staff on quality assurance/quality control procedures that are pertinent to their daily activities.
- Have a general knowledge of the analytical test methods for which data audit/review is performed (and/or having the means of getting this information when needed).
- Arrange for or conducting internal audits on quality systems and the technical operation.
- Notifying laboratory management of deficiencies in the quality system and ensuring corrective action is taken. Procedures that do not meet the standards set forth in the QA Manual or laboratory SOPs shall be investigated following procedures outlined in Section 14 and if deemed necessary may be temporarily suspended during the investigation.
- The laboratory QA Manager will maintain records of all ethics-related training, including the type and proof of attendance.
- Maintain, improve, and evaluate the corrective action database and the corrective and preventive action systems.
- Objectively monitor standards of performance in quality control and quality assurance without outside (e.g., managerial) influence.
- Coordinating of document control of SOPs, MDLs, control limits, and miscellaneous forms and information.
- Performing technical data audits and method audits to ensure consistency and compliance with regulatory requirements.
- Review of external audit reports and data validation requests.
- Follow-up with audits to ensure client QAPP requirements are met.
- Establishment of reporting schedule and preparation of various quality reports for the Laboratory Director, clients and/or NDSC QA Team.

- Development of suggestions and recommendations to improve quality systems.
- Research of current state and federal requirements and guidelines.
- Participate in the vendor and supplier approval process, including subcontractors.
- Captains the QA team to enable communication and to distribute duties and responsibilities.
- Communication to the relevant regulatory authorities when there are management or facility changes that impact the laboratory.
- Ensuring communication & monitoring standards of performance to ensure that systems are in place to produce the level of quality as defined in this document.
- Evaluation of the thoroughness and effectiveness of training.
- Compliance with ISO 17025
- Compliance with the DoD/DOE QSM.
- Asssuring compliance with The NELAC Institute (TNI) Standard.

4.2.8 Technical Manager or Designee

The Technical Manager is responsible for the technical operation of the laboratory and reports directly to the Laboratory Director. He/she is accountable for all analyses and analysts under their experienced supervision and for compliance with the ISO 17025:2017 Standard. The scope of responsibility ranges from the new-hire process and existing technology through the ongoing training and development programs for existing analysts and new instrumentation. Specific responsibilities include, but are not limited to:

- Exercises day-to-day supervision of laboratory operations for the appropriate field of accreditation and reporting of results. Coordinating, writing, and reviewing preparation of all test methods, i.e., SOPs, with regard to quality, integrity, regulatory and optimum and efficient production techniques, and subsequent analyst training and interpretation of the SOPs for implementation and unusual project samples. He/she insures that the SOPs are properly managed and adhered to at the bench. He/she develops standard costing of SOPs to include supplies, labor, overhead, and capacity (design vs. demonstrated versus first-run yield) utilization.
- Reviewing and approving, with input from the QA Manager, proposals from marketing, in accordance with an established procedure for the review of requests and contracts. This procedure addresses the adequate definition of methods to be used for analysis and any limitations, the laboratory's capability and resources, the client's expectations. Differences are resolved before the contract is signed and work begins. A system documenting any significant changes is maintained, as well as pertinent discussions with the client regarding their requirements or the results of the analyses during the performance of the contract. All work subcontracted by the laboratory must be approved by the client. Any deviations from the contract must be disclosed to the client. Once the work has begun, any amendments to the contract must be discussed with the client and so documented.
- Monitoring the validity of the analyses performed and data generated in the laboratory. This activity begins with reviewing and supporting all new business contracts, insuring data quality, analyzing internal and external non-conformances to identify root cause issues and implementing the resulting corrective and preventive actions, facilitating the data review process (training, development, and accountability at the bench), and providing technical and troubleshooting expertise on routine and unusual or complex problems.

- Providing training and development programs to applicable laboratory staff as new hires and, subsequently, on a scheduled basis. Training includes instruction on calculations, instrumentation management to include troubleshooting and preventive maintenance.
- Enhancing efficiency and improving quality through technical advances and improved LIMS utilization. Capital forecasting and instrument life cycle planning for second generation methods and instruments as well as asset inventory management.
- Coordinating sample management from “cradle to grave,” insuring that no time is lost in locating samples.
- Scheduling all QA/QC-related requirements for compliance, e.g., MDLs, etc.
- Captains department personnel to communicate quality, technical, personnel, and instrumental issues for a consistent team approach.
- Coordinates audit responses with the QA Manager.
- Compliance with ISO 17025.
- Compliance with the DoD/DOE QSM.
- Compliance with The NELAC Institute (TNI) Standard.

4.2.9 Operations Manager

The Operations Manager manages and directs the analytical production sections of the laboratory. He/She reports directly to the Laboratory Director. He/She assists the Technical Manager in determining the most efficient instrument utilization. More specifically, he/she:

- Scheduling analytical operations.
- Supervising QC activities performed as a part of routine analytical operations.
- Implementing data review procedures.
- Supervising the preparation and maintenance of laboratory records.
- Supervising maintenance of instruments and scheduling of repairs.
- Supervising the daily activities of the Report Production Group.
- Working with the Project Managers and Group Leaders to assure the requirements of projects are met in a timely manner.
- Ensuring that corrective actions are implemented and effective.
- Evaluates the level of internal/external non-conformances for all departments.
- Continuously evaluates production capacity and improves capacity utilization.
- Continuously evaluates turnaround time and addresses any problems that may hinder meeting the required and committed turnaround time from the various departments.
- Develops and improves the training of all analysts in cooperation with the Technical Manager and QA Manager and in compliance with regulatory requirements.
- Is responsible for efficient utilization of supplies.
- Constantly monitors and modifies the processing of samples through the departments.
- Fully supports the quality system and, if called upon in the absence of the QA Manager, serves as his substitute in the interim.

- Complying with ISO17025:2017, The NELAC Institute (TNI) Standard, DoD/DOE QSM and the various QC programs implemented at the laboratory.

4.2.10 Project Manager (PM)

Members of the laboratory Project Management Group are responsible for organizing and managing client projects. Clients are assigned a project manager who serves as their primary contact at the laboratory. It is the PM's responsibility to act as the client advocate by communicating client requirements to laboratory personnel and ensuring that clients provide complete information needed by the laboratory to meet those requirements – including all verbal communcations.

The Project Manager's responsibilities include:

- Scheduling sample submissions, sample container orders and sample pick-up via the laboratory courier service.
- Confirming certification status
- Coordinating and communicating turnaround time (TAT) requirements for high priority samples/projects.
- Answering common technical questions, facilitating problem resolution and coordinating technical details with the laboratory staff.
- Ensuring that client specifications, when known, are met by communicating project and quality assurance requirements to the laboratory.
- Notifying laboratory personnel of incoming projects and sample delivery schedules.
- Coordinating and communicating with EH&S staff regarding new/unusual sample matrices and/or analyses in advance of the arrival of the work.
- Monitor the status of all data package projects in-house to ensure timely and accurate delivery of reports.
- Coordinating client requests for sample containers and other services.
- Scheduling sample pick-ups from client offices or project sites and notifying the laboratory staff of incoming samples.
- Coordinating subcontract work.
- Respond to client inquires and resolve service issues.

4.2.11 Group Leaders

Group Leaders report to the Operations Manager. Each one is responsible to:

- Ensure that analysts in their department adhere to applicable SOPs and the QA Manual. They perform frequent SOP and QA Manual review to determine if analysts are in compliance and if new, modified, and optimized measures are feasible and should be added to these documents.
- With regard to analysts, participates in the selection, training (as documented in Section 5.3), development of performance objectives and standards of performance, appraisal (measurement of objectives), scheduling, counseling, discipline, and motivation of analysts and documents these activities in accordance with systems developed by the QA and Personnel Departments. They evaluate staffing sufficiency and overtime needs. Training consists of familiarization with SOP, QC, Safety, and computer systems.

- Encourage the development of analysts to become cross-trained in various methods and/or operate multiple instruments efficiently while performing maintenance and documentation, self-supervise, and function as a department team.
- Provide guidance to analysts in resolving problems encountered daily during sample prep/analysis in conjunction with the Technical Manager, Operations Manager, and/or QA Manager. Each is responsible for 100% of the data review and documentation, non-conformance and *CPAR* issues, the timely and accurate completion of performance evaluation samples and MDLs, for his department.
- Ensure all logbooks are maintained, current, and properly labeled or archived.
- Report all non-conformance conditions to the QA Manager, Technical Manager, Operations Manager, and/or BU / Laboratory Director.
- Ensure that preventive maintenance is performed on instrumentation as detailed in the QA Manual or SOPs. He is responsible for developing and implementing a system for preventive maintenance, troubleshooting, and repairing or arranging for repair of instruments.
- Maintain adequate and valid inventory of reagents, standards, spare parts, and other relevant resources required to perform daily analysis.
- Achieve optimum turnaround time on analyses and compliance with holding times.
- Conduct efficiency and cost control evaluations on an ongoing basis to determine optimization of labor, supplies, overtime, first-run yield, capacity (designed vs. demonstrated), second- and third-generation production techniques/instruments, and long-term needs for budgetary planning.
- Develop, implement, and enhance calibration programs.
- Provide written responses to external and internal audit issues.
- Complying with ISO17025:2017, The NELAC Institute (TNI) Standard, DoD/DOE QSM and the various QC programs implemented at the laboratory.

4.2.12 Laboratory Analysts

Laboratory analysts are responsible for conducting analysis and performing all tasks assigned to them by the group leader or supervisor. The responsibilities of the analysts are listed below:

- Perform analyses by adhering to analytical and quality control protocols prescribed by current SOPs, this QA Manual, and project-specific plans honestly, accurately, timely, safely, and in the most cost-effective manner.
- Document standard and sample preparation, instrument calibration and maintenance, data calculations, sample matrix effects, and any observed non-conformance on worklists, benchsheets, lab notebooks and/or the Non-Conformance Database.
- Report all non-conformance situations, instrument problems, matrix problems and QC failures, which might affect the reliability of the data, to their supervisor, the Technical Manager, and/or the QA Manager or member of QA staff.
- Perform 100% review of the data generated prior to entering and submitting for secondary level review.
- Suggest method improvements to their supervisor, the Technical Manager, and the QA Manager. These improvements, if approved, will be incorporated. Ideas for the optimum

performance of their assigned area, for example, through the proper cleaning and maintenance of the assigned instruments and equipment, are encouraged.

- Work cohesively as a team in their department to achieve the goals of accurate results, optimum turnaround time, cost effectiveness, cleanliness, complete documentation, and personal knowledge of environmental analysis.

4.2.13 Environmental Health and Safety Coordinator and Radiation Safety Officer

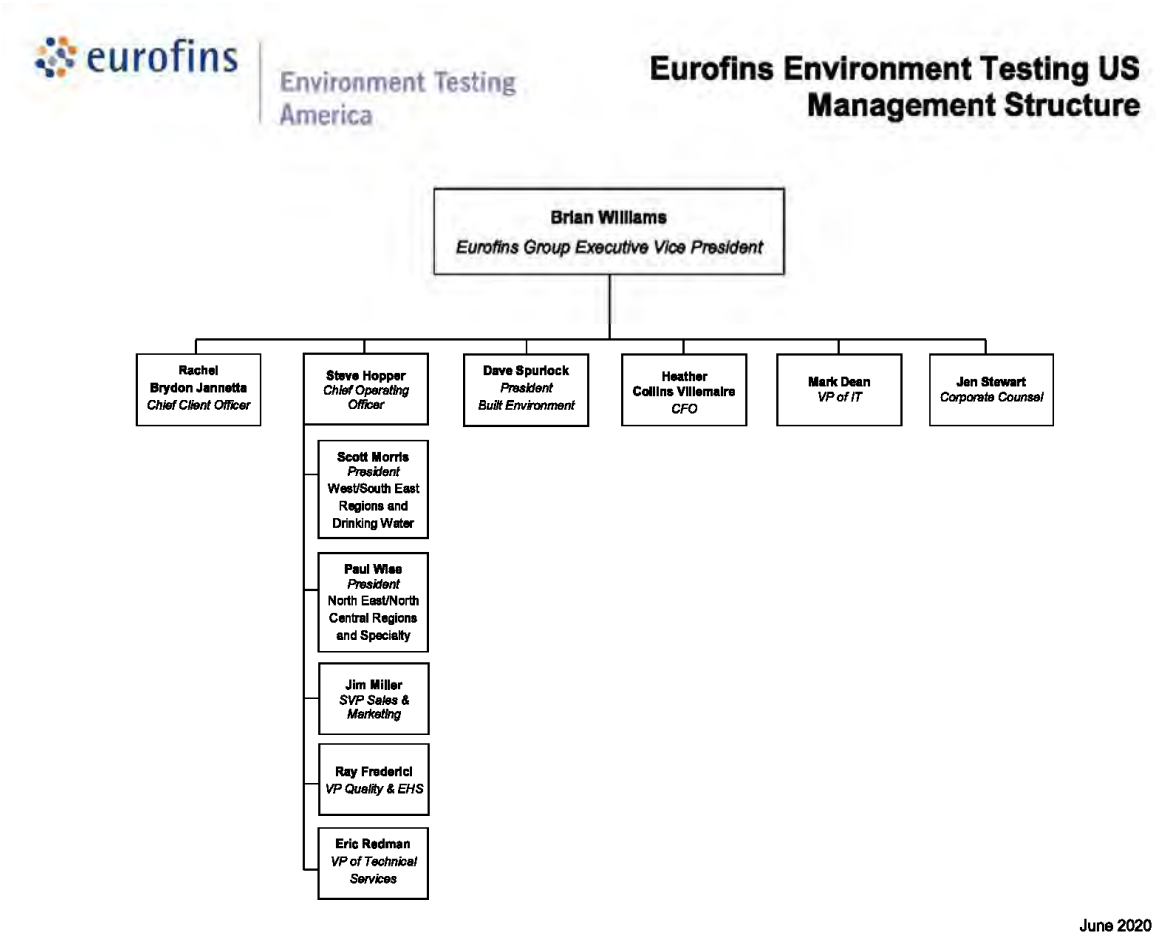
The Environmental Health and Safety Coordinator reports directly to the Laboratory Director. Responsibilities include, but are not limited to:

- Staying current with the hazardous waste regulations.
- Continuing training on hazardous waste issues.
- Reviewing and updating annually the Hazardous Waste Contingency Plan.
- Auditing the staff with regard to compliance with the TestAmerica Knoxville Specific Emergency Contingency Plan and the Corporate Environmental Health and Safety Manual (CW-E-M-001).
- Contacting the hazardous waste subcontractors for review of procedures and opportunities for minimization of waste.
- Conducting ongoing, necessary safety training and conduct new employee safety orientation.
- Assisting in developing and maintaining the Chemical Hygiene/Safety Manual.
- Administering dispersal of all Material Safety Data Sheet (MSDS) information.
- Performing regular chemical hygiene and housekeeping instruction.
- Giving instruction on proper labeling and practice; Serving as chairman of the laboratory safety committee.
- Overseeing the inspection and maintenance of general safety equipment – fire extinguishers, safety showers, eyewash fountains, etc. and ensure prompt repairs as needed.
- Supervising and scheduling fire drills and emergency evacuation drills.

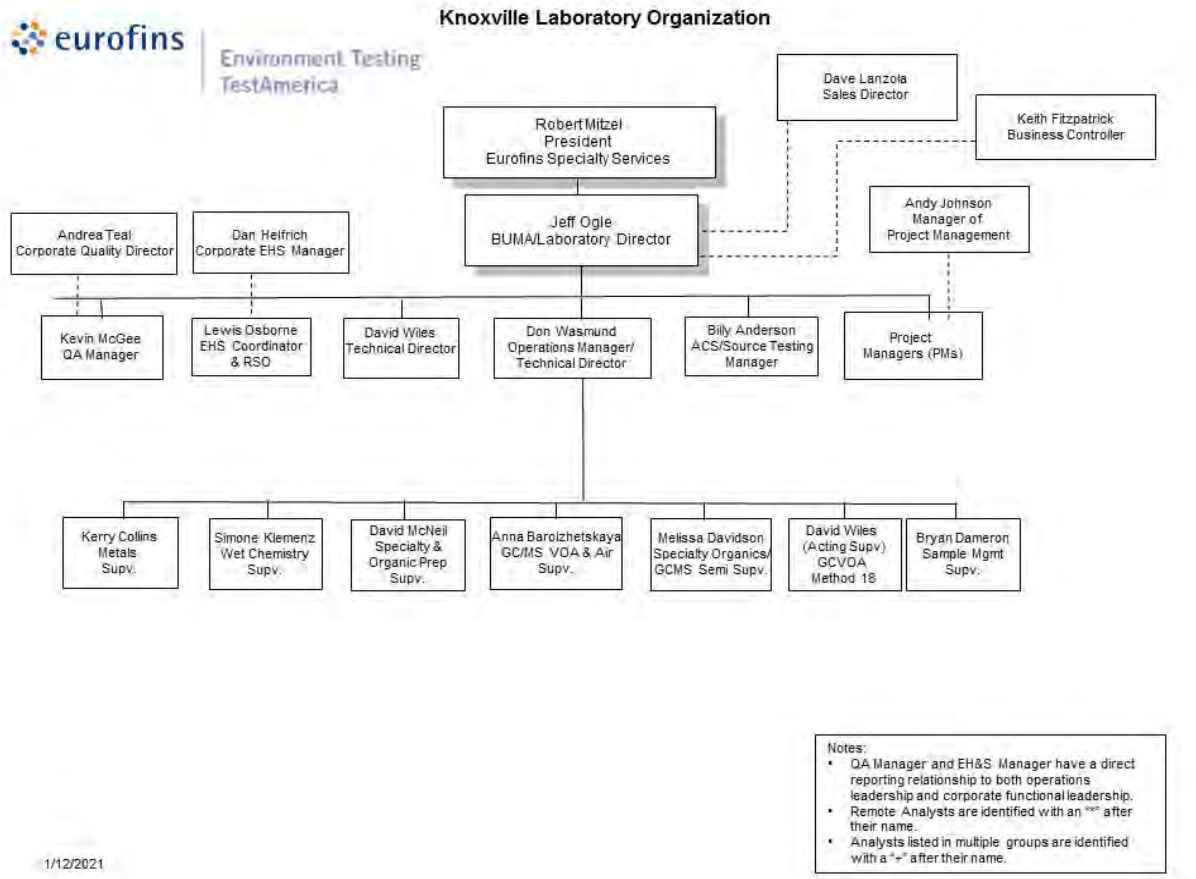
As Radiation Safety Officer (RSO), responsibilities include but are not limited to:

- Ensuring that all uses of radioactive materials and radiation sources are conducted safely, in accordance with the conditions of the license and applicable regulations, and result in exposures to personnel which are as low as reasonably achievable (ALARA).

- Apprising and informing management of the radiation safety status of the facility and for keeping them aware of their responsibility in maintaining an adequate radiation protection program.



4.3 Business Continuity and Contingency Plans



Various policies and practices are in place to address continuity of business and contingency plans to ensure continued operations or minimal disruption in operations should unplanned events (natural disasters, unexpected management changes, etc.) occur. Deputies are identified for all key management personnel. Deputies would temporarily fill a role if the primary is absent for more than 15 consecutive calendar days. The deputies must meet the same qualifications as the primary person should they be required to take on the responsibilities. The QA Manager communicates to the relevant regulatory authorities when there are management or facility changes that impact the laboratory. Changes in the technical director must be communicated within a period of time and in the manner dictated by each regulatory authority.

The following table defines who assumes the responsibilities of key personnel in their absence:

Key Personnel	**Deputy**
Laboratory Director: Jeff Ogle	Don Wasmund
Quality Assurance Manager: Kevin McGee	Annette Ribet
Technical Manager: David Wiles	Melissa Davidson
EHS Coordinator: Lewis Osborne	Kevin McGee
Radiation Safety Officer (RSO): Lewis Osborne	Mike Ridenhower

• QA Manager and EH&S Manager have a direct reporting relationship to both operations leadership and corporate functional leadership.
• Remote Analysts are identified with an "*" after their name.
• Analysts listed in multiple groups are identified with a "+" after their name.

5.0 PERSONNEL

5.1 Overview

The laboratory's management believes that its highly qualified and professional staff is the single most important aspect in assuring a high level of data quality and service. The staff consists of professionals and support personnel.

All personnel must demonstrate competence in the areas where they have responsibility. Any staff that is undergoing training shall have appropriate supervision until they have demonstrated their ability to perform their job function on their own. Staff shall be qualified for their tasks based on appropriate education, training, experience and/or demonstrated skills as required.

The laboratory employs sufficient personnel with the necessary education, training, technical knowledge and experience for their assigned responsibilities.

All personnel are responsible for complying with all QA/QC requirements that pertain to the laboratory and their area of responsibility. Each staff member must have a combination of experience and education to adequately demonstrate a specific knowledge of their particular area of responsibility. Technical staff must also have a general knowledge of lab operations, test methods, QA/QC procedures and records management.

Laboratory management is responsible for formulating goals for lab staff with respect to education, training and skills and ensuring that the laboratory has a policy and procedures for identifying training needs and providing training of personnel. The training shall be relevant to the present and anticipated responsibilities of the lab staff.

The laboratory only uses personnel that are employed by or under contract to, the laboratory. Contracted personnel, when used, must meet competency standards of the laboratory and work in accordance to the laboratory's quality system.

5.2 Education and Experience Requirements for Technical Personnel

The laboratory makes every effort to hire analytical staffs that possess a college degree (AA, BA, BS) in an applied science with some chemistry in the curriculum. Exceptions may be made based upon the technical nature of the position and the individual's experience and abilities. Selection of qualified candidates for laboratory employment begins with documentation of minimum education, training, and experience prerequisites needed to perform the prescribed task. Minimum education and training requirements for laboratory employees are outlined in job descriptions maintained by Eurofins Environment Testing America Human Resources.

Experience and specialized training are occasionally accepted in lieu of a college degree (basic lab skills such as using a balance, colony counting, aseptic or quantitation techniques, etc., are also considered).

As a general rule for analytical staff:

Specialty	Education	Experience
Extractions, Digestions, some electrode methods (pH, DO, Redox, etc.), or Titrimetric and Gravimetric Analyses	H.S. Diploma	On the job training (OJT)

Specialty	Education	Experience
CVAA, Single component or short list Chromatography (e.g., Fuels, BTEX-GC, IC)	A college degree in an applied science or 2 years of college and at least 1 year of college chemistry	Or 2 years prior analytical experience is required
ICP, ICPMS, Long List or complex chromatography (e.g., Pesticides, PCB, Herbicides, HPLC, etc.), GCMS	A college degree in an applied science or 2 years of college chemistry	or 5 years of prior analytical experience
Spectra Interpretation	A college degree in an applied science or 2 years of college chemistry	And 2 years relevant experience Or 5 years of prior analytical experience
Technical Managers – **General**	Bachelor's Degree in an applied science or engineering with 24 semester hours in chemistry An advanced (MS, PhD.) degree may substitute for one year of experience	And 2 years experience in environmental analysis of representative analytes for which they will oversee
Technical Managers – **Wet Chem** only (no advanced instrumentation)	Associates degree in an applied science or engineering or 2 years of college with 16 semester hours in chemistry	And 2 years relevant experience

When an analyst does not meet these requirements, they can perform a task under the direct supervision of a qualified analyst, peer reviewer or Group Leader, and are considered an analyst in training. The person supervising an analyst in training is accountable for the quality of the analytical data and must review and approve data and associated corrective actions.

5.3 Training

The laboratory is committed to furthering the professional and technical development of employees at all levels.

Orientation to the laboratory's policies and procedures, in-house method training, and employee attendance at outside training courses and conferences all contribute toward employee proficiency. Below are examples of various areas of required employee training:

Required Training	Time Frame	Employee Type
Environmental Health & Safety	Prior to lab work	All
Ethics – New Hires	1 week of hire	All
Ethics – Comprehensive	60 days of hire	All

Required Training	Time Frame	Employee Type
Data Integrity	60 days of hire	Technical and PMs
Quality Assurance	90 days of hire	All
Ethics – Comprehensive Refresher	Annually	All
Initial Demonstration of Capability (DOC)	Prior to unsupervised method performance	Technical

The laboratory maintains records of relevant authorization/competence, education, professional qualifications, training, skills and experience of technical personnel (including contracted personnel) as well as the date that approval/authorization was given. These records are kept on file at the laboratory. Also refer to "Demonstration of Capability" in Section 19.

The training of technical staff is kept up to date by:

- Each employee must have documentation in their training file that they have read, understood and agreed to follow the most recent version of the laboratory QA Manual and SOPs in their area of responsibility. This documentation is updated as SOPs are updated.
- Documentation from any training courses or workshops on specific equipment, analytical techniques or other relevant topics.
- Documentation of proficiency (refer to Section 19).
- An Ethics Agreement signed by each staff member (renewed each year) and evidence of annual ethics training.
- A Confidentiality Agreement signed by each staff member signed at the time of employment.
- Human Resources maintains documentation and attestation forms on employment status and records; benefit programs; timekeeping/payroll; and employee conduct (e.g., ethics violations). This information is maintained in the employee's secured personnel file.

Evidence of successful training could include such items as:

- Adequate documentation of training within operational areas, including one-on-one technical training for individual technologies, and particularly for people cross-trained.
- Analysts knowledge to refer to QA Manual for quality issues.
- Analysts following SOPs, i.e., practice matches SOPs.
- Analysts regularly communicate to supervisors and QA if SOPs need revision, rather than waiting for auditors to find problems.

The QA Manager is responsible for QA and Ethics Orientation, Initial and On-Going Ethics and Data Integrity Training and QA training. The EH&S Coordinator is responsible for EH&S Orientation and Training. Group Leaders and Technical Managers are responsible for technical training.

The QA Manager evaluates the effectiveness of training through the review of demonstration of capability documentation, on-going proficiency test results, nonconformances and corrective action reports, and internal and external audit reports.

Further details of the laboratory's training program are described in Personnel Orientation and Training SOP (KNOX-QA-0009).

5.4 Data Integrity and Ethics Training Program

The laboratory's Ethics and Data Integrity Program is discussed in Section 6.2. Employees are trained as to the legal and environmental repercussions that result from data misrepresentation. Key topics covered in the presentation include:

- Organizational mission and its relationship to the critical need for honesty and full disclosure in all analytical reporting.
- Ethics Policy
- How and when to report ethical/data integrity issues. Confidential reporting.
- Record keeping.
- Discussion regarding data integrity procedures.
- Specific examples of breaches of ethical behavior (e.g. peak shaving, altering data or computer clocks, improper macros, etc., accepting/offering kickbacks, illegal accounting practices, unfair competition/collusion)
- Internal monitoring. Investigations and data recalls.
- Consequences for infractions including potential for immediate termination, debarment, or criminal prosecution.
- Importance of proper written narration / data qualification by the analyst and project manager with respect to those cases where the data may still be usable but are in one sense or another partially deficient.

Additionally, a data integrity hotline (1-800-736-9407) is maintained by the NDSC.

6.0 ACCOMMODATIONS AND ENVIRONMENTAL CONDITIONS

6.1 Overview

The laboratory is a 28,000 ft^2 secure laboratory facility with controlled access and designed to accommodate an efficient workflow and to provide a safe and comfortable work environment for employees. All visitors sign in and are escorted by laboratory personnel. Access is controlled by various measures.

The laboratory is equipped with structural safety features. Each employee is familiar with the location, use, and capabilities of general and specialized safety features associated with their workplace. The laboratory provides and requires the use of protective equipment including safety glasses, protective clothing, gloves, etc., OSHA and other regulatory agency guidelines regarding required amounts of bench and fume hood space, lighting, ventilation (temperature and humidity controlled), access, and safety equipment are met or exceeded.

Traffic flow through sample preparation and analysis areas is minimized to reduce the likelihood of contamination. Adequate floor space and bench top area is provided to allow unencumbered sample preparation and analysis space. Sufficient space is also provided for storage of reagents and media, glassware, and portable equipment. Ample space is also provided for refrigerated sample storage before analysis and archival storage of samples after analysis. Laboratory HVAC and deionized water systems are designed to minimize potential trace contaminants.

The laboratory is separated into specific areas for sample receiving, sample preparation, volatile organic sample analysis, non-volatile organic sample analysis, specialty organics sample preparation, specialty organics analysis, metals sample preparation, metals analysis, inorganic sample analysis, and administrative functions.

6.2 Environment

Laboratory accommodation, test areas, energy sources, and lighting are adequate to facilitate proper performance of tests. The facility is equipped with heating, ventilation, and air conditioning (HVAC) systems appropriate to the needs of environmental testing performed at this laboratory.

The environment in which these activities are undertaken does not invalidate the results or adversely affect the required accuracy of any measurements.

The laboratory provides for the effective monitoring, control and recording of environmental conditions that may affect the results of environmental tests as required by the relevant specifications, methods, and procedures. Such environmental conditions include humidity controls, temperature controls, and voltage conditioning with an uninterruptible backup power supply.

When any of the method or regulatory required environmental conditions change to a point where they may adversely affect test results, analytical testing will be discontinued until the environmental conditions are returned to the required levels.

Environmental conditions of the facility housing the computer network and LIMS are regulated to protect against raw data loss.

When the laboratory performs laboratory activities at sites or facilities outside its permanent control, it shall ensure that the requirements related to facilities and environmental conditions of this document are met.

Specific requirements for facility and environmental conditions, as well as periodic monitoring of conditions, are given in the Environmental Health & Safety Manual plus each laboratory's Facility Addendum.

6.3 Work Areas

There is effective separation between neighboring areas when the activities therein are incompatible with each other. Examples include:

- Volatile organic chemical handling areas, including sample preparation and waste disposal, and volatile organic chemical analysis areas.

Access to and use of all areas affecting the quality of analytical testing is defined and controlled by secure access to the laboratory building as described below in the Building Security section.

Adequate measures are taken to ensure good housekeeping in the laboratory and to ensure that any contamination does not adversely affect data quality. These measures include regular cleaning to control dirt and dust within the laboratory.

Work areas are available to ensure an unencumbered work area. Work areas include:

- Access and entryways to the laboratory.
- Sample receipt areas.
- Sample storage areas.
- Chemical and waste storage areas.
- Data handling and storage areas.
- Sample processing areas.
- Sample analysis areas.

6.4 Responding to Emergencies

Employees must be aware of procedures to respond to all emergencies that might occur in the workplace. Employees must be familiar with the location and proper operation of all emergency equipment, evacuation routes and designated assembly areas for all areas where they work. Refer to the NDSC EH&S Manual Document No. CW-E-M-001. Sec. 7 and the laboratory's local EH&S addendum for complete details. These documents provide direction for situations where normal operations of the laboratory are not possible (e.g., electrical failures, heating/air conditioning failures, fire/building evacuation, computer failures, hazardous material spills, injury to employees, pandemic flu, disruption of phone service, etc.)

In the event that the building or information technology (IT) systems would be severely challenged, a designated disaster recovery team, which includes Facility Management, Maintenance, Safety, Laboratory/Executive Management, Public Relations, IT, QA and other applicable personnel depending on the scope of the disaster, would assemble at a designated area to assess the situation and formulate a plan.

6.5 Building Security

Building access codes and alarm codes are distributed to employees as necessary.

Visitors to the laboratory sign in and out in a visitor's logbook. A visitor is defined as any person who visits the laboratory who is not an employee of the laboratory. In addition to signing into the laboratory, the Environmental, Health and Safety Manual contains requirements for visitors and vendors. There are specific safety forms that must be reviewed and signed.

Visitors (with the exception of company employees) are escorted by laboratory personnel at all times, or the location of the visitor is noted in the visitor's logbook.

7.0 QUALITY SYSTEM

7.1 Quality Policy Statement

The Quality Policy statement gives employees clear requirements for the production of analytical data. As an organization, all personnel are committed to high quality professional practice, testing and data, and service to our clients.

We strive to provide the highest quality data achievable by:

- Reading and understanding all of the quality documents applicable to each position and implementing the process in our work.
- Following all recordkeeping requirements; describing clearly and accurately all activities performed; recording “real time” as the task is carried out; understanding that it is never acceptable to “back date” entries and should additional information be required at a later date, the actual date and by whom the notation is made must be documented.
- Ensuring data integrity through the completeness, consistency, impartiality and accuracy of the data generated. Data is attributable, legible, contemporaneously recorded, original or a true copy, and accurate (ALCOA). This applies to manual paper documentation and electronic records.
- Providing accountability and traceability for each sample analyzed through proper sample handling, labeling, preparation, instrument calibration/qualification/validation, analysis, and reporting; establishing an audit trail (the who, what, when, and why) that identifies date, time, analyst, instrument used, instrument conditions, quality control samples (where appropriate and/or required by the method), and associated standard material.
- Emphasizing a total quality management process which provides impartiality, accuracy, and strict compliance with agency regulations and client requirements, giving the highest degree of confidence; understanding that meeting the requirements of the next employee in the work flow process is just as important as meeting the needs of the external client.
- Providing thorough documentation and explanation to qualify reported data that may not meet all requirements and specifications, but is still of use to the client; understanding this occurs only after discussion with the client on the data limitations and acceptability of this approach.
- Responding immediately to indications of questionable data, out-of-specification occurrences, equipment malfunctions, and other types of laboratory problems, with investigation and applicable corrective action; documenting these activities completely, including the reasons for the decisions made.
- Providing a work environment that ensures accessibility to all levels of management and encourages questions and expression of concerns on quality issues to management. Eurofins recognizes that the implementation of a quality assurance program requires management’s commitment and support as well as the involvement of the entire staff
- Continually improve systems and manage risk to support quality improvement efforts in laboratory, administrative and managerial activities

7.2 Ethics and Data Integrity

Eurofins Environment Testing America is committed to ensuring the integrity of its data and meeting the quality needs of its clients. The laboratory operates our Ethics and Data Integrity program under the guidance of Eurofin's Key Guidance Document (KGD). The elements of the our program include:

- An Ethics Policy (NDSC Document No. CW-L-P-004;) and Employee Ethics Statements.
- Ethics and Compliance Officer/s (ECOs).
- A Training Program.
- Self-governance through disciplinary action for violations.
- A confidential mechanism for anonymously reporting alleged misconduct and a means for conducting internal investigations of all alleged misconduct. (NDSC Document No. CW-L-S-002,
- Procedures and guidance for recalling data if necessary (NDSC Document No. CW-Q-S-005).
- Effective external and internal monitoring system that includes procedures for internal audits (Section 17).
- Produce results, which are accurate and include QA/QC information that meets client pre-defined Data Quality Objectives (DQOs).
- Present services in a confidential, honest and forthright manner.
- Provide employees with guidelines and an understanding of the Ethical and Quality Standards of our Industry.
- Provide procedures and guidance to ensure the impartiality and confidentiality of all data and customer information.
- Operate our facilities in a manner that protects the environment and the health and safety of employees and the public.
- Obey all pertinent federal, state and local laws and regulations and encourage other members of our industry to do the same.
- Educate clients as to the extent and kinds of services available.
- Assert competency only for work for which adequate personnel and equipment are available and for which adequate preparation has been made.
- Promote the status of environmental laboratories, their employees, and the value of services rendered by them.

7.3 Quality System Documentation

The laboratory's Quality System is communicated through a variety of documents.

- Quality Assurance (QA) Manual – Each laboratory has a lab-specific QA manual.
- NDSC Official Documents – Each laboratory may use the Guidance (instructional use) documents at their discretion. Template documents are process documents that the laboratory's need to implement locally by using the document as is or as an outline to define their internal practices that meet the minimum requirements of the template. Required documents need to be implemented as is and listed in the laboratory's document control list.

- Key Guidance Documents (KGDs) - Documents compiled at the Group Service Centre (GSC) level by Functional Leaders (document owners) aimed at providing specific Eurofins groups of employees with guidelines necessary for the good conduct of their respective work.
- Laboratory SOPs and Policies – General and Technical
- Work Instructions – A subset of procedural steps, tasks or forms associated with an operation of a management system (e.g., checklists, preformatted bench sheets, forms).

7.3.1 Order of Precedence

In the event of a conflict or discrepancy between policies, the order of precedence is as follows:

- Quality Management Plan (QMP)
- NDSC Guidance Documents
- KGDs
- Laboratory Quality Assurance Manual (QA Manual)
- Laboratory SOPs and Policies
- Other (Work Instructions (WI), memos, flow charts, etc.)

NOTE: The laboratory has the responsibility and authority to operate in compliance with regulatory requirements of the jurisdiction in which the work is performed. Where the QMP conflicts with those regulatory requirements, the regulatory requirements of the jurisdiction shall hold primacy. The laboratory's QA Manual shall take precedence over the QMP in those cases. Any regulatory requirements (e.g.; Ohio EPA VAP, CT RCP, etc) provided in the laboratory specific documents (i.e., QAM and SOPs) take precedence over any policies provided in corporate documents.

7.4 QA/QC Objectives for the Measurement of Data

Quality Assurance (QA) is responsible for developing planned activities whose purpose is to provide assurance to all levels of management that a quality program is in place within the laboratory, and that it is functioning in an effective manner that is consistent with the requirements of NELAP, ISO 17025, DoD, and any other regulatory agencies (i.e., states) in which the laboratory maintains accreditation.

Quality Control (QC) is generally understood to be limited to the analyses of samples and to be synonymous with the term *"analytical quality control"*. QC refers to the routine application of statistically based procedures to evaluate and control the accuracy of results from analytical measurements. The QC program includes procedures for estimating and controlling precision and bias and for determining reporting limits.

Request for Proposals (RFPs) and Quality Assurance Project Plans (QAPP) provide a mechanism for the client and the laboratory to discuss the data quality objectives in order to ensure that analytical services closely correspond to client needs. In order to ensure the ability of the laboratory to meet the Data Quality Objectives (DQOs) specified in the QAPP, clients are advised to allow time for the laboratory to review the QAPP before being finalized. The client is responsible for developing the QAPP; however, the laboratory will provide support to the client for developing the sections of the QAPP that concern laboratory activities.

Note: TestAmerica Knoxville must comply with the information provided in its VAP approved QAM and SOPs.

Historically, laboratories have described their QC objectives in terms of precision, accuracy, representativeness, comparability, completeness, selectivity and sensitivity (PARCCSS). Each laboratory SOP defines the required QC indicators.

7.4.1 Precision

The objective is to meet the performance for precision demonstrated for the methods on similar samples and to meet DQOs of the EPA and/or other regulatory programs. Precision is defined as the degree of reproducibility of measurements under a given set of analytical conditions (exclusive of field sampling variability). Precision is documented on the basis of replicate analysis, usually duplicate or matrix spike (MS) duplicate samples.

7.4.2 Accuracy

The objective is to meet the performance for accuracy demonstrated for the methods on similar samples and to meet DQOs of the EPA and/or other regulatory programs. Accuracy is defined as the degree of bias in a measurement system. Accuracy may be documented through the use of laboratory control samples (LCS) and/or MS. A statement of accuracy is expressed as an interval of acceptance recovery about the mean recovery.

7.4.3 Representativeness

The objective is to provide data which is representative of the sampled medium. Representativeness is defined as the degree to which data represent a characteristic of a population or set of samples and is a measurement of both analytical and field sampling precision. The representativeness of the analytical data is a function of the procedures used in procuring and processing the samples. The representativeness can be documented by the relative percent difference between separately procured, but otherwise identical samples or sample aliquots.

The representativeness of the data from the sampling sites depends on both the sampling procedures and the analytical procedures. Refer to laboratory SOPs for subsampling and homogenization techniques appropriate to the analytical method.

7.4.4 Comparability

The objective is to provide analytical data for which the accuracy, precision, representativeness, and reporting limit statistics are similar to these quality indicators generated by other laboratories for similar samples, and data generated by the laboratory over time.

Comparability is documented by inter-laboratory studies carried out by regulatory agencies or carried out for specific projects or contracts, by comparison of periodically generated statements of accuracy, precision, and reporting limits with those of other laboratories.

7.4.5 Completeness

The completeness objective for data is 90% (or as specified by a particular project), expressed as the ratio of the valid data to the total data over the course of the project. Data will be considered valid if they are adequate for their intended use. Data usability will be defined in a QAPP, project scope, or regulatory requirement. Data validation is the process for reviewing

data to determine its usability and completeness. If the completeness objective is not met, actions will be taken internally and with the data user to improve performance. This may take the form of an audit to evaluate the methodology and procedures as possible sources for the difficulty or may result in a recommendation to use a different method.

7.4.6 Selectivity

Selectivity is defined as the capability of a test method or instrument to respond to a target substance or constituent in the presence of non-target substances. Target analytes are separated from non-target constituents and subsequently identified/detected through one or more of the following, depending on the analytical method: extractions (separation), digestions (separation), interelement corrections (separation), use of matrix modifiers (separation), specific retention times (separation and identification), confirmations with different columns or detectors (separation and identification), specific wavelengths (identification), specific mass spectra (identification), and specific electrodes (separation and identification).

7.4.7 Sensitivity

Sensitivity refers to the amount of analyte necessary to produce a detector response that can be reliably detected (above the Method Detection Limit, Estimated Detection Limit, or Limit of Detection) or quantified (above the Reporting Limit, Minimum Level, or Limit of Quantitation).

7.5 Criteria for Quality Indicators

The laboratory can prepare upon request a Quality Control Limit Summary from the Laboratory Information Management System (LIMS) that summarize the precision and accuracy acceptability limits for performed analyses. This summary includes an effective date, is updated each time new limits are generated and is located in the LIMS. Current limits are controlled through the LIMS. The limits in effect for a given date are archived in the LIMS with the associated sample data. Unless otherwise noted, limits within these tables are laboratory generated. Some acceptability limits are derived from US EPA methods when they are required. Where US EPA method limits are not required, the laboratory has developed limits from evaluation of data from similar matrices. Criteria for development of control limits is contained in SOP KNOX-QA-0004.

7.6 Statistical Quality Control

Statistically-derived precision and accuracy limits are required by selected methods (such as SW-846) and programs. The laboratory routinely utilizes statistically-derived limits to evaluate method performance and determine when corrective action is appropriate. The laboratory analysts are instructed to use the current limits in the laboratory (dated and approved by the Technical Manager/Group Leader and QA Manager) and entered into TALS. The Quality Assurance department maintains an archive of all limits used within the laboratory. These limits are maintained in the LIMS as part of the analytical historical record. If a method defines the QC limits, the method limits are used.

If a method requires the generation of historical limits, the lab develops such limits from recent data in the QC database of the LIMS following the guidelines described in Section 26. All calculations and limits are documented and dated when approved and effective. On occasion, a client requests contract-specified limits for a specific project.

Current QC limits are entered and maintained in TALS analyte database. As sample results and the related QC are entered into TALS, the sample QC values are compared with the limits

in TALS to determine if they are within the acceptable range. The laboratory analyst then evaluates if the sample needs to be rerun or re-extracted/rerun or if a comment should be added to the report explaining the reason for the QC outlier.

7.6.1 QC Charts

As the QC limits are calculated, QC charts are generated showing warning and control limits for the purpose of evaluating trends. The QA Manager evaluates these to determine if adjustments need to be made or for corrective actions to methods. All findings are documented and kept on file. The generation and use of QC Charts (Control Charts) are described in the laboratory SOP KNOX-QA-0004.

7.7 Quality System Metrics

In addition to the QC parameters discussed above, the entire Quality System is evaluated on a monthly basis through the use of specific metrics (refer to Section 18). These metrics are used to drive continuous improvement in the laboratory's Quality System.

8.0 DOCUMENT CONTROL

8.1 Overview

The QA Department is responsible for the control of documents used in the laboratory to ensure that approved, up-to-date documents are in circulation and out-of-date (obsolete) documents are archived or destroyed. The following documents, at a minimum, must be controlled:

- Laboratory Quality Assurance (QA) Manual
- Laboratory Standard Operating Procedures (SOP)
- Laboratory Policies
- Work Instructions and Forms
- NDSC Documents[1]

[1]Includes locally implemented documents that are document controlled within the laboratory's document control system.

The NDSC documents are only considered controlled when they are read on the intranet site. Printed copies are considered uncontrolled unless the laboratory physically distributes them as controlled documents. A detailed description of the procedure for issuing, authorizing, controlling, distributing, and archiving NDSC Official Documents is found in Document No. CW-Q-S-001, NDSC Document Control and Archiving. The laboratory's internal document control procedure is defined in KNOX-QA-0011, Document Control and Distribution.

The laboratory QA Department also maintains access to various references and document sources integral to the operation of the laboratory. This includes reference methods and regulations. Instrument manuals (hard or electronic copies) are also maintained by the laboratory.

The laboratory maintains control of records for raw analytical data and supporting records such as audit reports and responses, logbooks, standard logs, training files, MDL studies, Proficiency Testing (PT) studies, certifications and related correspondence, and nonconformance reports (NCMs). Raw analytical data consists of bound logbooks, instrument printouts, any other notes, magnetic media, electronic data, and final reports.

8.2 Document Approval and Issue

The pertinent elements of the document control system includes a unique document title and number, pagination, the total number of pages of the item or an 'end of document' page, the effective date, revision number, and the laboratory's name. The QA personnel are responsible for the maintenance of this system.

Controlled documents are authorized by the QA Department and other laboratory management. In order to develop a new document, a responsible manager submits a draft to the QA Department by way of the group leader/Technical Manager. Upon approval, QA personnel add the identifying version information to the document and retains that document as the official document on file. That document is then provided to all applicable operational units (may include electronic access). Controlled documents are identified as such and records of their distribution are kept by the QA Department. Document control may be achieved by either electronic or hardcopy distribution.

The QA Department maintains a list of the official versions of controlled documents.

Quality System Policies and Procedures are reviewed at a minimum of every two years and revised as appropriate. Technical procedures used in support of work done for the Department of Defense (DOD) and Department of Energy (DOE), and the Eurofins TestAmerica Knoxville Quality Assurance Manual must be reviewed at a one year frequency. Changes to documents occur when a procedural change warrants a revision of the document.

8.3 Procedures for Document Control Policy

For changes to the QAM, requests for change or revision may be made to the TestAmerica QA Manager. Changes affecting the text of the Corporate Quality Management Plan are forwarded to the Corporate QA Director for review and approval. If the proposed changes are accepted, they are incorporated into the next revision of the appropriate section of the QAM. Each revision to the QAM is approved by the same authorized signatories as shown on the cover page of the QAM. Uncontrolled copies must not be used within the laboratory. Previous revisions are archived by the QA department.

For changes to SOPs, refer to SOP No. KNOX-QA-0018, Preparation and Management of Standard Operating Procedures.

Forms, worksheets, work instructions and information are organized by form number and revision number on the QAQC shared directory on a local area network server.

8.4 Obsolete Documents

All invalid or obsolete documents are removed, or otherwise prevented from unintended use. The laboratory has specific procedures as described above to accomplish this. In general, obsolete documents are collected from employees according to distribution lists and are marked obsolete on the cover or destroyed. At least one copy of the obsolete document is archived according to KNOX-QA-0011, Document Control and Distribution.

9.0 SERVICE TO THE CLIENT

9.1 Overview

The laboratory has established procedures for the review of work requests and contracts, oral or written. The procedures include evaluation of the laboratory's capability and resources to meet the contract's requirements within the requested time period. All requirements, including the methods to be used, must be adequately defined, documented and understood. For many environmental sampling and analysis programs, testing design is site or program specific and does not necessarily fit into a standard laboratory service or product. It is the laboratory's intent to provide both standard and customized environmental laboratory services to our clients.

A thorough review of technical and QC requirements contained in contracts is performed to ensure project success. The appropriateness of requested methods, and the lab's capability to perform them must be established. Projects, proposals, and contracts are reviewed for adequately defined requirements and the laboratory's capability to meet those requirements. Alternate test methods that are capable of meeting the clients' requirements may be proposed by the lab. A review of the lab's capability to analyze non-routine analytes is also part of this review process.

All projects, proposals and contracts are reviewed for the client's requirements in terms of compound lists, test methodology requested, sensitivity (detection and reporting levels), accuracy, and precision requirements (% Recovery and RPD). The reviewer ensures that the laboratory's test methods are suitable to achieve these requirements and that the laboratory holds the appropriate certifications and approvals to perform the work. The laboratory and any potential subcontract laboratories must be certified, as required, for all proposed tests.

Electronic or hard copy deliverable requirements are evaluated against the laboratory's capacity for production of the documentation.

If the laboratory cannot provide all services but intends to subcontract such services, whether to another Eurofins facility on the same LIMS or to an outside firm, this will be documented and discussed with the client prior to contract approval. (Refer to Section 10 for Subcontracting Procedures.)

The laboratory informs the client of the results of the review if it indicates any potential conflict, deficiency, lack of accreditation, or inability of the lab to complete the work satisfactorily. Any discrepancy between the client's requirements and the laboratory's capability to meet those requirements is resolved in writing before acceptance of the contract. It is necessary that the contract be acceptable to both the laboratory and the client. Amendments initiated by the client and/or Eurofins TestAmerica Knoxville are documented in writing.

All contracts, QAPPs, Sampling and Analysis Plans (SAPs), contract amendments, and documented communications become part of the project record.

The same contract review process used for the initial review is repeated when there are amendments to the original contract by the client, and the participating personnel are informed of the changes.

9.2 Review Sequence and Key Personnel

Appropriate personnel will review the work request at each stage of evaluation.

For routine projects and other simple tasks, a review by the Project Manager (PM) is considered adequate. The PM confirms that the laboratory has any required certifications, that it can meet the clients' data quality and reporting requirements and that the lab has the capacity to meet the clients turn around needs.

It is recommended that, where there is a sales person assigned to the account, an attempt should be made to contact that sales person to inform them of the incoming samples.

For new, complex or large projects, the proposed contract is given to the Client Relationship Manager or Proposal Team, who will decide which lab will receive the work based on the scope of work and other requirements, including certification, testing methodology, and available capacity to perform the work. The contract review process is outlined in NDSC Document No. CA-L-P-002**,** Contract Compliance Policy.

This review encompasses all facets of the operation. The scope of work is distributed to the appropriate personnel, as needed based on scope of contract, to evaluate all of the requirements shown above (not necessarily in the order below) Contract Administrator

- Laboratory Project Manager
- Laboratory Directors and/or Technical Managers
- Account Executives
- Quality Managers
- Laboratory Environmental Health and Safety Managers/Directors

The Laboratory Director reviews the formal laboratory quote and makes final acceptance for their facility.

The Sales Director, Contract Administrator, Account Executive or Proposal Coordinator then submits the final proposal to the client.

In the event that one of the above personnel is not available to review the contract, his or her back-up will fulfill the review requirements.

9.3 Balancing Laboratory Capacity and Workload

Evaluating laboratory capacity to perform specific projects is the responsibility of the Vice-President, Laboratory Director and Operations Manager. Many analysts are cross-trained to perform a variety of tests, and there is redundant equipment available in case of malfunctions. This minimizes the need to evaluate small and medium size projects against capacity available to complete them. Large and complex projects are reviewed against capacity estimates before bids are submitted to ensure that the client's analysis schedule is met. Regularly scheduled meetings are held between laboratory management, PMs, Client Services and QA personnel to review progress with current projects, as well as special requirements of new work scheduled for the laboratory. Laboratory capacity and backlog is tracked on a continuous basis using information from the Laboratory Sample Information System (LIMS) including turnaround time, and work in-house.

9.4 Documentation

The Contracts Department maintains copies of all signed contracts

Appropriate records are maintained for every contract or work request. All stages of the contract review process are documented and include records of any significant changes. This information is archived in the project files

The contract is distributed to and maintained by the appropriate sales/marketing personnel and the Account Executive. A copy of the contract and formal quote will be filed with the laboratory PM and the Laboratory Director.

Records are maintained of pertinent discussions with a client relating to the client's requirements or the results of the work during the period of execution of the contract. The PM keeps a phone log of conversations with the client. This information is archived in the project file as appropriate.

9.4.1 Project-Specific Quality Planning

Communication of contract specific technical and QC criteria is an essential activity in ensuring the success of site specific testing programs. To achieve this goal, a PM is assigned to each client. It is the PM's responsibility to ensure that project-specific technical and QC requirements are effectively evaluated and communicated to the laboratory personnel before and during the project. QA department involvement may be needed to assist in the evaluation of custom QC requirements.

PM's are the primary client contact and they ensure resources are available to meet project requirements, they coordinate opportunities and work with laboratory management and supervisory staff to ensure available resources are sufficient to perform work for the client's project.

Prior to work on a new project, the dissemination of project information and/or project opening meetings may occur to discuss schedules and unique aspects of the project. Items to be discussed may include the project technical profile, turnaround times, holding times, methods, analyte lists, reporting limits, deliverables, sample hazards, or other special requirements. The PM introduces new project information to the laboratory staff through project kick-off meetings or to the supervisory staff during production meetings. These meetings provide direction to the laboratory staff in order to maximize production and client satisfaction, while maintaining quality.

Any change that may occur within an active project is agreed upon between the client/regulatory agency and the PM/laboratory. These changes (e.g., use of a non-standard method or modification of a method) and approvals must be documented prior to implementation. Documentation pertains to any document (e.g., letter, e-mail, variance, contract addendum), which has been signed by both parties.

Project specific instructions are communicated to the laboratory through the use of notes, comments and attachments in TALS or by reference to a Quality Assurance Summary.

The laboratory strongly encourages client visits to the laboratory and for formal/informal information sharing session with employees in order to effectively communicate ongoing client needs as well as project specific details for customized testing programs.

9.5 Special Services

The laboratory cooperates with clients and their representatives to monitor the laboratory's performance in relation to work performed for the client. It is the laboratory's goal to meet all client requirements in addition to statutory and regulatory requirements. The laboratory has procedures to ensure confidentiality to clients (Section 17 and 25).

The laboratory's standard procedures for reporting data are described in Section 25. Special services are also available and provided upon request. These services include:

- Reasonable access for our clients or their representatives to the relevant areas of the laboratory for the witnessing of tests performed for the client.
- Assisting client-specified third party data validators as specified in the client's contract.
- Supplemental information pertaining to the analysis of their samples. Note: An additional charge may apply for additional data/information that was not requested prior to the time of sample analysis or previously agreed upon.

When the client requests a statement of conformity to a specification or standard based on the analysis performed by the laboratory (e.g., pass/fail, in-tolerance/out-of-tolerance), the decision rule shall be clearly defined. Unless inherent in the requested specification or standard, the decision rule selected shall be communicated to the client. Associated reporting requirements are addressed in Section 25.2.18.

9.6 Client Communication

PMs are the primary communication link to the clients. They shall inform their clients of any delays in project completion as well as any non-conformances in either sample receipt or sample analysis. Project management will maintain ongoing client communication throughout the entire client project.

Technical Managers are available to discuss any technical questions or concerns that the client may have.

9.7 Reporting

The laboratory works with our clients to produce any special communication reports required by the contract.

9.8 Client Feedback and Surveys

The laboratory assesses both positive and negative client feedback. The results are used to improve overall laboratory quality and client service.

Eurofins Sales and Marketing teams periodically develop lab and client specific surveys to assess client satisfaction.

When a complaint is received, we determine, to the best of our ability, the extent of the issue and what data is in question. The person receiving the complaint documents this information and promptly forwards it to the appropriate management personnel where the work in question was performed. If a data reporting error is discovered, the final report and/or data must be regenerated with the correct value(s).

The project manager or QA is responsible for entering client concerns into iCAT In some cases, an ICAT / ICAR (Investigation and Corrective Action Report) is initiated to address and document the situation. While an individual issue may not warrant a formal investigation, QA monitors these issues for potential trends and will issue an ICAR/ICAT if a trend is evident.

10.0 SUBCONTRACTING OF TESTS

10.1 Overview

For the purpose of this quality manual, the phrase subcontract laboratory refers to a laboratory external to the Eurofins TestAmerica laboratories. The phrase “work sharing” refers to internal transfers of samples between the Eurofins TestAmerica laboratories. The term outsourcing refers to the act of subcontracting tests.

When contracting with our clients, the laboratory makes commitments regarding the services to be performed and the data quality for the results to be generated. When the need arises to outsource testing for our clients because project scope, changes in laboratory capabilities, capacity, or unforeseen circumstances, we must be assured that the subcontractors or work sharing laboratories understand the requirements and will meet the same commitments we have made to the client. Refer to the <NDSC Documents on Subcontracting Procedures (CW-L-S-004) and the Work Sharing Process (CA-C-S-001).

When outsourcing analytical services, the laboratory will assure, to the extent necessary, that the subcontract or work sharing laboratory maintains a program consistent with the requirements of this document, the requirements specified in TNI/ISO 17025 and/or the client’s Quality Assurance Project Plan (QAPP). All QC guidelines specific to the client’s analytical program are transmitted to the subcontractor and agreed upon before sending the samples to the subcontract facility. Additionally, work requiring accreditation will be placed with an appropriately accredited laboratory. The laboratory performing the subcontracted work will be identified in the final report, as will non-TNI accredited work where required.

PMs or other responsible Client Service members, for the Export Lab (i.e., the Eurofins TestAmerica laboratory that transfers samples to another laboratory) are responsible for obtaining client approval prior to subcontracting any samples. The laboratory will advise the client of a subcontract arrangement in writing and when possible approval from the client shall be obtained and retained in the project folder. Standard Eurofins TestAmerica Terms & Conditions include the flexibility to subcontract samples within the Eurofins TestAmerica laboratories. Therefore, additional advance notification to clients for intra-laboratory subcontracting is not necessary unless specifically required by a client contract.

Note: In addition to the client, some regulating agencies (e.g., USDA) or contracts (e.g., DoD and DOE projects) require notification prior to placing such work**.** Unless the work is done directly for the USDA, this notification is made to the client who is responsible for ensuring notification of the regulating agency.

10.2 Qualifying and Monitoring Subcontractors

Whenever a PM or Client Relationship Manager becomes aware of a client requirement or laboratory need where samples must be outsourced to another laboratory, the other laboratory(s) shall be selected based on the following:

- Subcontractors specified by the client - In these circumstances, the client assumes responsibility for the quality of the data generated from the use of a subcontractor.
- Subcontractors reviewed by Eurofins TestAmerica Knoxville – Firms which have been reviewed by the company and are known to meet standards for accreditations (e.g., State,

TNI and DoD/DOE); technical specifications; legal and financial information.

A listing of vendors is available on the Eurofins TestAmerica intranet site.

All Eurofins TestAmerica laboratories are pre-qualified for work sharing provided they hold the appropriate accreditations and can adhere to the project/program requirements. Client approval is not necessary unless specifically required by the contract. In these cases, the client must provide acknowledgement that the samples can be sent to that facility (an e-mail is sufficient documentation or if acknowledgement is verbal, the date, time, and name of person providing acknowledgement must be documented). The originating laboratory is responsible for communicating all technical, quality, and deliverable requirements as well as other contract needs. (NDSC Document No. CA-C-S-001, Work Sharing).

10.2.1 When the potential subcontract laboratory has not been previously approved, PMs may nominate a laboratory as a subcontractor based on need. The decision to nominate a laboratory must be approved by the Laboratory Director. The Laboratory Director requests that the PM begin the process of approving the subcontract laboratory. Refer to the NDSC Document No. CW-L-S-004, Subcontracting Procedures

Once the appropriate accreditation and legal information is received by the laboratory, it is evaluated for acceptability and forwarded to the NDSC Quality Information Manager (QIM) for review. After the NDSC QIM reviews the documents for completeness, the information is forwarded to the Finance Department for formal signature and contracting with the laboratory. The approved vendor will be added to the approved subcontractor list on the intranet site, and the finance group is concurrently notified.

The client will assume responsibility for the quality of the data generated from the use of a subcontractor they have requested the lab to use. The qualified subcontractors on the intranet site are known to meet minimal standards. Eurofins TestAmerica does not certify laboratories. The subcontractors on our approved list can only be recommended to the extent that we would use them.

10.3 Oversight and Reporting

The status and performance of qualified subcontractors will be monitored by NDSC and includes an annual review process (ref.: NDSC Document No. SOP CW-L-S-004). Any problems identified will be brought to the attention of NDSC.

- Complaints shall be investigated. Documentation of the complaint, investigation, and corrective action will be maintained in the subcontractor's file on the intranet site. Complaints are posted using the Vendor Performance Report.
- Information shall be updated on the intranet when new information is received from the subcontracted laboratories.
- Subcontractors in good standing will be retained on the intranet listing. Client Service personnel will notify all Eurofins Testamerica laboratories, NDSC, and Corporate Contracts if any laboratory requires removal from the intranet site. This notification will be posted on the intranet site and e-mailed to all Client Service Personnel, Laboratory Directors, QA Managers, and Sales Personnel.

Prior to initially sending samples to the subcontracted laboratory, the PM confirms their certification status to determine if it's current and scope-inclusive. The information is documented within the project records.

The laboratory's certifications can be viewed on the company's website http://www.testamericainc.com.

10.3.1 All subcontracted samples must be accompanied by a Eurofins TestAmerica Chain of Custody (COC). A copy of the original COC sent by the client must be available in LIMS for all samples workshared within Eurofins TestAmerica. Client COCs are only forwarded to external subcontractors when samples are shipped directly from the project site to the subcontractor lab. Under routine circumstances, client COCs are not provided to external subcontractors.

Through communication with the subcontracted laboratory, the PM monitors the status of the subcontracted analyses, facilitates successful execution of the work, and ensures the timeliness and completeness of the analytical report.

Non-TNI accredited work must be identified in the subcontractor's report as appropriate. If TNI accreditation is not required, the report does not need to include this information.

Reports submitted from subcontractor laboratories are not altered and are included in their original form in the final project report. This clearly identifies the data as being produced by a subcontractor facility. If subcontract laboratory data is incorporated into the laboratory's EDD (i.e., imported), the report must explicitly indicate which lab produced the data for which methods and samples.

Note: The results submitted by a Eurofins TestAmerica work sharing laboratory may be transferred electronically and the results reported by the Eurofins TestAmerica work sharing lab are identified on the final report. The report must explicitly indicate which lab produced the data for which methods and samples. The final report must include a copy of the completed COC for all work sharing reports.

10.4 Contingency Planning

The full qualification of a subcontractor may be waived to meet emergency needs. This decision and justification must be documented in the project files, and the 'Purchase Order Terms And Conditions For Subcontracted Laboratory Services' must be sent with the samples and COC.

In the event this provision is utilized, the laboratory (e.g., PM) will be required to verify and document the applicable accreditations of the subcontractor. All other quality and accreditation requirements will still be applicable, but the subcontractor need not have signed a subcontract agreement with Eurofins TestAmerica at this time.

The use of any emergency subcontractor will require the PM to complete a New Vendor Add Form in order to process payment to the vendor and add them to LIMS. This form requires the user to define the subcontractor's category/s of testing and the reason for testing.

10.5 Use of NELAP and A2LA Logo

It is not laboratory policy to use these logos on any company letterhead, including analytical reports.

11.0 PURCHASING SERVICES AND SUPPLIES

11.1 Overview

Evaluation and selection of suppliers and vendors is performed, in part, on the basis of the quality of their products, their ability to meet the demand for their products on a continuous and short term basis, the overall quality of their services, their past history, and competitive pricing. This is achieved through evaluation of objective evidence of quality furnished by the supplier, which can include certificates of analysis, recommendations, and proof of historical compliance with similar programs for other clients. To ensure that quality critical consumables and equipment conform to specified requirements, which may affect quality, all purchases from specific vendors are approved by a member of the supervisory or management staff. Capital expenditures are made in accordance with NDSC Document No. CW-F-S-007, Eurofins TestAmerica's Fixed Asset Acquisition, Retention and Safeguarding.

Contracts are signed in accordance with NDSC Document No. CW-F-P-002, Company-Wide Authorization Matrix Policy. Request for Proposals (RFP's) will be issued where more information is required from the potential vendors than just price. Process details are available in the NDSC Document No. CW-F-P-004, Guidance on Procurement and Contracts Policy. RFP's allow the laboratory to determine if a vendor is capable of meeting requirements such as supplying all of the laboratory facilities, meeting required quality standards and adhering to necessary ethical and environmental standards. The RFP process also allows potential vendors to outline any additional capabilities they may offer.

11.2 Glassware

Glassware used for volumetric measurements must be Class A or verified for accuracy according to laboratory procedure. Pyrex (or equivalent) glass should be used where possible. For safety purposes, thick-wall glassware should be used where available.

11.3 Reagents, Standards & Supplies

Purchasing guidelines for equipment, consumables, and reagents must meet the requirements of the specific method and testing procedures for which they are being purchased. Solvents and acids are pre-tested in accordance with NDSC Document No. CA-Q-S-001, Solvent & Acid Lot Testing & Approval. Approval information for the solvents and acids tested under Document No. CA-Q-S-001 is stored on the laboratory's SharePoint site, under Solvent Approvals. A master list of all tested materials, as well as the certificates of analysis for the materials, is stored in the same location.

11.3.1 Purchasing

Chemical reagents, solvents, glassware, and general supplies are ordered as needed to maintain sufficient quantities on hand. Materials used in the analytical process must be of a known quality. The wide variety of materials and reagents available makes it advisable to specify recommendations for the name, brand, and grade of materials to be used in any determination. This information is contained in the method SOP.

Many consumable items are maintained in an on-site consignment system, where the items in inventory have been pre-approved for laboratory use. On-site consignment is an inventory of

commonly used items maintained at the laboratory by a laboratory supply company where they track the supply of items and restock as needed. If an item is not included in the on-site consignment system but is needed for laboratory operations, the group leader or designee enters the request into the procurement system. The vendor item catalogue number is entered into the system to specify the required quality. Each request is reviewed and approved by the Laboratory Director or the Technical Manager (or designee) prior to purchase.

11.3.2 Receiving

It is the responsibility of the laboratory associate (typically sample receiving personnel) to receive the shipment. Once the ordered reagents or materials are received, the analyst compares the information on the label or packaging to the original order to ensure that the purchase meets the quality level specified and documents the date the materials were received. Refer to SOP KNOX-QA-0001 for further details.

The laboratory associate verifies the lot numbers of received solvents and acids against the pre-approval lists. If a received material is listed as unapproved, or is not listed, it is sequestered and returned to the vendor. Alternatively, the laboratory may test the material for the intended use, and if it is acceptable, document the approval on the approval list. Records of any testing performed locally are maintained on the shared “public” folder on the computer network.

Materials may not be released for use in the laboratory until they have been inspected, verified as suitable for use, and the inspection/verification has been documented.

Safety Data Sheets (SDSs) are available online through the Company’s intranet website. Anyone may review these for relevant information on the safe handling and emergency precautions of on-site chemicals.

11.3.3 Specifications

Methods used in the laboratory specify the grade of reagent that must be used in the procedure. If the quality of the reagent is not specified, analytical reagent grade will be used. It is the responsibility of the analyst to check the procedure carefully for the suitability of grade of reagent.

Chemicals must not be used past the manufacturer’s expiration date and must not be used past the expiration time noted in a method SOP. If expiration dates are not provided, the laboratory may contact the manufacturer to determine an expiration date.

The laboratory assumes a five year expiration date on inorganic dry chemicals and solvents unless noted otherwise by the manufacturer or by the reference source method. Chemicals/solvents should not be used past the manufacturer’s or SOP expiration date unless verified as outlined below.

- An expiration date **cannot** be extended if the dry chemical/solvent is discolored or appears otherwise physically degraded. In this case, the dry chemical/solvent must be discarded.
- Expiration dates can be extended if the dry chemical/solvent is found to be satisfactory based on acceptable performance of quality control samples (Continuing Calibration Verification (CCV), Blanks, Laboratory Control Sample (LCS), etc.).
- If the dry chemical/solvent is used for the preparation of standards, the expiration dates can be extended 6 months if the dry chemical/solvent is compared to an unexpired independent source in performing the method and the performance of the dry chemical/solvent is found to be satisfactory. The comparison must show that the dry chemical/solvent meets CCV

limits. The comparison studies are maintained on-file and available for review in the group share on the local area network with the associated scanned calibration files.

Wherever possible, standards must be traceable to national or international standards of measurement or to national or international reference materials. Records to that effect are available to the user.

Compressed gases in use are checked for pressure and secure positioning daily. To prevent a tank from going to dryness, or introducing potential impurities, the pressure should be closely watched as it decreases to approximately 15% of the original reading, at which point it should be replaced. For example, a standard sized laboratory gas cylinder containing 3,000 psig of gas should be replaced when it drops to approximately 500 psig. The quality of the gases must meet method or manufacturer specification or be of a grade that does not cause any analytical interference.

Water used in the preparation of samples, standards or reagents must have a specific conductivity of less than 1-µmho/cm (or specific resistivity of greater than 1.0 megohm-cm) at 25°C. The specific conductivity is checked and recorded daily. If the water's specific conductivity is greater than the specified limit, the Facility Manager and appropriate Technical Managers must be notified immediately in order to notify all departments, decide on cessation (based on intended use) of activities, and make arrangements for correction.

The laboratory may purchase reagent grade (or other similar quality) water for use in the laboratory. This water must be certified clean by the supplier for all target analytes or otherwise verified by the laboratory prior to use. This verification is documented.

Standard lots are verified before first time use if the laboratory switches manufacturers or has historically had a problem with the type of standard. Spiking standards are verified before use and instrument calibration standards are verified with a second source calibration verification standard. (Note: For Ohio EPA VAP, the continuing calibration verification standard must be from the same source used to prepare the standards used for the calibration curve, unless the analytical method states otherwise.)

Purchased bottleware used for sampling must be certified clean and the certificates must be maintained. If uncertified sampling bottleware is purchased, all lots must be verified clean prior to use. This verification must be maintained.

Tedlar bags purchased by the laboratory must be certified clean and the certificates must be maintained. Tedlar bags are not recommended for trace level analyses as the lab default reporting limits are 20x higher for Tedlar bags than for Summa Canisters.

Required records for solvents and standards are specified in the laboratory SOP KNOX-QA-0001, "Standard/Reagent Labeling and Documentation."

11.3.4 Storage

Reagent and chemical storage is important from the aspects of both integrity and safety. Light-sensitive reagents may be stored in brown-glass containers. Storage conditions are per the NDSC Environmental Health & Safety Manual, Document No. CW-E-M-001, and method SOPs or manufacturer instructions.

11.4 Purchase of Equipment / Instruments / Software

When a new piece of equipment is needed, either for additional capacity or for replacing

inoperable equipment, the analyst or supervisor makes a supply request to the Technical Manager and/or the Laboratory Director. If they agree with the request, the procedures outlined in NDSC Document No. CA-T-P-001, Qualified Products List, are followed. A decision is made as to which piece of equipment can best satisfy the requirements. The appropriate written requests are completed and purchasing places the order.

Upon receipt of a new or used piece of equipment, an identification name is assigned in the LIMS and added to the equipment list. IT must also be notified so that they can synchronize the instrument for back-ups. Its capability is assessed to determine if it is adequate or not for the specific application. For instruments, a calibration curve is generated, followed by MDLs, Demonstration of Capabilities (DOCs), and other relevant criteria (refer to Section 20). For software, its operation must be deemed reliable and evidence of instrument verification must be retained by the IT Department. Software certificates supplied by the vendors are filed with the LIMS Administrator. The manufacturer's operation manual is retained at the bench.

11.5 Services

Service to analytical instruments (except analytical balances) is performed on an as needed basis. Routine preventative maintenance is discussed in Section 22. The need for service is determined by analysts and/or Group Leaders. The service providers that perform the services are approved by the Group Leader/Technical Manager.

Analytical balances are serviced and calibrated annually in accordance with SOP KNOX-QA-0005, "Balance Calibration and Weight Verification." The calibration and maintenance services are performed on-site, and the balances are returned to use immediately following successful calibration. Calibration certificates are filed for reference. If the calibration was unsuccessful, the balance is immediately removed from service and segregated pending either further maintenance or disposal.

Calibration services for support equipment such as thermometers, weight sets, autopipettors, etc., are obtained from vendors with current and valid ISO 17025 accreditation for calibration of the specific piece of equipment. Prior to utilizing the vendor's services, the vendor's accreditation status is verified. Once the equipment has been calibrated, the calibration certificates are reviewed by the QA department, and documentation of the review is filed with the calibration certificates. The equipment is then returned to service within the laboratory

11.6 Suppliers

The laboratory selects vendors through a competitive proposal / bid process, strategic business alliances or negotiated vendor partnerships (contracts). This process is defined in the NDSC Document No. CW-F-P-004, Procurement & Contracts Policy. The level of control used in the selection process is dependent on the anticipated spending amount and the potential impact on the laboratory's business. Vendors that provide test and measuring equipment, solvents, standards, certified containers, instrument related service contracts or subcontract laboratory services shall be subject to more rigorous controls than vendors that provide off-the-shelf items of defined quality that meet the end use requirements. The purchasing system includes all suppliers/vendors that have been approved for use.

Evaluation of suppliers is accomplished by ensuring the supplier ships the product or material ordered and that the material is of the appropriate quality. This is documented by signing off on packing slips or other supply receipt documents. The purchasing documents contain the data that adequately describe the services and supplies ordered.

Any issues of vendor performance are to be reported immediately by the laboratory staff to the Purchasing Group by completing a Vendor Performance Report.

The Purchasing Group will work through the appropriate channels to gather the information required to clearly identify the problem and will contact the vendor to report the problem and to make any necessary arrangements for exchange, return authorization, credit, etc.

Suppliers are subject to re-evaluation, as deemed appropriate, through the use of Vendor Performance Reports used to summarize and review to determine corrective action necessary, or service improvements required by vendors

The laboratory has access to a listing of all approved suppliers of critical consumables, supplies and services. This information is provided through the purchasing system.

11.6.1 New Vendor Procedure

Laboratory employees who wish to request the addition of a new vendor must complete a Vendor Add Request Form.

New vendors are evaluated based upon criteria appropriate to the products or services provided as well as their ability to provide those products and services at a competitive cost. Vendors are also evaluated to determine if there are ethical reasons or potential conflicts of interest with laboratory employees that would make it prohibitive to do business with them as well as their financial stability. The QA Department and/or the Technical Services Director are consulted with vendor and product selection that have an impact on quality.

12.0 COMPLAINTS

12.1 Overview

The laboratory considers an effective client complaint handling processes to be of significant business and strategic value. Listening to and documenting client concerns captures client knowledge that enables our operations to continually improve processes and client satisfaction. An effective client complaint handling process also provides assurance to the data user that the laboratory will stand behind its data, service obligations and products.

A client complaint is any expression of dissatisfaction with any aspect of our business services (e.g., communications, responsiveness, data, reports, invoicing and other functions) expressed by any party, whether received verbally or in written form. Client inquiries, complaints or noted discrepancies are documented, communicated to management, and addressed promptly and thoroughly.

The laboratory has procedures for addressing both external and internal complaints with the goal of providing satisfactory resolution to complaints in a timely and professional manner.

The nature of the complaint is identified, documented and investigated, and an appropriate action is determined and taken. In cases where a client complaint indicates that an established policy or procedure was not followed, the QA Department must evaluate whether a special audit must be conducted to assist in resolving the issue. A written confirmation or letter to the client, outlining the issue and response taken is recommended as part of the overall action taken.

The process of complaint resolution and documentation utilizes the procedures outlined in Section 14 (Corrective Actions) and is documented following the procedure for Nonconformance and Corrective Action System (SOP KNOX-QA-0008). Client complaints are recorded as a type of nonconformance memo (NCM) in TestAmerica LIMS (i.e., TALS), and are summarized in the monthly QA Reports to Management. It is the laboratory's goal to provide a satisfactory resolution to complaints in a timely and professional manner.

12.2 External Complaints

An employee that receives a complaint initiates the complaint resolution process by first documentation of the complaint.

Complaints fall into two categories: correctable and non-correctable. An example of a correctable complaint would be one where a report re-issue would resolve the complaint. An example of a non-correctable complaint would be one where a client complains that their data was repeatedly late. Non-correctable complaints should be reviewed for preventive action measures to reduce the likelihood of future occurrence and mitigation of client impact.

The general steps in the complaint handling process are:

- Receiving and documenting complaints
- Acknowledging receipt of complaint, whenever possible
- Complaint investigation and service recovery
- Process improvement

The laboratory informs the initiator of the complaint of the results of the investigation and the corrective action taken, if any.

12.3 Internal Complaints

Internal complaints include, but are not limited to: errors and non-conformances, training issues, internal audit findings, and deviations from methods. Corrective actions may be initiated by any staff member who observes a nonconformance and shall follow the procedures outlined in Section 14. In addition, Executive Management, Sales and Marketing and IT may initiate a complaint by contacting the laboratory or through the corrective action system described in Section 14.

12.4 Management Review

The number and nature of client complaints is reported by the QA Manager to the Laboratory Director and Quality Director in the QA Monthly report. Monitoring and addressing the overall level and nature of client complaints and the effectiveness of the solutions is part of the Annual Management Systems Review (Section 18).

13.0 CONTROL OF NON-CONFORMING WORK

13.1 Overview

When data discrepancies are discovered or deviations and departures from laboratory SOPs, policies and/or client requests have occurred, corrective action is taken immediately. First, the laboratory evaluates the significance of the nonconforming work. Then, a corrective action plan is initiated based on the outcome of the evaluation. If it is determined that the nonconforming work is an isolated incident, the plan could be as simple as adding a qualifier to the final results and/or making a notation in the case narrative. If it is determined that the nonconforming work is a systematic or improper practices issue, the corrective action plan could include a more in depth investigation and a possible suspension of an analytical method. In all cases, the actions taken are documented using the laboratory's corrective action system (refer to Section 14).

Due to the frequently unique nature of environmental samples, sometimes departures from documented policies and procedures are needed. When a laboratory analyst encounters such a situation, the problem is typically discussed with the group leader. The group leader or laboratory analyst may elect to discuss it with the Technical Manager or have the Project Manager contact the client to decide on a logical course of action. Once an approach is agreed upon, the laboratory analyst documents it using the laboratory's corrective action system described in Section 14. This information is supplied to the client in the form of a footnote or a case narrative with the report.

Note: For Ohio EPA VAP work, the laboratory must implement corrective action procedures to resolve the deviation and limit qualification of the final results. The laboratory is not permitted to deviate from its VAP approved SOP for nonconformances under the laboratory's control if it intends to attest under affidavit that the "results" are VAP certified. When all corrective actions listed in the SOP have been exhausted for nonconformances under the laboratory's control, data still considered qualified is noted as not VAP certified on the affidavit. The SOPs must include exceptions to taking corrective actions for situations outside the laboratory's control. For example, this includes but is not limited to samples prepared or analyzed outside holding times due to no fault of the laboratory and insufficient sample amount. The positive or negative bias associated with the situation outside the laboratory's control must be narrated as described in the SOP and the data is reported as VAP certified on the affidavit.

Project Management may encounter situations where a client may request that a special procedure be applied to a sample that is not standard lab practice. Based on a technical evaluation, the lab may accept or opt to reject the request based on technical or ethical merit. If accepted, such a request is documented in project specific instructions to the laboratory.

13.2 Responsibilities and Authorities

Under certain circumstances the Laboratory Director, Technical Manager, Group Leader or the QA Manager may exceptionally authorize departures from documented procedures or policies depending on the nature and extent of the departure. The departures may be a result of procedural changes due to the nature of the sample; a one-time procedure for a client; QC failures with insufficient sample to reanalyze, etc. In most cases, the client is informed of the departure prior to the reporting of the data. Any departures must be well documented using the laboratory's corrective action procedures. This information may also need to be documented on

data review checklists as appropriate. Any impacted data must be referenced in a case narrative and/or flagged with an appropriate data qualifier.

Any misrepresentation or possible misrepresentation of analytical data discovered by any laboratory staff member must be reported to facility Senior Management within 24-hours. The Senior Management staff is comprised of the Laboratory Director, the QA Manager, Technical Manager(s) and the Operations Manager. The Laboratory Director and QA Manager must be included in the notification. The reporting of issues involving alleged violations of the company's Data Integrity or Manual Integration procedures must be conveyed to an Ethics and Compliance Officer (ECO) (e.g., the VP-QA/EHS) and the laboratory's Quality Director within 24 hours of discovery.

Whether an inaccurate result was reported due to calculation or quantitation errors, data entry errors, improper practices, or failure to follow SOPs, the data must be evaluated to determine the possible effect.

The Laboratory Director, QA Manager, ECOs, VP of Operations and the Quality Directors have the authority and responsibility to halt work, withhold final reports, or suspend an analysis for due cause as well as authorize the resumption of work.

13.3 Evaluation of Significance and Actions Taken

For each nonconforming issue reported, an evaluation of its significance and the level of management involvement needed is made. This includes reviewing its impact on the final data, whether or not it is an isolated or systematic issue, and how it relates to any special client requirements.

The NDSC Document entitled Data Recalls (CW-Q-S-005) is the procedure to be followed when it is discovered that erroneous or biased data may have been reported to clients or regulatory agencies.

The NDSC Document entitled Internal Investigations (CW-L-S-002) is the procedure to be followed for investigation and correction of situations involved alleged incidents of misconduct or violation of the company's ethics policy.

Laboratory level decisions are documented and approved using the laboratory's standard nonconformance/corrective action reporting in lieu of the data recall determination form contained in NDSC Document No CW-Q-S-005.

13.4 Prevention of Nonconforming Work

If it is determined that the nonconforming work could recur, further corrective actions must be made following the laboratory's corrective action system. Periodically as defined by the laboratory's preventive action schedule, the QA Department evaluates non-conformances to determine if any nonconforming work has been repeated multiple times. If so, the laboratory's corrective action process may be followed.

13.5 Method Suspension / Restriction (Stop Work Procedures)

In some cases, it may be necessary to suspend/restrict the use of a method or target analyte which constitutes significant risk and/or liability to the laboratory. Suspension/restriction procedures can be initiated by any of the persons noted in Section 13.2, Paragraph 5.

Prior to suspension/restriction, confidentiality will be respected, and the problem with the required corrective and preventive action will be stated in writing and presented to the Laboratory Director.

The Laboratory Director shall arrange for the appropriate personnel to meet with the QA Manager as needed. This meeting shall be held to confirm that there is a problem, that suspension/restriction of the method is required and will be concluded with a discussion of the steps necessary to bring the method/target or test fully back on line. In some cases, that may not be necessary if all appropriate personnel have already agreed there is a problem and there is agreement on the steps needed to bring the method, target or test fully back on line. The QA Manager will also initiate a corrective action report as described in Section 14 if one has not already been started. A copy of any meeting notes and agreed upon steps should be e-mailed by the laboratory to their Business Unit President; VP-QA & EHS. This e-mail acts as notification of the incident.

After suspension/restriction, the lab will hold all reports to clients pending review. No faxing, mailing or distributing through electronic means may occur. The report must not be posted for viewing on the internet. It is the responsibility of the Laboratory Director to hold all reporting and to notify all relevant laboratory personnel regarding the suspension/restriction (e.g., Project Management, Log-in, etc.). Clients will NOT generally be notified at this time. Analysis may proceed in some instances depending on the non-conformance issue.

Within 72 hours, the QA Manager will determine if compliance is now met and reports can be released, OR determine the plan of action to bring work into compliance, and release work. A team, with all principals involved (e.g., Laboratory Director, Technical Manager, QA Manager, Project Manager, Group Leader) can devise a start-up plan to cover all steps from client notification through compliance and release of reports. Project Management and the Directors of Client Services and Sales and Marketing must be notified if clients must be notified or if the suspension/restriction affects the laboratory's ability to accept work. The QA Manager must approve start-up or elimination of any restrictions after all corrective action is complete.

14.0 CORRECTIVE ACTION

14.1 Overview

A major component of the laboratory's (QA) Program is the problem investigation and feedback mechanism designed to keep the laboratory staff informed on quality related issues and to provide insight to problem resolution. When nonconforming work or departures from policies and procedures in the quality system or technical operations are identified, the corrective action procedure provides a systematic approach to assess the issues, restore the laboratory's system integrity, and prevent reoccurrence. The laboratory employs two systems to manage non-conformances. Issues suspected of being systematic in nature and for which root cause analysis and a formal Corrective Action Report (CAR) are documented in the Incident Corrective Action Tracking (ICAT) database. Routine batch non-conformances, events that are understood to be isolated in nature, are documented in the LIMS non-conformance memo (NCM) system.

14.2 General

Problems within the quality system or within analytical operations may be discovered in a variety of ways, such as QC sample failures, internal or external audits, proficiency testing (PT) performance, client complaints, staff observation, etc.

The purpose of a corrective action system is to:

- Identify non-conformance events and assign responsibility for investigating.
- Resolve non-conformance events and assign responsibility for any required corrective action.
- Identify systematic problems before they become serious.
- Identify and track client complaints and provide resolution.

14.2.1 Non-Conformance Memo (NCM)

NCMs are used to document the following types of corrective actions:

- Deviations from an established procedure or SOP
- QC outside of limits
- Isolated reporting / calculation errors
- Client complaints
- Equipment Failures (Equipment Tag-out)
- Discrepancies in materials / goods received vs. manufacturer packing slips (Forms of documentation other than NCMs in LIMS are also acceptable)

See SOP KNOX-QA-0008, Nonconformance and Corrective Action System, current revision, for details.

14.2.2 Corrective Actions Documented In the ICAT Database

- Internal and external audit findings

- Failed or unacceptable PT results
- Identified poor process or method performance trends
- Systematic reporting / calculation errors
- Data recall investigations
- Questionable trends that are found in the review of NCMs.
- Client complaints
- Excessive revised reports

The ICAT database is used to document background information, track the results of corrective action investigations and root cause analysis, and to provide reports of corrective action plans.

14.3 Closed Loop Corrective Action Process

Any employee in the company can initiate a corrective action. There are four main components to a closed-loop corrective action process once an issue has been identified: Cause Analysis, Selection and Implementation of Corrective Actions (both short and long term), Monitoring of the Corrective Actions, and Follow-up.

14.3.1 Cause Analysis

- Upon discovery of a non-conformance event, the event must be defined and documented. An entry into the ICAT system must be initiated, someone is assigned to investigate the issue and the event is investigated for cause. Table 12-1 provides some general guidelines on determining responsibility for assessment.
- The cause analysis step is the key to the process as a long term corrective action cannot be determined until the cause is determined.
- If the cause is not readily obvious, the Technical Manager, Laboratory Director, or QA Manager (or QA designee) is consulted.

14.3.2 Selection and Implementation of Corrective Actions

- Where corrective action is needed, the laboratory shall identify potential corrective actions. The action(s) most likely to eliminate the problem and prevent recurrence are selected and implemented. Responsibility for implementation is assigned.
- Corrective actions shall be to a degree appropriate to the magnitude of the problem identified through the cause analysis.
- Whatever corrective action is determined to be appropriate, the laboratory shall document and implement the changes. The ICAT record is used for this documentation.

14.3.3 Root Cause Analysis

Root Cause Analysis is a class of problem solving (investigative) methods aimed at identifying the basic or causal factor(s) that underlie variation in performance or the occurrence of a significant failure. The root cause may be buried under seemingly innocuous events, many steps preceding the perceived failure. At first glance, the immediate response is typically directed at a symptom and not the cause. Typically, root cause analysis would be best with

three or more incidents to triangulate a weakness. NDSC Document No. CA-Q-S-009, Root Cause Analysis, provides guidance on this procedure.

Systematically analyze and document the root causes of the more significant problems that are reported. Identify, track, and implement the corrective actions required to reduce the likelihood of recurrence of significant incidents. Trend the root cause data from these incidents to identify root causes that, when corrected, can lead to dramatic improvements in performance by eliminating entire classes of problems.

Identify the one event associated with problem and ask why this event occurred. Brainstorm the root causes of failures; for example, by asking why events occurred or conditions existed; and then why the cause occurred consecutive times until you get to the root cause. For each of these sub events or causes, ask why it occurred. Repeat the process for the other events associated with the incident.

Root cause analysis does not mean the investigation is over. Look at technique or other systems outside the normal indicators. Often creative thinking will find root causes that ordinarily would be missed and continue to plague the laboratory or operation.

14.3.4 Monitoring of the Corrective Actions

- The Group Leader, Operations Manager, Technical Manager and QA Manager are responsible to ensure that the corrective action taken was effective.
- Ineffective actions are documented and re-evaluated until acceptable resolution is achieved. Technical Managers are accountable to the Laboratory Director to ensure final acceptable resolution is achieved and documented appropriately.
- The QA Manager reviews monthly NCM and ICAT records for trends. Highlights are included in the QA monthly report (refer to Section 18). If a significant trend develops that adversely affects quality, an audit of the area is performed and corrective action implemented.
- Any out-of-control situations that are not addressed acceptably at the laboratory level may be reported to the NDSC Quality Director by the QA Manager, indicating the nature of the out-of-control situation and problems encountered in solving the situation.

14.3.5 Follow-up Audits

- Follow-up audits may be initiated by the QA Manager and shall be performed as soon as possible when the identification of a nonconformance casts doubt on the laboratory's compliance with its own policies and procedures, or on its compliance with state or federal requirements.
- These audits often follow the implementation of the corrective actions to verify effectiveness. An additional audit would only be necessary when a critical issue or risk to business is discovered.

(Also refer to Section 17.1.4, Special Audits.)

14.4 Technical Corrective Actions

In addition to providing acceptance criteria and specific protocols for technical corrective actions in the method SOPs, the laboratory has general procedures to be followed to determine when departures from the documented policies and procedures and quality control have occurred

(refer to Section 13). The documentation of these procedures is through the use of an NCM or record in the ICAT system.

Table 14-1 includes examples of general technical corrective actions. For specific criteria and corrective actions, refer to the analytical methods or specific method SOPs. The laboratory may also maintain Work Instructions on these items that are available upon request.

Table 14-1 provides some general guidelines for identifying the individual(s) responsible for assessing each QC type and initiating corrective action. The table also provides general guidance on how a data set should be treated if associated QC measurements are unacceptable. Specific procedures are included in Method SOPs, Work Instructions, QA Manual Sections 19 and 20. All corrective actions are reviewed monthly, at a minimum, by the QA Manager and highlights are included in the QA monthly report.

To the extent possible, samples shall be reported only if all quality control measures are acceptable. If the deficiency does not impair the usability of the results, data will be reported with an appropriate data qualifier and/or the deficiency will be noted in the case narrative. Where sample results may be impaired, the PM is notified by an NCM and appropriate corrective action (e.g., reanalysis) is taken and documented.

14.5 Basic Corrections

When mistakes occur in records, each mistake shall be crossed-out, [not obliterated (e.g. no white-out)], and the correct value entered alongside. All such corrections shall be initialed (or signed) and dated by the person making the correction. In the case of records stored electronically, the original uncorrected file must be maintained intact and a second corrected file is created.

This same process applies to adding additional information to a record. All additions made later than the initial must also be initialed (or signed) and dated.

When corrections are due to reasons other than obvious transcription errors, the reason for the corrections (or additions) shall also be documented.

Table 14-1. Example – General Corrective Action Procedures

QC Activity ***(Individual Responsible for Initiation/Assessment)***	**Acceptance Criteria**	**Recommended Corrective Action**
Initial Instrument Blank *(Analyst)*	- Instrument response < Reporting Limit (RL)[1]	- Prepare another instrument blank. - If same response, determine cause of contamination: reagents, environment, instrument equipment failure, etc.
Initial Calibration Standards *(Analyst, Group Leader)*	- Correlation coefficient r>0.990 for organics and r>0.995 for inorganics or - %RSD within acceptance range. - See details in Method SOP.	- Reanalyze standards. - If still unacceptable, remake standards and recalibrate instrument.

QC Activity *(Individual Responsible for Initiation/Assessment)*	Acceptance Criteria	Recommended Corrective Action
Independent Calibration Verification (Second Source) *(Analyst, Group Leaders)*	- % Recovery within control limits.	- Remake and reanalyze standard. - If still unacceptable, then remake calibration standards or use new primary standards and recalibrate instrument.
Continuing Calibration Standards *(Analyst, Data Reviewer)*	% Difference (or %Drift) within acceptance limits.	- Reanalyze standard. - If still unacceptable, then recalibrate and rerun affected samples.
Matrix Spike / Matrix Spike Duplicate (MS/MSD) *(Analyst, Data Reviewer)*	- % Recovery within limits documented in TALS.	- If the acceptance criteria for duplicates or matrix spikes are not met because of matrix interferences, the acceptance of the analytical batch is determined by the validity of the LCS. - If the LCS is within acceptable limits the batch is acceptable. - The results of the duplicates, matrix spikes and the LCS are reported with the data set. - For matrix spike or duplicate results outside criteria the data for that sample shall be reported with qualifiers.
Laboratory Control Sample (LCS) and LCSD (where applicable) *(Analyst, Data Reviewer)*	- % Recovery within limits specified in TALS. This includes any allowable marginal exceedance (Marginal Exceedances are not allowed for Ohio VAP).	- Batch must be re-prepared and re-analyzed. Note: See Method SOPs for further details. For example, if there is insufficient sample or the holding time cannot be met, contact client and report with flags.
Surrogates *(Analyst, Data Reviewer)*	- % Recovery within limits of method or within three standard deviations of the historical mean.	- Individual sample must be repeated. Place comment in LIMS. - Surrogate results outside criteria shall be reported with qualifiers. Note: See Method SOPs for further details. For example, if there is insufficient sample or the holding time cannot be met, contact client and report with flags.
Method Blank (MB) *(Analyst, Data Reviewer)*	< Reporting Limit [1]	- Reanalyze blank. - If still positive, determine source of contamination. If necessary, reprocess (i.e. digest or extract) entire sample batch. Report blank results. - Qualify the result(s) if the concentration of a targeted analyte in the MB is at or above the reporting limit AND is > 1/10 of the amount measured in the sample.

QC Activity ***(Individual Responsible for Initiation/Assessment)***	**Acceptance Criteria**	**Recommended Corrective Action**
Proficiency Testing (PT) Samples *(QA Manager, Technical Manager(s))*	- Criteria supplied by PT Supplier.	- Any failures or warnings must be investigated for cause. Failures may result in the need to repeat a PT sample to show the problem is corrected.
Internal / External Audits *(QA Manager, Technical Manager(s), Laboratory Director)*	- Defined in Quality System documentation such as SOPs, QAM, etc..	- Non-conformances must be investigated through CAR system and necessary corrections must be made.
Reporting / Calculation Errors (Depends on issue – possible individuals include: Analysts, Data Reviewers, Project Managers, Technical Managers, QA Manager, NDSC QA, Executive Management)	- NDSC Document No. CW-Q-S-005, Data Recall **or** local SOP No.	- Corrective action is determined by type of error. Follow the procedures in NDSC Document No. CW-L-S-002 **or** your lab's CA SOP.
Client Complaints *(Project Managers, Lab Director/Manager, Sales and Marketing)*	-	- Corrective action is determined by the type of complaint. For example, a complaint regarding an incorrect address on a report will result in the report being corrected and then follow-up must be performed on the reasons the address was incorrect (e.g., database needs to be updated).
QA Monthly Report (Refer to Section 16 for an example) (QA Manager, Lab Director/Manager, *Technical Manager(s)*)	- QAM, SOPs.	- Corrective action is determined by the type of issue. For example, CARs for the month are reviewed and possible trends are investigated.
Health and Safety Violation (Safety Officer, Lab Director/Manager, *Technical Manager(s)*)	- Environmental Health and Safety (EHS) Manual.	- Non-conformance is investigated and corrected through CAR system.

Note:

1. See specific method SOPs for acceptance criteria. Concentrations up to five times the reporting limit may be allowed for the common laboratory and reagent contaminants: methylene chloride, toluene, acetone, 2-butanone and phthalates. Some program requirements (e.g. DOD QSM and Ohio EPA VAP) have more stringent requirements that must be followed when performing work for those programs. For example, DOD QSM requires the Method Blanks < ½ Reporting Limit with common lab contaminants <Reporting Limit. (Note: Ohio EPA VAP requires all analytes of concern in Method Blanks to be less than the RL.)

15.0 PREVENTIVE ACTION / IMPROVEMENT

15.1 Overview

The laboratory's preventive action programs improve or eliminate potential causes of nonconforming product and/or nonconformance to the quality system. This preventive action process is a proactive and continuous process of improvement activities that can be initiated through feedback from clients, employees, business providers, and affiliates. The QA Department has the overall responsibility to ensure that the preventive action process is in place, and that relevant information on actions is submitted for management review.

Dedicating resources to an effective preventive action system emphasizes the laboratory's commitment to its QA Program. It is beneficial to identify and address negative trends before they develop into complaints, problems and corrective actions. Additionally, the laboratory continually strives to improve customer service and client satisfaction through continuous improvements to laboratory systems.

Opportunities for improvement may be discovered through any of the following:

- review of the monthly QA Metrics Report,
- trending NCMs,
- review of control charts and QC results,
- trending proficiency testing (PT) results,
- performance of management system reviews,
- trending client complaints,
- review of processing operations, or
- staff observations.

The monthly Management Systems Metrics Report shows performance indicators in all areas of the laboratory and quality system. These areas include revised reports, corrective actions, audit findings, internal auditing and data authenticity audits, client complaints, PT samples, holding time violations, SOPs, ethics training, etc. The metrics report is reviewed monthly by the laboratory management, NDSC QA Team, Local and Executive Mangement. These metrics are used in evaluating the management and quality system performance on an ongoing basis and provide a tool for identifying areas for improvement.

Items identified as continuous improvement opportunities to the management system may be issued as goals from the annual management systems review, recommendations from internal audits, white papers, Lessons Learned, Technical Services audit report, Technical Best Practices, or as Executive or management initiatives.

The laboratory's corrective action process is integral to implementation of preventive actions. A critical piece of the corrective action process is the implementation of actions to prevent further occurrence of a non-compliance event. Historical review of corrective action and non-conformances provides a valuable mechanism for identifying preventive action opportunities.

15.1.1 The following elements are part of a preventive action/process improvement system:

- Identification of an opportunity for preventive action or process improvement.

- Process for the preventive action or improvement.
- Define the measurements of the effectiveness of the process once undertaken.
- Execution of the preventive action or improvement.
- Evaluation of the plan using the defined measurements.
- Verification of the effectiveness of the preventive action or improvement.
- Close-Out by documenting any permanent changes to the Quality System as a result of the Preventive Action or Process Improvement. Documentation of Preventive Action/process Improvement is incorporated into the monthly QA reports, corrective action process and management review.

15.1.2 Any preventive actions/process improvement undertaken or attempted shall be taken into account during the annual Management Systems Review (Section 16). A highly detailed report is not required; however, a summary of successes and failures within the preventive action program is sufficient to provide management with a measurement for evaluation.

15.2 Management of Change

The Management of Change process is designed to manage significant events and changes that occur within the laboratory. This is routinely managed by the Laboratory Director with input from the General Manager, the QA Manager, Operations Manager, Technical Managers, Group Leaders, and IT support staff. Through these procedures, the potential risks inherent with a new event or change are identified and evaluated. The risks are minimized or eliminated through pre-planning and the development of preventive measures. The types of changes covered under this system include: Facility Changes, Major Accreditation Changes, Addition or Deletion to Division's Capabilities or Instrumentation, Key Personnel Changes, Laboratory Information Management System (LIMS) changes.

16.0 CONTROL OF RECORDS

The laboratory maintains a records management system appropriate to its needs and that complies with applicable standards or regulations as required. The system produces unequivocal, accurate records that document all laboratory activities. The laboratory retains all original observations, calculations and derived data, calibration records and a copy of the analytical report for a minimum of five years after it has been issued. Exceptions for programs with longer retention requirements are discussed in Section 16.1.2.

16.1 Overview

The laboratory has established procedures for identification, collection, indexing, access, filing, storage, maintenance and disposal of quality and technical records. A record index is listed in Table 16-1. More detailed information on retention of specific records is provided in NDSC Document Nos. CW-L-P-001, Records Retention Policy and CW-L-WI-001, Records Retention/Storage Schedule. Quality records are maintained by the QA department in a database, which is backed up as part of the regular laboratory backup. Records are of two types; either electronic or hard copy paper formats depending on whether the record is computer or hand generated (some records may be in both formats). Technical records are maintained by Group Leaders and the local IT staff.

Table 16-1. Record Index

	Record Types [1]:	**Retention Time:**
Technical Records	- Raw Data - Logbooks[2] - Standards - Certificates - Analytical Records - MDLs/IDLs/DOCs - Lab Reports	5 Years from analytical report issue*
Official Documents	- Quality Assurance Manual (QAM) - Work Instructions - Policies - SOPs - Policy Memorandums - Manuals - Published Methods	Indefinitely
QA Records	- Certifications - Method and Software Validation / Verification Data	Indefinitely
QA Records	- Internal & External Audits/Responses - Corrective/Preventive Actions - Management Reviews - Data Investigation	5 Years from archival* **Data Investigation:** 5 years or the life of the affected raw data storage whichever is greater (beyond 5 years if ongoing project or pending investigation)

	Record Types [1]:	Retention Time:
Project Records	- Sample Receipt & COC Documents - Contracts and Amendments - Correspondence - QAPP - SAP - Telephone Logbooks - Lab Reports	5 Years from analytical report issue*
Administrative Records	Financial and Business Operations	Refer to NDSC Doc. No. CW-L-WI-001
	EH&S Manual, Permits	Indefinitely
	Disposal Records	Indefinitely
	Employee Handbook	Indefinitely
	Personnel files, Employee Signature & Initials, Administrative Training Records (e.g., Ethics)	Refer to HR Manual
	Administrative Policies	Indefinitely
	Technical Training Records	7 years
	Legal Records	Indefinitely
	HR Records	Refer to NDSC Doc. No. CW-L-WI-001
	IT Records	Refer to NDSC Doc. No. CW-L-WI-001
	NDSC Governance Records	Refer to NDSC Doc. No. CW-L-WI-001
	Sales & Marketing	5 years
	Real Estate	Indefinitely

[1] Record Types encompass hardcopy and electronic records.
[2] Examples of Logbook types: Maintenance, Instrument Run, Preparation (standard and samples), Standard and Reagent Receipt, Archiving, Balance Calibration, Temperature (hardcopy or electronic records).
* Exceptions listed in Table 16-2.

16.1.1 All records are stored and retained in such a way that they are secure and readily retrievable at the laboratory facility. All records are protected against fire, theft, loss, environmental deterioration, and vermin. In the case of electronic records, electronic or magnetic sources, storage media are protected from deterioration caused by magnetic fields and/or electronic deterioration.

Access to the data is limited to laboratory and company employees and shall be documented with an access log**.** Records are maintained for a minimum of five years unless otherwise specified by a client or regulatory requirement.

Note: For the Ohio EPA VAP program the laboratory is required to notify Ohio EPA of its intent to dispose of any records.

For raw data and project records, record retention shall be calculated from the date the project report is issued. For other records, such as NDSC Documents, QA, or Administrative Records, the retention time is calculated from the date the record is formally retired. Records related to the programs listed in Table 16-2 have lengthier retention requirements and are subject to the requirements in Section 16.2.

16.2 Programs with Longer Retention Requirements

Some regulatory programs have longer record retention requirements than the standard record retention time. These are detailed in Table 16-2 with their retention requirements. In these cases, the longer retention requirement is enacted. If special instructions exist such that client data cannot be destroyed prior to notification of the client, the container or box containing that data is marked as to who to contact for authorization prior to destroying the data.

Table 16-2. Example: Special Record Retention Requirements

Program	[1]Retention Requirement
Drinking Water – All States	10 years (lab reports and raw data) 10 years - Radiochemistry (project records)
DOE Hanford	5 years, Written approval must be received from DOE Hanford prior to disposal of analytical data
FIFRA – 40 CFR Part 160	Retain for life of research or marketing permit for pesticides regulated by EPA
Housing and Urban Development (HUD) Environmental Lead Testing	10 years
Alaska	10 years
Louisiana – All	10 years
Michigan Department of Environmental Quality – all environmental data	10 years
NY Potable Water NTCRR Part 55-2	10 years
Ohio EPA VAP	10 years and State contacted prior to disposal
OSHA	30 years

[1]Note: Extended retention requirements must be noted with the archive documents or addressed in facility-specific records retention procedures.

16.2.1 The laboratory has procedures to protect and back-up records stored electronically and to prevent unauthorized access to or amendment of these records. All analytical data is maintained as hard copy or in a secure readable electronic format. For analytical reports that are maintained as copies in PDF format, refer to Section 19.15.1 for more information.

16.2.2 The record keeping system allows for historical reconstruction of all laboratory activities that produced the analytical data, as well as rapid recovery of historical data.The history of the sample from when the laboratory took possession of the samples must be readily understood through the documentation. This shall include inter-laboratory transfers of samples and/or extracts.

- The records include the identity of personnel involved in sampling, sample receipt, preparation, or testing. All analytical work contains the initials (at least) of the personnel involved. The laboratory's copy of the COC is stored with the invoice and the work order sheet generated by TALS. The chain of custody would indicate the name of the sampler.
- All information relating to the laboratory facilities' equipment, analytical test methods, and related laboratory activities, such as sample receipt, sample preparation, or data verification are documented.
- The record keeping system facilitates the retrieval of all working files and archived records for inspection and verification purposes (e.g., set format for naming electronic files, set

format for what is included with a given analytical data set. Instrument data is stored sequentially by instrument. A given day's analyses are maintained in the order of the analysis. Run logs are maintained for each instrument or method; a copy of each day's run log or instrument sequence is stored with the data to aid in re-constructing an analytical sequence. Where an analysis is performed without an instrument, bound logbooks or bench sheets are used to record and file data. Standard and reagent information is recorded in logbooks or entered into TALS for each method as required.

- Changes to hardcopy records shall follow the procedures outlined in Section 12 and 19. Changes to electronic records in LIMS or instrument data are recorded in audit trails.
- The reason for a signature or initials on a document is clearly indicated in the records such as "sampled by," "prepared by," "reviewed by", or "analyzed by".
- All generated data except those that are generated by automated data collection systems, are recorded directly, promptly and legibly in permanent dark ink.
- Hard copy data may be scanned into PDF format for record storage as long as the scanning process can be verified in order to ensure that no data is lost and the data files and storage media must be tested to verify the laboratory's ability to retrieve the information prior to the destruction of the hard copy that was scanned. . The procedure for scanning the records is discussed in CW-L-P-001, Records Retention Policy.
- Also refer to Section 19.15.1 'Computer and Electronic Data Related Requirements'.

16.3 Technical and Analytical Records

16.3.1 The laboratory retains records of original observations, derived data and sufficient information to establish an audit trail, calibration records, staff records and a copy of each analytical report issued, for a minimum of five years unless otherwise specified by a client or regulatory requirement. The records for each analysis shall contain sufficient information to enable the analysis to be repeated under conditions as close as possible to the original. The records shall include the identity of laboratory personnel responsible for the sampling, performance of each analysis and reviewing results.

16.3.2 Observations, data and calculations are recorded real-time and are identifiable to the specific task.

16.3.3 Changes to hardcopy records shall follow the procedures outlined in Section 12 and 19. Changes to electronic records in TALS or instrument data are recorded in audit trails.

The essential information to be associated with analysis, such as strip charts, tabular printouts, computer data files, analytical notebooks, and run logs, include:

- Laboratory sample ID code;
- Date of analysis; time of analysis is also required if the holding time is seventy-two (72) hours or less, or when time critical steps are included in the analysis (e.g., drying times, incubations, etc.); instrumental analyses have the date and time of analysis recorded as part of their general operations. Where a time critical step exists in an analysis, location for such a time is included as part of the documentation in a specific logbook or on a benchsheet.
- Instrumentation identification and instrument operating conditions/parameters. Operating conditions/parameters are typically recorded in instrument maintenance logs where available.
- Analysis type;

- All manual calculations and manual integrations;
- Laboratory Analyst's or operator's initials/signature;
- Sample preparation including cleanup, separation protocols, incubation periods or subculture, ID codes, volumes, weights, instrument printouts, meter readings, calculations, reagents;
- Test results;
- Standard and reagent origin, receipt, preparation, and use;
- Calibration criteria, frequency and acceptance criteria;
- Data and statistical calculations, review, confirmation, interpretation, assessment and reporting conventions;
- Quality control protocols and assessment;
- Electronic data security, software documentation and verification, software and hardware audits, backups, and records of any changes to automated data entries; and
- Method performance criteria including expected quality control requirements. These are indicated both in TALS and on specific analytical report formats.

16.3.4 All logbooks used during receipt, preparation, storage, analysis, and reporting of samples or monitoring of support equipment shall undergo a periodic, documented supervisory or peer review on a periodic basis.

16.4 Laboratory Support Activities

In addition to documenting all the above-mentioned activities, the following are retained QA records and project records (previous discussions in this section relate where and how these data are stored):

- All original raw data, whether hard copy or electronic, for calibrations, samples and quality control measures, including analysts' work sheets and data output records (chromatograms, strip charts, and other instrument response readout records);
- A written description or reference to the specific test method used which includes a description of the specific computational steps used to translate parametric observations into a reportable analytical value;
- Copies of final reports;
- Archived SOPs;
- Correspondence relating to laboratory activities for a specific project;
- All corrective action reports, audits and audit responses;
- Proficiency test results and raw data; and
- Results of data review, verification, and crosschecking procedures

16.4.1 Sample Handling Records

Records of all procedures to which a sample is subjected while in the possession of the laboratory are maintained. These include but are not limited to records pertaining to:

- Sample preservation including appropriateness of sample container and compliance with

holding time requirement;

- Sample identification, receipt, acceptance or rejection and login;
- Sample storage and tracking including shipping receipts, sample transmittal / COC forms; and
- Procedures for the receipt and retention of samples, including all provisions necessary to protect the integrity of samples.

16.5 Administrative Records

The laboratory also maintains the administrative records in either electronic or hard copy form. Refer to Table 16-1.

16.6 Records Management, Storage and Disposal

All records (including those pertaining to test equipment), certificates and reports are safely stored, held secure and in confidence to the client. Certification related records are available upon request.

All information necessary for the historical reconstruction of data is maintained by the laboratory. Records that are stored only on electronic media must be supported by the hardware and software necessary for their retrieval.

Records that are stored or generated by computers or personal computers have hard copy, write-protected backup copies, or an electronic audit trail controlling access**.**

The laboratory has a record management system for control of laboratory notebooks, instrument logbooks, standards logbooks, and project records. Laboratory notebooks are sequentially numbered by QA and issued to the analytical group as needed. Bench sheets are filed and archived with the project raw data. Completed logbooks are returned to QA for archive storage. Records are considered archived when moved to the archive server on the local area network or when logbooks are turned in to QA for storage. Access to archived hard-copy information is documented with in/out cards.

16.6.1 Transfer of Ownership

In the event that the laboratory transfers ownership or goes out of business, the laboratory shall ensure that the records are maintained or transferred according to client's instructions. Upon ownership transfer, record retention requirements shall be addressed in the ownership transfer agreement and the responsibility for maintaining archives is clearly established. In addition, in cases of bankruptcy, appropriate regulatory and state legal requirements concerning laboratory records must be followed. In the event of the closure of the laboratory, all records will revert to the control of NDSC. Should the entire company cease to exist, as much notice as possible will be given to clients and the accrediting bodies who have worked with the laboratory during the previous 5 years of such action.

16.6.2 Records Disposal

Records are removed from the archive and destroyed after 5 years unless otherwise specified by a client or regulatory requirement. On a project specific or program basis, clients may need to be notified prior to record destruction. Records are destroyed in a manner that ensures their confidentiality such as shredding, mutilation or incineration. (Refer to Tables 16-1 and 16-2).

Electronic copies of records must be destroyed by erasure or physically damaging off-line storage media so no records can be read.

If a third party records management company is hired to dispose of records, a “Certificate of Destruction” is required. [Refer to Policy No. CW-L-P-001 (Records Retention).]

17.0 AUDITS

17.1 Internal Audits

Internal audits are performed to verify that laboratory operations comply with the requirements of the lab's quality system and with the external quality programs under which the laboratory operates. Audits are planned and organized by the QA staff. Personnel conducting the audits should be independent of the area being evaluated. Auditors will have sufficient authority, access to work areas, and organizational freedom necessary to observe all activities affecting quality and to report the assessments to laboratory management and, when requested, to Executive Management.

Audits are conducted and documented as described in the <NDSC Document No. on performing Internal Auditing, SOP No. CW-Q-S-003. The types and frequency of routine internal audits are described in Table 17-1. Special or ad hoc assessments may be conducted as needed under the direction of the QA staff.

Table 17-1. Types of Internal Audits and Frequency

Description	Performed by	Frequency
Quality Systems Audits	QA Department, QA approved designee, or NDSC QA	All areas of the laboratory annually
Method Audits QA Technical Audits	Joint responsibility: a) QA Manager or designee b) Technical Manager or Designee (Refer to NDSC CW-Q-S-003)	QA Technical Audits Frequency: 50% of methods annually
SOP Method Compliance	Joint responsibility: a) QA Manager or designee b) Technical Manager or Designee (Refer to NDSC CW-Q-S-003)	SOP Compliance Review Frequency: • Every 2 years • Every 1 year (Drinking Water Methods) • 100% of SOPs annually (DoD/DOE Labs)
Special	QA Department or Designee	Surveillance or spot checks performed as needed, e.g., to confirm corrective actions from other audits.
Performance Testing	Analysts with QA oversight	Two successful per year for each TNI-field of testing or as dictated by regulatory requirements

17.1.1 Annual Quality Systems Audit

An annual quality systems audit is required to ensure compliance to analytical methods and SOPs, Eurofins Data Integrity and Ethics Policies (see Sec. 7.2), TNI quality systems, client and

state requirements, and the effectiveness of the internal controls of the analytical process, including but not limited to data review, quality controls, preventive action and corrective action. The completeness of earlier corrective actions is assessed for effectiveness & sustainability. The audit is divided into sections for each operating or support area of the lab, and each section is comprehensive for a given area. The area audits may be performed on a rotating schedule throughout the year to ensure adequate coverage of all areas. This schedule may change as situations in the laboratory warrant.

Note: Part of the quality systems audit relates to regulatory compliance. An assessment of the laboratory's compliance to regulatory requirements is performed by Corporate QA through monthly management reports, review of client and regulatory concerns and also through periodic on-site evaluations.

The annual quality systems audit must include a review of logbooks and benchsheets used in laboratory areas as well as the items listed in the Internal Audit Checklists as described in SOP CW-Q-S-003.

17.1.2 QA Technical Audits

QA technical audits assess data authenticity and analyst integrity. These audits are based on client projects, associated sample delivery groups, and the methods performed. Reported results are compared to raw data to verify the authenticity of results. The validity of calibrations and QC results are compared to data qualifiers, footnotes, and case narratives. Documentation is assessed by examining run logs and records of manual integrations. Manual calculations are checked. Where possible, electronic audit miner programs (e.g., Chrom AuditMiner) are used to identify unusual manipulations of the data deserving closer scrutiny. QA technical audits will include all methods within a two-year period.

The QA Technical Audits must include a review of raw sample data, calibration data and QC data records.

17.1.3 SOP Method Compliance

Compliance of all SOPs with the source methods and compliance of the operational groups with the SOPs will be assessed by the Technical Manager or qualified designee at least every two years. (Annually for methods and administrative SOPs related to DoD/DOE programs and DW compliance methods. - where applicable) It is also recommended that the work of each newly hired analyst is assessed within 3 months of working independently, (e.g., completion of method IDOC). In addition, as analysts add methods to their capabilities, (new IDOC) reviews of the analyst work products will be performed within 3 months of completing the documented training.

17.1.4 Special Audits

Special audits are conducted on an as needed basis, generally as a follow up to specific issues such as client complaints, corrective actions, PT results, data audits, system audits, validation comments, regulatory audits or suspected ethical improprieties. Special audits are focused on a specific issue, and report format, distribution, and timeframes are designed to address the nature of the issue.

17.1.5 Performance Testing

The laboratory participates semi-annually in performance audits conducted through the analysis of PT samples provided by a third party. The laboratory generally participates in the following types of PT studies: Drinking Water, Non-potable Water, Soil, Tissue and Air.

It is Eurofins policy that PT samples be treated as typical samples in the production process. Furthermore, where PT samples present special or unique problems, in the regular production process they may need to be treated differently, as would any special or unique request submitted by any client. The QA Manager must be consulted and in agreement with any decisions made to treat a PT sample differently due to some special circumstance.

Written investigations for unacceptable PT results are required. In some cases it may be necessary for blind QC samples to be submitted to the laboratory to show a return to control.

17.2 External Audits

External audits are performed when certifying agencies or clients conduct on-site inspections or submit performance testing samples for analysis. It is Eurofins TestAmerica policy to cooperate fully with regulatory authorities and clients. The laboratory makes every effort to provide the auditors with access to personnel, documentation, and assistance. Laboratory supervisors are responsible for providing corrective actions to the QA Manager who coordinates the response. Audit responses are due in the time allotted by the client or agency performing the audit.

The laboratory cooperates with clients and their representatives to monitor the laboratory's performance in relation to work performed for the client. The client may only view data and systems related directly to the client's work. All efforts are made to keep other client information confidential.

17.2.1 Confidential Business Information (CBI) Considerations

During on-site audits, auditors may come into possession of information claimed as business confidential. A business confidentiality claim is defined as "a claim or allegation that business information is entitled to confidential treatment for reasons of business confidentiality or a request for a determination that such information is entitled to such treatment." When information is claimed as business confidential, the laboratory must place on (or attach to) the information at the time it is submitted to the auditor, a cover sheet, stamped or typed legend or other suitable form of notice, employing language such as "trade secret", "proprietary" or "company confidential". Confidential portions of documents otherwise non-confidential must be clearly identified. CBI may be purged of references to client identity by the responsible laboratory official at the time of removal from the laboratory. However, sample identifiers may not be obscured from the information. Additional information regarding CBI can be found in within the 2009 and 2016 TNI standards.

17.3 Audit Findings

Audit findings are documented using the corrective action process and database (see Section 14). This database provides a record of the audit findings for each laboratory area and recommended corrective actions to the appropriate Group Leader. The laboratory corrective action is compiled by QA and responses to external audits are signed by the QA Manager and the Laboratory Director

The laboratory's corrective action responses may include action plans that could not be completed within a predefined timeframe. In these instances, a completion date must be set and agreed to by operations management and the QA Manager.

Developing and implementing corrective actions to findings is the responsibility of the Group Leader where the finding originated. Findings that are not corrected by specified due dates are reported monthly to management in the QA monthly report.

If any audit finding casts doubt on the effectiveness of the operations or on the correctness or validity of the laboratory's test results, the laboratory shall take timely corrective action, and shall notify clients in writing if the investigations show that the laboratory results have been affected. Once corrective action is implemented, a follow-up audit is scheduled to ensure that the problem has been corrected.

Clients must be notified promptly in writing of any event such as the identification of defective measuring or test equipment that casts doubt on the validity of results given in any test report or amendment to a test report. The investigation must begin within 24 hours of discovery of the problem and all efforts are made to notify the client within two weeks after the completion of the investigation.

18.0 MANAGEMENT REVIEWS

18.1 Quality Assurance Report

The QA Department is responsible for preparing a comprehensive monthly metrics report to Management to keep them apprised of current quality issues. This report fosters communication, review, and refinement of the QA system to evaluate the suitability of policies and procedures to meet both regulatory and laboratory quality objectives.

The NDSC QA team compiles information from all of the Environment Testing laboratories monthly metrics reports for the Executive Management team. This report includes notable information and concerns regarding the laboratories QA program and a listing of new regulations that may potentially impact the laboratories.

18.2 Annual Management Review

The Laboratory Management team (Laboratory Director, Technical Managers, QA Manager) conducts a review annually of its quality systems to ensure its continuing suitability and effectiveness in meeting client and regulatory requirements and to introduce any necessary changes or improvements. It will also provide a platform for defining goals, objectives and action items that feed into the laboratory planning system. NDSC personnel is be included in this meeting at the discretion of the Laboratory Director. The LIMS review consists of examining any audits, complaints or concerns that have been raised through the year that are related to LIMS. The laboratory will summarize any critical findings that cannot be solved by the lab and report them to Corporate IT.

This management systems review (NDSC Document No. CW-Q-S-004 and Work Instruction No. CW-Q-WI-003) uses information generated during the preceding year to assess the “big picture” by ensuring that routine actions taken and reviewed on a monthly basis are not components of larger systematic concerns. The monthly review should keep the quality systems current and effective, therefore, the annual review is a formal senior management process to review specific existing documentation. Significant issues from the following documentation are compiled or summarized by the QA Manager prior to the review meeting:

- Matters arising from the previous annual review.
- Prior Monthly QA Reports issues.
- Laboratory QA Metrics.
- Review of report reissue requests.
- Review of client feedback and complaints.
- Issues arising from any prior management or staff meetings.
- Minutes from prior senior lab management meetings. Issues that may be raised from these meetings include:
    - Adequacy of staff, equipment and facility resources.
    - Adequacy of policies and procedures.
    - Future plans for resources and testing capability and capacity.

- The annual internal double blind PT program sample performance (if performed),
- Compliance to the Ethics Policy and Data Integrity Plan. Including any evidence/incidents of inappropriate actions or vulnerabilities related to data Integrity.
- For labs analyzing radioactive samples, also include the following:
  - Radiation health and safety
  - Radioactive hazardous waste management
  - Radioactive materials management
- Evaluation of overall risk, including risks to impartiality, confidentiality, reporting statements of conformity, and nonconforming work.

A report is generated by the QA Manager and management. The report is distributed to the Laboratory Manager, President of the Business Unit, Business Unit Manager. The report includes, but is not limited to:

- The date of the review and the names and titles of participants.
- A reference to the existing data quality related documents and topics that were reviewed.
- Quality system or operational changes or improvements that will be made as a result of the review [e.g., an implementation schedule including assigned responsibilities for the changes (Action Table)].

Changes to the quality systems requiring update to the laboratory QA Manual shall be included in the next revision of the QA Manual.

18.3 Potential Integrity Related Managerial Reviews

Potential integrity issues (data or business related) must be handled and reviewed in a confidential manner until such time as a follow-up evaluation, full investigation, or other appropriate actions have been completed and issues clarified. <The NDSC Document No. CW-L-S-002, Internal Investigations, shall be followed. All investigations that result in finding of inappropriate activity are documented and include any disciplinary actions involved, corrective actions taken, and all appropriate notifications of clients.

The Eurofins Environment Testing America Presidents, Business Unit Managers, Laboratory Directors, NDSC Team are informed of any current data integrity or data recall investigations via the monthly metrics report.

19.0 TEST METHODS AND METHOD VALIDATION

19.1 Overview

The laboratory uses methods that are appropriate to meet our clients' requirements and that are within the scope of the laboratory's capabilities. These include sampling, handling, transport, storage and preparation of samples, and, where appropriate, an estimation of the measurement of uncertainty as well as statistical techniques for analysis of environmental data.

Instructions are available in the laboratory for the operation of equipment as well as for the handling and preparation of samples. All instructions, Standard Operating Procedures (SOPs), reference methods and manuals relevant to the working of the laboratory are readily available to all staff. Deviations from published methods are documented (with justification) in the laboratory's approved SOPs. SOPs are submitted to clients for review at their request. Significant deviations from published methods require client approval and regulatory approval where applicable.

19.2 Standard Operating Procedures (SOPs)

The laboratory maintains SOPs that accurately reflect all phases of the laboratory such as assessing data integrity, corrective actions, handling customer complaints as well as all analytical methods and sampling procedures. The method SOPs are derived from the most recently promulgated/approved, published methods and are specifically adapted to the laboratory facility. Modifications or clarifications to published methods are clearly noted in the SOPs. All SOPs are controlled in the laboratory.

- All SOPs contain a revision number, effective date, and appropriate approval signatures. Controlled copies are available to all staff.
- Procedures for writing an SOP are incorporated by reference to NDSC Document No. CW-Q-S-002, Writing a Standard Operating Procedure, or the laboratory's SOP KNOX-QA-0018 "Preparation and Management of Standard Operating Procedures."
- SOPs are reviewed at a minimum of every 2 years (annually for Drinking Water and DoD/DOE SOPs), and where necessary, revised to ensure continuing suitability and compliance with applicable requirements.

  Note: The laboratory must ensure laboratory analysts comply with the procedures in its VAP approved SOPs.

19.3 Laboratory Methods Manual

For each test method, the laboratory shall have available the published referenced method as well as the laboratory developed SOP.

Note: If more stringent standards or requirements are included in a mandated test method or regulation than those specified in this manual, the laboratory shall demonstrate that such requirements are met. If it is not clear which requirements are more stringent, the standard from the method or regulation is to be followed. Any exceptions or deviations from the referenced methods or regulations are noted in the specific analytical SOP.

The laboratory maintains an SOP Index for both technical and non-technical SOPs. Technical SOPs are maintained to describe a specific test method. Non-technical SOPs are maintained to describe functions and processes not related to a specific test method.

19.4 Selection of Methods

Since numerous methods and analytical techniques are available, continued communication between the client and laboratory is imperative to assure the correct methods are utilized. Once client methodology requirements are established, this and other pertinent information is summarized by the PM. These mechanisms ensure that the proper analytical methods are applied when the samples arrive for log-in. For non-routine analytical services (e.g., special matrices, non-routine compound lists), the method of choice is selected based on client needs and available technology. The methods selected should be capable of measuring the specific parameter of interest, in the concentration range of interest, and with the required precision and accuracy.

19.4.1 Sources of Methods

Routine analytical services are performed using standard EPA-approved methodology. In some cases, modification of standard approved methods may be necessary to provide accurate analyses of particularly complex matrices. When the use of specific methods for sample analysis is mandated through project or regulatory requirements, only those methods shall be used.

When clients do not specify the method to be used or methods are not required, the methods used will be clearly validated and documented in an SOP and available to clients and/or the end user of the data.

Refer to Appendix 6 for a list of the currently accepted U.S. EPA analytical method references used by the laboratory.

The laboratory reviews updated versions to all the aforementioned references for adaptation based upon capabilities, instrumentation, etc., and implements them as appropriate. As such, the laboratory strives to perform only the latest versions of each approved method as regulations allow or require.

Other reference procedures for non-routine analyses may include methods established by specific states (e.g., Underground Storage Tank methods), ASTM or equipment manufacturers. Sample type, source, and the governing regulatory agency requiring the analysis will determine the method utilized.

The laboratory informs the client when a method proposed by the client may be inappropriate or out of date. After the client has been informed, and they wish to proceed contrary to the laboratory's recommendation, it will be documented.

19.4.1.1 Client Supplied Methods

Most of the client-supplied method requirements presented to us involve achieving specific quality control criteria, limits of quantitation (LOQ), and/or method detection limits (MDL) using standard EPA methods. These requirements are communicated to the appropriate technical groups prior to the project start up. Each technical group evaluates the scope of work and the requirements to ensure the criteria can be met using the standard EPA method. The data is monitored to ensure the criteria are met throughout the project. The PM notifies the client if

there is a more appropriate method available or if the client's criteria cannot be achieved on a certain sample matrix (i.e., due to matrix or dilutions).

Occasionally, we are asked to transfer a non-standardized method from a client into our lab or to develop a new method, when one is not available. In the case of a method transfer, we set up the client's method and perform some initial evaluation. After the initial evaluation, we may make recommendations on how to improve method performance. If the method appears to be adequate, we determine linearity, specificity, precision, accuracy, MDL, and LOQ by performing calibrations, analyzing method blanks, and carrying out method detection limit and IDOC studies.

In the case of method development, we work with the client and/or data user to determine the level of validation required ensuring that the method meets its intended purpose. In addition to the elements above, we also determine standard and sample stability and robustness depending on the scope of the project. Typically, a standard operating procedure is written and submitted to the client with the results of the validation. These steps are completed prior to analysis of field samples. Data related to the setup of the method are archived.

19.4.2 Demonstration of Capability

Before the laboratory may institute a new method and begin reporting results, the laboratory shall confirm that it can properly operate the method. In general, this demonstration does not test the performance of the method in real world samples, but in an applicable and available clean matrix sample. If the method is for the testing of analytes that are not conducive to spiking, demonstration of capability may be performed on quality control samples.

A demonstration of capability (DOC, Lab SOP # KNOX-QA-0009) is performed whenever there is a change in instrument type (e.g., new instrumentation), matrix, method or personnel (e.g., analyst has not performed the test within the last 12 months).

Note: The laboratory shall have a DOC for all analytes included in the methods that the laboratory performs, and proficiency DOCs for each analyst shall include all analytes that the laboratory routinely performs. Addition of non-routine analytes does not require new DOCs for all analysts if those analysts are already qualified for routine analytes tested using identical chemistry and instrument conditions.

The initial demonstration of capability must be thoroughly documented and approved by the Technical Manager and QA Manager prior to independently analyzing client samples. All associated documentation must be retained in accordance with the laboratory's archiving procedures.

The laboratory must have an approved SOP, demonstrate satisfactory performance, and conduct an MDL study (when applicable). There may be other requirements as stated within the published method or regulations (e.g., retention time window study).

Note: In some instances, a situation may arise where a client requests that an unusual analyte be reported using a method where this analyte is not normally reported. If the analyte is being reported for regulatory purposes, the method must meet all procedures outlined within this QA Manual (SOP, MDL, and Demonstration of Capability). If the client states that the information is not for regulatory purposes, the result may be reported as long as the following criteria are met:

- The instrument is calibrated for the analyte to be reported using the criteria for the method and ICV/CCV criteria are met (unless an ICV/CCV is not required by the method or criteria are per project DQOs).

- The laboratory's nominal or default reporting limit (RL) is equal to the quantitation limit (QL), must be at or above the lowest non-zero standard in the calibration curve and must be reliably determined. Project RLs are client specified reporting levels which may be higher than the QL. Results reported below the QL must be qualified as estimated values. Also, see Section 19.6.1.3, Relationship of Limit of Detection (LOD) to Quantitation Limit (QL).
- The client request is documented and the lab informs the client of its procedure for working with unusual compounds. The final report must be footnoted: *Reporting Limit based on the low standard of the calibration curve.*

19.4.3 Initial Demonstration of Capability (IDOC) Procedures

19.4.3.1 A quality control sample shall be obtained from an outside source. If not available, the QC sample may be prepared by the laboratory using stock standards that are prepared independently from those used in instrument calibration.

19.4.3.2 The analyte(s) shall be diluted in a volume of clean matrix sufficient to prepare four aliquots at the concentration specified by the method or the laboratory SOP.

19.4.3.3 At least four aliquots are prepared (including any applicable routine clean-up procedures) and analyzed according to the test method (either concurrently or over a period of days).

19.4.3.4 Using all of the results, calculate the mean recovery in the appropriate reporting units and the standard deviation for each parameter of interest.

19.4.3.5 When it is not possible to determine the mean and standard deviation, such as for presence, absence and logarithmic values, the laboratory will assess performance against criteria described in the laboratory SOP.

19.4.3.6 Compare the information obtained above to the corresponding acceptance criteria for precision and accuracy in the test method (if applicable) or in laboratory generated acceptance criteria (LCS or interim criteria) if there is no mandatory criteria established. If any one of the parameters do not meet the acceptance criteria, the performance is unacceptable for that parameter.

19.4.3.7 When one or more of the tested parameters fail at least one of the acceptance criteria, the analyst must proceed according to either option listed below:

• Locate and correct the source of the problem and repeat the test for all parameters of interest beginning with 19.4.3.3 above.

• Beginning with 19.4.3.3 above, repeat the test for all parameters that failed to meet criteria. Repeated failure, however, will confirm a general problem with the measurement system. If this occurs, locate and correct the source of the problem and repeat the test for all compounds of interest beginning with 19.4.3.1 above.

Note: Results of successive LCS analyses can be used to fulfill the DOC requirement.

19.4.3.8 Refer to SOP KNOX-QA-0009, Personnel Orientation and Training for further details.

Methods on line prior to the effective date of this Section shall be updated to the procedures outlined above as new analysts perform their demonstration of capability. A copy of the new record will replace that which was used for documentation in the past. At a minimum, the precision and accuracy of four mid-level laboratory control samples must have been compared to the laboratory's quality control acceptance limits.

19.5 Laboratory Developed Methods and Non-Standard Methods

Any new method developed by the laboratory must be fully defined in an SOP and validated by qualified personnel with adequate resources to perform the method. Method specifications and the relation to client requirements must be clearly conveyed to the client if the method is a non-standard method (not a published or routinely accepted method). The client must also be in agreement to the use of the non-standard method.

19.6 Validation of Methods

Validation is the confirmation by examination and the provision of objective evidence that the particular requirements for a specific intended use are fulfilled.

All non-standard methods, laboratory designed/developed methods, standard methods used outside of their scope, and major modifications to published methods must be validated to confirm they are fit for their intended use. The validation will be as extensive as necessary to meet the needs of the given application. The results are documented with the validation procedure used and contain a statement as to the fitness for use.

19.6.1 Method Validation and Verification Activities for All New Methods

While method validation can take various courses, the following activities can be required as part of method validation. Method validation records are designated QC records and are archived accordingly.

When changes are made to any validated methods, the influence of such changes shall be documented and, if appropriate, a new validation shall be performed.

19.6.1.1 **Determination of Method Selectivity** – Method selectivity is the demonstrated ability to discriminate the analyte(s) of interest from other compounds in the specific matrix or matrices from other analytes or interference. In some cases to achieve the required selectivity for an analyte, a confirmation analysis is required as part of the method.

19.6.1.2 **Determination of Method Sensitivity** – Sensitivity can be both estimated and demonstrated. Whether a study is required to estimate sensitivity depends on the level of method development required when applying a particular measurement system to a specific set of samples. Detection limit studies are conducted as described in Section 19.7. Where other protocols for estimations and/or demonstrations of sensitivity are required by regulation or client agreement, these shall be followed.

19.6.1.3 **Relationship of Limit of Detection (LOD) to the Limit of Quantitation (LOQ)** – An important characteristic of expression of sensitivity is the distinction between the LOD and the LOQ. The LOD is the minimum level at which the presence of an analyte can be reliably concluded. The LOQ is the minimum concentration of analyte that can be quantitatively determined with acceptable precision and bias, equivalent to the laboratory's routine reporting limit (RL). For most instrumental measurement systems, there is a region where semi-quantitative data is generated around the LOD (both above and below the estimated MDL or LOD) and below the LOQ. In this region, detection of an analyte may be confirmed but quantification of the analyte is unreliable within the accuracy and precision guidelines of the measurement system. When an analyte is detected below the LOQ, and the presence of the analyte is confirmed by meeting the qualitative identification criteria for the analyte, the analyte can be reliably reported, but the amount of the analyte can only be estimated. If data is to be reported in this region, it must be done so with a qualification that denotes the semi-quantitative nature of the result.

19.6.1.4 **Determination of Interferences** – A determination that the method is free from interferences in a blank matrix is performed.

19.6.1.5 **Determination of Range** – Where appropriate to the method, the quantitation range is determined by comparison of the response of an analyte in a curve to established or targeted criteria. Generally the upper quantitation limit is defined by highest acceptable calibration concentration. The lower quantitation limit or QL cannot be lower than the lowest non-zero calibration level, and can be constrained by required levels of bias and precision.

19.6.1.6 **Determination of Accuracy and Precision** – Accuracy and precision studies are generally performed using replicate analyses, with a resulting percent recovery and measure of reproducibility (standard deviation, relative standard deviation) calculated and measured against a set of target criteria.

19.6.1.7 **Documentation of Method** – The method is formally documented in an SOP. If the method is a minor modification of a standard laboratory method that is already documented in an SOP, an SOP Attachment describing the specific differences in the new method is acceptable in place of a separate SOP.

19.6.1.8 **Continued Demonstration of Method Performance** – Continued demonstration of method performance is addressed in the SOP. Continued demonstration of method performance is generally accomplished by batch specific QC samples such as LCS, method blanks or PT samples.

19.7 Method Detection Limit (MDL) / Limits of Detection (LOD)

The MDL is the minimum measured quantity of a substance that can be reported with 99% confidence that the concentration is distinguishable from method blank results, consistent with 40CFR Part 136 Appendix B, August, 2017. The MDL is equivalent to the TNI LOD or DL, and is also equivalent to the DoD/DOE Quality Systems Manual (QSM) DL. The working or final MDL is the higher of the MDL value determined from spikes (MDLs) and the MDL value determined from blanks (MDLb). An initial MDL study shall be performed during the method validation process and when the method is altered in a way that can reasonably be expected to change its sensitivity. On-going data are collected during each quarter in which samples are being analyzed. At least once every 13 months the MDLs and MDLb are re-calculated and re-evaluated using data collected during the preceding period. Details of the laboratory's procedure for conducting MDL studies are given in NDSC Document No. CA-Q-S-006.

19.8 Verification of Detection Limits

If it is found during the re-evaluation of detection limit results that more than 5% of the spiked samples do not return positive numeric results that meet all method qualitative identification criteria, then then spiking level shall be increased and the initial MDL study pre-performed at the new spiking concentration. For DoD/DOE labs, additional guidance provided in NDSC Document No. No. CA-Q-S-006 - Attachment 2.

19.9 Instrument Detection Limits (IDL)

The IDL is sometimes used to assess the reasonableness of the MDL or in some cases required by the analytical method or program requirements. IDLs are most commonly used in metals analyses but may be useful in demonstration of instrument performance in other areas.

IDLs are calculated to determine an instrument's sensitivity independent of any preparation method. IDLs are calculated either using 7 replicate spike analyses, like MDL but without

sample preparation, or by the analysis of 10 instrument blanks and calculating 3 x the absolute value of the standard deviation.

19.10 Limit of Quantitation

The LOQ shall be at a concentration equivalent to the lowest calibration standard concentration, with the exception of methods using a single-point calibration, and shall be greater than the MDL. The LOQ is verified by preparing and analyzing spikes at concentrations 1-2X the selected LOQ, employing the complete analytical process. For DoD/DOE labs, additional requirements provided in NDSC Document No. CA-Q-S-006.

When the laboratory establishes a quantitation limit, it must be initially verified by the analysis of a low level standard or QC sample at 1-2 times the reporting limit or by a DL check samples at or below the LOQ. The LOQ is verified annually thereafter. The annual requirement is waived for methods that have an annually verified MDL. The laboratory will comply with any regulatory requirements.

19.11 Retention Time Windows

Most organic analyses and some inorganic analyses use chromatography techniques for qualitative and quantitative determinations. For every chromatography analysis or as specified in the reference method, each analyte will have a specific time of elution from the column to the detector. This is known as the analyte's retention time. The variance in the expected time of elution is defined as the retention time window. As the key to analyte identification in chromatography, retention time windows must be established on every column for every analyte used for that method. These records are kept on-file and available for review. Complete details are available in the laboratory SOPs.

19.12 Evaluation of Selectivity

The laboratory evaluates selectivity by following the checks within the applicable analytical methods, which include mass spectral tuning, mass resolution, second column confirmation, ICP interelement interference checks, chromatography retention time windows, and method blanks.

19.13 Estimation of Uncertainty of Measurement

19.13.1 Uncertainty is "a parameter associated with the result of a measurement, that characterizes the dispersion of the values that could reasonably be attributed to the measurand" (as defined by the International Vocabulary of Basic and General Terms in Metrology, ISO Geneva, 1993, ISBN 92-67-10175-1). Knowledge of the uncertainty of a measurement provides additional confidence in a result's validity. Its value accounts for all the factors which could possibly affect the result, such as adequacy of analyte definition, sampling, matrix effects and interferences, climatic conditions, variances in weights, volumes, and standards, analytical procedure, and random variation. Some national accreditation organizations require the use of an "expanded uncertainty" defined as the range within which the value of the measurand is believed to lie within at least a 95% confidence level with the coverage factor k=2.

19.13.2 Uncertainty is not error. Error is a single value (i.e., the difference between the true result and the measured result). On environmental samples, the true result is never known. The measurement is the sum of the unknown true value and the unknown error. Unknown error is a combination of systematic error, or bias, and random error. Bias varies predictably,

constantly, and independently from the number of measurements. Random error is unpredictable, assumed to be Gaussian in distribution, and reducible by increasing the number of measurements.

19.13.3 The minimum uncertainty associated with results generated by the laboratory can be determined by using the Laboratory Control Sample (LCS) accuracy range for a given analyte. The LCS limits are used to assess the performance of the measurement system since they take into consideration all of the laboratory variables associated with a given test over time (except for variability associated with the sampling and the variability due to matrix effects). The percent recovery of the LCS is compared either to the method-required LCS accuracy limits or to the statistical, historical, in-house LCS accuracy limits.

19.13.4 To calculate the uncertainty for the specific result reported, multiply the result by the decimal of the lower end of the LCS range percent value for the lower end of the uncertainty range, and multiply the result by the decimal of the upper end of the LCS range percent value for the upper end of the uncertainty range. These calculated values represent uncertainties at approximately the 99% confidence level with a coverage factor of k = 3. As an example, for a reported result of 1.0 mg/L with an LCS recovery range of 50 to 150%, the estimated uncertainty in the result would be 1.0 +/- 0.5 mg/L.

19.13.5 Refer to SOP KNOX-QA-0019 “Estimation of Measurement Uncertainty” for details regarding calculations that may be used to estimate measurement uncertainty associated with laboratory results.

19.13.6 In the case where a well-recognized test method specifies limits to the values of major sources of uncertainty of measurement (e.g., 524.2, 525, etc.) and specifies the form of presentation of calculated results, no further discussion of uncertainty is required.

19.14 Sample Reanalysis Guidelines

Because there is a certain level of uncertainty with any analytical measurement, a sample re-preparation (where appropriate) and subsequent analysis (hereafter referred to as ‘reanalysis’) may result in either a higher or lower value from an initial sample analysis. There are also variables that may be present (e.g., sample homogeneity, analyte precipitation over time, etc.) that may affect the results of a reanalysis. Based on the above comments, the laboratory will reanalyze samples at a client’s request with the following caveats. Client specific Contractual Terms & Conditions for reanalysis protocols may supersede the following items.

Homogenous samples: If a reanalysis agrees with the original result to within the RPD limits for MS/MSD or Duplicate analyses, or within $\pm$ 1 reporting limit for samples $\leq$ 5x the reporting limit, the original analysis will be reported. At the client’s request, both results may be reported on the same report but not on two separate reports.

- If the reanalysis does not agree (as defined above) with the original result, then the laboratory will investigate the discrepancy and reanalyze the sample a third time for confirmation if sufficient sample is available.
- Any potential charges related to reanalysis are discussed in the contract terms and conditions or discussed at the time of the request. The client will typically be charged for reanalysis unless it is determined that the lab was in error.
- Due to the potential for increased variability, reanalysis may not be applicable to Non-homogenous, Encore, and Sodium Bisulfate preserved samples. See the Area Supervisor or Laboratory Director if unsure.

19.15 Control of Data

The laboratory has policies and procedures in place to ensure the authenticity, integrity, and accuracy of the analytical data generated by the laboratory.

19.15.1 Computer and Electronic Data Related Requirements

The three basic objectives of our computer security procedures and policies are shown below.

The laboratory is currently using the Eurofins LIMS system, which has been highly customized to meet the needs of the laboratory.

19.15.1.1 Maintain the Database Integrity – Assurance that data is reliable and accurate through data verification (review) procedures, password-protecting access, anti-virus protection, data change requirements, as well as an internal LIMS permissions procedure.

- LIMS Database Integrity is achieved through data input validation, internal user controls, documentation of system failures and corrective actions taken, and data change requirements.
- Spreadsheets and other software developed in-house must be verified with documentation through hand calculations prior to use. Cells containing calculations must be lock-protected and controlled.
- Instrument hardware and software adjustments are safeguarded through maintenance logs, audit trails and controlled access.

19.15.1.2 Ensure Information Availability – Protection against loss of information or service is ensured through scheduled back-ups, stable file server network architecture, secure storage of media, line filter, Uninterruptible Power Supply (UPS), and maintaining older versions of software as revisions are implemented.

19.15.1.3 Maintain Confidentiality – Ensure data confidentiality through physical access controls such as password protection or website access approval when electronically transmitting data.

19.15.2 Data Reduction

The complexity of the data reduction depends on the analytical method and the number of discrete operations involved (e.g., extractions, dilutions, instrument readings and concentrations). The analyst calculates the final results from the raw data or uses appropriate computer programs to assist in the calculation of final reportable values.

For manual data entry, e.g., Wet Chemistry, the data is reduced by the analyst and then verified by the Department Manager or alternate analyst prior to updating the data in LIMS. The spreadsheets, or any other type of applicable documents, are signed by both the analyst and alternate reviewer to confirm the accuracy of the manual entry(s).

Manual integration of peaks will be documented and reviewed and the raw data will be flagged using NDSC Document No. CA-Q-S-002, Acceptable Manual Integration Practices.

Analytical results are reduced to appropriate concentration units specified by the analytical method, taking into account factors such as dilution, sample weight or volume, etc. Blank correction will be applied only when required by the method or per manufacturer's indication; otherwise, it should not be performed. Calculations are independently verified by appropriate laboratory staff. Calculations and data reduction steps for various methods are summarized in the respective analytical SOPs or program requirements.

19.15.2.1 All raw data must be retained in the worklist folder, computer file (if appropriate), and/or runlog. All criteria pertinent to the method must be recorded. The documentation is recorded at the time observations or calculations are made and must be signed or initialed/dated (month/day/year). It must be easily identifiable who performed which tasks if multiple people were involved.

(**Note:** This section does not apply to the Ohio VAP as all computations are done by the instrument data system and by the LIMS.)

19.15.2.2 In general, concentration results are reported in milligrams per liter (mg/l) or micrograms per liter (µg/l) for liquids and milligrams per kilogram (mg/kg) or micrograms per kilogram (µg/kg) for solids. For values greater than 10,000 mg/l, results can be reported in percent, i.e., 10,000 mg/l = 1**%.** Units are defined in each lab SOP.

19.15.2.3 In reporting, the analyst or the instrument output records the raw data result using values of known certainty plus one uncertain digit. If final calculations are performed external to LIMS, the results should be entered in LIMS with at least three significant figures. In general, results are reported to 2 significant figures on the final report.

19.15.2.4 For those methods that do not have an instrument printout or an instrumental output compatible with the LIMS, the raw results and dilution factors are entered directly into LIMS by the analyst, and the software calculates the final result for the analytical report. LIMS has a formatter for significant figure criterion for each analyte.

19.15.2.5 The laboratory strives to import data directly from instruments or calculation spreadsheets to ensure that the reported data are free from transcription and calculation errors. For those analyses with an instrumental output compatible with the LIMS, the raw results and dilution factors are transferred into LIMS, electronically after reviewing the quantitation report, and removing unrequested or poor spectrally-matched compounds. The analyst prints a copy of what has been entered to check for errors. This printout and the instrument's printout of calibrations, concentrations, retention times, chromatograms, and mass spectra, if applicable, are retained with the data file. The data file is stored in a monthly folder on the instrument computer; periodically, this file is transferred to the server and, eventually, to a tape file.

19.15.3 Logbook / Worksheet Use Guidelines

Logbooks and worksheets are filled out 'real time' and have enough information on them to trace the events of the applicable analysis/task. (e.g. calibrations, standards, analyst, sample ID, date, time on short holding time tests, temperatures when applicable, calculations are traceable, etc.)

- Corrections are made following the procedures outlined in Section 14.
- Logbooks are controlled by the QA department. A record is maintained of all logbooks in the lab.
- Unused portions of pages must be "Z"'d out, signed and dated.
- Worksheets are created with the approval of the Technical Manager/QA Manager at the facility. The QA Manager controls all worksheets following the procedures in Section 6.

19.15.4 Review / Verification Procedures

A minimum of three levels of review are performed before final sample data is reported to the client.

• Log-In Review.
• Second level technical review.
• Third level project management completeness review.

19.15.4.1 Log-In Review - The data review process starts at the sample receipt stage. Sample control personnel review chain-of-custody forms and project instructions from the project management group. This is the basis of the sample information and analytical instructions entered into the LIMS. The log-in instructions are reviewed by the personnel entering the information, and a second level review is conducted by the project management staff.

19.15.4.2 First Level Data Review - The next level of data review occurs with the analysts. As data are generated, analysts review their work to ensure that the results meet project and SOP requirements. First level reviews include inspection of all raw data (e.g., instrument output for continuous analyzers, chromatograms, spectra, and manual integrations), evaluation of calibration/calibration verification data in the day's analytical run, evaluation of QC data, and reliability of sample results. The analyst transfers data into LIMS, data qualifiers are added as needed. All first level reviews are documented.

19.15.4.3 Second Level Data Review – All analytical data are subject to review by a second qualified analyst or supervisor. Second level reviews include inspection of all raw data (e.g., instrument output, chromatograms, and spectra) including 100% of data associated with any changes made by the primary analyst, such as manual integrations or reassignment of peaks to different analytes, or elimination of false negative analytes. The second review also includes evaluation of initial calibration/calibration verification data in the day's analytical run, evaluation of QC data, reliability of sample results, qualifiers and NCM narratives. Manual calculations are checked in second level review. All second level reviews are documented.

Issues that deem further review include the following:

- QC data are outside the specified control limits for accuracy and precision
- Reviewed sample data does not match with reported results
- Unusual detection limit changes are observed
- Samples having unusually high results
- Samples exceeding a known regulatory limit
- Raw data indicating some type of contamination or poor technique
- Inconsistent peak integration
- Transcription errors
- Results outside of calibration range

19.15.4.4 Unacceptable analytical results may require reanalysis of the samples. Any problems are brought to the attention of the Laboratory Director, Project Manager, Quality Director/Manager, Technical Manager, or Supervisor for further investigation. Corrective action is initiated whenever necessary.

19.15.4.5 The results are then entered or directly transferred into the computer database and a (.pdf) is printed for the client.

19.15.4.6 As a final review prior to the release of the report, the Project Manager reviews the results for appropriateness and completeness. This review and approval ensures that client

requirements have been met and that the final report has been properly completed. The process includes, but is not limited to, verifying that the COC is followed, cover letters / narratives are present, flags are appropriate, and project specific requirements are met. The Project Manager may also evaluate the validity of results for different test methods given expected chemical relationships.

19.15.4.7 Any project that requires a data package is subject to a tertiary data review for transcription errors and acceptable quality control requirements. The Project Manager then signs the final report. The accounting personnel also check the report for any clerical or invoicing errors. When complete, the report is sent out to the client.

19.15.4.8 A brief overview of sample flow~~s~~ and information through the laboratory, as well as data review and validation, is presented in Figure 19-1.

19.15.5 Manual Integrations

Computerized data systems provide the analyst with the ability to re-integrate raw instrument data in order to optimize the interpretation of the data. Though manual integration of data is an invaluable tool for resolving variations in instrument performance and some sample matrix problems, when used improperly, this technique would make unacceptable data appear to meet quality control acceptance limits. Improper re-integrations lead to legally indefensible data, a poor reputation, or possible laboratory decertification. Because guidelines for re-integration of data are not provided in the methods and most methods were written prior to widespread implementation of computerized data systems, the laboratory trains all analytical staff on proper manual integration techniques using NDSC Document No. CA-Q-S-002, Acceptable Manual Integration Practices,

The analyst must adjust baseline or the area of a peak in some situations, for example when two compounds are not adequately resolved or when a peak shoulder needs to be separated from the peak of interest. The analyst must use professional judgment to determine when manual integrating is required. Analysts are encouraged to ask for assistance from a senior analyst or manager when in doubt.

19.15.5.1 Analysts shall not increase or decrease peak areas for the sole purpose of achieving acceptable QC recoveries that would have otherwise been unacceptable. The intentional recording or reporting of incorrect information (or the intentional omission of correct information) is against company principles and policy and is grounds for immediate termination.

19.15.5.2 Client samples, performance evaluation samples, and quality control samples are all treated equally when determining whether or not a peak area or baseline should be manually adjusted.

19.15.5.3 All manual integrations receive a second level review. Manual integrations must be indicated on ~~an~~ expanded scale “before” and “after” chromatograms such that the integration performed can be easily evaluated during data review. Expanded scale “before” chromatograms are also required for all manual integrations on QC parameters (calibrations, calibration verifications, laboratory control samples, internal standards, surrogates, etc.) unless the laboratory has another documented NDSC approved procedure in place that can demonstrate an active process for detection and deterrence of improper integration practices.

Figure 19-1. Example – Work Flow

Action	Personnel Involved
Bottle orders generated upon request - Bottles packed and shipped to the client under CoC	- Client Service Personnel / PM - Bottle Preparation Personnel
Samples received at laboratory - Unpacked and reconciled against client paperwork or CoC - Samples acceptance documented against completed (CoC)[1]	Sample Login Personnel
Samples are entered into LIMS - Job # assigned - Methods/Analytes linked from project - Sample labels generated - LIMS backlogs updated immediately	Sample Login Personnel
Sample Storage - Analysts are notified of short TATs and hold-time samples - Samples stored in assigned locations (refrigerated walk-in coolers, freezers, VOA refrigerators; etc.)	Sample Login Personnel
Sample Receipt Acknowledgement sent to client (when requested)	Sample Login Personnel
Sample Acquisition/Testing - Analysts collect samples from assigned storage. - Remaining sample returned to storage.	Analysts / Login Personnel
Preparation and analysis is performed according to selected analytical method and applicable Project notes - Raw data recorded/reviewed[2] - Data imported to LIMS	Analysts
LIMS performs calculations: - Data reviewed by primary/secondary analyst - Data approved as final	Data Process (LIMS / Analyst)
Generation/review/release of reports (automated through LIMS) - Electronic copy saved in LIMS	Project Management Assistants / Reporting Group
Electronic Data Deliverables (EDDs) generated (as applicable)	PM Group
Hard copy and electronic batch raw data is archived according to data archiving procedures.	Analysts / IT

[1]Refer to Sec. 23.3.
[2]Analyses requiring the analyst's interpretation may involve manual data reduction before entry into LIMS.

20.0 EQUIPMENT and CALIBRATIONS

20.1 Overview

The laboratory purchases the most technically advanced analytical instrumentation for sample analyses. Instrumentation is purchased on the basis of accuracy, dependability, efficiency and sensitivity. Each laboratory is furnished with all items of sampling, preparation, analytical testing and measurement equipment necessary to correctly perform the tests for which the laboratory has capabilities. Each piece of equipment is capable of achieving the required accuracy and complies with specifications relevant to the method being performed. Before being placed into use, the equipment (including sampling equipment) is calibrated and checked to establish that it meets its intended specification. The calibration routines for analytical instruments establish the range of quantitation. Calibration procedures are specified in laboratory SOPs. A list of available laboratory instrumentation is presented in Table 20-1.

Equipment is only operated by authorized and trained personnel. Manufacturer's instructions for equipment use are readily accessible to all appropriate laboratory personnel.

20.2 Preventive Maintenance

The laboratory follows a well-defined maintenance program to ensure proper equipment operation and to prevent the failure of laboratory equipment or instrumentation during use. This program of preventive maintenance helps to avoid delays due to instrument failure.

Routine preventive maintenance procedures and frequency, such as cleaning and replacements, should be performed according to the procedures outlined in the manufacturer's manual. Qualified personnel must also perform maintenance when there is evidence of degradation of peak resolution, a shift in the calibration curve, loss of sensitivity, or failure to continually meet one of the quality control criteria.

Scheduled routine maintenance is defined in each method SOP. It is the responsibility of each Group Leader to ensure that instrument maintenance logs are kept for all equipment in his/her department. Preventative maintenance procedures are also outlined in analytical SOPs or instrument manuals. (Note: for some equipment, the log used to document maintenance is also used to monitor performance.)

Instrument maintenance logs are controlled and are used to document instrument problems, instrument repair and maintenance activities. Maintenance logs shall be kept for all major pieces of equipment. Instrument maintenance logs may also be used to specify instrument parameters.

- Documentation must include all major maintenance activities such as contracted preventive maintenance and service and in-house activities such as the replacement of electrical components, lamps, tubing, valves, columns, detectors, cleaning and adjustments.
- Each entry in the instrument log includes the analyst's initials, the date, a detailed description of the problem (or maintenance needed/scheduled), a detailed explanation of the solution or maintenance performed, and a verification that the equipment is functioning properly (state what was used to determine a return to control. e.g. CCV run on *'date'* was acceptable, or instrument recalibrated on 'date' with acceptable verification, etc.) must also be documented in the instrument records.

- When maintenance or repair is performed by an outside agency, service receipts detailing the service performed are affixed into the maintenance logbook. The analyst signs across the entered item and the logbook page so that it is clear that the insert is missing if only half a signature is found in the logbook.
- In addition, the maintenance records contain:
  - The identification of the instrument/equipment (instrument's Serial Number and Model Number).
  - The date the instrument/equipment was put into use.
  - If available, the condition when the instrument was received (e.g., new, used, reconditioned).
- If an instrument requires repair (subjected to overloading or mishandling), gives suspect results, or otherwise has shown to be defective or outside of specified limits it shall be taken out of operation and tagged as out-of-service or otherwise isolated until such a time as the repairs have been made and the instrument can be demonstrated as operational by calibration and/or verification or other test to demonstrate acceptable performance. The laboratory shall examine the effect of this defect on previous analyses.

In the event of equipment malfunction that cannot be resolved, service shall be obtained from the instrument vendor manufacturer, or qualified service technician, if such a service can be tendered. If on-site service is unavailable, arrangements shall be made to have the instrument shipped back to the manufacturer for repair. Back up instruments, which have been approved, for the analysis shall perform the analysis normally carried out by the malfunctioning instrument. If the back-up is not available and the analysis cannot be carried out within the needed timeframe, the samples shall be subcontracted.

At a minimum, if an instrument is sent out for service or transferred to another facility, it must be recalibrated and the laboratory MDL verified (using an MDLV) prior to return to lab operations.

An inventory of critical spare parts is maintained to minimize delays in the completion of analyses. For most test methods, back-up instrumentation is also maintained to minimize delays.

20.3 Support Equipment

This section applies to all devices that may not be the actual test instrument, but are necessary to support laboratory operations. These include but are not limited to: balances, ovens, refrigerators, freezers, incubators, water baths, temperature measuring devices and volumetric dispensing devices if quantitative results are dependent on their accuracy, as in standard preparation and dispensing or dilution into a specified volume. All raw data records associated with the support equipment are retained to document instrument performance.

20.3.1 Weights and Balances

The accuracy of the balances used in the laboratory is checked every working day, before use. All balances are placed on stable counter tops. Balances must have their calibration checked each day of use with two weights bracketing the working range.

Each balance is checked prior to initial serviceable use with at least two certified ASTM type 1 weights spanning its range of use (weights that have been calibrated to ASTM type 1 weights

may also be used for daily verification). ASTM type 1 weights used only for calibration of other weights (and no other purpose) are inspected for corrosion, damage or nicks at least annually and if no damage is observed, they are calibrated at least every 5 years by an outside calibration laboratory. Any weights (including ASTM Type 1) used for daily balance checks or other purposes are recalibrated/recertified annually to NIST standards (this may be done internally if laboratory maintains "calibration only" ASTM type 1 weights).

All balances are serviced annually by a qualified service representative, who supplies the laboratory with a certificate that identifies traceability of the calibration to the NIST standards.

All of this information is recorded in logs, and the recalibration/recertification certificates are kept on file. Further details on balance calibration may be found in SOP KNOX-QA-0005, Balance Calibration and Weight Verification.

20.3.2 pH, Conductivity, and Turbidity Meters

The pH meters used in the laboratory are accurate to ± 0.1 pH units, and have a scale readability of at least 0.05 pH units. The meters automatically compensate for the temperature, and are calibrated with at least two working range buffer solutions before each use.

Conductivity meters used in the laboratory are capable or measuring conductivity with an error not exceeding 1% or one umhos/cm.

All of this information is documented in logbooks.

Consult the pH and Routine Monitoring of Deionized Water SOPs for further information.

20.3.3 Thermometers

All thermometers are calibrated on an annual basis with a NIST-traceable thermometer. IR thermometers and digital thermometers are calibrated quarterly.

- If the temperature measuring device is used over a range of 10°C or less, then a single point verification within the range of use is acceptable;
- If the temperature measuring device is used over a range of greater than 10°C, then the verification must bracket the range of use.

The NIST mercury reference thermometer(s) are recalibrated every five years (unless thermometer has been exposed to temperature extremes or apparent separation of internal liquid) by an approved outside service and the provided certificate of traceability is kept on file. NIST digital reference thermometers are recalibrated every two years. The NIST thermometer(s) have increments of 1ºC, and have a range applicable to all method and certification requirements. The NIST traceable thermometer is used for no other purpose than to calibrate other thermometers.

Thermometer calibrations are documented as described in SOP KNOX-QA-0010, Temperature Monitoring and Thermometer Calibration.

20.3.4 Refrigerators/Freezer Units, Water baths, Ovens and Incubators

The temperatures of all refrigerator units and freezers used for sample and standard storage are monitored each working day. Monitoring is performed 7 days per week to ensure that samples remain within an acceptable range.

Ovens, water baths and incubators are monitored on days of use.

All of this equipment has a unique identification number, and is assigned a thermometer for monitoring.

Sample storage refrigerator temperatures are kept between > 0ºC and ≤ 6 ºC.

Specific temperature settings/ranges for other refrigerators, ovens, water baths, and incubators can be found in method specific SOPs.

The temperatures are documented in temperature logbooks or in the method-specific logbooks/benchsheets.

20.3.5 Autopipettors, Dilutors, and Syringes

Mechanical volumetric dispensing devices including burettes (except Class A Glassware and glass microliter syringes) are given unique identification numbers and the delivery volumes are verified gravimetrically, at a minimum, on a quarterly basis.

Any device not regularly verified cannot be used for any quantitative measurements

Refer to SOP KNOX-QA-0012, Pipetter and Volumetric Labware Calibration Verification.

Micro-syringes are purchased from Hamilton Company. Each syringe is traceable to NIST. The laboratory keeps on file an “Accuracy and Precision Statement of Conformance” from Hamilton attesting established accuracy.

20.4 Instrument Calibrations

Calibration of analytical instrumentation is essential to the production of quality data. Strict calibration procedures are followed for each method. These procedures are designed to determine and document the method detection limits, the working range of the analytical instrumentation and any fluctuations that may occur from day to day.

Sufficient raw data records are retained to allow an outside party to reconstruct all facets of the initial calibration. Records contain, but are not limited to, the following: calibration date, method, instrument, analyst(s) initials or signatures, analysis date, analytes, concentration, response, and type of calibration (Avg RF, curve, or other calculations that may be used to reduce instrument responses to concentration.)

Sample results must be quantitated from the initial calibration and may not be quantitated from any continuing instrument calibration verification unless otherwise required by regulation, method or program.

If the initial calibration results are outside of the acceptance criteria, corrective action is performed and any affected samples are reanalyzed if possible. If the reanalysis is not possible, any data associated with an unacceptable initial calibration will be reported with appropriate data qualifiers (refer to Section 14).

Note: Instruments are calibrated initially and as needed after that and at least annually. The annual requirement does not apply to Isotope dilution.

20.4.1 Calibration Standards

Calibration standards are prepared using the procedures indicated in the Reagents and Standards section of the determinative method SOP. If a reference method does not specify the number of calibration standards, a minimum of 3 calibration points (exception being ICP and ICP/MS methods) shall be used.

Standards for instrument calibration are obtained from a variety of sources. All standards are traceable to national or international standards of measurement, or to national or international standard reference materials.

The lowest concentration calibration standard that is analyzed during an initial calibration must be at or below the stated reporting limit for the method based on the final volume of extract (or sample).

The other concentrations define the working range of the instrument/method or correspond to the expected range of concentrations found in actual samples that are also within the working range of the instrument/method. Results of samples not bracketed by initial instrument calibration standards (within calibration range to at least the same number of significant figures used to report the data) must be reported as having less certainty, e.g., defined qualifiers or flags (additional information may be included in the case narrative). The exceptions to these rules. ICP and ICPMS methods which define the working range with periodic linear dynamic range studies, rather than through the range of concentrations of daily calibration standards.

All initial calibrations are verified with a standard obtained from a second source and traceable to a national standard, when available (or vendor certified different lot if a second source is not available). For unique situations, such as air analysis where no other source or lot is available, a standard made by a different analyst would be considered a second source. This verification occurs immediately after the calibration curve has been analyzed, and before the analysis of any samples.

20.4.1.1 Calibration Verification

The calibration relationship established during the initial calibration must be verified initially and at least daily as specified in the laboratory method SOPs in accordance with the referenced analytical methods and in the 2009 and 2016 TNI Standard. The process of calibration verification applies to both external standard and internal standard calibration techniques, as well as to linear and non-linear calibration models. Initial calibration verification (ICV) is with a standard source secondary (second source standard) to the calibration standards, but continuing calibration verifications (CCV) may use the same source standards as the calibration curve.

Note: The process of calibration verification referred to here is fundamentally different from the approach called "calibration" in some methods. As described in those methods, the calibration factors or response factors calculated during calibration are used to update the calibration factors or response factors used for sample quantitation. This approach, while employed in other EPA programs, amounts to a daily single-point calibration.

All target analytes and surrogates, including those reported as non-detects, must be included in periodic calibration verifications for purposes of retention time confirmation and to demonstrate that calibration verification criteria are being met, i.e., RPD, per 2009 and 2016 TNI Std. EL-V1M4 Sec. 1.7.2.

Note: For Ohio EPA VAP projects the calibration solution used for calibration verification must be from the same source as that used for the calibration curve unless the method states otherwise.

All samples must be bracketed by periodic analyses of standards that meet the QC acceptance criteria (e.g., calibration and retention time). The frequency is found in the determinative methods or SOPs.

Note: If an internal standard calibration is being used then bracketing calibration verification standards may not be are not required, only daily verifications are needed. The results from

these verification standards must meet the calibration verification criteria and the retention time criteria (if applicable).

Generally, the calibrations must be verified by an ICV analyzed immediately following initial calibration and before sample analysis. The ICV may be used as the first bracketing CCV, if criteria for both are met.

A continuing instrument calibration verification (CCV) is generally analyzed at the beginning of each 12-hour analytical shift during which samples are analyzed. The 12-hour analytical shift begins with the injection of the calibration verification standard (or the MS tuning standard in MS methods). The shift ends after the completion of the analysis of the last sample, QC, or standard that can be injected within 12-hours of the beginning of the shift.

For methods that have quantitation by external calibration models, a CCV is analyzed at the end of each analytical sequence. Some methods have more frequent CCV requirements. See specific SOPs. Most inorganic methods require the CCV to be analyzed after ever 10 samples or injections, including matrix or batch QC samples.

Note: If an internal standard calibration is being used (e.g., GCMS) then bracketing standards are not required, only daily verifications are needed, except as specified by program or method requirements.

If the results of a CCV are outside the established acceptance criteria and analysis of a second consecutive (and immediate) CCV fails to produce results within acceptance criteria, corrective action shall be performed. Once corrective actions have been completed and documented, the laboratory shall demonstrate acceptable instrument / method performance by analyzing two consecutive CCVs, or a new initial instrument calibration shall be performed.

Note: For Ohio EPA VAP projects, if the instrument conditions have been changed, the laboratory must analyze a new calibration curve.

Sample analyses and reporting of data may not occur or continue until the analytical system is calibrated or calibration verified. However, data associated with an unacceptable calibration verification may be fully useable reported based upon discussion and approval of the client under the following special conditions:

a). when the acceptance criteria for the CCV are exceeded high (i.e., high bias) and the associated samples within the batch are non-detects, then those non-detects may be reported case narrative comment explaining the high bias. Otherwise the samples affected by the unacceptable CCV shall be re-analyzed after a new calibration curve has been established, evaluated and accepted; or

b). when the acceptance criteria for the CCV are exceeded low (i.e., low bias), those sample results may be reported if they exceed a maximum regulatory limit/decision level. Otherwise the samples affected by the unacceptable CCV shall be re-analyzed after a new calibration curve has been established, evaluated and accepted.

Samples reported by the 2 conditions identified above will be appropriately flagged.

20.4.1.2 Verification of Linear and Non-Linear Calibrations

Calibration verification for calibrations involves the calculation of the percent drift or the percent difference of the instrument response between the initial calibration and each subsequent analysis of the verification standard. (These calculations are available in the laboratory method SOPs.) Verification standards are evaluated based on the % Difference from the average CF or RF of the initial calibration or based on % Drift or % Recovery if a linear or quadratic curve is used.

Regardless of whether a linear or non-linear calibration model is used, if initial verification criterion is not met, then no sample analyses may take place until the calibration has been verified or a new initial calibration is performed that meets the specifications listed in the method SOPs. If the calibration cannot be verified after the analysis of a single verification standard, then adjust the instrument operating conditions and/or perform instrument maintenance, and analyze another aliquot of the verification standard. If the calibration cannot be verified with the second standard, then a new initial calibration is performed.

- When the acceptance criteria for the calibration verification are exceeded high, i.e., high bias, and there are associated samples that are non-detects, then those non-detects may be reported. Otherwise, the samples affected by the unacceptable calibration verification shall be reanalyzed after a new calibration curve has been established, evaluated and accepted.
- When the acceptance criteria for the calibration verification are exceeded low, i.e., low bias, those sample results may be reported if they exceed a maximum regulatory limit/decision level. Otherwise, the samples affected by the unacceptable verification shall be reanalyzed after a new calibration curve has been established, evaluated and accepted. Alternatively, a reporting limit standard may be analyzed to demonstrate that the laboratory can still support non-detects at their reporting limit.

  Note: This is not permitted for Ohio EPA VAP projects.

20.5 Tentatively Identified Compounds (TICs) – GC/MS Analysis

For samples containing components not associated with the calibration standards, a library search may be made for the purpose of tentative identification. The necessity to perform this type of identification will be determined by the purpose of the analyses being conducted. For example, the RCRA permit or waste delisting requirements may require the reporting of non-target analytes. Only after visual comparison of sample spectra with the nearest library searches may the analyst assign a tentative identification. Data system library search routines should not use normalization routines that would misrepresent the library or unknown spectra when compared to each other. Additional details are provided in NDSC Document No. CA-Q-QM-001, Tentatively Identified Compounds (TICS) - GCMS Analysis and SOP No.. KNOX-MS-0014, Tentatively Identified Compounds.

Note: If the TIC compound is not part of the client target analyte list but is calibrated by the laboratory and is both qualitatively and/or quantitatively identifiable, it should not be reported as a TIC. If the compound is reported on the same form as true TICs, it should be qualified and/or narrated that the reported compound is qualitatively and quantitatively (if verification in control) reported compared to a known standard that is in control (where applicable). Eurofins TestAmerica Knoxville will provide this service upon client request.

Note: For Ohio EPA VAP projects the laboratory may not attest under affidavit that TICs are “certified data.”

20.6 GC/MS Tuning

Prior to any GC/MS analytical sequence, including calibration, the instrument parameters for the tune and subsequent sample analyses within that sequence must be set.

Prior to tuning/auto-tuning the mass spectrometer, the parameters may be adjusted within the specifications set by the manufacturer or the analytical method. These generally do not need any adjustment but it may be required based on the current instrument performance. If the tune

verification does not pass it may be necessary to clean the source or perform additional maintenance. Any maintenance is documented in the maintenance log or run log.

21.0 MEASUREMENT TRACEABILITY

21.1 Overview

Traceability of measurements shall be assured using a system of documentation, calibration, and analysis of reference standards. Laboratory equipment that are peripheral to analysis and whose calibration is not necessarily documented in a test method analysis or by analysis of a reference standard shall be subject to ongoing certifications of accuracy. At a minimum, these must include procedures for checking specifications of ancillary equipment: balances, thermometers, temperature, Deionized (DI) and Reverse Osmosis (RO) water systems, automatic pipettes and other volumetric measuring devices. (Refer to Section 20.3). With the exception of Class A Glassware and glass microliter syringes, quarterly accuracy checks are performed for all mechanical volumetric devices. Wherever possible, subsidiary or peripheral equipment is checked against standard equipment or standards that are traceable to national or international standards. Class A Glassware and glass microliter syringes should be routinely inspected for chips, acid etching or deformity (e.g., bent needle). If the Class A glassware or syringe is suspect, the accuracy of the glassware will be assessed prior to use.

21.2 NIST-Traceable Weights and Thermometers

Reference standards of measurement shall be used for calibration only and for no other purpose, unless it can be shown that their performance as reference standards would not be invalidated.

For NIST-traceable weights and thermometers, the laboratory requires that all calibrations be conducted by a calibration laboratory accredited by A2LA, NVLAP (National Voluntary Laboratory Accreditation Program), or another accreditation organization that is a signatory to a MRA (Mutual Recognition Arrangement) of one or more of the following cooperations – ILAC (International Laboratory Accreditation Cooperation) or APLAC (Asia–Pacific Laboratory Accreditation Cooperation). A calibration certificate and scope of accreditation is kept on file at the laboratory.

An external certified service engineer services laboratory balances on an annual basis. This service is documented on each balance with a signed and dated certification sticker. Balance calibrations are checked each day of use. All mercury thermometers are calibrated annually against a traceable reference thermometer. Temperature readings of ovens, refrigerators, and incubators are checked on each day of use.

21.3 Reference Standards / Materials

Reference standards/materials, where commercially available, are traceable to certified reference materials. Commercially prepared reference standards, to the extent available, are purchased from vendors that are accredited to ISO Guide 34 and ISO/IEC Guide 17025. All reference standards from commercial vendors shall be accompanied with a certificate that includes at least the following information:

- Manufacturer
- Analytes or parameters calibrated
- Identification or lot number

- Calibration method
- Concentration with associated uncertainties
- Purity

If a standard cannot be purchased from a vendor that supplies a Certificate of Analysis, the purity of the standard is documented by analysis. The receipt of all reference standards must be documented. Reference standards are labeled with a unique Standard Identification Number and expiration date. All documentation received with the reference standard is retained as a QC record and references the Standard Identification Number.

All reference, primary and working standards/materials, whether commercially purchased or laboratory prepared, must be checked regularly to ensure that the variability of the standard or material from the true value does not exceed method requirements. The accuracy of calibration standards is checked by comparison with a standard from a second source. In cases where a second standard manufacturer is not available, a vendor certified different lot is acceptable for use as a second source. For unique situations, such as air analysis where no other source or lot is available, a standard made by a different analyst would be considered a second source. The appropriate Quality Control (QC) criteria for specific standards are defined in laboratory SOPs. In most cases, the analysis of an Initial Calibration Verification (ICV) or LCS (where there is no sample preparation) is used as the second source confirmation. These checks are generally performed as an integral part of the analysis method (e.g. calibration checks, laboratory control samples).

All standards and materials must be stored and handled according to method or manufacturer's requirements in order to prevent contamination or deterioration. Refer to the Environmental Health & Safety Manual or laboratory SOPs. For safety requirements, please refer to method SOPs and the laboratory's Environmental Health and Safety Manual.

Standards and reference materials shall not be used after their expiration dates unless their reliability is verified by the laboratory and their use is approved by the Quality Assurance Manager. The laboratory must have documented contingency procedures for re-verifying expired standards.

21.4 Documentation and Labeling of Standards, Reagents, and Reference Materials

Reagents must be at a minimum the purity required in the test method. The date of reagent receipt and the expiration date are documented. The lots for most of the common solvents and acids are tested for acceptability prior to company-wide purchase. Refer to NDSC Document No. CA-Q-S-001, Solvent and Acid Lot Testing and Approval.

All manufacturer or vendor supplied Certificate of Analysis or Purity must be retained, stored appropriately, and readily available for use and inspection. These records are maintained in the analytical laboratory. Records must be kept of the date of receipt and date of expiration of standards, reagents and reference materials. In addition, records of preparation of laboratory standards, reagents, and reference materials must be retained, stored appropriately, and be readily available for use and inspection. For detailed information on documentation and labeling, please refer to SOP KNOX-QA-0001, Standard/Reagent Labeling and Documentation.

Commercial materials purchased for preparation of calibration solutions, spike solutions, etc.., are usually accompanied with an assay certificate or the purity is noted on the label. If the assay purity is 96% or better, the weight provided by the vendor may be used without correction. If the assay purity is less than 96% a correction will be made to concentrations applied to solutions prepared from the stock commercial material (For 1613B dioxin/furan analyses the purity must

be 98% or corrections must be made). Blended gas standard cylinders use a nominal concentration if the certified value is within +/-15%, otherwise the certified values is used for the canister concentration.

21.4.1 All standards, reagents, and reference materials must be labeled in an unambiguous manner. Standards are logged into the laboratory's TALS system, and are assigned a unique identification number. The following information is typically recorded in the electronic database within the TALS.

- Standard ID
- Description of Standard
- Department
- Preparer's name
- Final volume and number of vials prepared
- Solvent type and lot number
- Preparation Date
- Expiration Date
- Standard source type (stock or daughter)
- Standard type (spike, surrogate, other)
- Parent standard ID (if applicable)
- Parent Standard Analyte Concentration (if applicable)
- Parent Standard Amount used (if applicable)
- Component Analytes
- Final concentration of each analyte
- Comment box (text field)

Note: All solvents and acids are stored at ambient temperature unless otherwise specified in the SOPs.

Records are maintained electronically for standard and reference material preparation. These records show the traceability to purchased stocks or neat compounds. These records also include method of preparation, date of preparation, expiration date and preparer's name or initials. Preparation procedures are provided in the Method SOPs.

21.4.2 All standards, reagents, and reference materials must be clearly labeled with a minimum of the following information:

- Expiration Date (include prep date for reagents)
- Standard ID
- Special Health/Safety warnings if applicable (Refer to the Health and Safety Manual)

Note: Refer to SOP KNOX-QA-0001 for more details.

21.4.3 In addition, the following information may be helpful:

- Date opened (for multi-use containers, if applicable)

- Description of standard (if different from manufacturer's label or if standard was prepared in the laboratory)
- Recommended Storage Conditions
- Concentration (if applicable)
- Initials of analyst preparing standard or opening container

All containers of prepared reagents must include an expiration date and an ID number to trace back to preparation.

Procedures for preparation of reagents can be found in the Method SOPs.

Standard ID numbers must be traceable through associated logbooks, worksheets and preparation/analytical batch records.

All reagents and standards must be stored in accordance to the following priority: 1) with the manufacturer's recommendations; 2) with requirements in the specific analytical methods as specified in the laboratory SOP.

22.0 SAMPLING

22.1 Overview

Eurofins TestAmerica Knoxville does not provide sampling services. The laboratory's responsibility in the sample collection process lies in supplying the sampler with the necessary coolers, reagent water, sample containers, preservatives, sample labels, custody seals, COC forms, ice, and packing materials required to properly preserve, pack, and ship samples to the laboratory. Eurofins TestAmerica Knoxville also provides pre-cleaned sampling media for sample collection (e.g. source emission testing air sampling media).

22.2 Sampling Containers

The laboratory offers clean sampling containers for use by clients. These containers are obtained from reputable container manufacturers and meet EPA specifications as required. Certificates of cleanliness for bottles and preservatives are provided by the supplier and are maintained at the laboratory. Alternatively, the certificates may be maintained by the supplier and available to the laboratory on-line.

22.2.1 Preservatives

Upon request, preservatives are provided to the client in pre-cleaned sampling containers. In some cases containers may be purchased pre-preserved from the container supplier. Whether prepared by the laboratory or bought pre-preserved, the grades of the preservatives are at a minimum:

- Hydrochloric Acid – Reagent ACS (Certified VOA Free) or equivalent
- Methanol – Purge and Trap grade
- Nitric Acid – Instra-Analyzed or equivalent
- Sodium Bisulfate – ACS Grade or equivalent
- Sodium Hydroxide – Instra-Analyzed or equivalent
- Sulfuric Acid – Instra-Analyzed or equivalent

22.3 Definition of Holding Time

The date and time of sampling documented on the COC form establishes the day and time zero. As a general rule, when the maximum allowable holding time is expressed in days (e.g., 14 days, 28 days), the holding time is based on calendar day measured. Holding times expressed in hours (e.g., 6 hours, 24 hours, etc.) are measured from date and time zero. The first day of holding time ends twenty-four hours after sampling. Holding times for analysis include any necessary reanalysis. However, there are some programs that determine holding time compliance based on the date and specific time of analysis compared to the time of sampling regardless of how long the holding time is.

22.3.1 Semi-Volatile - Holding times for sample preparation for semi-volatile organics are measured from the sampling date until the day solvent contacts the sample. Holding times for

analysis are measured from the date of initiation of extraction to the date of injection into the gas chromatograph.

22.3.2 Volatiles - Holding times for volatile organics are measured from the date (and time where applicable) of sampling to the date of injection into the gas chromatograph. Holding times for Encore preservation of volatiles samples is measured from the date and time of sampling to the date and time of sample preservation.

22.3.3 Inorganics - For inorganic and metals analysis, the preparation/digestion/distillation must be started within the maximum holding time as measured from the sampling date (and time where applicable). TestAmerica Knoxville measures the holding time for inorganics from sampling date (and time where applicable) to analysis date (and time where applicable).

22.4 Sampling Containers, Preservation Requirements, Holding Times

The preservation and holding time criteria specified in the laboratory SOPs are derived from the source documents for the methods. If method required holding times or preservation requirements are not met, the reports will be qualified using a flag, footnote or case narrative. As soon as possible or “ASAP” is an EPA designation for tests for which rapid analysis is advised, but for which neither EPA nor the laboratory have a basis for a holding time.

22.5 Sample Aliquots / Subsampling

Taking a representative sub-sample from a container is necessary to ensure that the analytical results are representative of the sample collected in the field. The size of the sample container, the quantity of sample fitted within the container, and the homogeneity of the sample need consideration when sub-sampling for sample preparation. It is the laboratory’s responsibility to take a representative subsample or aliquot of the sample provided for analysis.

Analysts should handle each sample as if it is potentially dangerous. At a minimum, safety glasses, gloves, and lab coats must be worn when preparing aliquots for analysis.

Refer to SOP KNOX-QA-0006, Subsampling, for details on the procedures to obtain representative subsamples for analysis from the samples submitted by the client.

Tables 22-1 to 22-6 detail holding times, preservation and container requirements, and sample volumes for SDWA and NPDES methods. The sample volumes are intended to be a minimal amount to perform the method, the containers that are used may be of larger size. Please Note: the holding times are program specific and different programs may have different holding times for equivalent methods (e.g., there are differences in Holding times for many Organic analytes between SDWA and NPDES. RCRA methods may also be different).

Table 22-1.
Holding Times, Preservation and Container Requirements: Drinking Water (SDWA)

PARAMETER	CONTAINER	PRESERVATION[1,2] Temp. [6]	Chemical	HOLDING TIME[3]	SAMPLE VOLUME
Nitrate	Plastic/Glass	4ºC	None	48 hours[4]	250 mL
Dioxin	Glass[5]	4ºC	$Na_2S_2O_3$	1 year	1 L

Key to Table

1. Sample preservation should be performed immediately upon sample collection. For composite chemical samples, each aliquot should be preserved at the time of collection. When use of an automated sampler makes it impossible to preserve each aliquot, then chemical samples may be preserved by maintaining at 4ºC until compositing and sample splitting is completed.
2. When any sample is to be shipped by common carrier or sent through the United States mails, it must comply with the Department of Transportation Hazardous Materials Regulations (49 CFR Part 172). The person offering such material for transportation is responsible for ensuring compliance. For the preservation requirements of Table 6-8, the Office of Hazardous Materials, Materials Transportation Bureau, Department of Transportation has determined that the Hazardous Materials Regulations do not apply to the following materials: Hydrochloric acid, (HCl) in water, solutions at concentrations of 0.04% by weight or less (pH about 1.96 or greater); Nitric acid (HNO_3) in water solutions at concentrations of 0.15% by weight or less (pH about 1.62 or greater); Sulfuric acid (H_2SO_4) in water solutions at concentrations of 0.35% by weight or less pH about 1.15 or greater); and Sodium hydroxide (NaOH) in water solutions at concentrations of 0.080% by weight or less (pH about 12.30 or less).
3. Samples should be analyzed as soon as possible after collection. The times listed are the maximum times that samples may be held before analysis and still be considered valid. Holding Times are determined from time of collection to time of analysis.
4. If the sample is chlorinated, the holding time for an un-acidified sample kept at 4ºC is extended to 14 days.
5. With Teflon lined septum.
6. For samples with a temperature requirement of 4ºC, a sample temperature of just above the water freezing temperature to < 6ºC is acceptable.

Table 22-2
Holding Times, Preservation and Container Requirements: NPDES - Inorganic

PARAMETER	CONTAINER [1]	PRESERVATION[2,3] Temp[10].	Chemical	HOLDING TIME[4]	SAMPLE VOLUME
Boron	Plastic[5]	None	HNO_3 to pH<2	6 months	200 mL
Bromide	Plastic/Glass	None	None	28 days	100 mL
Chloride	Plastic/Glass	None	None	28 days	50 mL
Fluoride	Plastic	None	None	28 days	300 mL
Hardness	Plastic/Glass	None	HNO_3 to pH<2[7]	6 months	100 mL
Hydrogen Ion (pH)	Plastic/Glass	None	None	15 min.[6]	200 mL
Mercury	Plastic/Glass	None	HNO_3 to pH<2	28 days	200 mL
Metals[8,9]	Plastic/Glass	None	HNO_3 to pH<2[11]	6 months	200 mL
Nitrate	Plastic/Glass	≤ 6ºC	None	48 hours	100 mL
Nitrate-Nitrite	Plastic/Glass	≤ 6ºC	H_2SO_4 to pH <2	28 days	100 mL
Nitrite	Plastic/Glass	≤ 6ºC	None	48 hours	100 mL
Orthophosphate	Plastic/Glass	≤ 6ºC	Filter within 15 min.	48 hours	250 mL
Sulfate	Plastic/Glass	≤ 6ºC	None	28 days	250 mL

Key to Table

1. Plastic should be Polyethylene.
2. Sample preservation should be performed immediately upon sample collection. For composite chemical samples, each aliquot should be preserved at the time of collection. When use of an automated sampler makes it impossible to preserve each aliquot, then chemical samples may be preserved by maintaining at ≤ 6ºC until compositing and sample splitting is completed.
3. When any sample is to be shipped by common carrier or sent through the United States mails, it must comply with the Department of Transportation Hazardous Materials Regulations (49 CFR Part 172). The person offering such material for transportation is responsible for ensuring compliance. For the preservation requirements of Table 6-8, the Office of Hazardous Materials, Materials Transportation Bureau, Department of Transportation has determined that the Hazardous Materials Regulations do not apply to the following materials: Hydrochloric acid, (HCl) in water, solutions at concentrations of 0.04% by weight or less (pH about 1.96 or greater); Nitric acid (HNO_3) in water solutions at concentrations of 0.15% by weight or less (pH about 1.62 or greater); Sulfuric acid (H_2SO_4) in water solutions at concentrations of 0.35% by weight or less pH about 1.15 or greater); and Sodium hydroxide (NaOH) in water solutions at concentrations of 0.080% by weight or less (pH about 12.30 or less).
4. Samples should be analyzed as soon as possible after collection. The times listed are the maximum times that samples may be held before analysis and still be considered valid. Holding Times are determined from time of collection to time of analysis.
5. May also be collected in quartz or PFTE Plastic.
6. For compliance testing, the analysis must be performed in the field at the time of analysis. If transported to the laboratory for analysis, the analysis will be performed as soon as practical and reported qualified.
7. H_2SO_4 to a pH <2 is also acceptable.
8. Except Mercury and Hexavalent Chromium.
9. For dissolved metals, samples must be filtered on site before adding HNO_3 preservative (or before shipping to laboratory).

Key to Table

10. Aqueous samples must be preserved at ≤6 °C unless otherwise indicated, and should not be frozen unless data demonstrating that sample freezing does not adversely impact sample integrity is maintained on file and accepted as valid by the regulatory authority. Also, for purposes of NPDES monitoring, the specification of ‘‘≤ °C’’ is used in place of the ‘‘4 °C’’ and ‘‘<4 °C’’ sample temperature requirements listed in some methods.

11 Acid preservation may be omitted for shipping and laboratory will acidify at least 24 hours prior to analysis.

Table 22-3
Holding Times, Preservation and Container Requirements: NPDES - Organic

PARAMETER	CONTAINER	PRESERVATION[1,2] Temp.[7]	PRESERVATION[1,2] Chemical	HOLDING TIME[3]	SAMPLE VOLUME
CDD/CDFs[6] – Aqueous: Field/Lab Preservation	Glass	≤ 6ºC	pH <9, 0.008 % $Na_2S_2O_3$[5]	1 year	1 L
CDD/CDFs[6] – Solids/Mixed Phase/ - Field Preservation	Glass	≤ 6ºC	None	7 days[8]	10 grams/1 L
CDD/CDFs[6] – Tissue – Field Preservation	Glass	≤ 6ºC	None	24 hours[8]	10 grams
CDD/CDFs[6] – Solids/Mixed Phase/Tissue - Lab Preservation	Glass	< -10ºC	None	1 year	10 grams/1 L
Polychlorinated Biphenyls (PCB Congeners): Aqueous: Field/Lab Preservation[9]	Glass	≤ 6ºC	0.008 % $Na_2S_2O_3$[5]	1 year	1 L
Polychlorinated Biphenyls (PCB Congeners): Solid/Mixed Phase– Field Preservation[9]	Glass	≤ 6ºC	None	1 year	10 grams/1 L
Polychlorinated Biphenyls (PCB Congeners): Tissue-Field Preservation[9]	Glass	≤ 6ºC	None	24 hours[8]	10 grams
Polychlorinated Biphenyls (PCB Congeners): Solid/Mixed Phase/Tissue – Lab Preservation[9]	Glass	< -10ºC	None	1 year	10 grams/1 L

Key to Table

1. Sample preservation should be performed immediately upon sample collection. For composite chemical samples, each aliquot should be preserved at the time of collection. When use of an automated sampler makes it impossible to preserve each aliquot, then chemical samples may be preserved by maintaining at ≤ 6ºC until compositing and sample splitting is completed.
2. When any sample is to be shipped by common carrier or sent through the United States mails, it must comply with the Department of Transportation Hazardous Materials Regulations (49 CFR Part 172). The person offering such material for transportation is responsible for ensuring compliance. For the preservation requirements of Table 6-8, the Office of Hazardous Materials, Materials Transportation Bureau, Department of Transportation has determined that the Hazardous Materials Regulations do not apply to the following materials: Hydrochloric acid, (HCl) in water, solutions at concentrations of 0.04% by weight or less (pH about 1.96 or greater); Nitric acid (HNO_3) in water solutions at concentrations of 0.15%

Key to Table

by weight or less (pH about 1.62 or greater); Sulfuric acid (H_2SO_4) in water solutions at concentrations of 0.35% by weight or less pH about 1.15 or greater); and Sodium hydroxide (NaOH) in water solutions at concentrations of 0.080% by weight or less (pH about 12.30 or less).

3. Samples should be analyzed as soon as possible after collection. The times listed are the maximum times that samples may be held before analysis and still be considered valid. Holding Times are determined from time of collection to time of analysis (See also Footnote 8).
4. With Teflon lined septum.
5. Should only be used in the presence of residual chlorine. Ascorbic may be used instead.
6. When the extractable analytes of concern fall within a single chemical category, the specified preservative and maximum holding times should be observed for optimum safeguard of sample integrity. When the analytes of concern fall within two or more categories, the sample may be preserved by cooling to $\leq$ 6ºC reducing residual chlorine with 0.0008 % sodium thiosulfate, storing in the dark, and adjusting the pH to 6-9. Samples preserved in this manner may be held for 7 days before extraction and for 40 days after extraction. Exceptions to this optional preservation and holding time procedure are noted in footnote 5 (re the requirement for thiosulfate reduction of residual chlorine) and footnotes 10 and 11(re the analysis of Benzidine).
7. Aqueous samples must be preserved at ≤6 °C unless otherwise indicated, and should not be frozen unless data demonstrating that sample freezing does not adversely impact sample integrity is maintained on file and accepted as valid by the regulatory authority. Also, for purposes of NPDES monitoring, the specification of ‘‘≤ °C’’ is used in place of the ‘‘4 °C’’ and ‘‘<4 °C’’ sample temperature requirements listed in some methods.

8 Holding time from sampling field preservation at <6ºC to time of preservation at <-10ºC.

9 Polychlorinated biphenyls (PCB congeners) are in the proposed 40CFR Part 136 Rule September 23, 2010.

Table 22-4.
Holding Times, Preservation and Container Requirements: RCRA - Aqueous

PARAMETER	CONTAINER [1]	PRESERVATION[2,3] Temp.[9]	Chemical	HOLDING TIME[4]	SAMPLE VOLUME
Chloride	Plastic/Glass	4ºC	None	28 days	100 mL
Hydrogen Ion (pH)	Plastic/Glass	4ºC	None	24 hours[8]	100 mL
Nitrate	Plastic/Glass	4ºC	None	48 hours	28 days
Sulfate	Plastic/Glass	4ºC	None	28 days	400 mL
Mercury	Plastic/Glass	None	HNO_3 to pH<2	28 days	250 mL
Other Metals	Plastic/Glass	None	HNO_3 to pH<2	6 months	250 mL
Acrolein and Acrylonitrile	Glass[7]	4ºC	0.0008 % Na2S2O3[5] Adjust pH to 4-5[10]	14 days	1 L
Benzidines	Glass[7]	4ºC	0.0008 % $Na_2S_2O_3$[5]	7 days[6]	1 L
Chlorinated Hydrocarbons	Glass[7]	4ºC	0.0008 % $Na_2S_2O_3$[5]	7 days[6]	1 L
Dioxins and Furans	Glass[7]	4ºC	0.0008 % $Na_2S_2O_3$[5]	30 days[6]	1 L
Haloethers	Glass[7]	4ºC	0.0008 % $Na_2S_2O_3$[5]	7 days[6]	1 L
Nitroaromatics and cyclic ketones	Glass[7]	4ºC	0.0008 % $Na_2S_2O_3$[5], store in dark	7 days[6]	1 L
Nitrosamines	Glass[7]	4ºC	0.0008 % $Na_2S_2O_3$[5], store in dark	7 days[6]	1 L
PCBs	Glass[7]	4ºC	None	1 year[6]	1 L
Phenols	Glass[7]	4ºC	0.0008 % $Na_2S_2O_3$[5]	7 days[6]	1 L
Phthalate Esters	Glass[7]	4ºC	None	7 days[6]	1 L
Polynuclear Aromatic Hydrocarbons	Glass[7]	4ºC	0.0008 % $Na_2S_2O_3$[5], store in dark	7 days[6]	1 L
Purgeable Hydrocarbons	Glass[7]	4ºC	0.0008 % $Na_2S_2O_3$[5] Adjust pH <2[2]	14 days	40 mL
Purgeable Halocarbons	Glass[7]	4ºC	0.0008 % $Na_2S_2O_3$[5]	14 days	40 mL

Key to Table

1. Plastic should be Polyethylene.
2. Sample preservation should be performed immediately upon sample collection. For composite chemical samples, each aliquot should be preserved at the time of collection. When use of an automated sampler makes it impossible to preserve each aliquot, then chemical samples may be preserved by maintaining at 4ºC until compositing and sample splitting is completed.

Key to Table

3. When any sample is to be shipped by common carrier or sent through the United States mails, it must comply with the Department of Transportation Hazardous Materials Regulations (49 CFR Part 172). The person offering such material for transportation is responsible for ensuring compliance. For the preservation requirements of Table 6-8, the Office of Hazardous Materials, Materials Transportation Bureau, Department of Transportation has determined that the Hazardous Materials Regulations do not apply to the following materials: Hydrochloric acid, (HCl) in water, solutions at concentrations of 0.04% by weight or less (pH about 1.96 or greater); Nitric acid (HNO_3) in water solutions at concentrations of 0.15% by weight or less (pH about 1.62 or greater); Sulfuric acid (H_2SO_4) in water solutions at concentrations of 0.35% by weight or less pH about 1.15 or greater); and Sodium hydroxide (NaOH) in water solutions at concentrations of 0.080% by weight or less (pH about 12.30 or less).
4. Samples should be analyzed as soon as possible after collection. The times listed are the maximum times that samples may be held before analysis and still be considered valid. Holding Times are determined from time of collection to time of preparation (or to time of analysis if there is no separate preparation step).
5. Free Chlorine must be removed by the appropriate addition of $Na_2S_2O_3$.
6. 7 days to extraction. 40 days from extraction to analysis. For Dioxins/Furans: 30 days to extraction 45 days from extraction to analysis. For PCBs, no holding time is specified in SW-846 Chapter 4.
7. With Teflon lined septum.
8. Holding Time is listed as “As Soon as Possible” in SW 846. Per EPA MICE, the recommended maximum holding time for pH in water is 24 hours and pH in soil is 7 days. There are no mandated regulatory requirements.
9. For samples with a temperature requirement of 4°C, a sample temperature of just above the water freezing temperature to $\leq$ 6°C is acceptable.
10 Based on guidance from EPA MICE, if samples are received without pH adjustment, the holding time is 7 days.

Table 22-5.
Holding Times, Preservation and Container Requirements: RCRA – Non-Aqueous

PARAMETER	CONTAINER [1]	PRESERVATION Temp.[7]	PRESERVATION Chemical	HOLDING TIME[2]	SAMPLE WEIGHT
Chloride	Glass	4ºC	None	28 days	50 g
Hydrogen Ion (pH)	Glass	4ºC	None	7 days[6]	50 g
Nitrate	Glass	4ºC	None	N/A	50 g
Mercury	Plastic/Glass	4ºC	None	28 days	50 g
Other Metals	Plastic/Glass	None	None	6 months	50 g
Acrolein and Acrylonitrile	Glass[4]	4ºC	None	14 days	50 g
Benzidines	Glass[4]	4ºC	None	14 days[3]	50 g
Chlorinated Hydrocarbons	Glass[4]	4ºC	None	14 days[3]	50 g
Dioxins and Furans	Glass[4]	4ºC	None	30 days[3]	50 g
Haloethers	Glass[4]	4ºC	None	14 days[3]	50 g
Nitroaromatics and cyclic ketones	Glass[4]	4ºC	None	14 days[3]	50 g
Nitrosamines	Glass[4]	4ºC	None	14 days[3]	50 g
PCBs	Glass[4]	4ºC	None	1 year[3]	50 g
Phenols	Glass[4]	4ºC	None	14 days[3]	50 g
Phthalate Esters	Glass[4]	4ºC	None	14 days[3]	50 g
Polynuclear Aromatic Hydrocarbons	Glass[4]	4ºC	None	14 days[3]	50 g
Purgeable Hydrocarbons	Glass[4]	4ºC	None	14 days[5]	50 g
Purgeable Halocarbons	Glass[4]	4ºC	None	14 days[5]	50 g

Key to Table

1. Plastic should be Polyethylene.
2. Samples should be analyzed as soon as possible after collection. The times listed are the maximum times that samples may be held before analysis and still be considered valid.
3. 14 days to extraction. 40 days from extraction to analysis. For Dioxins/Furans (Method 8290) in Matrices other than tissue: 30 days to extraction 45 days from extraction to analysis. For Dioxins/Furans (Method 8290) in Tissue: 30 days to extraction 45 days from collection to analysis. Holding Times are determined from time of collection to time of preparation (or to time of analysis if there is no separate preparation step). For PCBs, no holding time is specified in SW-846 Chapter 4.
4. With Teflon Lined Septum

5. See Volatile SOP for more detailed preservation requirements.
6. Holding Time is listed as “As Soon as Possible” in SW 846. Per EPA MICE, the recommended maximum holding time for pH in water is 24 hours and pH in soil is 7 days. There are no mandated regulatory requirements.
7. For samples with a temperature requirement of 4°C, a sample temperature of just above the water freezing temperature to ≤ 6°C is acceptable.

Table 22-6.
Holding Times, Preservation and Container Requirements: Air Samples[1]

PARAMETER	CONTAINER	PRESERVATION Temp.	PRESERVATION Chemical	HOLDING TIME[2]	SAMPLE WEIGHT
Volatile Organics (TO-15, TO-14A)	Summa Canister	None	None	30 days	6L or 1L
Volatile Organics (TO-15, TO-14A)	Tedlar Bag	None	None	72 hrs[3,4]	1 L
Polynuclear Aromatic Hydrocarbons (TO-13A)	PUF/XAD	4ºC[5]	None	7 days[6]	N/A
Organochlorine Pesticides/PCBs (TO-4A)	PUF/XAD	4ºC[5]	None	7 days[6]	N/A
Dioxins/Furans (TO-9A)	PUF/XAD	4ºC[5]	None	7 days[6]	N/A

Key to Table

1. For details on Source Air Emission Holding Times, Containers, and Preservation please contact the laboratory for method specific information.
2. Samples should be analyzed as soon as possible after collection. The times listed are the maximum times that samples may be held before analysis and still be considered valid. Holding Times are determined from time of collection to time of preparation (or to time of analysis if there is no separate preparation step).
3. Holding Time is based on SW 846 Method 0040 “SAMPLING OF PRINCIPAL ORGANIC HAZARDOUS CONSTITUENTS FROM COMBUSTION SOURCES USING TEDLAR® BAGS”. Some states specifically enforce this holding time (e.g. Florida, New Jersey) and others have not specified this information in their regulatory requirements.
4. The holding time is 72 hours unless the laboratory has a documented validation study that indicates a longer HT is acceptable for the analytes of interest. Alternatively, the sample may be transferred into a Summa Canister within 72 hours.

5 For samples with a temperature requirement of 4ºC, a sample temperature of just above the water freezing temperature to $\leq$ 6ºC is acceptable.

6 7 days from collection to extraction, 40 days from extraction to analysis.

23.0 HANDLING OF SAMPLES

It is the responsibility of the client to send us representative and/or homogeneous and properly preserved samples of the system from which they are drawn. The laboratory assumes that all multiple sample containers with the same designator/description and bottle type contain a homogeneous, representative sample.

The laboratory may provide the appropriate sample containers, required preservative, chain-of-custody (COC) forms, shipping containers, labels, and custody seals. The laboratory also provides trip blanks and analyte-free water for field blanks. Preparation of methanol containers for field preservation of volatile soil samples is available.

Sample management procedures at the laboratory ensure that sample integrity and custody are maintained and documented from sampling/receipt through disposal.

23.1 Chain of Custody (COC)

The COC form is the written documented history of any sample and is initiated at the time of sampling. This form is completed by the sampling personnel and accompanies the samples to the laboratory where it is received and stored under the laboratory's custody. The purpose of the COC form is to provide a legal written record of the handling of samples from the time of collection until they are received at the laboratory. It also serves as the primary written request for analyses from the client to the laboratory. The COC form acts as a purchase order for analytical services when no other contractual agreement is in effect.

23.1.1 Field Documentation

The information the sampler needs to provide at the time of sampling on the container label is:

- Sample identification
- Date and time
- Preservative

During the sampling process, the COC form is completed and must be legible. This form includes information such as:

- Client name, address, phone number and fax number (if available)
- Project name and/or number
- The sample identification
- Date, time and location of sampling
- Sample collectors name
- The matrix description
- The container description
- The total number of each type of container
- Preservatives used
- Analysis requested

- Requested turnaround time (TAT)
- Any special instructions
- Purchase Order number or billing information (e.g. quote number) if available
- The date and time that each person received or relinquished the sample(s), including their signed name.

When the sampling personnel deliver the samples directly to the laboratory personnel, the samples are stored in a cooler with ice, as applicable, and remain solely in the possession of the client's field technician until the samples are delivered to the laboratory personnel. The sample collector must assure that each container is in his/her physical possession or in his/her view at all times, or stored in such a place and manner to preclude tampering. The field technician relinquishes the samples in writing on the COC form to the sample control personnel at the laboratory or to a laboratory courier. When sampling personnel deliver the samples through a common carrier (Fed-Ex, UPS), the CoC relinquished date/time is completed by the field personnel and samples are released to the carrier. Samples are only considered to be received by the laboratory when personnel at the fixed laboratory facility have physical contact with the samples.

Note: Independent couriers are not required to sign the COC form.

23.1.2 Legal / Evidentiary Chain-of-Custody

TestAmerica Knoxville provides internal sample chain-of-custody tracking. However, it does not provide chain-of-custody evidence for samples identified for legal/evidentiary purposes.

23.2 Sample Receipt

Per State and/or Federal Regulation, the client is responsible to ensure that samples are shipped in accordance with DOT/IATA requirements, and that radioactive materials may only be delivered to licensed facilities. Any samples containing (or suspected to contain) Source, Byproduct, or Special Nuclear Material as defined by 10 CFR should be delivered directly to facilities licensed to handle such radioactive material. Natural material or ores containing naturally occurring radionuclides may be delivered to any Eurofins TestAmerica facility or courier as long as the activity concentration of the material does not exceed 270 pCi/g alpha or 2700 pCi/g beta (49 CFR Part 173).

Samples are received at the laboratory by designated sample receiving personnel and a unique laboratory project identification number is assigned. Each sample container shall be assigned a unique sample identification number that is cross-referenced to the client identification number such that traceability of test samples is unambiguous and documented. Each sample container is affixed with a durable sample identification label. Sample acceptance, receipt, tracking and storage procedures summarized in the following sections.

23.2.1 Laboratory Receipt

When samples arrive at the laboratory, sample receiving personnel inspect the coolers and samples. The integrity of each sample must be determined by comparing sample labels or tags with the COC and by visual checks of the container for possible damage. Any non-conformance, irregularity, or compromised sample receipt must be documented on a Condition Upon Receipt Form (See Example form in Figure 23-2) and brought to the immediate attention of the client. The COC, shipping documents, documentation of any non-conformance, irregularity, or compromised sample receipt, record of client contact, and resulting instructions become part of

the project record. Details on the receipt of samples are found in SOP KNOX-SC-0003, Sample Receipt and Log-in.

Note: North Carolina requires that they be notified when samples are processed that do not meet sample acceptance criteria.

23.3 Sample Acceptance Policy

The laboratory has a written sample acceptance policy (Figure 23-1) that clearly outlines the circumstances under which samples shall be accepted or rejected. These include:

- a COC filled out completely;
- samples must be properly labeled;
- proper sample containers with adequate volume for the analysis (Sampling Guide) and necessary QC;
- samples must be preserved according to the requirements of the requested analytical method (Sampling Guide);
- sample holding times must be adhered to (Sampling Guide);
- the project manager will be notified if any sample is received in damaged condition.

Data from samples which do not meet these criteria are flagged and the nature of the variation from policy is defined.

23.4 Sample Storage

In order to avoid deterioration, contamination or damage to a sample during storage and handling, from the time of receipt until all analyses are complete, samples are stored in refrigerators, freezers or protected locations suitable for the sample matrix. Samples for methods that do not require refrigeration (e.g., aqueous samples for ICP metals analysis) are stored on shelves at ambient temperature. In addition, samples to be analyzed for volatile organic parameters are stored in separate refrigerators designated for volatile organic parameters only. Samples are never to be stored with reagents, standards or materials that may create contamination.

To ensure the integrity of the samples during storage, refrigerator blanks are maintained in the volatile sample refrigerators and analyzed every two weeks.

Laboratory Analysts retrieve the sample container(s) allocated to their analysis from the designated storage location, analyze the sample, and return the remaining sample to the storage location from which it originally came. Residual samples are maintained in the designated storage location until disposal at least thirty days after the report is issued. (Exception: TO-14A or TO-15 canister samples are subject to disposal two days after the report is issued.) Special arrangements are made to store samples for longer periods of time.

Access to the laboratory is controlled such that sample storage need not be locked at all times unless a project specifically demands it. Samples are accessible to laboratory personnel only. Visitors to the laboratory are prohibited from entering the refrigerator and laboratory areas unless accompanied by an employee of Eurofins TestAmerica.

23.5 Hazardous Samples and Foreign Soils

All samples are assumed to be hazardous. All samples are either returned to the client or disposed of appropriately through a hazardous waste disposal firm. All soil samples are sent out for incineration by a USDA-approved waste disposal facility.

23.6 Sample Shipping

In the event that the laboratory needs to ship samples, the samples are placed in a cooler with enough ice to ensure the samples remain just above freezing and at or below 6.0°C during transit. The samples are carefully surrounded by packing material to avoid breakage (yet maintain appropriate temperature). A trip blank is enclosed for those samples requiring water/solid volatile organic analyses. The chain-of-custody form is signed by the sample control technician and attached to the shipping paperwork. Samples are generally shipped overnight express or hand-delivered by a Eurofins TestAmerica courier to maintain sample integrity. All personnel involved with shipping and receiving samples must be trained to maintain the proper chain-of-custody documentation and to keep the samples intact and on ice. The laboratory's Environmental, Health and Safety Manual contains additional shipping requirements.

Note: If a client does not request trip blank analysis on the COC or other paperwork, the laboratory will not analyze the trip blanks that were supplied. However, in the interest of good client service, the laboratory will advise the client at the time of sample receipt that it was noted that they did not request analysis of the trip blank; and that the laboratory is providing the notification to verify that they are not inadvertently omitting a key part of regulatory compliance testing.

23.7 Sample Disposal

Samples should be retained for a minimum of 30 days after the project report is sent, however, provisions may be made for earlier disposal of samples once the holding time is exceeded. Some samples are required to be held for longer periods based on regulatory or client requirements (e.g., 60 days after project report is sent). The laboratory must follow the longer sample retention requirements where required by regulation or client agreement. Several possibilities for sample disposal exist: the sample may be consumed completely during analysis, the sample may be returned to the customer or location of sampling for disposal, or the sample may be disposed of in accordance with the laboratory's waste disposal procedures (SOP: KNOX-SC-0005, Sample Disposal Return and Archive). All procedures in the laboratory's Environmental Health and Safety Manual are followed during disposal. Samples are normally maintained in the laboratory no longer than two months from receipt unless otherwise requested. Unused portions of samples found or suspected to be hazardous according to state or federal guidelines may be returned to the client upon completion of the analytical work. Waste disposal complies with all federal and state laws and regulations.

Figure 23-1. Example: Sample Acceptance Policy

NELAC specifies requirements under which any NELAC accredited laboratory will accept or reject samples. Eurofins TestAmerica Knoxville will review your sample shipment against those requirements listed below, and will communicate any discrepancies to you. Your project manager will assist you in the appropriate resolution of any issues related to sample receipt. Please contact your project manager with any questions.

When completing the chain of custody form, please do not forget to sign your name in the "relinquished by" box.

NELAC requirements are as follows:

- Proper, full and complete documentation, which includes sample identification, the location, date and time of collection, the collector's name, the preservation type, the sample matrix type, the requested testing method, and any special remarks concerning the samples shall be provided. (Chain of Custody filled out properly)

- Each sample shall be labeled with unique, durable and indelible identification, (See note below regarding SUMMA canisters and VOST tubes).

- The samples shall be collected in the appropriate sample containers.

- The samples shall arrive at the laboratory within the specified holding time for the analyses requested.

- Sufficient sample volume must be available to perform the requested analyses and associated quality control.

- All samples submitted for water/solid Volatile Organic analyses must have a Trip Blank submitted at the same time

- The laboratory will notify the client upon sample receipt if the samples exhibit obvious signs of damage, contamination or inadequate preservation. Also, if there is a breach in the chain-of-custody associated with the sample(s), the client will be notified to determine the disposition of the samples.

- Samples shall be rejected if they are received in broken containers or if they exceed the laboratory radiological license limits. The client will be notified to determine the disposition of the samples.

NOTE: Never affix a label directly on a SUMMA canister. A special tag is attached to each canister for this purpose. Never place a label on a VOST tube; use the external container for labeling.

NOTE: Canisters and flow controllers must be returned even if they were not used. Sampling equipment that is lost or not returned will be invoiced to the client at the replacement costs.

PM006R3.doc, 10/30/09

Figure 23-2. Example: Condition Upon Receipt Form

TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST Log In Number:

Review Items	Yes	No	NA	If No, what was the problem?	Comments/Actions Taken
1. Are the shipping containers intact?				☐ Containers, Broken	
2. Were ambient air containers received intact?				☐ Checked in lab	
3. The coolers/containers custody seal if present, is it intact?				☐ Yes ☐ NA	
4. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C) Thermometer ID :_____ Correction factor: _____				☐ Cooler Out of Temp, Client Contacted, Proceed/Cancel ☐ Cooler Out of Temp, Same Day Receipt	
5. Were all of the sample containers received intact?				☐ Containers, Broken	
6. Were samples received in appropriate containers?				☐ Containers, Improper; Client Contacted; Proceed/Cancel	
7. Do sample container labels match COC? (IDs, Dates, Times)				☐ COC & Samples Do Not Match ☐ COC Incorrect/Incomplete ☐ COC Not Received	
8. Were all of the samples listed on the COC received?				☐ Sample Received, Not on COC ☐ Sample on COC, Not Received	
9. Is the date/time of sample collection noted?				☐ COC; No Date/Time; Client Contacted	Labeling Verified by: Date:
10. Was the sampler identified on the COC?				☐ Sampler Not Listed on COC	
11. Is the client and project name/# identified?				☐ COC Incorrect/Incomplete	pH test strip lot number:
12. Are tests/parameters listed for each sample?				☐ COC No tests on COC	
13. Is the matrix of the samples noted?				☐ COC Incorrect/Incomplete	
14. Was COC relinquished? (Signed/Dated/Timed)				☐ COC Incorrect/Incomplete	Box 16A: pH Preservation / Box 18A: Residual Chlorine
15. Were samples received within holding time?				☐ Holding Time - Receipt	Preservative: _____
16. Were samples received with correct chemical preservative (excluding Encore)?				☐ pH Adjusted, pH Included (See box 16A) ☐ Incorrect Preservative	Lot Number: _____ Exp Date: _____ Analyst: _____ Date: _____ Time: _____
17. Were VOA samples received without headspace?				☐ Headspace (VOA only)	
18. Did you check for residual chlorine, if necessary? (e.g. 1613B, 1668) Chlorine test strip lot number: _____				☐ Residual Chlorine	
19. For 1613B water samples is pH<9?				☐ If no, notify lab to adjust	
20. For rad samples was sample activity info. Provided?				☐ Project missing info	

Project #: _____ PM Instructions: _____

Sample Receiving Associate: _____ Date: _____

24.0 ASSURING THE QUALITY OF TEST RESULTS

24.1 Overview

In order to assure our clients of the validity of their data, the laboratory continuously evaluates the quality of the analytical process. The analytical process is controlled not only by instrument calibration as discussed in Section 20, but also by routine process quality control measurements (e.g. Blanks, Laboratory Control Samples (LCS), Matrix Spikes (MS), duplicates (DUP), surrogates, Internal Standards (IS)). These quality control checks are performed as required by the method or regulations to assess precision and accuracy. Quality control samples are to be treated in the exact same manner as the associated field samples being tested. In addition to the routine process quality control samples, Proficiency Testing (PT) Samples (concentrations unknown to laboratory) are analyzed to help ensure laboratory performance.

24.2 Controls

Sample preparation or pre-treatment is commonly required before analysis. Typical preparation steps include homogenization, grinding, solvent extraction, sonication, acid digestion, distillation, reflux, evaporation, drying and ashing. During these pre-treatment steps, samples are arranged into discreet manageable groups referred to as preparation (prep) batches. Prep batches provide a means to control variability in sample treatment. Control samples are added to each prep batch to monitor method performance and are processed through the entire analytical procedure with investigative/field samples.

24.3 Negative Controls

Table 24-1. Example – Negative Controls

Control Type	Details
Method Blank (MB)	Are used to assess preparation and analysis for possible contamination during the preparation and processing steps.
	The specific frequency of use for method blanks during the analytical sequence is defined in the specific standard operating procedure for each analysis. Generally it is 1 for each batch of samples; not to exceed 20 environmental samples.
	The method blank is prepared from a clean matrix similar to that of the associated samples that is free from target analytes (e.g., Reagent water, Ottawa sand, glass beads, etc.) and is processed along with and under the same conditions as the associated samples. The method blank goes through all of the steps of the process (including as necessary: filtration, clean-ups, etc.).
	Reanalyze or qualify associated sample results when the concentration of a targeted analyte in the blank is at or above the reporting limit as established by the method or by regulation, AND is greater than 1/10 of the amount measured in the sample. (Ohio VAP method blanks must be <RL)
Calibration Blanks	Are prepared and analyzed along with calibration standards where applicable or injected at specified frequencies throughout an analytical sequence. They are prepared using the same reagents that are used to prepare the standards. In some analyses the calibration blank may be included in the calibration curve. These blanks are termed Initial Calibration Blanks (ICB) or Continuing Calibration Blanks (CCB)

Table 24-1. Example – Negative Controls

Control Type	Details
Instrument Blanks	Are blank reagents or reagent water that may be processed during an analytical sequence in order to assess contamination in the analytical system. In general, instrument blanks are used to differentiate between contamination caused by the analytical system and that caused by the sample handling or sample prep process. Instrument blanks may also be inserted throughout the analytical sequence to minimize the effect of carryover from samples with high analyte content.
Trip Blank [1]	Are required to be submitted by the client with each shipment of samples requiring aqueous and solid volatiles analyses (or as specified in the client's project plan). Additionally, trip blanks may be prepared and analyzed for volatile analysis of air samples, when required by the client. A trip blank may be purchased (certified clean) or is prepared by the laboratory by filling a clean container with pure deionized water that has been purged to remove any volatile compounds. Appropriate preservatives are also added to the container. The trip blank is sent with the bottle order and is intended to reflect the environment that the containers are subjected to throughout shipping and handling and help identify possible sources if contamination is found. The field sampler returns the trip blank in the cooler with the field samples.
Field Blanks [1]	Are sometimes used for specific projects by the field samplers. A field blank prepared in the field by filling a clean container with pure reagent water and appropriate preservative, if any, for the specific sampling activity being undertaken. (EPA OSWER)
Equipment Blanks [1]	Are also sometimes created in the field for specific projects. An equipment blank is a sample of analyte-free media which has been used to rinse common sampling equipment to check effectiveness of decontamination procedures. (TNI)
Holding Blanks	Also referred to as refrigerator or freezer blanks, are used to monitor the sample storage units for volatile organic compounds during the storage of VOA samples in the laboratory

[1] When known, these field QC samples should not be selected for matrix QC as it does not provide information on the behavior of the target compounds in the field samples. Usually, the client sample ID will provide information to identify the field blanks with labels such as "FB", "EB", or "TB."

Evaluation criteria and corrective action for these controls are defined in the specific standard operating procedure for each analysis.

24.4 Positive Controls

Control samples (e.g., QC indicators) are analyzed with each batch of samples to evaluate data based upon (1) Method Performance (Laboratory Control Sample (LCS) or Blank Spike (BS)), which entails both the preparation and measurement steps; and (2) Matrix Effects (Matrix Spike (MS) (Matrix spikes are not applicable to air) or Sample Duplicate (MD, DUP), which evaluates field sampling accuracy, precision, representativeness, interferences, and the effect of the matrix on the method performed. Each regulatory program and each method within those programs specify the control samples that are prepared and/or analyzed with a specific batch

Note that frequency of control samples vary with specific regulatory, methodology and project specific criteria. Complete details on method control samples are as listed in each analytical SOP.

24.4.1 Method Performance Control - Laboratory Control Sample (LCS)

The LCS measures the accuracy of the method in a blank matrix and assesses method performance independent of potential field sample matrix affects in a laboratory batch.

The LCS is prepared from a clean matrix similar to that of the associated samples that is free from target analytes (for example: Reagent water, Ottawa sand, glass beads, etc.) and is processed along with and under the same conditions as the associated samples. The LCS is spiked with verified known amounts of analytes or is made of a material containing known and verified amounts of analytes, taken through all preparation and analysis steps along with the field samples. Where there is no preparation taken for an analysis (such as in aqueous volatiles), or when all samples and standards undergo the same preparation and analysis process, a calibration verification standard is reported as the LCS. In some instances where there is no practical clean solid matrix available, aqueous LCS's may be processed for solid matrices; final results may be calculated as mg/kg or ug/kg, assuming 100% solids.

The specific frequency of use for LCS during the analytical sequence is defined in the specific standard operating procedure for each analysis. It is generally 1 for each batch of samples; not to exceed 20 environmental samples.

If the mandated or requested test method, or project requirements, do not specify the spiking components, the laboratory shall spike all reportable components to be reported in the Laboratory Control Sample (and Matrix Spike) where applicable (e.g. no spike of pH). However, in cases where the components interfere with accurate assessment (such as simultaneously spiking chlordane, Toxaphene and PCBs in Method 608), the test method has an extremely long list of components or components are incompatible, at a minimum, a representative number of the listed components (see below) shall be used to control the test method. The selected components of each spiking mix shall represent all chemistries, elution patterns and masses, permit specified analytes and other client requested components. However, the laboratory shall ensure that all reported components are used in the spike mixture within a two-year time period.

Note: This section is not applicable to Ohio EPA VAP projects.

- For methods that have 1-10 target analytes, spike all components.
- For methods that include 11-20 target analytes, spike at least 10 or 80%, whichever is greater.
- For methods with more than 20 target analytes, spike at least 16 components.
- Exception: Due to analyte incompatibility in pesticides, Toxaphene and Chlordane are only spiked at client request based on specific project needs.
- Exception: Due to analyte incompatibility between the various PCB aroclors, aroclors 1016 and 1260 are used for spiking as they cover the range of all of the aroclors. Specific aroclors may be used by request on a project specific basis.

24.5 Sample Matrix Controls

Table 24-3. Sample Matrix Control

Control Type	Details	
Matrix Spikes (MS)	Use	Used to assess the effect sample matrix of the spiked sample has on the precision and accuracy of the results generated by the method used;
	Typical Frequency [1]	At a minimum, with each matrix-specific batch of samples processed, an MS is carried through the complete analytical procedure. Unless specified by the client, samples used for spiking are randomly selected and rotated between different client projects. If the mandated or requested test method does not specify the spiking components, the laboratory shall spike all reportable components to be reported in the Laboratory Control Sample and Matrix Spike. Refer to the method SOP for complete details
	Description	Essentially a sample fortified with a known amount of the test analyte(s).
Surrogate	Use	Measures method performance to sample matrix (organics only).
	Typical Frequency [1]	Are added to all samples, standards, and blanks, for all organic chromatography methods except when the matrix precludes its use or when a surrogate is not available. The recovery of the surrogates is compared to the acceptance limits for the specific method. Poor surrogate recovery may indicate a problem with sample composition and shall be reported, with data qualifiers, to the client whose sample produced poor recovery.
	Description	Are similar to matrix spikes except the analytes are compounds with properties that mimic the analyte of interest and are unlikely to be found in environment samples.
Duplicates[2]	Use	For a measure of analytical precision, with each matrix-specific batch of samples processed, a matrix duplicate (MD or DUP) sample, matrix spike duplicate (MSD), or LCS duplicate (LCSD) is carried through the complete analytical procedure.
	Typical Frequency [1]	Duplicate samples are usually analyzed with methods that do not require matrix spike analysis.
	Description	Performed by analyzing two aliquots of the same field sample independently or an additional LCS.
Internal Standards	Use	Are spiked into all environmental and quality control samples (including the initial calibration standards) to monitor the qualitative aspect of organic and some inorganic analytical measurements.
	Typical Frequency [1]	All organic and ICP methods as required by the analytical method.
	Description	Used to correct for matrix effects and to help troubleshoot variability in analytical response and are assessed after data acquisition. Possible sources of poor internal standard response are sample matrix, poor analytical technique or instrument performance.

[1] See the specific analytical SOP for type and frequency of sample matrix control samples.

[2] LCSD's are normally not performed except when regulatory agencies or client specifications require them. The recoveries for the spiked duplicate samples must meet the same laboratory established recovery limits as the accuracy QC samples. If an LCSD is analyzed both the LCS and LCSD must meet the same recovery criteria and be included in the final report. The precision measurement is reported as "Relative Percent Difference" (RPD). Poor precision between duplicates (except LCS/LCSD) may indicate non-homogeneous matrix or sampling.

24.6 Acceptance Criteria (Control Limits)

As mandated by the test method, each individual analyte in the LCS, MS, or Surrogate Spike is evaluated against the control limits published in the test method. Where there are no established acceptance criteria, the laboratory calculates in-house control limits with the use of

control charts or, in some cases, utilizes client project specific control limits. When this occurs, the regulatory or project limits will supersede the laboratory's in-house limits.

Note: For methods, analytes and matrices with very limited data (e.g., unusual matrices not analyzed often), interim limits are established using available data or by analogy to similar methods or matrices.

Once control limits have been established, they are verified, reviewed, and updated if necessary on an annual basis unless the method requires more frequent updating. Control limits are established per method (as opposed to per instrument) regardless of the number of instruments utilized.

Laboratory generated % Recovery acceptance (control) limits are generally established by taking ± 3 Standard Deviations (99% confidence level) from the average recovery of a minimum of 20-30 data points (more points are preferred).

- Regardless of the calculated limit, the limit should be no tighter than the Calibration Verification (ICV/CCV). (Unless the analytical method specifies a tighter limit).
- In-house limits cannot be any wider than those mandated in a regulated analytical method. (e.g., SDWA Dioxin Method 1613B 2,3,7,8-TCDD on-going precision and recovery limits of 73% to 146% recovery). Client or contract required control limits are evaluated against the laboratory's statistically derived control limits to determine if the data quality objectives (DQOs) can be achieved. If laboratory control limits are not consistent with DQOs, then alternatives must be considered, such as method improvements or use of an alternate analytical method.
- The lowest acceptable recovery limit will be 10% (the analyte must be detectable and identifiable). Exception: The lowest acceptable recovery limit for Benzidine will be 5% and the analyte must be detectable and identifiable.

24.6.1 The lab must be able to generate a current listing of their control limits and track when the updates are performed. In addition, the laboratory must be able to recreate historical control limits.

24.6.2 Refer to SOP KNOX-QA-0004, Control Limits and Control Charting for details on the generation of control limits and the use of control charts at Eurofins TestAmerica Knoxville.

24.6.3 A LCS that is within the acceptance criteria establishes that the analytical system is in control and is used to validate the process. Samples that are analyzed with an LCS with recoveries outside of the acceptance limits may be determined as out of control and should be reanalyzed if possible. If reanalysis is not possible, then the results for all affected analytes for samples within the same batch must be qualified when reported. The internal corrective action process (see Section 12) is also initiated if an LCS exceeds the acceptance limits. Sample results may be qualified and reported without reanalysis if:

- The analyte results are below the reporting limit and the LCS is above the upper control limit.
- If the analytical results are above the relevant regulatory limit and the LCS is below the lower control limit. (Note: This is not applicable to Ohio EPA VAP projects.)
- For Department of Defense (DOD) and Department of Energy (DOE) work, there are an allowable number of Marginal Exceedances (ME). The use of allowable marginal exceedances may also be used for evaluation of LCS recoveries for TNI accredited methods.

Note: For Ohio EPA VAP, if an analyte is identified as a contaminant of interest, then the analyte must meet the LCS criteria and marginal exceedance limits are not applicable.

<11 analytes	0 marginal exceedances are allowed.
11 – 30 Analytes	1 marginal exceedance is allowed
31-50 Analytes	2 marginal exceedances are allowed
51-70 Analytes	3 marginal exceedances are allowed
71-90 Analytes	4 marginal exceedances are allowed
> 90 Analytes	5 marginal exceedances are allowed

- Marginal exceedances are recovery exceedances between 3 SD and 4 SD from the mean recovery limit (TNI). (Note: The DOD/DOE QSM has defined limits for marginal exceedances. Refer to the DOD QSM SOP KNOX-QA-0021, DOD/DOE QSM Program Requirements.)
- Marginal exceedances must be random. If the same analyte exceeds the LCS control limit repeatedly, it is an indication of a systematic problem. The source of the error must be located and corrective action taken. The laboratory has a system to monitor marginal exceedances to ensure that they are random. . Refer to the DOD/DOE QSM SOP KNOX-QA-0021, DOD/DOE QSM Program Requirements for details on how the laboratory ensures that the marginal exceedences are random.
- Though marginal exceedences may be allowed, the data must still be qualified to indicate it is outside of the normal limits.

24.6.4 If the MS/MSDs do not meet acceptance limits, the MS/MSD and the associated spiked sample is reported with a qualifier for those analytes that do not meet limits. If obvious preparation errors are suspected, or if requested by the client, unacceptable MS/MSDs are reprocessed and reanalyzed to prove matrix interference. A more detailed discussion of acceptance criteria and corrective action can be found in analytical SOPs and in Section 12.

24.6.5 If a surrogate standard falls outside the acceptance limits, and if there is not obvious chromatographic matrix interference, reanalyze the sample to confirm a possible matrix effect. If the recoveries confirm or there was obvious chromatographic interference, results are reported from the original analysis and a qualifier is added. If the reanalysis meets surrogate recovery criteria, the second run is reported (or both are reported if requested by the client). Under certain circumstances, where all of the samples are from the same location and share similar chromatography, the reanalysis may be performed on a single sample rather than all of the samples and if the surrogate meets the recovery criteria in the reanalysis, all of the affected samples would require reanalysis.

24.7 Additional Procedures to Assure Quality Control

The laboratory has written and approved method SOPs to assure the accuracy of the test method including calibration (see Section 20), use of certified reference materials (see Section 21) and use of PT samples (see Section 17).

A discussion regarding MDLs, Limit of Detection (LOD) and Limit of Quantitation (LOQ) can be found in Section 19.

- Use of formulae to reduce data is discussed in the method SOPs and in Section 20.
- Selection of appropriate reagents and standards is included in Section 11 and 21.
- A discussion on selectivity of the test is included in Section 7.
- Constant and consistent test conditions are discussed in Section 6.
- The laboratories sample acceptance policy is included in Section 23.

25.0 REPORTING RESULTS

25.1 Overview

The results of each test are reported accurately, clearly, unambiguously, and objectively in accordance with State and Federal regulations as well as client requirements. Analytical results are issued in a format that is intended to satisfy customer and laboratory accreditation requirements as well as provide the end user with the information needed to properly evaluate the results. Where there is conflict between client requests and laboratory ethics or regulatory requirements, the laboratory's ethical and legal requirements are paramount, and the laboratory will work with the client during project set up to develop an acceptable solution. Refer to Section 9.

A variety of report formats are available to meet specific needs.

In cases where a client asks for simplified reports, there must be a written request from the client. There still must be enough information that would show any analyses that were out of conformance (QC out of limits) and there should be a reference to a full report that is made available to the client.

Review of reported data is included in Section 19.

25.2 Test Reports

Analytical results are reported in a format that is satisfactory to the client and meets all requirements of applicable accrediting authorities and agencies. A variety of report formats are available to meet specific needs. The report is printed on laboratory letterhead, reviewed, and signed by the appropriate project manager. At a minimum, the standard laboratory report shall contain the following information:

25.2.1 A report title (e.g., Analytical Report) on the cover page with a "Result" column header on the sample results page.

25.2.2 The cover page shall include the laboratory name, address and telephone number.

25.2.3 A unique identification of the report (e.g., Job ID #) and on each page an identification in order to ensure the page is recognized as part of the report and a clear identification of the end.

Note: Page numbers of reports are represented on the upper right hand corner of each page. A table of contents precedes the cover page on each report which includes the page number of each section as well as the total number of pages.

25.2.4 A copy of the chain of custody (COC).

- Any COCs involved with Subcontracting are included.

25.2.5 The name and address of client and a project name/number, if applicable.

25.2.6 Client project manager or other contact.

25.2.7 Description and unambiguous identification of the tested sample(s) including the client identification code.

25.2.8 Date of receipt of sample, date and time of collection, and date(s) of test preparation and performance, and time of preparation or analysis if the required holding time for either activity is less than or equal to 72 hours. Both date and time of preparation and analysis are required to be included in the data report for work done in support of the DoD QSM; see SOP KNOX-QA-0021, “Department of Defense Quality Systems Manual Program Requirements.”

25.2.9 Date reported or date of revision, if applicable.

25.2.10 Method of analysis including method code (EPA, Standard Methods, etc.).

25.2.11 Reporting limit or Minimum Level.

25.2.12 Method detection limits or Estimated Detection Limits (if requested)

25.2.13 Definition of Data qualifiers and reporting acronyms (e.g. ND).

25.2.14 Sample results.

25.2.15 QC data consisting of method blank, surrogate, LCS, and MS/MSD recoveries and control limits.

25.2.16 Condition of samples at receipt including temperature. This may be accomplished in a narrative or by attaching sample login sheets. . This is discussed in the narrative and a copy of the condition upon receipt form is included with the chain of custody.

25.2.17 A statement to the effect that the results relate only to the items tested and the sample as received by the laboratory, except when information is provided by the client. When data is provided by the client there shall be a clear identification of it, and a disclaimer shall be put in the report when the client supplied data can affect the validity of the test.

25.2.18 A statement that the report shall not be reproduced except in full, without prior express written approval by the laboratory coordinator.

25.2.19 A signature and title of the person(s) accepting responsibility for the content of the report and date of issue. Authorized signatories are qualified Project Managers appointed by the Manager of Project Managers.

25.2.20 When TNI accreditation is required, the lab shall certify that the test results meet all requirements of TNI or provide reasons and/or justification if they do not.

25.2.21 Where applicable, a narrative to the report that explains the issue(s) and corrective action(s) taken in the event that a specific accreditation or certification requirement was not met.

25.2.22 When soil samples are analyzed, a specific identification as to whether soils are reported on a “wet weight” or “dry weight” basis.

25.2.23 Appropriate laboratory certification number for the state of origin of the sample, if applicable.

25.2.24 If only part of the report is provided to the client (client requests some results before all of it is complete), it must be clearly indicated on the report (e.g., preliminary report), and that a complete report will follow once all of the work has been completed. A complete report must be sent once all of the work has been completed.

25.2.25 Any non Eurofins TestAmerica subcontracted analysis results are provided as a separate report on the official letterhead of the subcontractor. All Eurofins TestAmerica subcontracting is clearly identified on the report as to which laboratory performed a specific analysis.

25.2.26 For Ohio EPA VAP work, a VAP affidavit must be completed and included with the report. Refer to the current Ohio Rules OAC 3745-300-04 and 3745-300-13(N) for additional details regarding Ohio EPA VAP affidavits.

25.2.27 A Certification Summary Report, where required, will document that, unless otherwise noted, all analytes tested and reported by the laboratory were covered by the noted certifications.

25.3 Reporting Level or Report Type

The laboratory offers four levels of quality control reporting. Each level, in addition to its own specific requirements, contains all the information provided in the preceding level. The packages provide the following information in addition to the information described above:

- Level 1 is a report with all of the elements outlined in Section 25.2 above, excluding 25.2.15 (QC data).
- Level II is a Level I report plus summary information, including results for the method blank reported to the laboratory MDL, percent recovery for laboratory control samples and matrix spike samples, and the RPD values for all MSD and sample duplicate analyses.
- Level III contains all the information supplied in Level II, but presented on the CLP-like summary forms, and relevant calibration information. A Level II report is not included, unless specifically requested. No raw data is provided.
- Level IV is the same as Level III with the addition of all raw supporting data.

In addition to the various levels of QC packaging, the laboratory also provides reports in EDD (see below). Initial reports may be provided to clients by facsimile. Procedures used to ensure client confidentiality are outlined in Section 25.6.

25.4 Electronic Data Deliverables (EDDs)

EDDs are routinely offered as part of Eurofins TestAmerica's services in addition to the test report as described in Section 25.2. When NELAP accreditation is required and both a test report and EDD are provided to the client, the official version of the test report will be the combined information of the report and the EDD. Eurofins TestAmerica Knoxville offers a variety of EDD formats including industry standard and client specific electronic deliverables.

EDDs shall be subject to a review to ensure their accuracy and completeness. If EDD generation is automated, review may be reduced to periodic screening if the laboratory can demonstrate that it can routinely generate that EDD without errors. Any revisions to the EDD format must be reviewed until it is demonstrated that it can routinely be generated without errors. If the EDD can be reproduced accurately and if all subsequent EDDs can be produced error-free, each EDD does not necessarily require a review.

25.5 Supplemental Information for Test

The lab identifies any unacceptable QC analyses or any other unusual circumstances or observations such as environmental conditions and any non-standard conditions that may have

affected the quality of a result. This is typically in the form of a footnote or a qualifier and/or a narrative explaining the discrepancy in the front of the report. See Appendix 4 for example data qualifiers.

Numeric results with values outside of the calibration range, either high or low are qualified as estimated.

Where quality system requirements are not met, a statement of compliance/non-compliance with requirements and/or specifications is required, including identification of test results derived from any sample that did not meet TNI sample acceptance requirements such as improper container, holding time, or temperature.

Where applicable, a statement on the estimated uncertainty of measurements; information on uncertainty is needed when a client's instructions so require.

When, as requested by the client and agreed to by Eurofins TestAmerica, the report includes a statement of conformity to specification or standard (see Special Services, Section 7.4), the report shall clearly identify:

- to which results the statement applies,
- which specifications, standard or parts thereof are met or not, and
- the decision rule that was applied (unless the decision rule is inherent in the requested specification or standard, taking into account the level of risk (such as false accept and false reject and statistical assumptions) associated with the decision rule.

Opinions and Interpretations - The test report contains objective information, and generally does not contain subjective information such as opinions and interpretations. If such information is required by the client, the Laboratory Director will determine if a response can be prepared. If so, the Laboratory Director will designate the appropriate member of the management team to prepare a response. The response will be fully documented, and reviewed by the Laboratory Director, before release to the client. There may be additional fees charged to the client at this time, as this is a non-routine function of the laboratory.

Note: Review of data deliverable packages for submittal to regulatory authorities requires responses to non-conforming data concerning potential impact on data quality. This necessitates a limited scope of interpretation, and this work is performed by the QA Department. This is the only form of "interpretation" of data that is routinely performed by the laboratory.

When opinions or interpretations are included in the report, the laboratory provides an explanation as to the basis upon which the opinions and interpretations have been made. Opinions and interpretations are clearly noted as such and where applicable, a comment should be added suggesting that the client verify the opinion or interpretation with their regulator.

25.6 Environmental Testing Obtained From Subcontractors

If the laboratory is not able to provide the client the requested analysis, the samples would be subcontracted following the procedures outlined in the NDSC Document No. CW-L-S-004, Subcontracting,

Data reported from analyses performed by a subcontractor laboratory are clearly identified as such on the analytical report provided to the client. Results from a subcontract laboratory outside of Eurofins TestAmerica Knoxville are reported to the client on the subcontract laboratory's original report stationary and the report includes any accompanying documentation.

Note: For Ohio EPA VAP projects Eurofins TestAmerica's affidavit must not attest that the data from the subcontract laboratory are certified. The subcontractor's affidavit must be included and the report must clearly state the test were subcontracted.

25.7 Client Confidentiality

Eurofins TestAmerica Knoxville is responsible for maintaining in confidence all client information obtained or created. In situations involving the transmission of environmental test results by telephone, facsimile or other electronic means, client confidentiality must be maintained.

The laboratory will not intentionally divulge to any person (other than the client or any other person designated by the client in writing) any information regarding the services provided by the laboratory or any information disclosed to the laboratory by the client. Furthermore, information known to be potentially endangering to national security or an entity's proprietary rights will not be released.

Information about the client obtained from sources other than the client (e.g., complainant, regulators) shall be confidential between client and the laboratory. The source of this information shall be confidential to the laboratory and shall not be shared with the client, unless agreed by the source.

Note: This shall not apply to the extent that the information is required to be disclosed by the laboratory under the compulsion of legal process. The laboratory will, to the extent feasible, provide reasonable notice to the client before disclosing the information.

Note: Authorized representatives of an accrediting authority are permitted to make copies of any analyses or records relevant to the accreditation process, and copies may be removed from the laboratory for purposes of assessment.

25.7.1 Report deliverable formats are discussed with each new client. If a client requests that reports be mailed, the reports are to meet all requirements of this document.

25.8 Format of Reports

The format of reports is designed to accommodate each type of environmental test carried out and to minimize the possibility of misunderstanding or misuse.

25.9 Amendments to Test Reports

Corrections, additions, or deletions to reports are only made when justification arises through supplemental documentation. Justification is documented using the laboratory's corrective action system (refer to Section 12).

The revised report is retained on the Archive data server, as is the original report. The revised report is stored in the Archive data server under the job number followed by "rev" The revised report will have the word "revised" on the cover page.

When the report is re-issued, a notation of "Reissued Report" is placed on the cover/signature page of the report or at the top of the narrative page with a brief explanation of reason for the re-issue.

25.10 Policies on Client Requests for Amendments

25.10.1 Policy on Data Omissions or Reporting Limit Increases

Fundamentally, our policy is simply to not omit previously reported results (including data qualifiers) or to not raise reporting limits and report sample results as ND. This policy has few exceptions. Exceptions are:

- Laboratory error.
- Sample identification is indeterminate (confusion between COC and sample labels).
- An incorrect analysis (not analyte) was requested (e.g., COC lists 8315 but client wanted 8310). A written request for the change is required.
- Incorrect limits reported based on regulatory requirements.
- The requested change has absolutely ***no possible*** impact on the interpretation of the analytical results and there is ***no possibility*** of the change being interpreted as misrepresentation by anyone inside or outside of our company.

25.10.2 Multiple Reports

The laboratory does not issue multiple reports for the same work order where there is different information on each report (this does not refer to copies of the same report) unless required to meet regulatory needs and approved by QA.

Appendix 1. List of Governing Documents applicable to the QA Manual

(NDSC and Laboratory SOPs and Policies)

NDSC Doc. No.	Title
CA-C-S-001	Work Sharing Process
CA-I-P-002	Electronic Reporting and Signature Policy

Appendix 2. List of Laboratory Certifications, Accreditations, Validations

The laboratory maintains accreditations, certifications, and approvals with numerous state and national entities. Programs vary but may include on-site audits, reciprocal agreements with another entity, performance testing evaluations, review of the QA Manual, Standard Operating Procedures, Method Detection Limits, training records, etc. At the time of this QA Manual revision, the laboratory has accreditation/ certification/licensing with the following organizations:

eurofins | Environment Testing TestAmerica

Appendix 5. Terms/Glossary and Acronyms (EL-V1M2 Sec. 3.1)

Terms/Glossary:

Acceptance Criteria: Specified limits placed on characteristics of an item, process, or service defined in requirement documents. (ASQC)

Accreditation: The process by which an agency or organization evaluates and recognizes a laboratory as meeting certain predetermined qualifications or standards, thereby accrediting the laboratory.

Accuracy: The degree of agreement between an observed value and an accepted reference value. Accuracy includes a combination of random error (precision) and systematic error (bias) components which are due to sampling and analytical operations; a data quality indicator. (QAMS)

Analyst: The designated individual who performs the "hands-on" analytical methods and associated techniques and who is the one responsible for applying required laboratory practices and other pertinent quality controls to meet the required level of quality.

Analytical Uncertainty: A subset of Measurement Uncertainty that includes all laboratory activities performed as part of the analysis. (TNI)

Anomaly: A condition or event, other than a deficiency, that may affect the quality of the data, whether in the laboratory's control or not.

Assessment: The evaluation process used to measure or establish the performance, effectiveness, and conformance of an organization and/or its systems to defined criteria (to the standards and requirements of laboratory accreditation). (TNI)

Audit: A systematic and independent examination of facilities, equipment, personnel, training, procedures, record-keeping, data validation, data management, and reporting aspects of a system to determine whether QA/QC and technical activities are being conducted as planned and whether these activities will effectively achieve quality objectives. (TNI)

Batch: Environmental samples that are prepared and/or analyzed together with the same process and personnel, using the same lot(s) of reagents. A **preparation batch** is composed of one (1) to twenty (20) environmental samples of the same quality systems matrix, meeting the above mentioned criteria and with a maximum time between the start of processing of the first and last sample in the batch to be twenty-four (24) hours. An **analytical batch** is composed of prepared environmental samples (extracts, digestates or concentrates) which are analyzed together as a group. An analytical batch can include prepared samples originating from various quality system matrices and can exceed twenty (20) samples. (TNI)

Bias: The systematic or persistent distortion of a measurement process, which causes errors in one direction (i.e., the expected sample measurement is different from the sample's true value). (TNI)

Blank: A sample that has not been exposed to the analyzed sample stream in order to monitor contamination during sampling, transport, storage or analysis. The blank is subjected to the usual analytical and measurement process to establish a zero baseline or background value and is sometimes used to adjust or correct routine analytical results. (ASQC)

Calibration: A set of operations that establish, under specified conditions, the relationship between values of quantities indicated by a measuring instrument or measuring system, or values represented by a material measure or a reference material, and the corresponding values realized by standards. (TNI)

1) In calibration of support equipment the values realized by standards are established through the use of reference standards that are traceable to the International System of Units (SI).

2) In calibration according to methods, the values realized by standards are typically established through the use of Reference Materials that are either purchased by the laboratory with a certificate of analysis or purity, or prepared by the laboratory using support equipment that has been calibrated or verified to meet specifications.

Calibration Curve: The mathematical relationship between the known values, such as concentrations, of a series of calibration standards and their instrument response. (TNI)

Calibration Standard: A substance or reference material used to calibrate an instrument (QAMS)

Certified Reference Material (CRM): A reference material accompanied by a certificate, having a value, measurement uncertainty, and stated metrological traceability chain to a national metrology institute. (TNI)

Chain of Custody (COC) Form: Record that documents the possession of the samples from the time of collection to receipt in the laboratory. This record generally includes: the number and types of containers; the mode of collection; the collector; time of collection; preservation; and requested analyses. (TNI)

Compromised Samples: Those samples which are improperly sampled, insufficiently documented (chain of custody and other sample records and/or labels), improperly preserved, collected in improper containers, or exceeding holding times when delivered to a laboratory. Under normal conditions, compromised samples are not analyzed. If emergency situation require analysis, the results must be appropriately qualified.

Confidential Business Information (CBI): Information that an organization designates as having the potential of providing a competitor with inappropriate insight into its management, operation or products. TNI and its representatives agree to safeguard identified CBI and to maintain all information identified as such in full confidentiality.

Confirmation: Verification of the identity of a component through the use of an approach with a different scientific principle from the original method. These may include, but are not limited to Second Column Confirmation; Alternate wavelength; Derivatization; Mass spectral interpretation; Alternative detectors or Additional Cleanup procedures. (TNI)

Conformance: An affirmative indication or judgment that a product or service has met the requirements of the relevant specifications, contract, or regulation; also the state of meeting the requirements. (ANSI/ASQC E4-1994)

Correction: Actions necessary to correct or repair analysis specific non-conformances. The acceptance criteria for method specific QC and protocols as well as the associated corrective actions. The analyst will most frequently be the one to identify the need for this action as a result of calibration checks and QC sample analysis**.** No significant action is taken to change behavior, process or procedure.

Corrective Action: The action taken to eliminate the causes of an existing nonconformity, defect or other undesirable situation in order to prevent recurrence. (ISO 8402)

Data Integrity: The condition that exists when data are sound, correct, and complete, and accurately reflect activities and requirements. (TNI)

Data Audit: A qualitative and quantitative evaluation of the documentation and procedures associated with environmental measurements to verify that the resulting data re of acceptable quality (i.e., that they meet specified acceptance criteria).

Data Reduction: The process of transforming the number of data items by arithmetic or statistical calculations, standard curves, and concentration factors, and collation into a more useable form. (TNI)

Deficiency: An unauthorized deviation from acceptable procedures or practices, or a defect in an item (ASQC), whether in the laboratory's control or not.

Demonstration of Capability: A procedure to establish the ability of the analyst to generate analytical results of acceptable accuracy and precision. (TNI)

Document Control: The act of ensuring that documents (and revisions thereto) are proposed, reviewed for accuracy, approved for release by authorized personnel, distributed properly, and controlled to ensure use of the correct version at the location where the prescribed activity if performed. (ASQC)

Duplicate Analyses: The analyses or measurements of the variable of interest performed identically on two subsamples of the same sample. The results from duplicate analyses are used to evaluate analytical or measurement precision but not the precision of sampling, preservation or storage internal to the laboratory. (EPA-QAD)

Equipment Blank: Sample of analyte-free media which has been used to rinse common sampling equipment to check effectiveness of decontamination procedures.

External Standard Calibration: Calibrations for methods that do not utilize internal standards to compensate for changes in instrument conditions.

Field Blank: Blank prepared in the field by filing a clean container with pure de-ionized water and appropriate preservative, if any, for the specific sampling activity being undertaken (EPA OSWER)

Field of Accreditation: Those matrix, technology/method, and analyte combinations for which the accreditation body offers accreditation.

Holding Blank: A blank matrix stored with field samples of a similar matrix (Volatiles only) that measures storage contribution to any source of contamination.

Holding Times: The maximum time that samples may be held prior to analyses and still be considered valid or not compromised. (40 CFR Part 136)

Internal Standard: A known amount of standard added to a test portion of a sample as a reference for evaluating and controlling the precision and bias of the applied analytical test method. (TNI)

Internal Standard Calibration: Calibrations for methods that utilize internal standards to compensate for changes in instrument conditions.

Instrument Blank: A clean sample (e.g., distilled water) processed through the instrumental steps of the measurement process; used to determine instrument contamination. (EPA-QAD)

Instrument Detection Limit (IDL): The minimum amount of a substance that can be measured with a specified degree of confidence that the amount is greater than zero using a specific instrument. The IDL is associated with the instrumental portion of a specific method only, and sample preparation steps are not considered in its derivation. The IDL is a statistical estimation at a specified confidence interval of the concentration at which the relative uncertainty is ± 100%. The IDL represents a range where qualitative detection occurs on a specific instrument. Quantitative results are not produced in this range.

Laboratory Control Sample (however named, such as laboratory fortified blank, spiked blank, or QC check sample): A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes, taken through all preparation and analysis steps of the procedure unless otherwise noted in a reference method. It is generally used to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.

An LCS shall be prepared at a minimum of 1 per batch of 20 or less samples per matrix type per sample extraction or preparation method except for analytes for which spiking solutions are not available such as total suspended solids, total dissolved solids, total volatile solids, total solids, pH, color, odor, temperature, dissolved oxygen or turbidity. The results of these samples shall be used to determine batch acceptance.

Least Squares Regression (1st Order Curve): The least squares regression is a mathematical calculation of a straight line over two axes. The y axis represents the instrument response (or Response ratio) of a standard or sample and the x axis represents the concentration. The regression calculation will generate a correlation coefficient (r) that is a measure of the "goodness of fit" of the regression line to the data. A value of 1.00 indicates a perfect fit. In order to be used for quantitative purposes, r must be greater than or equal to 0.99 for organics and 0.995 for inorganics.

Limit(s) of Detection (LOD) [a.k.a., Method Detection Limit (MDL)]: The MDL is the minimum measured quantity of a substance that can be reported with 99% confidence that the concentration is distinguishable from method blank results, consistent with 40CFR Part 136 Appendix B, August, 2017.

Limit(s) of Quantitation (LOQ) [a.k.a., Reporting Limit]: The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence.

(QS) Matrix: The component or substrate that contains the analyte of interest. For purposes of batch and QC requirement determinations, the following matrix distinctions shall be used:

Aqueous: Any aqueous sample excluded from the definition of Drinking Water or Saline/Estuarine. Includes surface water, groundwater effluents, and TCLP or other extracts.

Drinking Water: Any aqueous sample that has been designated as a potable or potential potable water source.

Saline/Estuarine: Any aqueous sample from an ocean or estuary, or other salt water source such as the Great Salt Lake.

Non-Aqueous Liquid: Any organic liquid with <15% settleable solids.

Biological Tissue: Any sample of a biological origin such as fish tissue, shellfish, or plant material. Such samples shall be grouped according to origin.

Solids: Includes soils, sediments, sludges, and other matrices with >15% settleable solids.

Chemical Waste: A product or by-product of an industrial process that results in a matrix not previously defined.

Air & Emissions: Whole gas or vapor samples including those contained in flexible or rigid wall containers and the extracted concentrated analytes of interest from a gas or vapor that are collected with a sorbant tube, impinger solution, filter, or other device. (TNI)

Matrix Spike (spiked sample or fortified sample): A sample prepared, taken through all sample preparation and analytical steps of the procedure unless otherwise noted in a referenced method, by adding a known amount of target analyte to a specified amount of sample for which an independent test result of target analyte concentration is available. Matrix spikes are used, for example, to determine the effect of the matrix on a method's recovery efficiency.

Matrix Spike Duplicate (spiked sample or fortified sample duplicate): A replicate matrix spike prepared and analyzed to obtain a measure of the precision of the recovery for each analyte.

Method Blank: A sample of a matrix similar to the batch of associated samples (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences are present at concentrations that impact the analytical results for sample analyses.

Method Detection Limit: See Limit of Detection (LOD)

Negative Control: Measures taken to ensure that a test, its components, or the environment do not cause undesired effects, or produce incorrect test results.

Non-conformance: An indication, judgment, or state of not having met the requirements of the relevant specifications, contract, or regulation.

Observation: A record of phenomena that (1) may assist in evaluation of the sample data; (2) may be of importance to the project manager and/or the client, and yet not at the time of the observation have any known effect on quality.

Performance Audit: The routine comparison of independently obtained qualitative and quantitative measurement system data with routinely obtained data in order to evaluate the proficiency of an analyst or laboratory.

Positive Control: Measures taken to ensure that a test and/or its components are working properly and producing correct or expected results from positive test subjects.

Precision: The degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves; a data quality indicator. Precision is usually expressed as standard deviation, variance or range, in either absolute or relative terms. (TNI)

Preservation: Any conditions under which a sample must be kept in order to maintain chemical and/or biological integrity prior to analysis. (TNI)

Proficiency Testing: A means of evaluating a laboratory's performance under controlled conditions relative to a given set of criteria through analysis of unknown samples provided by an external source. (TNI)

Proficiency Testing Program: The aggregate of providing rigorously controlled and standardized environmental samples to a laboratory for analysis, reporting of results, statistical evaluation of the results and the collective demographics and results summary of all participating laboratories. (TNI)

Proficiency Test Sample (PT): A sample, the composition of which is unknown to the laboratory and is provided to test whether the laboratory can produce analytical results within specified acceptance criteria. (TNI)

Quality Assurance: An integrated system of management activities involving planning, implementation, assessment, reporting and quality improvement to ensure that a process, item or service is of the type of quality needed and expected by the client. (TNI)

Quality Assurance [Project] Plan (QAPP): A formal document describing the detailed quality control procedures by which the quality requirements defined for the data and decisions pertaining to a specific project are to be achieved. (EAP-QAD)

Quality Control: The overall system of technical activities that measures the attributes and performance of a process, item, or service against defined standards to verify that they meet the stated requirements established by the customer; operational techniques and activities that are used to fulfill requirements for quality; also the system of activities and checks used to ensure that measurement systems are maintained within prescribed limits, providing protection against “out of control” conditions and ensuring that the results are of acceptable quality. (TNI)

Quality Control Sample: A sample used to assess the performance of all or a portion of the measurement system. One of any number of samples, such as Certified Reference Materials, a quality system matrix fortified by spiking, or actual samples fortified by spiking, intended to demonstrate that a measurement system or activity is in control. (TNI)

Quality Manual: A document stating the management policies, objectives, principles, organizational structure and authority, responsibilities, accountability, and implementation of an agency, organization, or laboratory, to ensure the quality of its product and the utility of its product to its users. (TNI)

Quality System: A structured and documented management system describing the policies, objectives, principles, organizational authority, responsibilities, accountability, and implementation plan of an organization for ensuring quality in its work processes, products (items), and services. The quality system provides the framework for planning, implementing, and assessing work performed by the organization and for carrying out required QA and QC activities. (TNI)

Raw Data: The documentation generated during sampling and analysis. This documentation includes, but is not limited to, field notes, electronic data, magnetic tapes, untabulated sample results, QC sample results, print outs of chromatograms, instrument outputs, and handwritten records. (TNI)

Record Retention: The systematic collection, indexing and storing of documented information under secure conditions.

Reference Material: Material or substance one or more properties of which are sufficiently homogeneous and well established to be used for the calibration of an apparatus, the assessment of a measurement method, or for assigning values to materials. (TNI)

Reference Standard: Standard used for the calibration of working measurement standards in a given organization or a given location. (TNI)

Sampling: Activity related to obtaining a representative sample of the object of conformity assessment, according to a procedure.

Second Order Polynomial Curve (Quadratic): The 2nd order curves are a mathematical calculation of a slightly curved line over two axis. The y axis represents the instrument response (or Response ratio) of a standard or sample and the x axis represents the concentration. The 2nd order regression will generate a coefficient of determination (COD or r^2) that is a measure of the "goodness of fit" of the quadratic curvature the data. A value of 1.00 indicates a perfect fit. In order to be used for quantitative purposes, r^2 must be greater than or equal to 0.99.

Selectivity: The ability to analyze, distinguish, and determine a specific analyte or parameter from another component that may be a potential interferent or that may behave similarly to the target analyte or parameter within the measurement system. (TNI)

Sensitivity: The capability of a method or instrument to discriminate between measurement responses representing different levels (e.g., concentrations) of a variable of interest. (TNI)

Spike: A known mass of target analyte added to a blank, sample or sub-sample; used to determine recovery efficiency or for other quality control purposes.

Standard: The document describing the elements of laboratory accreditation that has been developed and established within the consensus principles of standard setting and meets the approval requirements of standard adoption organizations procedures and policies. (TNI)

Standard Operating Procedures (SOPs): A written document which details the method for an operation, analysis, or action, with thoroughly prescribed techniques and steps. SOPs are officially approved as the methods for performing certain routine or repetitive tasks. (TNI)

Storage Blank: A blank matrix stored with field samples of a similar matrix (volatiles only) that measures storage contribution to any source of contamination.

Surrogate: A substance with properties that mimic the analyte of interest. It is unlikely to be found in environment samples and is added to them for quality control purposes.

Surrogate compounds must be added to all samples, standards, and blanks, for all organic chromatography methods except when the matrix precludes its use or when a surrogate is not available. Poor surrogate recovery may indicate a problem with sample composition and shall be reported to the client whose sample produced poor recovery. (QAMS)

Systems Audit (also Technical Systems Audit): A thorough, systematic, qualitative on-site assessment of the facilities, equipment, personnel, training, procedures, record keeping, data validation, data management, and reporting aspects of a total measurement system. (EPA-QAD)

Technical Manager: A member of the staff of an environmental laboratory who exercises actual day-to-day supervision of laboratory operations for the appropriate fields of accreditation and reporting of results

Technology: A specific arrangement of analytical instruments, detection systems, and/or preparation techniques.

Traceability: The ability to trace the history, application, or location of an entity by means of recorded identifications. In a calibration sense, traceability relates measuring equipment to national or international standards, primary standards, basic physical constants or properties, or reference materials. In a data collection sense, it relates calculations and data generated throughout the project back to the requirements for the quality of the project. (TNI)

Trip Blank: A blank matrix placed in a sealed container at the laboratory that is shipped, held unopened in the field, and returned to the laboratory in the shipping container with the field samples.

Uncertainty: A parameter associated with the result of a measurement that characterizes the dispersion of the value that could reasonably be attributed to the measured value.

Acronyms:

CAR – Corrective Action Report

CCV – Continuing Calibration Verification

CF – Calibration Factor

CFR – Code of Federal Regulations

COC – Chain of Custody

DOC – Demonstration of Capability

DQO – Data Quality Objectives

DUP - Duplicate

Appendix 7. Example Data Qualifiers (Standard Flagging Suite)[1]

Qualifier	Footnote
!	Laboratory is not accredited for this parameter.
*	RPD of the LCS and LCSD exceeds the control limits
*	LCS or LCSD is outside acceptance limits
>	The analyte exceeded the indicated concentration
^	Instrument related QC is outside acceptance limits
4	MS,MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore control limits are not applicable
AP	Altered Pattern
B	Compound was found in the blank and sample
B7	Target analyte detected in the method blank at or above method reporting limit. Concentration found in sample was at 10X the concentration found in the blank
c	Compound falls outside routine control limits, but is within acceptable client specific calibration criteria
cn	Refer to Case Narrative for further detail
D	Sample results are obtained from a dilution; the surrogate or matrix spike recoveries reported are calculated from diluted samples
D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution may be flagged with a D
D	Sample results are obtained from a dilution; the surrogate or matrix spike recoveries reported are calculated from diluted samples.
DW	Result has been dry weight corrected
E	Result exceeded calibration range.
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits
F3	Duplicate RPD exceeds the control limit
F4	MS/MSD RPD exceeds control limits due to sample size difference.
F5	Duplicate RPD exceeds limit, and one or both sample results are less than 5 times RL. The data are considered valid because the absolute difference is less than the RL.
H	Sample was prepped or analyzed beyond the specified holding time
h	Alternate peak selection upon analytical review.
I	Indicates the presence of an interference, recovery is not calculated.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
NC	Not Confirmed
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
P	The %RPD between the primary and confirmation column/detector is >40%. The higher value has been reported
Q	Result was qualitatively confirmed, but not quantitated.
q	The reported result is the estimated maximum possible concentration of this analyte, quantitated using the theoretical ion ratio. The measured ion ratio does not meet qualitative identification criteria and indicates a possible interference.
S	Ion suppression
U	Indicates the analyte was analyzed for but not detected.

V	Serial Dilution exceeds the control limits
W	PS: Post-digestion spike was outside control limits
X	Surrogate is outside control limits

1 – This is a standard list of qualifiers commonly used. Other qualifiers are available in LIMS.

1 Scope and Application

1.1 This procedure is designed to meet analytical program requirements where HRGC/HRMS analysis of polychlorinated biphenyl (PCB) isomers is specified. The procedure is used by Eurofins TestAmerica Knoxville for the qualitative and quantitative measurement of all 209 PCB congeners in a variety of environmental matrices at part-per-trillion (ppt) to part-per-quadrillion (ppq) concentrations. This procedure is based on EPA method 1668A, 1668B and 1668C.

1.2 The compounds listed in Table 1 may be determined by this procedure. The detection limits and quantitation levels in this method are usually dependent on the level of interferences rather than instrumental limitations. The estimated minimum levels (EMLs) in Table 4 are the levels at which the PCBs can be determined with only common laboratory interferences present. The actual limits of detection and quantitation will vary depending on the complexity of the matrix.

1.3 The Low Calibration Levels (LCLs) of the method are listed in Table 3 for individual congeners. Analysis of a one-tenth aliquot of the sample permits measurements of concentrations up to 10 times the upper calibration range. Samples containing concentrations of PCBs that are greater than ten times the upper calibration are analyzed by protocols designed for such concentration levels.

1.4 The GC/MS portions of this method are for use only by analysts experienced with HRGC/HRMS or under the close supervision of such qualified persons. Each laboratory that uses this method must demonstrate the ability to generate acceptable results using the procedure in section 9.1.

1.5 This procedure is a "performance-based" method. These reference methods allow modifications to overcome interferences or lower the cost of measurements, if all performance criteria in the methods are met and method equivalency is established. Deviations from the referenced methods have been incorporated into this procedure and are listed in section 17.1. Deviations to this procedure are only allowed as specified in section 11.1.

1.6 Because of the extreme toxicity of many of these compounds, the analyst must take the necessary precautions to prevent exposure to materials known or believed to contain PCBs. It is the responsibility of the laboratory personnel to ensure that safe handling procedures are employed. Section 5 of this procedure discusses safety procedures.

2 Summary of Method

2.1 All solid and semi-solid samples are screened by GC/ECD prior to extraction. Other sample matrices may be screened if the potential for high congener concentrations exists. Variations in sample size, spiking levels and final volume are established based on the screening result.

2.2 After sample extraction, cleanup, and concentration, recovery standards are added to each extract, and an aliquot of the extract is injected into the gas chromatograph. The analytes are separated by the GC and detected by a high-resolution (≥10,000) mass spectrometer. Two exact masses are monitored for each analyte.

2.3 An individual PCB congener is identified by comparing the GC retention time and ion-abundance ratio of two exact masses with the corresponding retention time of an authentic

standard and the theoretical or acquired ion-abundance ratio of the two exact masses.

2.4 Quantitative analysis is performed using selected ion current profile areas using the internal standard technique.

2.5 The quality of the analysis is assured through reproducible calibration and verification of the extraction, cleanup, and GC/MS systems.

3 Definitions

These definitions and purposes are specific to this method but conform to common usage as much as possible.

Note: Terminology differences existing in some isotope dilution reference methods regarding the functionality of the labeled analogs may lead to confusion. For example, EPA's Office of Solid Waste methods (8280, 8290) use the term "Internal Standards" to describe the labeled analogs which are added to the sample prior to extraction and used to quantitate the native targets. EPA's Office of Water methods (1613B, 1668) use the term "Labeled Analogs" to describe these same compounds while using the term "Internal Standards" to describe the labeled analogs which are added to the extract just prior to analysis and used to quantitate the recovery of the labeled analogs added before extraction. EPA's Office of Solid Waste methods (8280, 8290) uses the term "Recovery Standards" to describe these later labeled analogs.

The terminology conventions established by the EPA's Office of Solid Waste methods (8280, 8290) are used in the laboratory for all Standard Operating Procedures and internal communications as defined in this section.Analyte – A PCB tested for by this method. The analytes are listed in Table 1.

3.1 Calibration verification standard (VER) – The mid-point calibration standard (CS3) that is used to verify calibration. See Table 6a.

3.2 CB – Chlorinated biphenyl congener. One of the 209 individual chlorinated biphenyl congeners determined using this method. The 209 CBs are listed in Table 1.

3.3 Congener – Any member of a particular homologous series, for example, 2,2’-DiCB.

3.4 CS0.5, CS1, CS2, CS3, CS4, CS5 – See Calibration standards and Table 6a.

3.5 Estimated Detection Limit (EDL) – The sample specific estimated detection limit (EDL) is the concentration of a given analyte required to produce a signal with a peak height of at least 2.5 times the background signal level (noise level).

3.6 Estimated Maximum Possible Concentration (EMPC) – The calculated concentration of a signal having the same retention time as a PCB congener but which does not meet all of the other qualitative identification criteria defined in the method.

3.7 Estimated Minimum Level (EML) – The lowest concentration at which an analyte can be measured reliably with common laboratory interferences present. This is the reporting limit (RL).

3.8 FC-43 (PFTBA) - Perfluorotributylamine; used to calibrate the exact mass scale in the HRMS.

3.9 Field blank – An aliquot of reagent water or other reference matrix that is placed in a sample container in the laboratory or the field, and treated as a sample in all respects, including exposure to sampling site conditions, storage, preservation, and all analytical procedures. The purpose of the field blank is to determine if the field or sample transporting procedures and environments have contaminated the sample.

3.10 GC – Gas chromatograph or gas chromatography.

3.11 Homologous Series – A series of compounds in which each member contains the same number of chlorine atoms. The members of the series are called homologs.

3.12 HRGC – High resolution GC.

3.13 HRMS – High resolution MS.

3.14 ICV – Initial Calibration Verification Standard. A calibration standard from a second source, traceable to a national standard if possible. The ICV is analyzed after the Initial calibration to verify the concentration of the initial calibration standards.

3.15 Isotope Dilution Analytes (IDAs) – Isotopically labeled analogs of the target analytes that are added to every sample, blank, quality control spike sample, and calibration solution. They are added to the sample before extraction and are used to calculate the concentration of the target analytes or detection limits.

3.16 IPR (also known as IDOC) – Initial precision and recovery; four aliquots of the PAR standard analyzed to establish the ability to generate acceptable precision and accuracy. An IPR is performed prior to the first time this method is used and any time the method or instrumentation undergoes significant modification.

3.17 Isomer – PCB congeners that contain the same number of chlorine atoms, but differ in the structural arrangement of the chlorine atoms. For example, PCB-4 and PCB-9 are isomers.

3.18 Laboratory blank – See Method blank.

3.19 Laboratory control sample (LCS) – See ongoing precision and recovery standard (OPR).

3.20 Laboratory reagent blank – See Method blank.

3.21 Level of Chlorination (LOC) Congeners – The first and last eluting congeners in each homolog (or level of chlorination). (For the SPB-Octyl Column the LOC Congeners are 1, 3; 4, 15; 19, 37; 54, 77; 104, 126; 155, 169; 188, 189; 202, 205; 208, 206; 209)

3.22 Method blank – An aliquot of a clean test matrix that is treated exactly as a sample including exposure to all glassware, equipment, solvents, reagents, internal standards, and surrogates that are used with samples. The method blank is used to determine if analytes or interferences are present in the laboratory environment, the reagents, or the apparatus.

3.23 Minimum Level (ML) – The level at which the entire analytical system must give a recognizable signal and acceptable calibration point for the analyte. It is equivalent to the concentration of the lowest calibration standard, assuming that all method-specified sample weights, volumes, and cleanup procedures have been employed.

Note: EML is the lowest concentration at which an analyte can be measured reliably with common laboratory interferences present

3.24 MS – Mass spectrometer or mass spectrometry.

3.25 OPR (also know as ODOC) – Ongoing precision and recovery standard (OPR); a laboratory blank spiked with known quantities of analytes. The OPR is analyzed exactly like a sample. Its purpose is to assure that the results produced by the laboratory remain within the limits specified in this method for precision and recovery.

3.26 PAR – Precision and recovery standard; secondary standard that is diluted and spiked to form the IPR and OPR.

3.27 PFK – Perfluorokerosene; the mixture of compounds used to calibrate the exact mass scale of the HRMS.

3.28 Primary dilution standard – A solution containing the specified analytes that is purchased or prepared from stock solutions and diluted as needed to prepare calibration solutions and other solutions.

3.29 Quality control check sample (QCS) – A sample containing all or a subset of the analytes at known concentrations. The QCS is obtained from a source external to the laboratory or is prepared from a source of standards different from the source of calibration standards. It is used to check laboratory performance with test materials prepared external to the normal preparation process.

3.30 PCB – Polychlorinated biphenyl.

3.31 Reagent water – Water demonstrated to be free from the analytes of interest and potentially interfering substances at the method minimum level for the analyte.

3.32 Recovery Standard (RS) – Isotopically labeled compounds which are added to every sample, blank, and quality control spike sample extract prior to analysis. They are used to measure the recovery of the internal standards and the cleanup standards.

3.33 Relative Percent Difference (RPD) – A measure of the difference between two values normalized to one of the values. It is used to determine the accuracy of the concentration measurements of second source verification standards.

3.34 Relative standard deviation (RSD) – The standard deviation times 100 divided by the mean. Also termed "coefficient of variation."

3.35 RF or RRF (Relative Response Factor) - The ratio of the response of the mass spectrometer to a known amount of a compound relative to that of a known amount of a reference standard as measured in the initial and continuing calibrations. It is used to determine instrument performance and it is used to calculate the concentration of target analytes, internal standard recoveries, or detection limits in samples, blanks, and quality control samples. See Section 10.3.4.2.

3.36 SPE – Solid-phase extraction; an extraction technique in which an analyte is extracted from an

aqueous sample by passage over or through a material capable of reversibly adsorbing the analyte. Also termed liquid-solid extraction.

3.37 Specificity – The ability to measure an analyte of interest in the presence of interferences and other analytes of interest encountered in a sample.

3.38 Stock solution - A solution containing an analyte that is prepared using a reference material traceable to EPA, the National Institute of Science and Technology (NIST), or a source that will attest to the purity and authenticity of the reference material.

3.39 Field Surrogate Standards (SU) - Isotopically labeled compounds that are added to XAD samples and calibration solution. They are added to XAD sampling tubes before sampling and are used to measure sampling and recovery efficiency.

3.40 Surrogate Standard (SU) – Isotopically labeled compounds that are added to samples, blanks, quality control samples, and calibration solutions. They are added to the samples after extraction but prior to extract cleanup, and are used to assess the efficiency of the cleanup procedures.

3.41 Toxic Congeners (or Toxic Isomers) – PCBs determined by the World Health Organization and USEPA to have dioxin-like toxicity. (PCBs 77, 81, 105, 114, 118, 123, 126, 156, 157, 167, 169, 189)

3.42 Toxic/LOC Congeners – PCBs belonging to either the Toxic Congeners list or the LOC Congeners list.

3.43 VER – See Calibration verification standard.

3.44 Additional definitions can be found in the Eurofins TestAmerica Knoxville Quality Assurance Manual (QAM), current revision.

4 Interferences

4.1 Solvents, reagents, glassware, and other sample processing hardware may yield artifacts and/or elevated baselines causing misinterpretation of chromatograms. Where possible, glassware is cleaned by extraction or solvent rinse. The non-coplanar PCB congeners 105, 114, 118, 123, 156, 157, 167, and 180 have been shown to be very difficult to completely eliminate from the laboratory at the minimum levels in this method, and baking of glassware in a kiln or furnace at 450 - 500°C may be necessary to remove these and other contaminants.

4.2 All materials used in the analysis shall be demonstrated to be free from interferences by running laboratory method blanks (section 9.5) initially and with each sample batch.

4.3 Interferences coextracted from samples will vary considerably from source to source, depending on the diversity of the site being sampled. Interfering compounds may be present at concentrations several orders of magnitude higher than the PCBs. The most frequently encountered interferences are chlorinated dioxins and dibenzofurans, methoxy biphenyls, hydroxy-diphenyl ethers, benzylphenyl ethers, polynuclear aromatics, and pesticides. Because very low levels of PCBs are measured by this method, the elimination of interferences is essential. Cleanup steps can be used to reduce or eliminate these interferences and thereby

permit reliable determination of the PCBs at the levels shown in Table 3.

5 Safety

5.1 Employees must abide by the policies and procedures in the Corporate Safety Manual, Radiation Safety Manual and this document.

5.2 Eye protection that satisfies ANSI Z87.1 (as per the Corporate Safety Manual), laboratory coat and appropriate gloves must be worn while samples, standards, solvents and reagents are being handled. Disposable gloves that have become contaminated will be removed and discarded, other gloves will be cleaned immediately.

5.2.1 Latex and vinyl gloves provide no protection against most of the organic solvents used in this method. For the operations described herein, Nitrile gloves are to be worn. For operations using solvents that may splash, SilverShield® gloves are recommended. SilverShield® gloves protect against breakthrough for most of the solvents used in this procedure.

5.3 The effluents of sample splitters for the gas chromatograph and roughing pumps on the mass spectrometer must be vented to the laboratory hood exhaust system or must pass through an activated charcoal filter.

5.4 The gas chromatograph and mass spectrometer contain zones that have elevated temperatures. The analyst needs to be aware of the locations of those zones, and must cool them to room temperature prior to working on them or use thermal protection when working on them while they are above room temperature.

5.5 The mass spectrometer is under high vacuum. The mass spectrometer must be brought to atmospheric pressure prior to working on the source. Alternatively, the source may be removed from the vacuum manifold through a vacuum interlock.

5.6 There are areas of high voltage in both the gas chromatograph and the mass spectrometer. Depending on the type of work involved, either turn the power to the instrument off, or disconnect it from its source of power. If the work involved requires measurement of voltage supplies, the instrument may be left on.

5.7 Primary Materials Used: The following is a list of the materials used in this method, which have a serious or significant hazard rating. **NOTE: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the SDS for each of the materials listed in the table.** A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the SDS for each material before using it for the first time or when there are major changes to the SDS.

Material	Hazards	Exposure Limit (1)	Signs and symptoms of exposure
Methylene Chloride	Carcinogen, Irritant	25 ppm-TWA, 125 ppm-STEL	Causes irritation to respiratory tract. Has a strong narcotic effect with symptoms of mental confusion, light-headedness, fatigue, nausea, vomiting and headache. Causes irritation, redness and pain to the skin and eyes. Prolonged contact can cause burns. Liquid degreases the skin. May be absorbed through skin.
Hexane	Flammable, Irritant	500 ppm-TWA	Inhalation of vapors irritates the respiratory tract. Overexposure may cause lightheadedness, nausea, headache, and blurred vision. Vapors may cause irritation to the skin and eyes.
Methanol	Flammable, Poison, Irritant	200 ppm-TWA	A slight irritant to the mucous membranes. Toxic effects exerted upon nervous system, particularly the optic nerve. Symptoms of overexposure may include headache, drowsiness and dizziness. Methyl alcohol is a defatting agent and may cause skin to become dry and cracked. Skin absorption can occur; symptoms may parallel inhalation exposure. Irritant to the eyes.
Toluene	Flammable, Poison, Irritant	200 ppm-TWA 300 ppm-Ceiling	Inhalation may cause irritation of the upper respiratory tract. Symptoms of overexposure may include fatigue, confusion, headache, dizziness and drowsiness. Peculiar skin sensations (e. g. pins and needles) or numbness may be produced. Causes severe eye and skin irritation with redness and pain. May be absorbed through the skin.
Acetone	Flammable	1000 ppm-TWA	Inhalation of vapors irritates the respiratory tract. May cause coughing, dizziness, dullness, and headache.
Nonane	Flammable	None established	Harmful if inhaled/swallowed. Vapor/mist is irritating to eyes, mucous memebranes and upper respiratory tract. Causes skin irritiation.
1 – Exposure limit refers to the OSHA regulatory exposure limit.			

5.8 Chemicals that have been classified as **carcinogens**, **potential carcinogens**, or **mutagens include**: methylene chloride, polychlorinated biphenyls, and toluene. The toxicity or carcinogenicity of each reagent used in this method is not precisely defined; however, each chemical compound should be treated as a potential health hazard. From this viewpoint, exposure to these chemicals must be kept to a minimum.)

5.9 Chemicals known to be **flammable** are: acetone, hexane, nonane and toluene.

5.10 Exposure to chemicals will be maintained as low as reasonably achievable; therefore, unless they are known to be non-hazardous, all samples will be opened, transferred and prepared in a fume hood, or under other means of mechanical ventilation. Solvent and waste containers will be kept closed unless transfers are being made.

5.11 The preparation of all standards will be conducted in a fume hood with the sash closed as far as the operations will permit.

5.12 Confinement: Work areas should be isolated and posted with signs. Glassware and tools should be segregated. Bench tops should be covered with plastic backed absorbent paper.

5.13 Waste: Good technique includes minimizing contaminated waste. Plastic bag liners should be used in waste cans.

5.14 Accidents: Remove contaminated clothing immediately, taking precautions not to contaminate skin or other articles. Wash exposed skin vigorously and repeatedly until medical attention is obtained.

5.15 All work must be stopped in the event of a known or potential compromise to the health or safety of laboratory personnel. The situation must be reported immediately to a laboratory supervisor.

6 Equipment and Supplies

6.1 Gas chromatograph - Shall have splitless or on-column injection port for capillary column, temperature program with isothermal hold, and shall meet all of the performance specifications in Section 10.

6.1.1 Column #1 – 30±5-m long x 0.25±0.02-mm ID; 0.25-µm film SPB-Octyl (Supelco 2-4218, or equivalent).

6.2 Mass spectrometer - Electron impact ionization, shall be capable of repetitively selectively monitoring 20 exact masses minimum at high resolution (≥10,000) during a period less than 1.0 second, and shall meet all of the performance specifications in Section 10.

6.3 GC/MS interface - The mass spectrometer (MS) shall be interfaced to the GC such that the end of the capillary column terminates within 1 cm of the ion source but does not intercept the electron or ion beams.

6.4 Data system - Capable of collecting, recording, and storing MS data.

7 Reagents and Standards

CAUTION: Refer to Safety Data Sheets (SDS) for specific safety information on chemicals and reagents prior to use or as needed.

CAUTION: During preparation of reagents, associates shall wear lab coat, gloves, safety glasses with side shields, and laboratory approved shoes as a minimum. Reagents shall be prepared in a fume hood.

7.1 Solvents - Acetone, toluene, n-hexane, methanol, methylene chloride, and nonane; pesticide quality.

7.2 Perfluorokerosene (PFK) high boiling mass spectroscopy grade; bp 210-260°C; d^{20}_4 1.94; n^{20}_D 1.330; Fluka (Catalog No. - 77275).

7.3 FC-43 (PFTBA) is used in neat form to tune and calibrate the mass spectrometer. (Scientific Instrument Services Catalog No. FC-43-35)

7.4 $^{13}C_{12}$ Labeled PCB Congener Isotope Dilution Analytes (IDA): Obtained as individual Certified Reference Standards from Cambridge Isotope Laboratories (CIL, Andover Massachusetts) and

Wellington Laboratories (Guelph, Ontario, Canada). Refer to Table 5b for a list of individual standards. These standards are purchased at 40 µg/mL or 50 µg/mL in nonane. If the chemical purity is 98% or greater, the stated manufacturer concentration may be used without correction to compute the concentration of the standard. Once a standard ampoule has been vortexed and opened, the solution is transferred to an amber glass vial with a Teflon®-lined screw cap. When not being used, standards are stored in a dark box at room temperature. These purchased standards are used to prepare the following mixed stock solutions and spiking solutions:

7.4.1 IDA Stock Solution: Prepared by diluting the individual $^{13}C_{12}$ labeled IDAs listed in Table 5b, to a concentration of 1000 ng/mL in nonane. The concentration is verified by GC/MS before use.

7.4.2 IDA Spiking Solution: Prepared by diluting the 1000 ng/mL IDA stock solution to a concentration of 10 ng/mL in acetone. 1.0 to 4.0 mL of this solution is added to each solid/tissue sample prior to extraction. Refer to Table 12, "Assignment of Sample Preparation Protocols" to determine the exact volume to add. Prior to extraction, aqueous samples are spiked with IDA spiking solution at 1/5 the levels of solid/tissue samples (typically 20 uL).

7.4.3 Internal Standard Stock Solution (IS): Prepared by diluting the individual $^{13}C_{12}$ labeled ISTDslisted in Table 5b to a concentration of 1000 ng/mL in nonane. The concentration is verified by GC/MS before use.

7.4.4 Internal Standard Spiking Solution: Prepared by diluting the 1000 ng/mL internal standard stock solution to a concentration of 100 ng/mL in nonane. Fifty to 100 µL of this spiking solution is added to each solid/tissue sample extract prior to analysis (refer to Table 12), whereas, 20 µL is added to each aqueous sample extract.

7.4.5 Surrogate Stock Solution: Prepared by diluting the individual $^{13}C_{12}$ labeled cleanup standards listed in Table 5b, to a concentration of 5000 ng/mL in nonane. The concentration is verified by GC/MS before use.

7.4.6 Surrogate Standard Spiking Solution: Prepared by diluting the 5000 ng/mL surrogate standard stock solution to a concentration of 10 ng/mL in hexane. One half to 1.0 mL of this solution is added to each solid/tissue sample extract prior to cleanup (refer to Table 12), whereas, 0.20 mL is added to each aqueous sample extract.

7.4.7 Air Surrogate Standard Stock Solution: Prepared by diluting the individual $^{13}C_{12}$ labeled sampling air standards listed in Table 5b to a concentration of 5000 ng/mL in nonane. The concentration is verified by GC/MS before use.

7.4.8 Air Surrogate Spiking Solution: Prepared by diluting the 5000 ng/mL air surrogate stock solution to a concentration of 50 ng/mL in nonane.

7.5 Target PCB Congener Standard Mix: Obtained as a Certified Reference Standard from Accustandard (New Haven, CT). This standard contains all 209 PCB congeners at 4000 ng/mL in nonane. If the chemical purity is 98% or greater, the weight may be used without correction to compute the concentration of the standard. Once a standard ampoule has been vortexed and opened, the solution is transferred to an amber glass vial with a Teflon®-lined screw cap. When

not being used, the standard is stored in a dark box at room temperature. This purchased standard is used to prepare the following target stock solution and spiking solution:

7.5.1 Target PCB Congener Stock Solution: Prepared by diluting the 4000 ng/mL target PCB congener standard mix to a concentration of 40 ng/mL in nonane. The concentration is verified by GC/MS before use.

7.5.2 LCS Target Spiking Solution: Prepared by diluting the 4000 ng/mL target PCB congener standard to a concentration of 5.0 ng/mL in acetone. One mL of this solution is added to each solid/tissue LCS prior to extraction, whereas, 0.20 mL is added to each aqueous LCS.

7.6 Calibration Standard Solutions (CS 0.5 through CS 5) are prepared by dilution of the target PCB congener standards in section 7.5 and 7.5.1 and the IDA standards in section 7.4 in nonane. Table 6a shows the calibration solution analytes and final concentrations. Table 6b provides details for preparation of these calibration solutions.

7.6.1 This series of solutions is used to establish linearity and relative response factors for all compounds in the initial calibration solutions. These RRFs are used to quantify PCB congeners in the calibration verification (VER) and all samples. The CS3 standard is used for calibration verification. The VER solution is also used to verify chromatographic performance.

7.7 PCB Congener Mix 1 through 5 standard solutions containing all 209 isomers are Certified Reference Standards (Accustandard Product No's. M-1668A-1, M-1668A-2, M-1668A-3, M-1668A-4, M-1668A-5). Stock solutions are purchased at 250-750 µg/mL in isooctane. Once the ampoule has been sonicated and opened, the solution is transferred to an amber glass vial with Teflon®-lined cap and is used as received. These five mixes are run to determine the retention times for each of the congeners and which congeners will co-elute for each new SPB Octyl column used.

7.7.1 Initial Calibration Verification Standard. This is a single solution containing all 209 individual PCBs as well as IDA and Istd at the following concentrations:

- mono, di, and tri CBs at 50 ng/mL
- tetra, penta, hexa and hepta CBs at 100 ng/mL
- octa, nona, and deca CBs at 150 ng/mL
- IDAs and Istds are at the same concentration as the calibration standards (CS 0.5 – CS 5).

This solution is always analyzed immediately after the initial calibration.

7.7.1.1 Combine 20 uL of each mix from Section 7.7 (PCB Congener Mixes 1 through 5) with 100 uL of the 1000 ng/mL $^{13}C_{12}$ labeled IDA stock solution, 20 uL of the 5000 ng/mL $^{13}C_{12}$ labeled surrogate standard stock solution, 100 uL of the 1000 ng/mL $^{13}C_{12}$ labeled istd standard stock solution, 20 uL of the of the 5000 ng/mL $^{13}C_{12}$ labeled field spike and 660 uL of nonane to produce the

concentrations listed in section 7.7.1.

7.7.2 Retention Time Calibration Mixes: These 5 solutions are injected to establish the retention time data referenced in section 10.2.3. Combine 10 uL of the Accustandard PCB Congener Mix 1 (Section 7.7) with 50 uL of the 1000 ng/mL 13C12 IDA stock solution, 10 uL of the 5000 ng/mL 13C12 labeled surrogate standard stock solution, 50 uL of the 1000 ng/mL 13C12 labeled istd stock solution, 10 uL of the 13C12 of the 5000 ng/mL labeled air surrogate spike and 370 uL of nonane to produce the concentrations listed in section 7.7.1. Repeat the process using the Accustandard PCB Congener Mixes 2 through 5.

7.8 QC Check Sample - A QC Check Sample should be obtained from a source independent of the calibration standards. This check sample is a certified standard reference material (SRM) containing the PCBs in known concentrations in a sample matrix similar to the matrix under test. The National Institute of Standards and Technology (NIST) in Gaithersburg, Maryland has an SRM 1944 – New York/New Jersey Waterway Sediment that the NYSDEC recommends for use.

8 Sample Collection, Preservation and Storage

8.1 Sampling is not performed for this method by Eurofins TestAmerica Knoxville. For information regarding sample shipping, refer to SOP KNOX-SC-0003, “Sample Receipt and Login”, current revision.

8.2 Holding Times

8.2.1 Store sample extracts in a dark box at room temperature until analyzed. If stored in the dark at room temperature, sample extracts may be stored for up to one year.

9 Quality Control

9.1 Initial precision and recovery (IPR) or initial demonstration of capabilty (IDOC) samples are analyzed to demonstrate the ability to generate acceptable precision and accuracy.

9.1.1 For aqueous samples, extract, clean, concentrate, and analyze four 1-L aliquots of reagent water spiked with IDAs, surrogate standard, internal standard and the LCS spiking solution, according to the procedures in section 11. For solid/tissue samples, extract, clean, concentrate, and analyze four aliquots of sodium sulfate/corn oil spiked with IDAs, surrogate standard, internal standard and the LCS spiking solution, according to the procedures in section 11. All steps that are to be used for processing samples, including preparation, extraction and cleanup, shall be included in this test.

9.1.2 Using the results of the set of four analyses, compute the average percent recovery (%R) of the extracts and the relative standard deviation (%RSD) of the concentration in ng/L (aqueous) and ng/g (solid) for each compound.

9.1.3 For each PCB and labeled compound, compare the %RSD and %R with the corresponding limits for initial precision and recovery in the approprirate Table 10A or 10B. If the RSD and %R for all compounds meet the acceptance criteria, system performance is acceptable and analysis of samples may begin. If, however, any individual

%RSD exceeds the precision limit or any individual %R falls outside the range for accuracy, system performance is unacceptable for that compound. Correct the problem and repeat the test.

9.2 Isotope Dilution Analytes (IDAs)

9.2.1 Every sample, blank, and QC sample is spiked with isotope dilution analytes. IDA recoveries in samples, blanks, and QC samples must be assessed to ensure that recoveries are within established limits. When properly applied, results from isotope dilution techniques are independent of recovery. The recovery of each IDA should be within the limits in Table 10A or 10B depending on the method revision being used. If the recovery is outside these limits the following corrective action should be taken:

- Check all calculations for error.
- Ensure that instrument performance is acceptable; if applicable, a daily CCV will be analyzed to confirm instrument performance.
- Recalculate the data and/or reanalyze if either of the above checks reveal a problem.
- If the recovery of any IDA is less than the limits indicated in Tables 10A and 10B, calculate the S/N ratio of the IDA. If the S/N is > 10 and the estimated detection limits (EDLs) are less than the estimated minimum levels (EMLs), report the data as is with qualifiers in the report and a discussion in the case narrative. If the S/N is < 10 or the estimated detection limits (EDLs) are greater than the estimated minimum levels (EMLs), re-extract and reanalyze the sample. If the ion chromatogram of the PFK lock mass indicates ion suppression in the region where the IDA elutes, reanalyzing the extract at up to a 1/10 dilution may improve the IDA recovery. If the poor IDA recovery is judged to be a result of sample matrix, a reduced portion of the sample may be re-extracted or additional cleanups may be employed. The decision to reanalyze or flag the data should be made in consultation with the client.

9.2.2 Refer to the QC Program document (QA-003) for further details of the corrective actions.

9.3 Surrogate Standards: Every sample, blank, and QC sample extract is spiked with $^{13}C_{12}$ labeled surrogate standards after extraction but prior to extract cleanup. They are used to assess the efficiency of the cleanup procedures.

9.4 ISTDs: Every sample, blank, and QC sample extract is spiked with $^{13}C_{12}$ labeled istds prior to analysis. They are used to measure the recovery of the istds and the surrogate standards.

9.5 Method Blanks

9.5.1 A laboratory method blank must be run along with each analytical batch of 20 or fewer samples. The method blank consists of reagent water for aqueous samples, sodium sulfate for solid and tissue samples, processed in the same manner and at the same time as the associated samples. The method blank is used to identify any background interference or contamination of the analytical system that may lead to the reporting of elevated concentration levels or false positive data. Analyze the method blank immediately after analysis of the LCS to demonstrate freedom from contamination. If CBs will be carried

over from the LCS into the method blank, analyze one or more aliquots of solvent between the LCS and the method blank. The method blank should not contain any of the compounds of interest at a concentration above the estimated minimum level (EML) shown in Table 4.

9.5.2 Corrective action is required when compounds of interest are detected in the method blank above the EML. Corrective action may include reanalysis of the method blank. Contact the Project Manager to determine further corrective action. At a minimum, all associated results are qualified with a B flag. Re-extraction and reanalysis of all samples associated with a contaminated method blank is required if requested by the client or Project Manager. Investigation of the source of the method blank contamination will be initiated before further samples are extracted.

9.5.3 The method blank must have acceptable IDA recoveries. If IDA recoveries are not acceptable, the data must be evaluated to determine if the method blank has served the purpose of demonstrating that the analysis is free of contamination. If IDA recoveries are low and the following criteria are met, the MB is considered acceptable: S/N > 10/1 for all IDA masses, EDL<ML for all target analytes, all positive detections are below the ML.

9.6 Instrument Blank

9.6.1 Instruments must be evaluated for contamination during each 12-hour analytical run. This may be accomplished by analysis of a method blank. If a method blank is not available, an instrument blank must be analyzed.

9.6.2 An instrument blank consists of solvent with the IDAs and internal standards added. It is evaluated in the same way as the method blank.

9.7 Laboratory Control Sample – A laboratory control sample (LCS) is prepared and analyzed with every batch of 20 or fewer samples. All target analytes must be within established control limits specified in the appropriate Table 10A or 10B. The LCS is spiked with the compounds listed in Table 5a.

9.7.1 If any target in the LCS is outside the control limits, corrective action must occur. Corrective action may include re-extraction and reanalysis of the batch.

- If the batch is not re-extracted and reanalyzed, the reasons for accepting the batch must be clearly presented in the project records and the report.
- If re-extraction and reanalysis of the batch is not possible due to limited sample volume or other constraints, the LCS is reported and the failure is documented in the project narrative.

9.8 QC Check Sample - Analyze the QC Check Sample (section 7.8) periodically to assure the accuracy of calibration standards and the overall reliability of the analytical process. It is suggested that the QC Check Sample be analyzed at least annually.

10 Calibration and Standardization

10.1 Three types of calibration procedures are required. The first type establishes retention times, relative retention times and relative retention time windows to be used during the subsequent calibrations and analyses. The second type, initial calibration, is required to establish response factors and is required before any samples are analyzed. It may be required intermittently throughout sample analyses as dictated by the results of continuing calibration procedures described below. The third type, continuing calibration, consists of analyzing the continuing calibration verification solution (VER). No samples are to be analyzed until acceptable calibration as described in sections 10.2, 10.3 and 10.4 is demonstrated and documented.

10.2 Retention Time Calibration

Retention time calibration is required if the retention time criteria cannot be met.

10.2.1 The absolute retention time of CB 209 must exceed 55 minutes. Otherwise the GC temperature program must be adjusted and the test repeated until the requirement is met.

10.2.2 **NOTE**: When adjusting chromatographic conditions, the resolution requirements of sections 10.4.5.7 to 10.4.5.8 must be maintained.

10.2.3 Tune the instrument to meet the mass resolution and mass accuracy requirements of section 10.3.2. Document the resolution and accuracy.

10.2.4 Analyze 1 µL (2uL for MATs) of each of the five individual PCB mixtures (section 7.7.3). Set the switch-points for the MID descriptors. The switch-points must be set to insure that the first and last eluting isomer of each homolog group and the labeled IDAs are acquired properly. Determine the average retention time of each PCB congener using the elution order information in Table 11.

NOTE 1: PCB Mixture 5 (M-1668A-5) contains the first and last eluting isomer in each homolog group for the SPB-Octyl column (see Table 7).

NOTE 2: Laboratory data has indicated that the SPB-Octyl column can exhibit significant differences in performance from column to column. It has also been indicated that the column's performance can change significantly due to oxidation with subsequent changes in congener retention times and elution order. The individual PCB mixtures should be analyzed whenever the column's performance or specific congeners retention times are in doubt.

10.2.5 Calculate the relative retention times for all target and labeled congeners, using their retention time references from Table 2 (RT Ref). Calculate the relative retention time for each run in which the congener and its retention time reference are present Five RRTs will be calculated for each IDA. Use the generated retention times for all target and labeled congeners as the RT calibration source in the calculation software.

10.2.6 Calculate the relative retention time window using the absolute retention time windows (RT Window) from Table 2.

$$\text{RRT Limit Low} = \frac{RT_A - (RT_{WIN}/2)}{RT_{IS}}$$

$$\text{RRT Limit High} = \frac{RT_{A} + (RT_{WIN}/2)}{RT_{IS}}$$

Where:

RT_A = Average retention time of analyte.

RT_{IS} = Average retention time of RT reference.

RT_{WIN} = Absolute RT window in seconds from Table 2.

10.2.7 A single pair of RRT limits is used for all congeners in coeluting set. Use the RRT Limit Low that was calculated for the first eluting congener, and the RRT Limit High calculated for the last eluting congener (in the coelution set).

10.3 Initial Calibration

Initial calibration is required before any samples are analyzed for PCBs. Initial calibration is also required if any continuing calibration (section 10.4) does not meet the required criteria in section 10.4.5 after routine maintenance.

10.3.1 Prepare multi-level calibration standards containing the compounds and concentrations as specified in Table 6a. Calibration standards should be stored at room temperature and preferably in amber vials. Calibration standard solutions have an expiration date of ten (10) years from date of receipt based on stability of PCBs and history of vendor's recertification of standard lots.

10.3.2 Establish operating parameters for the GC/MS system (suggested operating conditions are displayed in Figure 1 and Figure 2). By using a PFK or FC43 molecular leak, tune the instrument (see the appropriate instrument manufacturer's operating manual for tuning instructions) to meet the minimum resolving power of 10,000 (10 percent valley) at mass 342.9792 (PFK) or 313.9834 (FC43). For each MID descriptor group, monitor and record the mass resolution and exact masses of three reference peaks covering the mass range of the descriptor (see below). By using peak matching techniques, verify that the deviation between the exact mass and the theoretical mass for each mass monitored is less than 5 ppm. Iteratively adjust operating parameters and tuning values until the mass resolution and mass accuracy criteria are met for each ion. Document the mass resolution and mass accuracy for each of MID group ion sets. Because of the extensive mass range covered in each MID group, it may not be possible to maintain 10,000 resolution throughout the mass range of the MID group. Therefore, resolution must be greater than 8,000 throughout the mass range and must be greater than 10,000 in the center of the mass range for each MID group. The minimum resolution of 10,000 must be met for mass 342.9792 or 313.9834.

MID Group 1 PFK ions - 192.9888, 230.98563, 280.98243
MID Group 2 PFK ions - 268.98243, 292.98243, 380.97605

MID Group 3 PFK ions - 342.97924, 380.97605, 430.97285
MID Group 4 PFK ions - 404.97604, 442.97285, 530.96646

MID Group 1 FC43 ions - 168.9883, 213.9897, 263.9866
MID Group 2 FC43 ions - 263.9866, 313.9834, 375.9802
MID Group 3 FC43 ions - 313.9834, 375.9802, 413.9770
MID Group 4 FC43 ions - 413.9770, 463.9738, 501.9706

10.3.3 Inject a 1 µL (2uL for MATs) aliquot of the CS 0.5 calibration solution.

10.3.3.1 Ion abundance ratios, minimum levels, and signal-to-noise ratios.

10.3.3.1.1 Measure the selected ion current profile areas for each congener or congener group, and compute the ion abundance ratios at the exact masses specified in Table 8. Compare the computed ratio to the theoretical ratio given in Table 9.

10.3.3.1.2 All Toxic/LOC and labeled compounds in the CS-0.5 standard must be within the QC limits in Table 9 for their respective ion abundance ratios; otherwise, the mass spectrometer must be adjusted and this test repeated until the mass ratios fall within the limits specified. If the adjustment alters the resolution of the mass spectrometer, resolution must be verified (Section 10.3.2) prior to repeat of the test.

10.3.3.1.3 The peaks representing the CBs and labeled compounds in the CS-0.5 calibration standard must have signal-to-noise ratios (S/N) $\geq$ 10; otherwise, the mass spectrometer must be adjusted and this test repeated until the signal to noise criteria are met.

10.3.3.1.4 When using PFK an exception to the ion abundance ratio and signal to noise ratio requirements is the secondary ion for dichlorinated biphenyls (mass 223.9974). High background from PFK fragments at 223.9974 results in noise levels which exceed 10% of the signal height at levels that are reliably quantifiable. FC-43 does not interfer with dichlorinated biphenyls.

10.3.4 Analyze 1 µL (2uL for MATs) of each of the other calibration standards.

10.3.4.1 Isomer specificity

10.3.4.1.1 Use the CS-3 calibration standard to evaluate column performance. The toxic isomers must be uniquely resolved from all other congeners. Isomers may be unresolved so long as they have the same toxicity equivalency factor (TEF) and response factor and so long as these unresolved isomers are uniquely resolved from all

other congeners. For example, the SPB-Octyl column achieves unique GC resolution of all Toxics except congeners with IUPAC numbers 156 and 157. This isomeric pair is uniquely resolved from all other congeners and these congeners have the same TEF and response factor.

10.3.4.1.2 Evaluate and document the percent valley between PCBs 34 and 23. The valley height must be less than 40 percent of the height of the shorter of the two peaks.

10.3.4.1.3 Evaluate and document the percent valley between PCBs 187 and 182. The valley height must be less than 40 percent of the height of the shorter of the two peaks.

10.3.4.1.4 Classify each congener as resolved or as a member of a coelution set. To be documented as resolved, the valleys between any two isomers must be less than 40 percent of the height of the shorter of the two adjacent peaks. Each member of a coelution set is designated with a qualifier in the format of CXXX, where XXX = the lowest numbered congener in the set. For example, if PCB 156 and PCB 157 coelute, qualify PCB 157 with "C156".

10.3.4.2 Calculate the RRF of each compound of interest (target analytes, coelution sets, IDAs, and surrogate standards) vs. the appropriate reference standard (as specified in Table 2) using the following equation:

$$RRF = \frac{As \times Cis}{Ais \times Cs}$$

Where:

As = sum of the areas of the quantitation ions of the compound of interest.
Ais = sum of the areas of the quantitation ions of the appropriate reference standard.
Cis = concentration of the appropriate reference standard.
Cs = concentration of the compound of interest.

NOTE: When calculating the RRF for a coelution set, sum the areas of all isomers in the set. Use the resulting RRF for all congeners within the set.

10.3.4.3 Calculate the mean relative response factor (mean RRF) and the percent relative standard deviation (%RSD) of the response factors for each compound of interest in the six calibration standard solutions using the following equations:

$$\overline{RRF}_{n=6} = \frac{1}{n} \times \sum_{i=1}^{n} RF_i$$

$$\%RSD_{n=6} = \sqrt{\frac{\sum_{i=1}^{n}\left(RF_i - \overline{RRF}\right)^2}{n-1}} \times \frac{100}{\overline{RRF}}$$

10.3.4.4 Criteria for Acceptable Calibration - The criteria listed below for acceptable calibration must be met before sample analyses are performed. If acceptable initial calibration is not achieved, identify the root cause, perform corrective action, and repeat the initial calibration. If the root cause can be traced to problems with an individual analysis within the calibration series, repeat the individual analysis and recalculate the percent relative standard deviation. If the calibration is acceptable, document the problem and proceed, otherwise repeat the initial calibration.

10.3.4.5 The percent relative standard deviation (%RSD) for the mean relative response factors for the unlabeled native analytes calculated by isotope dilution must not exceed 20 percent. The percent RSD for the mean relative response factors for the unlabeled target analytes calculated by IDA must not exceed 35 percent. The percent RSD for the mean relative response factors for the labeled IDAs must not exceed 35 percent.

10.3.5 Analyze 1 µL (2uL for MATs) of the Initial Calibration Verification (ICV) Standard in section 7.6. 1 after completion of the ICAL prior to sample analysis. Calculate the concentration of the ICV using the RRFs from the CS-3 standard analyzed in section 10.3.4. Calculate the percent difference (%D) between the expected and the calculated ICV concentration using the following formula:

$$\%D = \frac{\left(C_{Exp} - C_{Calc}\right)}{C_{Exp}} \times 100$$

Where:
C_{Exp} = The expected concentration of the ICV Standard.
C_{Calc} = The calculated concentration of the ICV Standard.

10.3.5.1 The criteria for acceptance of the ICV Standard are as follows:

10.3.5.2 The %D may not exceed ±35% for more than 4 of the native and labeled compounds.

- The %D may not exceed ±50% for any native or labeled compound.

10.3.5.3 All data associated with compounds with percent differences exceeding ±35% must be reviewed before acceptance and shall be documented as a NCM. In addition, all data associated with these compounds require corrective action that may include the following:

- Reanalyze the ICV Standard.
- Replace and reanalyze the ICV Standard.
- Evaluate the instrument performance.

- Evaluate the Initial Calibration Standards.

10.4 Continuing Calibration

10.4.1 Continuing calibration is performed at the beginning of a 12-hour period after successful mass resolution check.

10.4.2 Document the mass resolution performance as specified in section 10.3.2 at both the beginning and end of the 12-hour period.

10.4.3 Analyze 1 µL (2uL for MATs) of the Continuing Calibration Verification Standard (VER/CS3). Calculate the concentration (C) of the compounds of interest (target analytes, IDAs, and surrogate standards) vs. the appropriate quantitation reference (as specified in Table 2) using the following equation:

$$C = \frac{As \times Cis}{Ais \times RRF}$$

Where:

As = sum of the areas of the quantitation ions of the compound of interest.
Ais = sum of the areas of the quantitation ions of the appropriate reference standard.
Cis = concentration of the appropriate reference standard.
RRF = mean relative response factor from section 10.3.4.2.

10.4.4 Calculate the concentrations as percentages of the test concentrations and compare them to the limits specified in the appropriate Table 10A or 10B using the following equation:

$$C_{ver}\% = \frac{C_{ver}}{C_{test}} \times 100$$

Where:

C_{ver} = the concentration of the VER standard calculated in section 10.4.3
C_{test} = the test concentration of the VER standard listed in Table 6a.

10.4.5 Criteria for Acceptable Calibration - The criteria listed below for acceptable calibration must be met before sample analyses are performed. If the acceptance criteria are met, the calibration is deemed to be in control and the RRFs generated from the initial calibration are used to quantify samples. If acceptable calibration is not achieved, identify the root cause, perform corrective action, and repeat the continuing calibration. If a second consecutive attempt at a continuing calibration fails, two consecutive calibrations must meet the criteria, or an initial calibration must be run before proceeding with client samples.

10.4.5.1 The ion abundance ratios of the peaks representing the Toxics/LOCs and labeled standards must be within the control limits specified in Table 9.

10.4.5.2 The S/N for the GC signals present in every selected ion current profile (including those for labeled standards) must be ≥ 10.

10.4.5.3 For Toxic and LOC congeners, as listed in the first section of Table 10A or 10B, the percent of the calculated concentration relative to the test concentration must be within 70-130% for 1668A and 1668B and 75-125% for 1668C.

10.4.5.4 For non-Toxic congeners the calculated concentrations must be within 70-130% of the test concentrations for 1668A, 1668B and 1668C.

10.4.5.5 The absolute retention times (RT) of the labeled IDAs must be within ±15 seconds of the retention times obtained during initial calibration.

10.4.5.6 The relative retention times (RRT) of the Toxics/LOC congeners must be within their respective RRT limits generated in the retention time calibration in section 10.2.

10.4.5.6.1 If the RRTs or RTs are not within the limits above, the GC may not be performing properly. However, routine column maintenance may include removing short amounts of the beginning of the column when active sites or non-volatile compounds in sample extracts cause poor chromatography and loss of specificity. Shortening of the column can cause the RRTs or RTs to fall outside the above limits.

10.4.5.6.2 When the RRT of any compound or the RT of any IDA is not within the above limits, corrective action must be taken. If the GC is not performing properly, correct the problem and repeat the test. If the GC is performing properly but the RRTs or RTs have changed due to routine column maintenance, adjust the GC or replace the GC column, then repeat the test or repeat the retention time calibration.

10.4.5.7 Evaluate and document the percent valley between PCBs 34 and 23. The valley height must be less than 40 percent of the height of the shorter of the two peaks.

10.4.5.8 Evaluate and document the percent valley between PCBs 187 and 182. The valley height must be less than 40 percent of the height of the shorter of the two peaks.

10.4.6 Daily calibration must be performed every 12 hours of instrument operation. The 12-hour shift begins with the documentation of the mass resolution followed by the injection of the Continuing Calibration Standard (VER).

11 Procedure

11.1 One time procedural variations are allowed only if deemed necessary in the professional judgement of supervision to accommodate variations in sample matrix, radioactivity, chemistry, sample size, or other parameters. Any variations in the procedure, except those specified by project specific instructions, shall be completely documented using a Nonconformance Memo

and approved by a Technical Specialist, Project Manager, and QA Manager. If contractually required, the client shall be notified.

Any unauthorized deviations from this procedure must also be documented as a nonconformance, with a cause and corrective action described.

11.2 Sample Extraction and Cleanup

The extraction and cleanup procedures are described in SOP KNOX-OP-0021, "Extraction of Polychlorinated Biphenyl (PCB) Isomers for Analysis by Isotope Dilution HRGC/HRMS", current revision.

11.3 Sample Analysis

11.3.1 Analyze the sample extracts under the same instrument operating conditions used to perform the instrument calibrations. Inject 2 µL into the GC/MS and acquire data beginning at 11 minutes and ending after decachlorobiphenyl has eluted from the column.

11.3.2 The RTs of the unambiguous labeled congeners (RT Markers) are used to calculate a least squares best fit regression for retention times compared to those of the retention time calibration.

11.3.3 The resulting regression is used to calculate predicted retention times for target analytes. These predicted retention times are used by the software to identify candidate peaks for targets.

11.3.4 The analyst reviews the peaks identified as targets and determines whether to accept the identification. This determination is made by evaluating the retention time values against the shift from the predicted retention times

11.3.5 A RRT window is calculated by multiplying the RRT Limit High and the RRT Limit Low by the retention time of the designated RT reference.

11.4 HRGC/HRMS Troubleshooting Guide

11.4.1 Perform the instrument's leak check: Evaluate the air spectrum. Mass 28 should be less than 5 times mass 69. If the air spectrum is not acceptable, replace transfer line ferrule and/or pump out PFK reservoir.

11.4.2 Check the voltage on the 5V power supply: If voltage is not reading 5V, adjust voltage to read 5V.

11.4.3 Check daily calibration standard: Evaluate the signal to noise (S/N), examine peak shape/chromatography, and evaluate response factors. Refer to specific SOP's requirements and acceptance criteria for all natives and internal standards. If daily calibration is not acceptable , perform the following troubleshooting options as needed and reanalyze a daily CS-3 calibration standard:

- Replace the inlet seal and clean the injection port body with methanol to improve response factor.

- Perform column/injector port maintenance and/or retune the instrument to resolve chromatography/resolution, signal to noise issues.
- Perform a gain test on the electron multiplier.
- Adjust the tuning parameters of the instrumentation to achieve optimum sensitivity and peak shape.
- Evaluate carryover from sample analyses. If carryover or contamination is suspected, run solvent rinses (nonane) under MID to evaluate the contamination.
- When troubleshooting cannot resolve an instrument problem, a manufacture's service engineer may be consulted for possible solution, or called onsite for diagnosis/repair.

11.5 Refer to the Eurofins TestAmerica Knoxville Quality Assurance Manual, KX-QAM, current revision for the HRGC/HRMS instrument equipment maintenance table.

11.6 Refer to Eurofins TestAmerica SOP CA-I-S-0006, current revision for requirements for computer hardware and software.

12 Data Analysis and Calculations

12.1 Qualitative Identification Criteria for PCBs

For a gas chromatographic peak to be identified as a PCB, it must meet all of the following criteria:

12.1.1 The signals for the two exact masses in Table 8 must be present and must maximize within ±2 seconds.

12.1.2 The signal to noise ratio (S/N) for each GC peak at each exact mass must be greater than or equal to (≥) 2.5. (This requirement does not apply to the secondary ion for dichlorinated biphenyls [mass 223.9974]). High background from PFK fragments at 223.9974 results in noise levels which exceed 10% of the signal height at levels that are reliably quantifiable.

12.1.3 The ratio of the integrated areas of the two exact masses specified in Table 8 must be within the limits in Table 9 . Alternately, the ratios may be within ±15% of the ratio in the midpoint (CS-3) calibration or calibration verification (VER), whichever is most recent.

12.1.4 The relative retention time of the peak for a CB must be within the RRT QC limits calculated in section 10.2.5.

NOTE: For target CBs determined by IDA quantitation, a given CB congener may fall within more than one RT window and be misidentified unless the RRT windows are made very narrow, as in Table 2. Therefore, consistency of the RT and RRT with other congeners and the labeled compounds may be required for rigorous congener identification. Retention time regression analysis may be employed for this purpose.

12.1.5 If identification is ambiguous, (i.e., some, but not all of the identification criteria are met for a congener) an experienced analyst must determine the presence or absence of the congener.

12.2 Quantitation for PCBs

12.2.1 Calculate the IDA Recoveries (Ris) relative to the istd according to the following equation:

$$Ris = \frac{Ais \times Qrs}{Ars \times RRFis \times Qis} \times 100\%$$

Where:

Ais = sum of the areas of the quantitation ions of the appropriate IDA
Ars = sum of the areas of the quantitation ions of the istd
Qrs = ng of istd added to extract
Qis = ng of IDA added to sample
RRFis = mean relative response factor of IDA obtained during initial calibration

NOTE: In some situations, such as source testing, the extract is split for multiple analyses. In this case, Qrs must be correctly calculated to account for the splitting of extracts before the istd was added.

$$Qrs = Qrss \times Split$$

Where:

Qrs = ng of istd added to extract
Qrss= ng of istd added to the split portion of the extract
Split= split ratio of the extract

12.2.2 Calculate the concentration of individual PCBs according to the following equation:

$$Concentration = \frac{As \times Qis}{Ais \times RRF \times W \times S}$$

Where:

As = sum of the areas of the quantitation ions of the compound of interest
Ais = sum of the areas of the quantitation ions of the appropriate IDA
Qis = ng of IDA added to sample
RRF = mean relative response factor of compound obtained during initial calibration
W = amount of sample extracted (grams or liters)
S = decimal expression of solids (optional, if results are requested to be reported on dry weight basis)

12.2.3 If reporting results for Total Homolog Groups, calculate the total concentration of all isomers within each homolog group by summing the concentrations of the individual PCB isomers within that homolog group.

12.2.4 If no peaks are present in the region of the ion chromatogram where the compounds of

interest are expected to elute, calculate the estimated detection limit (EDL) for that compound according to the following equation:

$$EDL = \frac{N \times 2.5 \times Qis}{His \times RRF \times W}$$

Where:

N = sum of peak to peak noise of quantitation ion signals in the region of the ion chromatogram where the compound of interest is expected to elute
His = sum of peak heights of quantitation ions for appropriate IDA
Qis = ng of IDA added to sample
RRF = mean relative response factor of compound obtained during initial calibration
W = amount of sample extracted (grams or liters)

12.2.5 If peaks are present in the region of the ion chromatogram which do not meet the qualitative criteria listed in section 12.1, calculate an Estimated Maximum Possible Concentration (EMPC). Use the equation in section 12.2.2, except that "As" should represent the sum of the area under each mass peak calculated using the theoretical chlorine isotope ratio. The peak selected to calculate the theoretical area should be the one which gives the lower of the two possible results (i.e., the EMPC will always be lower than the result calculated from the uncorrected areas).

12.2.6 If the concentration in the final extract of any PCB isomer exceeds the upper method calibration limits, a dilution of the extract must be performed. If compound concentrations exceeding the calibration range cannot be brought within the calibration range by a dilution, a post dilution spike can be performed. The lab may report the measured concentration and indicate that the value exceeds the calibration limit by flagging the results with "E". Consultation with the client should occur before compounds are reported which exceed the calibration range.

12.3 The estimated minimum level (EML) is defined as the lowest concentration at which an analyte can be measured reliably with common laboratory interferences present assuming a sample is extracted at the recommended weight or volume and is carried through all normal extraction and analysis procedures. The EMLs for different matrices and extract volumes are listed in Table 4. Deviations from the extraction amounts or final volumes listed will result in corresponding changes in the actual sample EMLs.

12.4 Flag all compound results in the sample which are below the estimated minimum level with a "J" qualifier.

12.5 Flag all compound results in the sample which were detected in the method blank with a "B" qualifier.

12.6 Flag all compound results in the sample which are above the upper calibration limit with an "E" qualifier.

12.7 Flag all compound results in the sample which are "Estimated Maximum Possible Concentrations" with a "Q" qualifier or appropriate program qualifier.

12.8 Flag compound results in the sample that may contain co-eluting compounds with a "C" qualifier.

12.8.1 Flag congeners known to coelute with a higher numbered congener with a "C" qualifier.

12.8.2 Flag congeners that coelute with a lower numbered congener with a "Cx" qualifier where x is the CAS PCB number of the lowest numbered congener in the coeluting group.

12.9 If DOD QSM requirements are used, refer to SOP KNOX-QA-0021.

12.10 Flag compound results in the sample that may be affected by ion suppression with a "S" qualifier. When ion suppression of a PFK trace occurs at greater than or equal to 20% of full scale on both the lock mass and QC mass traces, and when the suppression is sustained for greater than 4 seconds, the suppression must be evaluated to determine which, if any, PCB congeners co-elute with the suppression. Samples may be diluted to decrease the effects of the ion suppression and rerun. Congeners that are determined to co-elute with the suppression are flagged with an "S" qualifier.

12.11 Data Review

12.11.1 Refer to Figure 3 for an example data review checklists used to perform and document the review of the data. Using the data review checklist, the analyst also creates a narrative which includes any qualifications of the sample data.

12.11.2 The analyst who performs the initial data calculations must first level review the raw data to document that they have performed the qualitative and quantitative analysis on the sample data.

12.11.3 A second analyst must verify all qualitative peak identifications and second level review the raw data. If discrepancies are found, the data must be reviewed by the first analyst before a change is made.

12.11.4 All items listed on the data review checklist must be checked by both the analyst who performed the initial qualitative and quantitative analysis and the analyst who performed the second level review. An example data review checklist is shown in Figure 3.

13 Method Performance

13.1 Method Detection Limit (MDL) - An MDL must be determined for each analyte in each routine matrix prior to the analysis of any samples. The procedure for determination of the method detection limit is given in the SOP CA-Q-S006, current revision, based on 40 CFR Part 136 Appendix B. The result of the MDL determination must support the reporting limit (ML). Current method detection limits are available in the TestAmerica Laboratory Information Management System (TALS).

13.2 Initial Demonstration of Capability – Each analyst must perform an initial demonstration of capability (IDOC) for each target analyte prior to performing the analysis independently. The IDOC is determined by analyzing four replicate spikes (e.g., LCSs) as detailed in Eurofins TestAmerica Knoxville SOP KNOX-QA-0009.

13.3 Training Qualification: The group/team leader has the responsibility to ensure that this procedure is performed by an associate who has been properly trained in its use and has the required experience. Refer to SOP KNOX-QA-0009 current revision for further requirements for performing and documenting initial and on-going demonstrations of capability**.**

14 Pollution Prevention

14.1 All attempts will be made to minimize the use of solvents and standard materials.

15 Waste Management

15.1 All waste will be disposed of in accordance with Federal, State and Local regulations. Where reasonably feasible, technological changes have been implemented to minimize the potential for pollution of the environment. Employees will abide by this method and the policies in section 13 of the Corporate Safety Manual for "Waste Management and Pollution Prevention."

15.2 Waste Streams Produced by the Procedure: The following waste streams are produced when this method is carried out.

15.2.1 Miscellaneous disposable glassware, chemical resistant gloves, bench paper and similar materials shall be placed in the incinerable laboratory waste stream, contained in a steel or poly satellite accumulation container.

17 Miscellaneous

17.1 Deviations from EPA Method 1668, Revisions A, B and C.

17.1.1 Additional internal standards are used in this procedure. The additional standards are listed in Table 1.

17.1.2 Additional labeled standards are used in this procedure as field sampling surrogates. The additional standards are listed in Table 1

17.1.3 This procedure uses IDAs which are within the same MID group as the target congener that is being calculated. This improvement is used to reduce the effects of full verses reduced accelerating voltage tuning differences which can be exaggerated when crossing MID groups.

17.1.4 The calibration procedure in the method 1668A, revision B, and C call for a single point standard for the non-Toxic/LOC congeners. This procedure uses a multi-point calibration for all 209 congeners.

17.1.5 This procedure uses MID groups that differ from the method. The procedure uses 4 groups, rather than 6, to improve instrument stability, by holding the magnet current steady for longer periods. Therefore alternate PFK lock masses are monitored, to reflect the mass ranges of the procedures MID groups. The SOP allows the use of FC-43 as the instrument reference compound based on the manufacturer's recommendation. Section 10.2.1 of Methods 1668A, 1668B and 1668C allows the use of other reference material than PFK.

17.1.6 This procedure uses average retention times (and average relative retention times) produced by analysis of the 5 mixes specified, rather than single analyses of the diluted 209 standard.

17.1.7 The absolute retention times, relative retention times, and relative retention time limits used by the laboratory differ from those listed in all versions of Method 1668. Each SPB-Octyl column lot used by the laboratory has exhibited slightly different retention time characteristics resulting in different absolute retention times than those listed in the method or those observed with another SPB-Octyl column lot. To ensure that the correct peak assignments are made, a retention time study is performed for each new column lot to verify the original study. This study includes the analysis of the five retention time mixes listed in Method 1668A as described in Section 10.2. If the retention time study is found to be different than the original elution pattern, a new ICAL will be performed. This procedure requires a minimum elution time of 55 minutes for PCB 209.

17.1.8 The calibration verification procedures in the method call for updating the retention times, relative retention times and response factors for non-Toxic compounds during daily calibration and use the retention times, relative retention times and response factors

from the initial calibration for Toxic and LOC compounds. This laboratory uses the retention times and relative retention times from analysis of the 5-mix series, which contains all congeners, and uses response factors from the initial calibration for all 209 compounds. The practice of updating the relative retention times of only a subset of compounds causes significant error in the linear regression prediction formulas used by targeting software to identify the compounds. This procedure has provisions for updating all RTs and RRTs by analyzing a new retention time calibration series.

17.1.9 The EMLs listed in Table 4 differ from those listed in the reference method. The EMLs are set above the mean plus 2 standard deviations for the higher of detections or EDLs for method blanks. In no case is the EML lower than the low calibration limit. The survey period was approximately 14 months.

17.1.10 This procedure uses a 100uL final volume for solid samples, or a variation depending on the protocol assigned to the sample based on screen results prior to extraction.

17.1.11 Method 1668C requires istd standards be added immediately prior to analysis. In this procedure istd standards are added to sample extracts at the conclusion of the extraction / clean up process prior to analysis.

17.1.12 Method 1668C implies that all qualitative criteria must be met in order for a positive hit to be reported. This procedure allows positive hits to be reported with "Q" qualifiers or appropriate program qualifier.

17.1.13 This procedure uses calculated concentrations for determining if a dilution is required not area counts as suggested by Method 1668C, section 17.5.

17.1.14 This procedure reports positive hits below the estimated minimum level (EML) which are determined to be greater than 2.5 signal to noise. These hits are qualified with a "J" or appropriate program qualifier.

17.1.15 This procedure does not report blank corrected values.

17.1.16 When samples are diluted to bring a native analyte within the upper calibration range all 209 congeners are reported from this analysis. This procedure reports all congeners from one analytical analysis.

17.1.17 This procedure uses a daily calibration CCV consisting of all 209 congeners at the beginning of each 12 hour analytical shift.

17.1.18 Extracts are stored in a dark box at room temperature in the same manner as standards.

17.1.19 1668C EML limits are listed in Table 4. However, this laboratory currently uses the 1668A/B limits

17.1.20 The limits established in 1668B, Table 6 for the IPR and OPR performance evaluations have been observed by EPA reviewers to penalize an analyst who achieves better performance than those observed in the inter-laboratory study. Based on EPA's recommendations (section 16.10), Eurofins TestAmerica Knoxville performs analysis by Method 1668B with the QC acceptance criteria in Table 6 of EPA Method 1668A.

Table 10 "Acceptance Criteria for Performance Tests" of this SOP will be used for the IPR and OPR limits.

1. The PCB congener number is from Method 1668C and Chemical Abstract Services.
2. The BZ number is from Ballschmiter and Zell (1980). The IUPAC number, when different from the BZ, follows the recommended changes to the BZ number per Schulte and Malisch (1983) and Guitart et al. (1993).
3. The chemical structure names are from Ballschmiter and Zell (1980). IUPAC nomenclature structure names are listed in parenthesis when different from the BZ name (source CAS Registry).
4. Chemical Abstract Service Registry number (source CAS Registry and 1668A Table 1).

Table 2 - RT References, Quantitation References, Retention Times (RTs), and Relative Retention Times (RRTs) for the 209 CB congeners on SPB-Octyl

1. Number of chlorines on congener.
2. Suffix "L" indicates labeled compound.
3. IUPAC Number per Table 2 of Method 1668A. (Numbers in parentheses are PCB Numbers from 1668C)
4. Retention time reference that is used to locate target congener.
5. Quantitation reference that is used to calculate the concentration of the target congener or labeled standard.
6. RT window width for congener or group of two or more congeners.

Table 3 - Low Calibration Levels (LCLs) Based on Final Extract Volumes

		20 µL Extract Volume	100µL Extract Volume
Analyte	Minimum Cal. Level CS 0.5 (ng/mL)	Water 1L (ng/L)	Solids and Tissues 10g[2] (ng/g)
Monochlorobiphenyls	0.5	0.01[1]	0.005
Dichlorobiphenyls	0.5	0.01[1]	0.005
Trichlorobiphenyls	0.5	0.01	0.005
Tetrachlorobiphenyls	0.5	0.01	0.005
Pentachlorobiphenyls	0.5	0.01	0.005
Hexachlorobiphenyls	0.5	0.01	0.005
Heptachlorobiphenyls	0.5	0.01	0.005
Octachlorobiphenyls	0.5	0.01	0.005
Nonachlorobiphenyls	0.5	0.01	0.005
Decachlorobiphenyl	0.5	0.01	0.005

1. This value reflects the LCL. Reliable detection at this level may not be attained due to evaporative loss in adjusting the extract volume to 20 µL for these homolog groups.

2. The values for solids and tissues reflect the LCLs for Protocol 1 as described in Table 12. If the sample is prepared by another protocol described in that table, the LCLs shown in this table must be adjusted appropriately.

Table 4 - Estimated Minimum Levels EPA 1668A, B & C- Matrix and Concentration

[1] The estimated minimum level (EML) is defined as the lowest concentration at which an analyte can be measured reliably with common laboratory interferences present assuming a sample is extracted at the recommended weight or volume and is carried through all normal extraction and analysis procedures The values for other matrices (solids, tissues and solid wastes) reflect the EMLs for Protocol 1 as described in Table 12. If the sample is prepared by another protocol described in that section, the EMLs shown in this table must be adjusted appropriately. The EMLs are based on the mean plus 2 standard deviations for matrix-pooled historical blank data and calibration data obtained while performing EPA 1668A. The survey period was fourteen months, ending in February 2004. Individual EMLs may be adjusted to reflect more recent data.

[2] For reference purposes only, not currently used by TestAmerica Knoxville

[3] Other matrices include solids, tissues and solid wastes

Table 5a- Concentration of Target PCB Congener Stock and Spiking Solutions

Target PCB Congener	PCB	Standard Source	Catalog Number	Vendor Conc (ng/mL)	LCS Spiking Solution Conc (ng/mL)
2-MoCB	1	AccuStd	S-99994-4x	4000	5.0
