Instrument Performance Check (IPC) (Note: ICV and CCV are used to satisfy IPC.)	EPA 245.1 only: After each ICAL and every 10 samples	Initial IPC = within 5% Subsequent IPC = within 10%	Recalibrate
2nd Source Quality Control (QCS) (Note: ICV is used to satisfy QCS.)	EPA 245.1 only: Quarterly	within 10%	Recalibrate
Continuing Calibration Verification (CCV)	At the beginning and end of the analysis and every 10 samples.	EPA 7470A = within ± 10% EPA 7471B = within ± 10% EPA 245.1 = within ±10%	Terminate the analysis. Correct the problem and reanalyze all samples since the last compliant CCV.
Calibration Blank (ICB/CCB)	After ICV and every CCV	Absolute value of the calibration blank must be < ½ RL	Terminate the analysis. Correct the problem and reanalyze all samples since the last compliant CCB.
RL Standard	After every calibration but not before the ICV. This standard is not a requirement of SW846, if a multi-point calibration encompassing the RL level is used.	50-150% of true value	Recalibrate

QC Item	Frequency	Criteria	Corrective Action
Method Blank (MB)	One per batch of twenty or fewer samples	Result < ½ RL	Refer to SOP SA-QA-017
Low-Level Laboratory Control Sample (LLCS)	EPA 245.1 Drinking Water Only: One per batch of twenty or fewer samples	Qualitatively identified	If the "regular" LCS meets criteria, initiate NCM and report data If the "regular" LCS does not meet criteria, redigest and reanalyze batch
Laboratory Control Sample (LCS)	One per batch of twenty or fewer samples	MLG Limits	Refer to SOP SA-QA-017
Matrix Spike (MS)	EPA 245.1: One MS per 10% of samples (i.e., 2 MS per batch of 20 samples) Other Methods: One MS per 5% of samples (i.e., 1 MS per batch of 20 samples)	MLG Limits	Refer to SOP SA-QA-017
Matrix Spike Duplicate (MSD)	1 per batch	MLG Limits	Refer to SOP SA-QA-017
Post Digestion Spikes (PDS)	When MS/MSD is unacceptable	Refer to Section 9.2.9 for guidance	Refer to Section 9.2.9 for guidance
Initial Demonstration of Capability (IDOC)	Initially, per analyst, per analyte/method/matrix combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006 Note: Unsupervised work must not begin until acceptable IDOC is obtained.
Continuing Demonstration of Capability	Annually, per analyst, per analyte/method combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006

QC Item	Frequency	Criteria	Corrective Action
(CDOC)			
Reporting Limit Verification (RLV)	Upon method/instrument set-up, per analyte/method/matrix combination. Then quarterly thereafter (for DOD ELAP) or annually thereafter (for non-DOD ELAP)	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007
Method Detection Limit Study (MDL)	Upon method/instrument set-up, per analyte/method/matrix combination	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007
MDL Verification (MDLV)	Upon method/instrument set-up, per analyte/method/matrix combination. Then quarterly thereafter (for DOD ELAP) or annually thereafter (for non-DOD ELAP)	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007
Instrument Detection Limit (IDL)	Upon method/instrument set-up, and then quarterly thereafter	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007

Attachment 4:
Instrument Maintenance and Troubleshooting

Instrument Labeling

Each instrument must be labeled with its name or ID (e.g., MSA, ICP-D, etc.). Additionally, non-operational instruments must be isolated from service or marked as being out of service. Each piece of equipment has an "Operational / Not Operational" sticker that is used for this purpose.

Maintenance Log

A maintenance log must be established for each piece of equipment used in the laboratory. All maintenance that is performed on the instrument must be recorded in the log including:

- Type of maintenance performed (Note: This includes preventative/routine maintenance; non-routine maintenance; maintenance performed by an external vendor; updates to software versions; etc.)
- Analyst or technician performing the maintenance
- Date the maintenance was performed
- Detailed explanation of the reason for the maintenance
- Resolution of the problem and return to control
- All service calls from instrument representatives
- Resolution of the problem (i.e., the Return to Control)

Preventive Maintenance

Refer to the instrument manufacturer's guides for trouble-shooting items.

LABORATORY EQUIPMENT PREVENTIVE MAINTENANCE SCHEDULE								
EQUIPMENT ITEM	**Service Interval**							**SERVICE LEVEL**
	D	**W**	**M**	**Q**	**SA**	**A**	**AN**	
Pump Tubing	**X**							Inspect daily. Replace as needed.
Optical cells							**X**	Clean as needed.
Drying Tube							**X**	Replace as needed.
Sample Probe			**X**					Inspect monthly. Clean or replace as needed.
Mercury Lamp							**X**	Replace as needed.

D = Daily; W = Weekly; M = Monthly; Q = Quarterly; SA = Semi-Annually; A = Annually; AN = as needed

Troubleshooting

Troubleshooting should be documented as outlined above. If possible, troubleshooting is best performed in a step-wise manner to systematically isolate instrument components. Refer to the instrument manufacturer's guides for specific information and strategies. Enlist assistance from technical and/or department management as needed.

Contingency Plan

Maintenance contracts are carried for most instrumentation and close contact is maintained with service personnel to ensure optimal instrument functioning. An extensive spare parts inventory is maintained for routine repairs, consisting of Hg lamps, drying tubes, flow cells, tubing, and other common instrumentation components. Since instrumentation is standardized throughout the laboratory network, spare parts and components can be readily exchanged among the network.

In general, the laboratory has at least one backup unit for each critical unit. In the event of instrument failure, portions of the sample load may be diverted to duplicate instrumentation, the analytical technique switched to an alternate approved technique (such as manual colorimetric determination as opposed to automated colorimetric determination), or samples shipped to another properly certified or approved Eurofins TestAmerica location.

Attachment 5:
Labware Cleaning Posting

GLASSWARE CLEANING PROCEDURES METALS DEPARTMENT
Graduated Cylinders 1. Scrub with hot, soapy H_2O and brush. 2. Rinse thoroughly with tap H2O. 3. Rinse with 10% HNO_3 4. Rinse thoroughly with DI H_2O.
Volumetric Flasks 1. Empty contents of flask 2. Squirt a small amount of cleaning detergent directly into volumetric flask 3. Fill flask 1/3 full with **HOT** H_2O 4. Replace top and shake flask. 5. Empty flask and rinse with **HOT** H_2O until no soap remains in flask. 6. Add approximately 10mL concentrated HNO_3 to 50mL, 100mL, and 250mL flasks ---- replace top and shake well. For 500mL or 1000mL flasks use 25mL and for 10mL flasks use 2 - 5mL of concentrated HNO_3. 7. Rinse 3 times with DI H_2O, filling flask 1/3 full and replacing top. Store until needed. *** NEVER PLACE VOLUMETRIC FLASKS OR TOPS IN SINK OR DISHPAN WITH OTHER DIRTY DISHES.**
***Dispose of all acid waste in accordance with the Eurofins TestAmerica Savannah Addendum to the Corporate Safety Manual.**

18.0 Revision History

Summary of Changes for Revision 15A

- Updated all references to an 8oz sample container to 4oz as this is the volume referenced in LIMS.
- Updated waste disposal procedures for soil samples.

Summary of Changes from Previous Revision 15

- Minor editorial and/or grammatical changes.
- Updated SOP signatories to reflect current responsibilities and titles.
- Updated company logo and name where applicable.
- Updated CCV criteria for method 7471B and 7470A to 10%D.
- Removed Attachment 5 for prep of mercury standards.

LIQUID PREPARATION PROCEDURES FOR ICP AND ICP/MS

(Methods: EPA 200.7, 200.8, 3005A, 3010A, SM3030C, and Filtration)

1.0 Scope and Application

This SOP gives the procedures for the preparation of metals in water and leachate samples prior to analysis by ICP (SOP SA-ME-070: *Elements by ICP*) or ICP/MS (SOP SA-ME-074: *Elements by ICP/MS*).

A complete target analyte list, the reporting limits (RL), the method detection limits (MDL), and the accuracy and precision criteria associated with this procedure are provided in the LIMS Method Limit Groups (MLGs).

This SOP was written by and for Eurofins TestAmerica's Savannah laboratory.

2.0 Summary of Method

2.1 Total Recoverable Metals: A known volume of sample, usually 50mL, is transferred to a digestion vessel. The sample is refluxed with dilute nitric acid and hydrochloric acid at approximately 95°C. After the sample has evaporated to approximately 10-20mL, the sample is brought up to the original volume with reagent water. The laboratory utilizes two versions of the Total Recoverable preparation procedure. One version is equivalent to the EPA 3005A procedure and the second procedure is equivalent to the EPA 200.7 and 200.8 procedures.

2.2 Total Metals and TCLP/SPLP Leachates: A known volume of sample, usually 50mL, is transferred to a digestion vessel. The sample is refluxed with nitric acid at approximately 95°C. After the sample has digested, as evidenced by a clear, pale yellow color, HCl is added and the sample is brought up to the original volume with reagent water. This procedure is equivalent to EPA 3010A, and is utilized as the total metals preparation procedure for the EPA 200.7 and EPA 200.8.

2.3 Acid Extractable Metals: A known volume of sample, usually 50mL, preserved with nitric acid, is transferred to a digestion vessel. Hydrochloric acid is added and the sample is heated on a hot block for 15 minutes. This procedure is equivalent to Standard Methods 3030C.

2.4 Silica Samples for EPA 200.7 and EPA 6010C: Liquid samples are filtered. The filtered liquid samples are analyzed by ICP.

2.5 Drinking water samples for EPA 200.7 and EPA 200.8 with a turbidity concentration of less than 1NTU may be analyzed with no digestion. The exception to this rule is silver, which requires sample digestion prior to analysis. If the sample turbidity is >1NTU, then the EPA 200.7 or the EPA Method 200.8 preparation procedure is used.

2.6 Samples filtered for the determination of dissolved metals do not require digestion if the following criteria are met:
1) The sample has a low COD (<20mg/L);
2) The sample has a turbidity <1NTU ;
3) The sample is colorless with no significant odor ; ***and***
4) The sample is of one liquid phase and is free of suspended particulates or precipitates after acidification.

Note: Generally the lab will digest samples for dissolved metals, even if the above criteria are met, as the presence of organics in the native sample may lead to false positives for arsenic and selenium.

2.7 This SOP is based on the following methods: EPA 200.7, EPA 200.8, EPA 3005A, EPA 3010A, and Standard Methods 3030C.

3.0 Definitions

Refer to the Glossary Section of the *Quality Assurance Manual* (QAM) for a complete listing of applicable definitions and acronyms.

4.0 Interferences

4.1 Procedural Interferences

4.1.1 Interferences may be caused by contaminants in solvents, reagents, glassware, and other sample processing apparatus and can make identification and/or quantification of the target analytes difficult.

4.1.2 All sample collection containers are single-use disposable containers which limits the potential for contamination. All non-disposable labware must be scrupulously cleaned in accordance with the posted Labware Cleaning Instructions to ensure it is free from contaminants and does not contribute artifacts.

4.1.3 High purity reagents and solvents are used to help minimize interference problems. Hydrochloric acid and nitric acid must be verified prior to use in accordance with the Eurofins TestAmerica Solvent Lot Testing Program.

4.1.4 Instrument and/or method blanks are routinely used to demonstrate all reagents and apparatus are free from interferences under the conditions of the analysis.

4.2 Matrix Interferences

4.2.1 Matrix interferences may be caused by contaminants that are co-extracted from the sample matrix. The sample may require cleanup or dilution prior to analysis to reduce or eliminate the interferences.

4.2.2 Interfering contamination may occur when a sample containing low concentrations of analytes is analyzed immediately following a sample containing relatively high concentrations of analytes. As such, samples known to be clean should be analyzed first. To prevent carryover into subsequent samples, analysis of reagent blanks may be needed after the analysis of a sample containing high concentrations of analytes.

4.2.3 Turbidity Matrix Interferences

4.2.3.1 The presence of floating debris and coarse sediments which settle out rapidly will give a low reading. Air bubbles will affect the results positively.

4.2.3.2 The presence of true color, that is the color of water which is due to dissolved substances that absorb light, will cause turbidities to be low, although this effect is generally not significant with drinking waters.

4.2.3.3 Light absorbing materials such as activated carbon in significant concentrations can cause low readings.

5.0 Safety

Employees must abide by the policies and procedures in the Eurofins TestAmerica Environmental Health and Safety Manual (EHSM), the Eurofins TestAmerica Savannah Addendum to the EHSM, and this document.

This procedure may involve hazardous materials, operations, and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user to follow appropriate safety, waste disposal, and health practices under the assumption that all samples and reagents are potentially hazardous.

The analyst must protect himself/herself from exposure to the sample matrix. Many of the samples that are tested may contain hazardous chemical compounds or biological organisms. The analyst must, at a minimum, wear protective clothing (lab coat), eye protection (safety glasses or face shield), disposable latex or nitrile gloves, and closed-toe, nonabsorbent shoes when handling samples.

5.1 Specific Safety Concerns or Requirements

Nitric acid and hydrochloric acid are extremely hazardous as oxidizers, corrosives, poisons, and are reactive. Inhalation of the vapors can cause coughing, choking, irritation of the nose, throat, and respiratory tract, breathing difficulties, and lead to pneumonia and pulmonary edema. Contact with the skin can cause severe burns, redness, and pain. Nitric acid can cause deep ulcers, and staining of the skin to a yellow or yellow-brown color. These acid vapors are irritating and can cause damage to the eyes. Contact with the eyes can cause permanent damage.

Samples that contain high concentrations of carbonates or organic matter, or samples that are at elevated pH can react violently when acids are added. Acids must be added to samples under a hood to avoid splash/splatter hazards and/or possibly toxic vapors that will be given off when the samples are acidified.

5.2 Primary Materials Used

The following is a list of the materials used in this procedure, which have a serious or significant hazard rating, and a summary of the primary hazards listed in their MSDS/SDS.

NOTE: This list does not include all materials used in the procedure. A complete list of materials used in this procedure can be found in the Reagents and Standards Section and the Equipment and Supplies Section of this SOP.

Employees must review the information in the MSDS/SDS for each material before using it for the first time or when there are major changes to the MSDS/SDS. Electronic copies of MSDS/SDS can be found using the "MSDS" link on the Oasis homepage and on the EH&S webpage on Oasis.

Material	Hazards	Exposure Limit[1]	Signs and Symptoms of Exposure
Hydrochloric Acid[2]	Corrosive Poison	5ppm Ceiling	Inhalation of vapors can cause coughing, choking, inflammation of the nose, throat, and upper respiratory tract, and in severe cases, pulmonary edema, circulatory failure, and death. Can cause redness, pain, and severe skin burns. Vapors are irritating and may cause damage to the eyes. Contact may cause severe burns and permanent eye damage.
Nitric Acid[2]	Corrosive Oxidizer Poison	2ppm TWA 4ppm STEL	Nitric acid is extremely hazardous; it is corrosive, reactive, an oxidizer, and a poison. Inhalation of vapors can cause breathing difficulties and lead to pneumonia and pulmonary edema, which may be fatal. Other symptoms may include coughing, choking, and irritation of the nose, throat, and respiratory tract. Can cause redness, pain, and severe skin burns. Concentrated solutions cause deep ulcers and stain skin a yellow or yellow-brown color. Vapors are irritating and may cause damage to the eyes. Contact may cause severe burns and permanent eye damage.
[1]Exposure limit refers to the OSHA regulatory exposure limit.			
[2]Always add acid to water to prevent violent reactions.			

6.0 Equipment and Supplies

6.1 Equipment and Instrumentation

Thermometers – Verify in accordance with SOP SA-AN-100: *Laboratory Support Equipment (Verification and Use)*

Digestion Block – capable of maintaining a sample digestion temperature of 95±5°C. The temperature of the digestion block must be monitored and recorded for each batch. The temperature is measured in a beaker or digestion vessel containing reagent water.

Turbidimeter – Hach Model 2100AN.

6.2 Volumetric Containers

All volumetric labware must be verified in accordance with SOP SA-AN-100: *Laboratory Support Equipment (Verification and Use).* Refer to Attachment 6 for Labware Cleaning Procedures.

Volumetric Labware	Volume	Type (Quantitative / Qualitative)	Use	Verification Frequency	Laboratory Verification Criteria
Volumetric Flasks (Class A)	Various	QUANTITATIVE	Preparing Standards and Dilutions	None (Class A)	None (Class A)
Graduated Cylinders (Class A)	Various	QUANTITATIVE	Preparing Standards and Dilutions	None (Class A)	None (Class A)
Eppendorf-Style Mechanical Pipettes	Various	QUANTITATIVE	Preparing Standards and Dilutions	Initially, prior to first use, then quarterly thereafter (Daily for DOD)	Accuracy = 2% Precision = 1%
Pump-Style Pipettes	Various	Qualitative	Acid/Base Delivery for pH Adjustment	Initially	Accuracy = 10% Precision = 10%
Autosampler Tubes	14mL	Qualitative	Digest Analysis	None	None
Digestion Vials	50mL	QUANTITATIVE	Initial and Final Volumes	None (Class A)	None (Class A)
Digestion Vials	100mL	QUANTITATIVE	Initial and Final Volumes	None (Class A)	None (Class A)
Disposable Medicine Cups	300mL	Qualitative	Used to contain aliquot for pH measurement	None	None

6.3 Lab Supplies

pH paper

Detergent – Alconox or equivalent, used for washing non-disposable labware.

0.45um polypropylene filters and syringes

6.4 Sample Collection Containers

All sample collection containers are single-use disposable containers which limits the potential for contamination.

The routine sample collection containers supplied by the laboratory are 250mL plastic containers purchased with Certificate of Analysis attesting to purity.
Note: Drinking Water samples collected for the Lead and Copper Rule require 1 liter containers.

7.0 Reagents and Standards

7.1 Expiration Dates

Expiration dates (time from initial use or receipt to final use) for standard and reagent materials must be set according to the guidance in this SOP. Note: These are maximum expiration dates and are not to be considered an absolute guarantee of standard or reagent quality. Sound judgment must be used when deciding whether to use a standard or reagent. If there is doubt about the quality of a standard or reagent material, a new material must be obtained or the standard or reagent material verified. Data quality must not be compromised to extend a standard's life.

The expiration date of any standard or reagent must not exceed the expiration date of the standard or reagent that was used to prepare it.

7.2 Reagents

Reagents must be prepared and documented in accordance with SOP SA-AN-041: *Reagent and Standard Materials Procedures.*

Hydrochloric Acid and Nitric Acid must be verified prior to use in accordance with the Eurofins TestAmerica Solvent Lot Testing Program.

Laboratory Reagent Water – ASTM Type I

Nitric Acid (HNO_3): reagent grade. Stable under ordinary conditions of use and storage.
Storage: Store in a cool, dry, ventilated storage area with acid resistant floors and good drainage. Store away from sunlight, heat, water, and incompatible materials.
Expiration:

Unopened: Manufacturer's expiration date
Opened: 5 years from date of opening

Hydrochloric Acid (HCl): reagent grade. Stable under ordinary conditions of use and storage.
Storage: Store in a cool, dry, ventilated storage area with acid resistant floors and good drainage. Store away from sunlight, heat, water, and incompatible materials.
Expiration:

Unopened: Manufacturer's expiration date
Opened: 5 years from date of opening

7.3 Standards

Standards must be prepared and documented in accordance with SOP SA-AN-041: *Reagent and Standard Materials Procedures.* Certificates of analysis or purity must be received with all purchased standards, and scanned and attached in LIMS.

7.3.1 Turbidity Standards

Turbidity Standard, 1.0 NTU, Hach pre-prepared 1L
TALS Name: TURB 1.0_XXXX
Storage: Gen. Instrument Lab – Store in a cool, dry area away from heat or light
Expiration: Manufacturer's expiration date, or 30 days from opening

7.3.2 Silica/Silicon Standards

Silicon (Si) stock solutions are usually purchased for this procedure. The following conversion is used to adjust any volumes or concentrations appropriately:

$$Si = \frac{SiO_2}{2.14}$$

7.3.2.1 Stock SiO_2 Standard, 10000mg/L Si / 21400mg/L SiO_2 – purchased from CPI. Store at room temperature. This standard must be used by the manufacturer's expiration date. Storage: Store in a cool, dry, ventilated storage area. Store away from sunlight, heat, water, and incompatible materials.

7.3.2.2 Intermediate SiO_2 Standard, 467mg/L Si / 1000mg/L SiO_2 – Add 20mL to 30mL of reagent water to a clean, plastic 100mL volumetric flask. Add the volume of the Stock SiO_2 Standard given in the table below to the volumetric flask. Dilute to volume with reagent water.

Element	Conc. Stock SiO_2 Std (mg/L)	Volume Stock SiO_2 Std (mL)	Final Volume (mL)	Final Conc. (mg/L)
Silica (SiO_2) [Silicon (Si)]	21400 [10000]	4.67	100	1000 [467]

Storage: Store in a cool, dry, ventilated storage area. Store away from sunlight, heat, water, and incompatible materials.

Expiration: Prepare this solution every 180 days or sooner as needed or required. The expiration date must not exceed the expiration date of any of the components.

7.3.3 ICP/MS Spiking Solutions

7.3.3.1 ICP/MS Spiking Solution 1 – Purchased from CPI International (4400-060117RHO2). The concentrations of the analytes in this solution are listed on the accompanying certificate of analysis.
Storage: Store this solution at room temperature.
Expiration: Replace this solution by the manufacturer's expiration date or sooner if needed or required.

7.3.3.2 ICP/MS Spiking Solution 2 – Add 10mL of hydrochloric acid to a 100mL volumetric flask containing about 50mL of laboratory reagent water. Add the appropriate volume of each single element stock standard to the flask. Dilute to volume with reagent water, and mix thoroughly. Transfer the spiking solution to a labeled storage container.

Element	Parent Standard Concentration (mg/L)	Volume Added (mL)	Final Volume (mL)	Final Concentration (mg/L)
Mercury (Hg)	1000	0.25	500	0.50

Storage: Store in a cool, dry, ventilated storage area with acid resistant floors and good drainage. Store away from sunlight, heat, water, and incompatible materials.
Expiration: Due to mercury requirements, prepare this solution every 28 days or sooner as needed. The expiration date must not exceed the expiration date of any of the components.

7.3.3.3 ICP/MS Silver Spiking Solution – Add 10mL of hydrochloric acid to a 100mL volumetric flask containing about 50mL of laboratory reagent water. Add the appropriate volume of each single element stock standard to the flask. Dilute to volume with reagent water, and mix thoroughly. Transfer the spiking solution to a labeled storage container.

Element	Parent Standard Concentration (mg/L)	Volume Added (mL)	Final Volume (mL)	Final Concentration (mg/L)
Silver (Ag)	1000	2.5	500	5.0

8.0 Sample Collection, Preservation, Shipment, and Storage

8.1 Aqueous Samples

8.1.1 Total Metals

Aqueous samples are routinely collected in 250mL plastic containers containing 3mL of a 1:3 nitric acid preservative. The preservative should be sufficient to achieve a sample pH of less than 2.

Although no temperature preservation is required, samples are routinely iced at the time of collection at 0-6°C (less than 6°C but not frozen). Samples are stored at room temperature until the time of digestion. Samples must be digested and analyzed within 180 days of sample collection. If mercury is requested the samples must be digested and analyzed within 28 days of collection. Digestates are stored at room temperature until the time of analysis.

Note: Drinking water samples for the Lead and Copper Rule require 1 liter of sample to be collected.

NCMs must be initiated for samples collected in improper containers and containing improper or insufficient preservatives.

8.1.2 Dissolved Metals

Aqueous samples for dissolved metals are routinely filtered at the time of sampling and collected in 500mL plastic containers containing 3mL of a 1:3 nitric acid preservative. The preservative should be sufficient to achieve a sample pH of less than 2.

Although no temperature preservation is required, samples are routinely iced at the time of collection at 0-6°C (less than 6°C but not frozen). Samples are stored at room temperature until the time of digestion. Samples must be digested and analyzed within 180 days of sample collection. If mercury is requested the samples must be digested and analyzed within 28 days of collection. Digestates are stored at room temperature until the time of analysis.

Note: If the sample is to be filtered in the laboratory, the sample must be collected in 500mL plastic container with no preservatives. The sample must be stored at 0-6°C (less than 6°C but not frozen) until filtered. Once filtered, the laboratory will add nitric acid to obtain a pH of less than 2.

NCMs must be initiated for samples collected in improper containers and containing improper or insufficient preservatives.

8.1.3 Silica Samples

Aqueous samples for silica are routinely collected in 500mL plastic containers.

Samples must be iced at the time of collection and maintained at 0-6°C (less than 6°C but not frozen) until the time of filtration and analysis. Samples must be filtered and analyzed within 180 days of collection.

NCMs must be initiated for samples collected in improper containers.

Note: Acid preserved samples routinely collected for ICP analyses and acid digested samples should not be used for the analysis of silica. Also note that glass containers should be avoided.

8.1.4 Preservation Checks – pH Verification

For each sample, prior to sample preparation,

- Place a piece of pH paper in a disposable medicine cup.
- Pour a few drops of sample into the medicine cup and note the color change of the pH paper.
- If the pH is greater than 2, initiate a Nonconformance Memo, and perform the additional steps listed below:
  1. Add ~0.5mL of concentrated nitric acid. Mix well, and re-check the pH. If the pH is still > 2, add additional aliquots of concentrated nitric acid, until the pH is < 2.

2. Set the sample aside, and re-check the pH after 24 hours. If pH is still greater than 2 after 24 hours, then repeat Steps 1 and 2, until the pH remains < 2 after 24 hours.

Note: Initial preservation checks for samples that require pH adjustment are captured in the PRESERV_CHK batch, with the final pH check (i.e., the re-check that occurs after 24 hours) recorded in the prep batch. Preservation checks for samples that do not require pH adjustment are captured in the prep batch.

Note: To avoid cross-contamination, use a separate medicine cup and piece of pH paper per sample. Do not dip the pH paper into the sample container. The pH paper dye may bleed into the sample and affect sample results.

Note: Samples that are not at pH <2 upon arrival in the lab may contain cyanide or sulfide or may be highly buffered. Working under a hood minimizes the hazard that may be caused by the evolution of hydrogen cyanide or hydrogen sulfide upon acidification of the sample. Be aware that acid/base neutralization reaction may be violent and evolve a significant amount of heat.

Note: The Sample Receiving Department performs an initial determination of sufficient preservation upon sample receipt to the laboratory. Samples received from the client that are not properly preserved are marked with a black dot sticker on the lid of the container, prior to transfer to the Metals Department. This sticker serves as a method of informing the preparations analyst that the sample was not preserved properly and that preservation steps are needed.

8.2 TCLP/SPLP Leachate Samples

Once the TCLP/SPLP extraction procedure has been performed, the leachate is transferred to a plastic container. The leachate must be acidified with nitric acid to pH <2, upon receipt to the Metals Department. The leachate sample must be digested and analyzed within 180 days of completion of the TCLP/SPLP extraction. If mercury is requested, the leachate sample must be digested and analyzed within 28 days of completion of the TCLP/SPLP extraction.

9.0 Quality Control

SOP SA-QA-017: *Evaluation of Batch QC Data* and the SOP Summary in Attachment 3 of the associated analytical SOPs provide requirements for evaluating QC data.

9.1 Batch QC

A digestion batch consists of up to 20 environmental samples and the associated QC items digested together within a 24 hour period.

EPA 200.7 and EPA 200.8 – Drinking Water

The laboratory's default minimum QC items performed for each digestion batch are: a method blank and a laboratory control sample (LCS), a low-level LCS (LLCS), a matrix spike (MS) to be performed on a minimum of 10% of samples or one per batch – whichever is greater, and a matrix spike duplicate (MSD).

This frequency equates to the following:

- For a batch of 10 or fewer samples, the minimum QC items are a method blank, an LCS, an LLCS, 1 matrix spike, and 1 matrix spike duplicate.
- For a batch of 11-20 samples, the minimum QC items are a method blank, an LCS, an LLCS, 1 matrix spike (from sample 1-10), another matrix spike (from sample 11-20), and a matrix spike duplicate (MSD).

EPA 200.7 and EPA 200.8 – Clean Water Act

The laboratory's default minimum QC items performed for each digestion batch are: a method blank and a laboratory control sample (LCS), a matrix spike (MS) to be performed on a minimum of 10% of samples or one per batch – whichever is greater, and a matrix spike duplicate (MSD).

This frequency equates to the following:

- For a batch of 10 or fewer samples, the minimum QC items are a method blank, an LCS, 1 matrix spike, and a matrix spike duplicate.
- For a batch of 11-20 samples, the minimum QC items are a method blank, an LCS, 1 matrix spike (from sample 1-10), another matrix spike (from sample 11-20), and a matrix spike duplicate.

EPA Methods 3005A and 3010A and Standard Methods 3030C

The laboratory's default minimum QC items performed for each digestion batch are: a method blank, a laboratory control sample (LCS), a matrix spike (MS), and a matrix spike duplicate (MSD) or a sample duplicate.

The routine container supplied for this method is a 250mL container. 50mL is required for digestion. Reduced sample initial volumes may be necessary to achieve the required batch matrix spike frequency; however, the minimum digestion volume to be used for the matrix spike samples is 25mL. Note: Final volumes and spike amounts must be adjusted to compensate for these reduced initial volumes.

If there is insufficient sample volume to perform the required matrix spike(s), the LCS must be prepared in duplicate (i.e., LCSD). An NCM must be initiated on all affected samples to denote this situation. Insufficient sample volume is defined as receiving less than a total of 100mL.

Note: If an LCS and LCSD are performed, both QC items must be evaluated and reported. Acceptable recoveries (as well as %RPD) for both LCS and LCSD are required.

9.2 Instrument QC

Details on instrument QC are given in the associated analytical SOPs listed in Section 1.

9.2.1 Turbidimeter Instrument QC

Refer to SOP SA-GE-206 for additional information on the initial calibration of the turbidimeter. The Metals Department uses this turbidimeter only to assess whether drinking water samples can be analyzed undigested; therefore, a reduced QC frequency is applied for this department.

The calibration curve must be verified initially and at the end of the analysis with a low-level standard at 1.0 NTU. The CCV must be within 10% of the true value to be acceptable.

9.3 Corrective Action for Out-of-Control Data

When the quality control parameters do not meet the criteria set forth in this SOP, corrective action must be taken in accordance with SOP SA-QA-005: *Preventive and Corrective Action Procedures* the QC Summary Table in Attachment 3 of the associated analytical SOP. SOP SA-QA-005 provides contingencies for out-of-control data and gives guidance for exceptionally permitting departures from approved policies and procedures. Nonconformance Memos must be initiated to document all instances where QC criteria are not met and all departures from approved policies and procedures.

10.0 Procedure

10.1 Sample and QC Sample Preparation

Unless otherwise requested, groundwater and surface waters are to be prepared using the total recoverable metals procedure given in Section 10.1.3. TCLP/SPLP samples must be digested for total metals (Section 10.1.4). Note that there are different spiking solutions for routine and TCLP/SPLP matrix spikes.

NOTE: The block digestion apparatus must be at 95 ± 3°C during prep. To verify temperature of the hotblock a digestion tube filled with DI water must be placed at random locations across each block used for digestion. This position must be changed daily. A single thermometer is transferred from block to block and a minimum of 10 minutes allowed for the thermometer to equilibrate before taking the reading. This temperature reading, uncorrected and corrected, is then recorded in the batch information.

10.1.1 Dissolved Metals

10.1.1.1 Results reported as “dissolved metals” are defined as the concentrations of analytes in a liquid sample that will pass through a 0.45um membrane filter prior to acidification/preservation. The filtration step can occur in the field or in the laboratory. In either case, the sample must be unpreserved prior to filtration and then filtered using a 0.45um filter.

10.1.1.2 Field filtered samples are usually preserved in the field, immediately after filtration. Unpreserved samples sent to the laboratory for lab filtration must be preserved immediately after filtration.

10.1.1.3 If the laboratory filters the samples, the reagent water used to prepare the method blank and laboratory control samples associated with the "dissolved metals" samples must be filtered through the same type of filter used to filter the field samples.

Note: The LCS must be spiked prior to filtration.

10.1.1.4 A comparison between total and dissolved results is good practice, and logic should follow that total results should be equal or greater than dissolved results, especially if the dissolved metals are lab filtered. Comparable hits with less than 20% RPD should be considered equal. Any other discrepancies should be discussed with the Department Manager or Supervisor, Technical Manager, or the Project Manager.

10.1.1.5 The laboratory's standard practice is to digest all non-silica liquid samples; however, samples filtered for the determination of dissolved metals do not require digestion if the sample:

- has a low COD (<20mg/L);
- has a turbidity <1 NTU;
- is colorless with no significant odor; ***and***
- is of one liquid phase and free of suspended particulates or precipitates after acidification

10.1.2 Turbidity Determination for Drinking Water Samples

Drinking water samples with a turbidity concentration of less than 1NTU may be analyzed without digestion. The exception to this rule is silver, which requires sample digestion prior to analysis. The turbidity of drinking water samples is checked using the procedures outlined in this section. If the turbidity of the sample is not checked, the digestion procedure must be performed.

10.1.2.1 Turn on turbidimeter and allow it to warm up 15-30 minutes.

10.1.2.2 Verify the instrument is operating properly by the analysis of a continuing calibration verification sample initially, after every 25 samples, and at the end of the run with the Turbidity Standard at 1.0 NTU.

10.1.2.3 Analyze a DI water blank (CCB). The DI water blank must be less than 1NTU to be acceptable. If the DI water blank is greater the 1NTU, check to be certain the sample cell is clean. If the blank is significantly above 1NTU, the sample cell may be scratched and may need to be replaced.

10.1.2.4 Determine the turbidities for all samples by filling the cell with sample and placing the cell in the sample well of the turbidimeter. Record values for samples with a turbidity less than 1NTU in the drinking water prep batch worksheet in LIMS. (Samples with a turbidity reading greater than 1NTU or samples being analyzed for silver, MUST be digested). Be certain to rinse the cells between samples with DI water to avoid contamination.

10.1.3 Total Recoverable Metals (EPA 3005A)

This digestion procedure is used to prepare aqueous samples for total recoverable metals determination by ICP and ICP/MS.

10.1.3.1 Transfer a 50mL aliquot (or an appropriate volume diluted to 50mL with reagent water) of a well-mixed sample to a 50mL digestion block vial.

Note: If there is not sufficient volume to use a 50mL aliquot, the lab can use a smaller volume of sample, proportional volumes of reagents, and adjust the final digestate volume back to the original volume of the sample used. For example, if 25mL of sample is digested, one half of the routine volumes of reagent are used and the final volume of the digestate is brought back to 25mL. When a smaller aliquot is used, the digestion analyst must be careful not to allow the sample digest to evaporate completely.

10.1.3.2 Add 50mL of reagent water to a digestion block vial to serve as the method blank. This QC sample is taken through all digestion and sample preparation steps to monitor for contamination that may be due to glassware, reagents, or sample handling.

10.1.3.3 Add 0.50mL of the appropriate spiking solutions to a 50mL aliquot of reagent water to serve as the laboratory control spike (LCS). If a duplicate laboratory control spike (LCSD) is required, spike a second 50mL aliquot of reagent water with 0.50mL of the appropriate spiking solutions.

Analytical Method	Matrix	QC	Spiking Solutions
EPA 6010C	Aqueous	LCS/MS/MSD	ICP/MS Spike 1 ICP/MS Spike 2 ICP/MS Ag Spike
EPA 6020A	Aqueous	LCS/MS/MSD	ICP/MS Spike 1 ICP/MS Spike 2 ICP/MS Ag Spike

10.1.3.4 Add 0.50mL of the appropriate spiking solutions to each of two 50mL aliquots of the client sample designated as the matrix spike samples (MS and MSD).

10.1.3.5 Add 2.5mL of concentrated HCl and 1.0mL of concentrated HNO_3 to each sample. Gently heat the digestion vessel until the sample refluxes. The sample must not be heated to boiling; that is, bubbles are not formed in the liquid in the bottom of the digestion vessel. The sample/acid solution is refluxing when the liquid evaporates and drops of liquid condense on the sides of the digestion vessel and fall back into the digestion vessel. Evaporate the sample until the volume is approximately 15mL. Do not allow any portion of the vessel bottom to become dry at any time during the digestion.

Note: If a volume of sample smaller than 50mL is digested, the amount of acid should be reduced proportionately.

10.1.3.6 Wash down the inside of the digestion vessel with reagent water. Dilute the sample digestate to 50mL with reagent water.

Note: The digestate may be diluted to a volume less than the original volume if sample pre-concentration is required to meet lower reporting limits. The pre-concentration must be limited to a factor of four.

10.1.3.7 The sample is now ready for analysis via the appropriate analytical SOP.

10.1.4 Total Metals (EPA 3010A, EPA 200.7, and EPA 200.8)

This digestion procedure is used for the preparation of aqueous samples for total metals determination by ICP and ICP/MS.

10.1.4.1 Transfer a 50mL aliquot (or an appropriate volume diluted to 50mL with reagent water) of a well-mixed sample to a 50mL digestion block vial.

Note: If there is not sufficient volume to use a 50mL aliquot, the lab can use a smaller volume of sample, proportional volumes of reagents, and adjust the final digestate volume back to the original volume of the sample used. For example, if 25mL of sample is digested, one half of the routine volumes of reagent are used and the final volume of the digestate is brought back to 25mL. When a smaller aliquot is used, the digestion analyst must be careful not to allow the sample digest to evaporate completely.

10.1.4.2 Add 50mL of reagent water to a digestion block vial to serve as the method blank. This QC sample is taken through all digestion and sample preparation steps to monitor for contamination that may be due to glassware, reagents, or sample handling.

10.1.4.3 Add 0.50mL of the appropriate spiking solutions to a 50mL aliquot of reagent water to serve as the laboratory control spike (LCS). If a duplicate laboratory control spike (LCSD) is required, spike a second 50mL aliquot of reagent water with 0.50mL of the appropriate spiking solutions.

Analytical Method	Matrix	QC	Spiking Solutions
EPA 6010C EPA 200.7	Aqueous	LCS/MS/MSD	ICP/MS Spike 1 ICP/MS Spike 2 ICP/MS Ag Spike
EPA 6020A EPA 200.8	Aqueous	LCS/MS/MSD	ICP/MS Spike 1 ICP/MS Spike 2 ICP/MS Ag Spike

10.1.4.4 Add 0.50mL of the appropriate spiking solutions to two 50mL aliquots of the client sample designated as the matrix spike samples (MS and MSD).

10.1.4.5 Add 1.5mL of concentrated HNO_3 to each sample. Gently heat the digestion vessel until the sample refluxes. The sample must not be heated to boiling; that is, bubbles are not formed in the liquid in the bottom of the digestion vessel. The sample/acid solution is refluxing when the liquid evaporates and drops of liquid condense on the sides of the digestion vessel and fall back into the digestion vessel. Evaporate the sample until the volume is approximately 5-10mL. Do not allow any portion of the vessel bottom to become dry at any time during the digestion.

Note: If a volume of sample smaller than 50mL is digested, the amount of acid should be reduced proportionately.

10.1.4.6 Remove the digestion vessels from the digestion block and cool the digestion vessels to room temperature. Add another 1.5mL portion of concentrated HNO_3. Continue heating the sample on the digestion block. Again, at the proper temperature, the sample should gently reflux in the digestion vessel. Do not allow the sample to boil.

10.1.4.7 Continue heating the sample and adding additional 1.5mL portions of concentrated HNO_3 until the digestate is light in color or does not change in appearance after subsequent additions of HNO_3. If a sample requires more than 6mL of acid to digest, contact the Department Manager for guidance.

10.1.4.8 Evaporate the digestate until the volume is approximately 5-10mL.

10.1.4.9 Add 2.5mL of concentrated HCl and warm the sample digestate for 15 minutes.

10.1.4.10 Wash down the inside of the digestion vessel with reagent water. Dilute the sample digestate to 50mL with reagent water.

Note: The digestate may be diluted to a volume less than the original volume if sample pre-concentration is required to meet lower reporting limits. The pre-concentration should be limited to a factor of four.

10.1.4.11 The sample is now ready for analysis via the appropriate analytical SOP.

10.1.5 Total Metals and TCLP/SPLP Samples (EPA 3010A)

This digestion procedure is used for the preparation of TCLP/SPLP leachate samples for total metals determination by ICP. Note that the LCS is spiked with the routine analytes to allow the TCLP/SPLP samples to be digested along with aqueous samples.

Note: The TCLP/SPLP leachate MS/MSD must be spiked prior to acidification. This is to be performed as close to 8 hours upon receipt of the leachate to the Metals Prep area as possible. Refer to Section 10.1.5.4 for more information.

10.1.5.1 Transfer a 5mL aliquot (diluted to 50mL) for TCLP or a 50mL aliquot for SPLP of a well-mixed sample to a clean 50mL digestion vessel. Larger volumes may be digested at the discretion of the lab. The volume of spike solution added should be adjusted proportionately.

10.1.5.2 Add 5mL of extraction fluid diluted to 50mL for TCLP or 50mL for SPLP to a digestion vessel to serve as the method blank. This QC sample is taken through all digestion and sample preparation steps to monitor for contamination that may be due to glassware, reagents, or sample handling. A blank for each type of extraction fluid must be digested and analyzed.

10.1.5.3 Add 1.0mL of the appropriate spiking solutions to a 5mL aliquot of extraction fluid diluted to 50mL for TCLP or to a 50mL aliquot of extraction fluid for SPLP. This is designated as the laboratory control spike (LCS). If required, perform a LCSD by following the same procedure as the LCS. The routine ICP/MS spiking solution is used for the TCLP/SPLP LCS because of frequent client requests for reporting more analytes from the TCLP/SPLP leachate than are currently regulated. Preparing an LCS with all of the target analytes eliminates re-digestion and provides QC for the requested analytes.

Note: If both Extraction Fluid 1 and Extraction Fluid 2 are included in the batch, use Extraction Fluid 1 for the LCS and LCSD. Refer to SOP SA-EX-015: *Toxicity Characteristic Leaching Procedure (TCLP) and Synthetic Precipitation Leaching Procedure (SPLP)* for information on the TCLP/SPLP extraction fluids.

Analytical Method	Matrix	QC	Spiking Solutions
EPA 6010C	TCLP/SPLP	LCS	ICP/MS Spike 1 ICP/MS Spike 2 ICP/MS Ag Spike

10.1.5.4 The TCLP MS/MSD is prepared as follows: add 4.0mL of the ICPMS Calibration Stock and 0.4mL of the ICPMS Hg intermediate calibration standard to each of two 20mL aliquots of leachate.

The SPLP MS/MSD is prepared as follows: add 4.0mL of the ICPMS Calibration Stock and 0.04mL of the ICPMS Hg intermediate calibration standard to each of two 100mL aliquots of the leachate.

Note: The TCLP/SPLP digestion batch consists of twenty or fewer field samples and the associated QC items. A TCLP/SPLP digestion batch must not exceed 20 field samples. Every TCLP/SPLP digestion batch will have a method blank (MB), a laboratory control sample (LCS), and a matrix spike (MS).

10.1.5.5 Add 1.5mL of concentrated HNO_3 to each sample. Gently heat the digestion vessel until the sample refluxes. The sample is not heated to boiling; that is, bubbles are not formed in the liquid in the bottom of the digestion vessel. The sample/acid solution is refluxing when the liquid evaporates and drops of liquid condense on the sides of the digestion vessel and fall back into the digestion

vessel. Evaporate the sample until the volume is approximately 5mL. Do not allow any portion of the vessel bottom to become dry at any time during the digestion.

Note: If a volume of sample smaller than 50mL is digested, the amount of acid should be reduced proportionately.

10.1.5.6 Remove the digestion vessels from the digestion block and cool the digestion vessels to room temperature. Add another 1.5mL portion of concentrated HNO_3. Continue heating the sample on the digestion block. Again, at the proper temperature, the sample should gently reflux in the digestion vessel. Do not allow the sample to boil.

10.1.5.7 Continue heating the sample and adding additional 1.5mL portions of concentrated HNO_3 until the digestate is light in color or does not change in appearance after subsequent additions of HNO_3. If a sample requires more than 6mL of acid to digest, contact the Department Manager for guidance.

10.1.5.8 Evaporate the digestate until the volume is approximately 5-10mL.

10.1.5.9 Add 2.5mL of concentrated HCl and warm the sample digestate for 15 minutes.

10.1.5.10 Wash down the inside of the digestion vessel with reagent water. Dilute the sample digestate to 50mL with reagent water.

10.1.5.11 The sample is now ready for analysis by ICP.

10.1.6 Acid-Extractable Metals (SM3030C)

This digestion procedure is used for the preparation of aqueous samples for acid-extractable metals by ICP and ICP/MS.

10.1.6.1 Transfer a 50mL aliquot (or an appropriate volume diluted to 50mL with reagent water) of a well-mixed sample to a 50mL digestion block vial.

Note: If there is not sufficient volume to use a 50mL aliquot, the lab can use a smaller volume of sample, proportional volumes of reagents, and adjust the final digestate volume back to the original volume of the sample used. For example, if 25mL of sample is digested, one half of the routine volumes of reagent are used and the final volume of the digestate is brought back to 25mL. When a smaller aliquot is used, the digestion analyst must be careful not to allow the sample digest to evaporate completely.

10.1.6.2 Add 50mL of reagent water to a beaker that has been designated as the method blank. This QC sample is taken through all digestion and sample preparation steps to monitor for contamination that may be due to glassware, reagents, or sample handling.

10.1.6.3 Add 0.50mL of the appropriate spiking solutions to a 50mL aliquot of reagent water designated as the laboratory control spike (LCS). If a duplicate laboratory control spike (LCSD) is required, spike a second 50mL aliquot of reagent water with 0.50mL of the appropriate spiking solutions.

Analytical Method	Matrix	QC	Spiking Solutions
EPA 6010C	Aqueous	LCS/MS/MSD	ICP/MS Spike 1 ICP/MS Spike 2 ICP/MS Ag Spike
EPA 6020A	Aqueous	LCS/MS/MSD	ICP/MS Spike 1 ICP/MS Spike 2 ICP/MS Ag Spike

10.1.6.4 Add 0.50mL of the appropriate spiking solutions to each of two 50mL aliquots of the client sample designated as the matrix spikes sample (MS and MSD).

10.1.6.5 Add 1.25mL of concentrated HCl to each sample and QC item.

Note: If a volume of sample smaller than 50mL is digested, the amount of acid should be reduced proportionately.

10.1.6.6 Heat for 15 minutes on a hot block.

10.1.6.7 The sample is now ready for filtration and final volume adjustment which occurs immediately prior to analysis by ICP or ICP/MS.

10.1.7 Total Recoverable Metals (EPA 200.8 and EPA 200.7)

This digestion procedure is used for the preparation of water and drinking water samples for total recoverable metal determination by ICP and ICP/MS.

10.1.7.1 Transfer a 50mL aliquot (or an appropriate volume diluted to 50mL with reagent water) of a well-mixed sample to a clean 50mL block digestion vial.

Note: If there is not sufficient volume to use a 50mL aliquot, the lab can use a smaller volume of sample and bring the final digestate volume back to the original volume of the sample used. That is, if 25mL of sample is digested, the final volume of the digestate should be brought back to 25mL. If a smaller aliquot is used, the digestion analyst must be careful not to allow the sample digest to evaporate completely.

10.1.7.2 Add 50mL of reagent water to a block digestion vial that has been designated as the method blank. This QC sample is taken through all digestion and sample preparation steps to monitor for contamination that may be due to glassware, reagents, or sample handling.

10.1.7.3 Add 0.50mL of the appropriate spiking solutions to a 50mL aliquot of reagent water designated as the laboratory control spike (LCS). If a duplicate laboratory control spike (LCSD) is required, spike a second 50mL aliquot of reagent water with 0.50mL of the appropriate spiking solutions.

Analytical Method	Matrix	QC	Spiking Solutions
200.7 DW and TR	Aqueous	LCS/MS/MSD	ICP/MS Spike 1 ICP/MS Spike 2 ICP/MS Ag Spike
200.8 DW and TR	Aqueous	LCS/MS/MSD	ICP/MS Spike 1 ICP/MS Spike 2 ICP/MS Ag Spike

10.1.7.4 Add 0.50mL of the appropriate spiking solutions to each of two 50mL aliquots of the client sample designated as the matrix spikes sample (MS and MSD).

10.1.7.5 Add 0.5mL of concentrated HNO_3 and 0.25mL of concentrated HCl to each sample. Gently heat the block digestion vial and reduce the sample volume to about 10mL without boiling; that is, bubbles are not formed in the liquid in the bottom of the block digestion vial. Do not allow any portion of the vessel bottom to become dry at any time during the digestion.

Note: If a volume of sample smaller than 50mL is digested, the amount of acid should be reduced proportionately.

10.1.7.6 Wash down the inside of the block digestion vial with reagent water. Dilute the sample digestate to 50mL with reagent water. Transfer the digest to a labeled storage container, usually a 125mL plastic vial. Allow any undissolved material to settle out or centrifuge the sample to remove particulate matter. A portion of the sample may be filtered, if necessary, to remove particulates but care must be taken to avoid contamination of the sample during filtration.

Note: The digestate may be diluted to a volume less than the original volume if sample concentration is required to meet lower reporting limits. The pre-concentration should be limited to a factor of four.

10.1.7.7 The sample is now ready for analysis by ICP and ICP/MS.

10.1.8 Silica Samples

10.1.8.1 Samples are prepared by filtration of an unpreserved aliquot through a 0.45um syringe filter. The sample must be kept refrigerated until time of analysis. Note: The same number of syringe filters should be used for the method blank, LCS, and the samples.

10.1.8.2 The method blank is prepared by filtering an amount of reagent water equal to the volume of sample that is filtered.

10.1.8.3 The LCS is prepared by spiking 10mL of reagent water with 0.10mL of SiO_2 Intermediate Standard, and passing it through a 0.45um syringe filter. The SiO_2 spike concentration in the LCS is 10mg/L.

10.1.8.5 The matrix spike and/or matrix spike duplicate (MS/MSD) are prepared by adding 0.10mL of SiO_2 Intermediate Standard solution to two separate 10mL aliquots of the sample to be spiked and filtering through a 0.45um filter. The SiO_2 spike concentration in the MS/MSD is 10mg/L.

10.2 Analysis

Details on sample analysis are given in the associated analytical SOPs listed in Section 1.

11.0 Calculations / Data Reduction

11.1 Data Reduction

Data must be evaluated in accordance with SOP SA-QA-002: *Data Generation and Review*.

11.1.1 Historical Data

Many of the laboratory's clients submit samples for repeat monitoring purposes. Prior to analysis, verify LIMS Worksheet Notes and/or use the Historical Data Tracker feature to determine if historical data is available for review.

11.1.2 Chemical Relationships

When available, the following chemical relationships must be evaluated for each sample. If these relationships are not met the Department Manager must be contacted immediately.

- Total results are ≥ Dissolved results

11.2 Calculations

Details on sample calculations are given in the associated analytical SOPs listed in Section 1.

12.0 Method Performance

12.1 Reporting Limit Verification (RLV)

At a minimum, RLVs must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

For analytes and methods certified by DOD ELAP, RLVs must also be performed quarterly thereafter. For analytes and methods certified by NELAC, RLVs must also be performed annually thereafter. Exceptions may be made for project-specific non-routine analytes.

12.2 Method Detection Limit (MDL) Study

The MDL is the lowest concentration that can be detected for a given analytical method and sample matrix with 99% confidence that the analyte is present. MDLs reflect a calculated (statistical) value determined under ideal laboratory conditions in a clean matrix and may not be achievable in all environmental matrices. The current MDLs associated with this procedure are given in the Method Limit Group (MLG) in LIMS.

At a minimum, MDL Studies must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

Note: MDL Studies are not required for non-routine analytes provided results are not reported below the RL (i.e., MDL equals RL in LIMS).

12.3 Method Detection Limit Verification (MDLV)

At a minimum, MDLVs must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

For analytes and methods certified by DOD ELAP, MDLVs must also be performed quarterly thereafter. For analytes and methods certified by NELAC, MDLVs must also be performed annually thereafter.

Note: MDLVs are not required for non-routine analytes provided results are not reported below the RL (i.e., MDL equals RL in LIMS).

12.4 Determination of the Instrument Detection Limit (IDL)

The instrument detection limit (IDL) is the concentration of analyte that can be statistically distinguished from the background noise of the instrument. The IDL limit must be determined annually, at a minimum, for each analyte in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits.*

The IDL is defined as three times the standard deviation of seven replicate analyses of a blank solution analyzed over three non-consecutive days. The IDL may be elevated above the background noise (blank levels). The current IDL associated with this procedure is given in the Equipment Limit Group (ELG) in LIMS.

12.5 QC Limit Generation, Control Charting, and Trend Analysis

The control limits for the batch QC items (LCS and MS/MSD) for this procedure are specified in the reference method and cannot be broadened; therefore, the laboratory defaults to the method-defined limits and does not utilize in-house or laboratory-derived limits for the evaluation of batch QC items.

Although the laboratory must default to the method-defined QC limits, control charting is a useful tool and is performed to assess analyte recoveries over time to evaluate trends. Control charting must be performed periodically (at a minimum annually) in accordance with SOP SA-QA-017: *Evaluation of Batch QC Data.*

12.6 Demonstrations of Capability

Initial and continuing demonstration of capability must be performed in accordance with SOP SA-QA-006*: Training Procedures.*

Prior to performing this procedure unsupervised, each new analyst who performs this analysis must demonstrate proficiency per method/analyte combination by successful completion of an initial demonstration of capability. The IDOC is performed by the analysis of 4 consecutive LCSs that meet the method criteria for accuracy and precision. The IDOC must be documented and routed to the QA Department for filing.

Annual continuing demonstrations of capability (CDOCs) are also required per analyst per method/analyte combination. The CDOC requirement may be met by the consecutive analysis of four LCS all in the same batch, by the analysis of four LCS analyzed in four consecutive batches (in different batches on different days), via acceptable results on a PT study, or analysis of client samples with statistically indistinguishable results when compared to another certified analyst. The CDOC must be documented and routed to the QA Department for filing.

12.7 Training Requirements

All training must be performed and documented in accordance with SOP SA-QA-006: *Training Procedures*.

Note: The SOPs listed in the Reference/Cross-Reference Section are applicable to this procedure. All employees performing this procedure must also be trained on these SOPs, and/or have a general understanding of these procedures, as applicable.

13.0 Pollution Control

It is Eurofins TestAmerica's policy to evaluate each method and look for opportunities to minimize waste generated (e.g., examining recycling options, ordering chemicals based on quantity needed, preparing reagents based on anticipated usage and reagent stability, etc.). Employees must abide by the policies in Section 13 of the Environmental Health and Safety Manual.

This procedure has been evaluated for opportunities to minimize the waste generated. Where reasonably feasible, pollution control procedures have been incorporated.

14.0 Waste Management

Waste management practices must be conducted consistent with all applicable federal, state, and local rules and regulations. All waste (i.e., excess reagents, samples, and method process wastes) must be disposed of in accordance with Section 9 of the Eurofins TestAmerica Savannah Addendum to the EHSM. Waste description rules and land disposal restrictions must be followed.

14.1 Waste Streams Produced by the Method

The following waste streams are produced when this method is carried out:

- Excess aqueous samples – Dispose according to characterization on the sample disposal program. Neutralize non-hazardous samples before disposal into drain/sewer. Transfer hazardous samples (identified on disposal program) to the waste department for disposal.
    - Samples within the prep lab must be placed in boxes to prevent possible loss or misplacement, and may be stacked and kept for a short time. Boxes up to a height of 3 stacked boxes may be kept, or for a duration of 1 month. Once either of these limits are reached samples must be scanned to the storage area.
- Acidic sample digestions: Neutralize before disposal into drain/sewer system.

Dispose of all metals standards with concentrations exceeding the TCLP threshold limits as a RCRA aqueous hazardous waste. The TCLP constituents and the respective threshold limits are:

Analyte	Disposal Limit (mg/L)
Arsenic	5.0
Barium	100
Cadmium	1.0
Chromium	5.0
Lead	5.0
Selenium	1.0
Silver	5.0
Mercury	0.20

Neutralize the standard by passing with sodium bicarbonate before transferring the waste to the RCRA aqueous hazardous waste drum.

All other metals standards may be disposed, using copious amounts of water, down a sink that flows to the neutralization pit.

- Standard Methods for the Examination of Water and Wastewater, Online Edition; American Public Health Association: Washington, DC 2004.

16.0 Method Modifications

16.1 The EPA 200.7 and EPA 200.8 reference methods were written specifically for drinking water and source water samples; however, the laboratory may perform other types of water samples using this procedure.

16.2 The EPA Manual for the Certification of Laboratories Analyzing Drinking Water requires a LFB at the MRL to be performed each day. The laboratory meets this requirement by preparing an LCS at the RL in each EPA 200.7 and EPA 200.8 drinking water batch. The EPA DW Manual does not specify criteria for the low-level LCS; therefore, the laboratory defaults to qualitative identification of the LL-LCS to be acceptable.

16.3 There is no method-defined batch precision requirement for some of these methods. The EPA does require precision for all samples analyzed under the Clean Water Act, and the laboratory routinely performs an MSD to support clients who require precision to be reported. If insufficient sample volume is provided to perform the MS/MSD, the laboratory performs the LCS in duplicate (i.e., LCS/LCSD).

16.4 The turbidimeter is calibrated and maintained by the General Chemistry Department for use with turbidity analyses for EPA 180.1 and SM2130B. The Metals Department uses this turbidimeter only to assess whether drinking water samples can be analyzed undigested; therefore, a reduced QC frequency applied for this department. Refer to SOP SA-GE-206 for additional information on the calibration and verification of this meter.

17.0 Attachments

The following Tables, Diagrams, and/or Validation Data are included as Attachments:

Attachment 1: SOP Summary
Attachment 2: Sample Collection, Preservation, and Holding Time Table
Attachment 3: QC Summary
Attachment 4: Instrument Maintenance and Troubleshooting
Attachment 5: Turbidity Form
Attachment 6: Glassware Cleaning Procedures

Attachment 1
SOP Summary

Sample Preparation Summary
Total Metals and TCLP/SPLP leachates: A known volume, usually 50mL, of sample is transferred to a digestion vessel. The sample is refluxed with nitric acid at approximately 95°C. After the sample has digested, as evidenced by a clear, pale yellow color, HCl is added and the sample is brought up to the original volume with reagent water. The laboratory utilizes two versions of the Total Recoverable preparation procedure. One version is equivalent to the EPA 3005A procedure and the second procedure is equivalent to the EPA 200.7 and 200.8 procedures.

Total Recoverable Metals: A known volume, usually 50mL, of sample is transferred to a digestion vessel. The sample is refluxed with dilute nitric acid and hydrochloric acid at approximately 95°C. After the sample has evaporated to approximately 10-20mL, the sample is brought up to the original volume with reagent water. This procedure is equivalent to EPA Method 3005A, and the EPA Methods 200.7 and 200.8 prep procedures for total recoverable metals.

Acid Extractable Metals: A known volume, usually 50mL of sample preserved with nitric acid, is transferred to a digestion vessel. Hydrochloric acid is added and the sample is heated on a hot block for 15 minutes. The sample is filtered and the final volume adjusted to the original volume. This procedure is equivalent to Standard Methods 3030C.

Silica samples for EPA Methods 200.7 and 6010C: Liquid samples are filtered. The filtered liquid samples are analyzed by ICP.

Drinking water samples for EPA Methods 200.7 and 200.8 with a turbidity concentration of less than 1NTU may be analyzed with no digestion. The exception to this rule is silver, which requires sample digestion prior to analysis. If the sample turbidity is >1NTU, then the EPA Method 200.7 preparation procedure or the EPA Method 200.8 preparation procedure is used.

Samples filtered for the determination of dissolved metals do not require digestion if the sample:
5) has a low COD(<20mg/L);
6) has a turbidity <1NTU ;
7) is colorless with no significant odor ; ***and***
8) is of one liquid phase and free of suspended particulates or precipitates after acidification.

Sample Analysis Summary

ICP: Sample digestates are aspirated and nebulized into a spray chamber. A stream of argon gas carries the sample aerosol through the innermost of three concentric tubes and injects it into the middle of the donut-shaped plasma. The sample elements are dissociated, atomized, and excited to a higher energy level. As the elements fall to a lower energy level, radiation characteristic of the elements present in the plasma is emitted. The light is directed through an entrance slit, dispersed by the diffraction grating, and projected on to the photomultiplier tube (PMT). The PMTs, located behind the exit slits, convert the light energy to an electrical current. This signal is then digitized and processed by the data system. Background correction is required for trace element determination.

ICP/MS: Sample digestates are aspirated and nebulized into a spray chamber. A stream of argon gas carries the sample aerosol through the innermost of three concentric tubes and injects it into the middle of the donut-shaped plasma. The sample elements are dissociated, atomized, and excited to a higher energy level. The ions that are produced are entrained in the plasma gas and introduced, by means of an interface, into a mass spectrometer. The ions are sorted according to their mass to charge ratios and quantified with a channel mass spectrometer.

Analytical Sequence

Refer to the appropriate analytical SOP for information on the analytical sequence.
ICP: SOP SA-ME-070: *Elements by ICP*
ICP/MS: SOP SA-ME-074: *Elements by ICP/MS*

Attachment 2:
Sample Collection, Preservation, and Holding Time Table

Matrix	Routine Sample Container	Routine Sample Size	Minimum Sample Size	Dechlorination Agent	Chemical Preservation	Thermal Preservation	Holding Time[2]
Water	250mL Plastic	50mL	25mL	Not Applicable	1:1 HNO_3 to pH<2	Not Applicable	Mercury: 28 days from collection Other Metals: 180 days from collection
Water (Lead & Copper Rule Only)	1L Plastic	50mL	25mL	Not Applicable	1:1 HNO_3 to pH<2	Not Applicable	180 days from collection
Water (Silica)	250mL Plastic	50mL	25mL	Not Applicable	Not Applicable	0-6 °C[1]	180 days from collection
Leachate	100mL or 250mL Plastic	50mL	25mL	Not Applicable	1:1 HNO_3 to pH<2	Not Applicable	Mercury: 28 days from leaching Other Metals: 180 days from leaching Note: SM3030C has a 72 hour HT.

[1]Samples are collected on ice and maintained at <6 °C with no frozen samples.
[2] Inclusive of digestion and analysis.

Note: If dissolved metals are requested, the sample must be filtered prior to the acid being added to the sample.

Attachment 3: QC Summary

QC Item	Frequency	Criteria	Corrective Action
Batch Definition	Digested together w/in 24-hr timeframe; not to exceed 20 field samples	Not Applicable	Not Applicable
Method Blank (MB)	One per batch	Refer to analytical SOP	Refer to analytical SOP
Lab Control Sample (LCS)	One per batch	Refer to analytical SOP	Refer to analytical SOP
Laboratory Control Sample Duplicate (LCSD)	One per batch, if insufficient sample provided for MS/MSD	LIMS MLG	Redigest and reanalyze batch
Low-Level Laboratory Control Sample (LLCS) – spiked at the RL	EPA 200.7 and EPA 200.8 DW: One per batch	Qualitatively identified	If the "regular" LCS meets criteria, initiate NCM and report data If the "regular" LCS does not meet criteria, redigest and reanalyze batch
Matrix Spike (MS)	EPA 200.7 and EPA 200.8: 10% of samples prepared; i.e., 2 separate matrix spikes per batch of twenty samples Other Methods: 5% of samples prepared; i.e., 1 matrix spike per batch of twenty samples	LIMS MLG	Flag and report data
Matrix Spike Duplicate (MSD) or Sample Duplicate (SD)	One per batch	LIMS MLG	Flag and report data
Initial Demonstration of Capability	Initially, per analyst, per analyte/method/matrix	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006

QC Item	Frequency	Criteria	Corrective Action
(IDOC)	combination		Note: Unsupervised work must not begin until acceptable IDOC is obtained.
Continuing Demonstration of Capability (CDOC)	Annually, per analyst, per analyte/method combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006
Reporting Limit Verification (RLV)	Upon method/instrument set-up, per analyte/method/matrix combination. Then quarterly thereafter (for DOD ELAP) or annually thereafter (for NELAC)	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007
Method Detection Limit Study (MDL Study)	Upon method/instrument set-up, per analyte/method/matrix combination	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007
MDL Verification (MDLV)	Upon method/instrument set-up, per analyte/method/matrix combination. Then quarterly thereafter (for DOD ELAP) or annually thereafter (for NELAC)	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007

Attachment 4:
Instrument Maintenance and Troubleshooting

Instrument Labeling

Each instrument must be labeled with its name or ID (e.g., MSA, ICP-D, etc.). Additionally, non-operational instruments must be isolated from service or marked as being out of service. Each piece of equipment has an "Operational / Not Operational" sticker that is used for this purpose.

Maintenance Logbook

A maintenance logbook must be available and in use for each piece of equipment. Note: This requirement includes analytical instruments as well as any support equipment/meters used to generate a final result (e.g., pH meters, turbidimeters, and spectrophotometers). The maintenance logbook can be a hardcopy notebook or an electronic notebook.

All maintenance performed must be recorded in the logbook in real time. Items to be captured include:

- Type of maintenance performed (Note: This includes preventative/routine maintenance; non-routine maintenance; maintenance performed by an external vendor; updates to software versions; etc.)
- Name of person performing the maintenance
- Date the maintenance was performed
- Detailed explanation of the reason for any non-routine maintenance (i.e., the source of the problem)
- Resolution of the problem (i.e., the Return to Control)

Note: All maintenance performed by external service providers should be accompanied by work orders, etc., which need to be scanned and filed with the associated instrument records.

Note: Monthly review of maintenance logbooks is required.

Preventive Maintenance

Refer to the instrument manufacturer's guides for trouble-shooting items.

The temperature of the hot plate or digestion block must be monitored with each batch. If the temperature required for sample preparation cannot be maintained, the heating device must be removed from service and repaired or replaced.

Troubleshooting

Troubleshooting should be documented as outlined above. If possible, troubleshooting is best performed in a step-wise manner to systematically isolate instrument components. Refer to the instrument manufacturer's guides for specific information and strategies. Enlist assistance from technical and/or department management as needed.

Contingency Plan

Maintenance contracts are carried for most instrumentation and close contact is maintained with service personnel to ensure optimal instrument functioning. An extensive spare parts inventory is maintained for routine repairs, consisting of thermocouples, digestion tubes, and turbidimeter cells, and other common instrumentation components. Since instrumentation is standardized throughout the laboratory network, spare parts and components can be readily exchanged among the network.

In general, the laboratory has at least one backup unit for each critical unit. In the event of instrument failure, portions of the sample load may be diverted to duplicate instrumentation, the analytical technique switched to an alternate approved technique (such as manual colorimetric determination as opposed to automated colorimetric determination), or samples shipped to another properly certified or approved Eurofins TestAmerica location.

Attachment 5:
Turbidity Form

Turbidity for Metals Drinking Water Samples

Date:

Analyst Initials:

CCV LIMS Standard Number:

CCV True Value: NTU

CCV criteria: ±10% of True Value
CCB criteria: <1NTU
If sample turbidity is <1NTU and silver is not requested, the sample does not require digestion.

Attachment 6:
Glassware Cleaning Procedures

GLASSWARE CLEANING PROCEDURES METALS DEPARTMENT
Graduated Cylinders 1. Scrub with hot, soapy H_2O and brush. 2. Rinse thoroughly with tap H2O. 3. Rinse with 10% HNO_3 4. Rinse thoroughly with DI H_2O.
Volumetric Flasks 1. Empty contents of flask 2. Squirt a small amount of cleaning detergent directly into volumetric flask 3. Fill flask 1/3 full with **HOT** H_2O 4. Replace top and shake flask. 5. Empty flask and rinse with **HOT** H_2O until no soap remains in flask. 6. Add approximately 10mL concentrated HNO_3 to 50mL, 100mL, and 250mL flasks ---- replace top and shake well. For 500mL or 1000mL flasks use 25mL and for 10mL flasks use 2 - 5mL of concentrated HNO_3. 7. Rinse 3 times with DI H_2O, filling flask 1/3 full and replacing top. Store until needed. *** NEVER PLACE VOLUMETRIC FLASKS OR TOPS IN SINK OR DISHPAN WITH OTHER DIRTY DISHES.**
***Dispose of all acid waste in accordance with the Eurofins TestAmerica Savannah Addendum to the Corporate Safety Manual.**

18.0 Revision History

Summary of Changes Revision 22A:
- Review completed and no changes implemented.

Summary of Changes from Revision 22:
- Added reference to SOP SA-GE-206: Turbidity as per SC DHEC certification renewal 07.10.2020.

Summary of Changes from Previous Revision:
- Minor editorial, grammatical, and/or formatting changes made.
- Updated SOP signatories to reflect current responsibilities and titles.
- Replaced all references to TALS to LIMS.
- Updated reference to Turbidity standard to the 1.0NTU standard in sections 7.3.1 and 10.1.2.

SOIL PREPARATION PROCEDURES FOR ICP AND ICP/MS

(Methods: 3050B and DI Leach)

Approvals (Signature/Date):

1.0 Scope and Application

This SOP gives the procedures for the digestion soil samples for the determination of total metals prior to analysis by ICP (SOP SA-ME-070: *Elements by ICP*) or ICP/MS (SOP SA-ME-074: *Elements by ICP/MS)*.

Note: The routine matrix for this procedure is soil; however, this procedure may be adapted to accommodate other matrices as outlined in Section 16.1.

A complete target analyte list, the reporting limits (RL), the method detection limits (MDL), and the accuracy and precision criteria associated with this procedure are provided in the LIMS Method Limit Groups (MLGs).

This SOP was written by and for Eurofins TestAmerica's Savannah laboratory.

2.0 Summary of Method

A known weight (approximately 1g) of the well-mixed sample is transferred to a suitable digestion vessel. The sample is digested with aliquots of nitric acid and hydrogen peroxide to break down the organics present in the sample. After the sample has been digested, as evidenced by a clear, pale yellow digestate, HCl is added to give an approximate acid concentration of 10% HCl and 5% HNO_3. Then the sample digest is diluted to 100mL with reagent water.

A smaller weight of sample may be digested and the sample brought to a final volume that is proportional to the 1g sample to 100mL final volume ratio. For example, if 0.50g is digested, the final volume of the digestate must be 50mL to achieve the same reporting limits.

Note: For silica samples for EPA 6010C or EPA 6010D, solid samples are extracted with reagent water using a DI Leach procedure and then filtered. The filtered solid extracts are analyzed by ICP.

This SOP is based on the following methods: SW-846 Method 3050B. Silica soil preparation guidance is taken from ASTM Method D3987-85.

3.0 Definitions

Refer to the Glossary Section of the *Quality Assurance Manual* (QAM) for a complete listing of applicable definitions and acronyms.

4.0 Interferences

4.1 Procedural Interferences

4.1.1 Interferences may be caused by contaminants in solvents, reagents, glassware, and other sample processing apparatus and can make identification and/or quantification of the target analytes difficult.

4.1.2 All sample collection containers are single-use disposable containers which limits the potential for contamination. All non-disposable labware must be scrupulously cleaned in accordance with the posted Labware Cleaning Instructions to ensure it is free from contaminants and does not contribute artifacts.

4.1.3 High purity reagents and solvents are used to help minimize interference problems. Hydrochloric acid, hydrogen peroxide, and nitric acid must be verified prior to use in accordance with the Eurofins TestAmerica Solvent Lot Testing Program.

4.1.4 Instrument and/or method blanks are routinely used to demonstrate all reagents and apparatus are free from interferences under the conditions of the analysis.

4.2 Matrix Interferences

4.2.1 Matrix interferences may be caused by contaminants that are co-extracted from the sample matrix.

4.2.2 Interfering contamination may occur when a sample containing low concentrations of analytes is analyzed immediately following a sample containing relatively high concentrations of analytes. As such, samples known to be clean should be analyzed first. To prevent carryover into subsequent samples, analysis of reagent blanks may be needed after the analysis of a sample containing high concentrations of analytes.

5.0 Safety

Employees must abide by the policies and procedures in the Eurofins TestAmerica Environmental Health and Safety Manual (EHSM), the Eurofins TestAmerica Savannah Addendum to the EHSM, and this document.

This procedure may involve hazardous materials, operations, and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user to follow appropriate safety, waste disposal, and health practices under the assumption that all samples and reagents are potentially hazardous.

The analyst must protect himself/herself from exposure to the sample matrix. Many of the samples that are tested may contain hazardous chemical compounds or biological organisms. The analyst must, at a minimum, wear protective clothing (lab coat), eye protection (safety glasses or face shield), disposable nitrile or latex gloves, and closed-toe, nonabsorbent shoes when handling samples.

5.1 Specific Safety Concerns or Requirements

Nitric and hydrochloric acids are extremely hazardous as oxidizers, corrosives, poisons, and are reactive. Inhalation of the vapors can cause coughing, choking, irritation of the nose, throat, and respiratory tract, breathing difficulties, and lead to pneumonia and pulmonary edema. Contact with the skin can cause severe burns, redness, and pain. Nitric acid can cause deep ulcers and staining of the skin to a yellow or yellow-brown color. These acid vapors are irritating and can cause damage to the eyes. Contact with the eyes can cause permanent damage. Procedures that utilize the addition of concentrated acids must be performed under a fully functioning fume hood.

Samples that contain high concentrations of carbonates or organic matter, or samples that are at elevated pH can react violently when acids are added. Acids must be added to samples under a hood to avoid splash/splatter hazards and/or possibly toxic vapors that will be given off when the samples are acidified.

Hydrogen peroxide is a strong oxidizer that can cause a fire when it comes into contact with materials. Contact with the skin or eyes can cause irritation and burns.

5.2 Primary Materials Used

The following is a list of the materials used in this procedure, which have a serious or significant hazard rating, and a summary of the primary hazards listed in their MSDS/SDS.

Note: This list does not include all materials used in the procedure. A complete list of materials used in this procedure can be found in the Reagents and Standards Section and the Equipment and Supplies Section of this SOP

Employees must review the information in the MSDS/SDS for each material before using it for the first time or when there are major changes to the MSDS/SDS. Electronic copies of MSDS/SDS can be found using the “SDS” link on the Oasis homepage, and on the EH&S webpage on Oasis.

Material	Hazards	Exposure Limit[1]	Signs and Symptoms of Exposure
Hydrochloric Acid[2]	Corrosive Poison	5ppm Ceiling	Inhalation of vapors can cause coughing, choking, inflammation of the nose, throat, and upper respiratory tract, and in severe cases, pulmonary edema, circulatory failure, and death. Can cause redness, pain, and severe skin burns. Vapors are irritating and may cause damage to the eyes. Contact may cause severe burns or permanent eye damage.
Nitric Acid[2]	Corrosive Oxidizer Poison	2ppm TWA 4ppm STEL	Nitric acid is extremely hazardous; it is corrosive, reactive, an oxidizer, and a poison. Inhalation of vapors can cause breathing difficulties and lead to pneumonia and pulmonary edema, which may be fatal. Other symptoms may include coughing, choking, and irritation of the nose, throat, and respiratory tract. Can cause redness, pain, and severe skin burns. Concentrated solutions cause deep ulcers and stain skin a yellow or yellow-brown color. Vapors are irritating and may cause damage to the eyes. Contact may cause severe burns and permanent eye damage.
Hydrogen Peroxide	Corrosive Oxidizer	1ppm TWA	Danger! Strong oxidizer. Contact with other material may cause a fire. Corrosive. Light sensitive. May be harmful if swallowed. May cause central nervous system effects. Eye contact may result in permanent eye damage. May cause severe respiratory tract irritation with possible burns. Causes eye and skin irritation and possible burns. May cause severe digestive tract irritation with possible burns.
[1]Exposure limit refers to the OSHA regulatory exposure limit.			
[2]Always add acid to water to prevent violent reactions.			

6.0 Equipment and Supplies

6.1 Equipment and Instrumentation

Top-loading Balance – Verify in accordance with SOP SA-AN-100: *Laboratory Support Equipment (Verification and Use)*

Thermometers – Verify in accordance with SOP SA-AN-100: *Laboratory Support Equipment (Verification and Use)*

Digestion Block – capable of maintaining a sample temperature of 95±5°C – The temperature of the digestion block must be monitored and recorded for each batch. The temperature is measured using an external thermometer placed in a digestion vessel containing reagent water.

Agitation/Leaching Equipment – capable of holding the sample containers and rotating around a central axis at 23-35rpm.

6.2 Lab Supplies

0.45um Syringe Filters

6.3 Volumetric Labware

Volumetric Containers – various sizes; Class A, where applicable. Verify in accordance with SOP SA-AN-100: *Laboratory Support Equipment (Verification and Use)*. Refer to Attachment 5 for Labware Cleaning Procedures.

Volumetric Labware	Volume	Type (Quantitative / Qualitative)	Use	Verification Frequency	Laboratory Verification Criteria
Eppendorf-Style Pipettes	Various	QUANTITATIVE	Standard Preparation and Spiking	Initially, prior to first use, then quarterly thereafter (Daily for DOD)	Accuracy = 2% Precision = 1%
Digestion Tubes	50-100mL	QUANTITAIVE	Final Sample Volumes	None (if purchased w/ COA attesting Class A criteria)	None (if purchased w/ COA attesting Class A criteria)
Pump-Style Pipettes	Various	Qualitative	To deliver acids	Initially, upon 1st use	Accuracy = 10% Precision = 10%

6.4 Sample Collection Containers

All sample collection containers are single-use disposable containers which limits the potential for contamination.

The routine sample collection containers supplied by the laboratory are:

8oz plastic soil jar – purchased with Certificate of Analysis attesting to purity.

7.0 Reagents and Standards

7.1 Expiration Dates

Expiration dates (time from initial use or receipt to final use) for standard and reagent materials must be set according to the guidance in this SOP. Note: These are maximum expiration dates and are not to be considered an absolute guarantee of standard or reagent quality. Sound judgment must be used when deciding whether to use a standard or reagent. If there is doubt about the quality of a standard or reagent material, a new material must be obtained or the standard or reagent material verified. Data quality must not be compromised to extend a standard's life.

The expiration date of any standard or reagent must not exceed the expiration date of the standard or reagent that was used to prepare it.

7.2 Reagents

Reagents must be prepared and documented in accordance with SOP SA-AN-041: *Reagent and Standard Materials Procedures.*

Hydrochloric acid, hydrogen peroxide, and nitric acid must be verified prior to use in accordance with the Eurofins TestAmerica Solvent Lot Testing Program.

7.2.1 Blank Matrix – Teflon chips or equivalent. Used for the preparation of soil QC samples.
LIMS Name: P_TEFLONCH_xxxxx
Storage: Room Temperature
Expiration: Unopened: Manufacturer's expiration date; Opened: 5 years from date opened

7.2.2 Laboratory Reagent Water – ASTM Type I; the conductivity must be checked daily in accordance with SOP SA-AN-100: *Laboratory Support Equipment (Verification and Use)*.

7.2.3 Nitric acid (HNO_3) – reagent grade.(Macron Chemicals)
LIMS Name: ME_HNO3_XXXX
Storage: room temperature in the acid cabinet. Store in a cool, dry, ventilated storage area with acid resistant floors and good drainage. Store away from sunlight, heat, water, and incompatible materials. Stable under ordinary conditions of use and storage.
Expiration:
Unopened: Manufacturer's expiration date or 5 years, whichever is sooner
Opened: Manufacturer's expiration date or 5 years, whichever is sooner

7.2.5 Hydrochloric acid (HCl) – reagent grade. (JT Baker)
LIMS Name: ME_HCL_XXXX
Storage: room temperature in the acid cabinet. Store in a cool, dry, ventilated storage area with acid resistant floors and good drainage. Store away from sunlight, heat, water, and incompatible materials. Stable under ordinary conditions of use and storage.
Expiration:
Unopened: Manufacturer's expiration date or 5 years, whichever is sooner
Opened: Manufacturer's expiration date or 5 years, whichever is sooner

7.2.7 Hydrogen peroxide (H_2O_2), 30% – reagent grade.
LIMS Name: ME_PEROX_XXXX
Storage: refrigerated between 0°C and 6°C. Separate from incompatibles.
Expiration:
Unopened: Manufacturer's expiration date
Opened: Manufacturer's expiration date

7.3 Standards

Standards must be prepared and documented in accordance with SOP SA-AN-041: *Reagent and Standard Materials Procedures.* Certificates of analysis or purity must be received with all purchased standards, and scanned and attached in LIMS.

7.3.1 Stock Standards – purchased from CPI, Inorganic Ventures, or equivalent vendor, at the concentrations listed below.

Aluminum – 10000mg/L; LIMS Reagent Name: Alspx10000
Antimony – 1000mg/L; LIMS Reagent Name: Sbcpi1000
Arsenic – 1000mg/L; LIMS Reagent Name: Ascpi1000
Barium – 1000mg/L; LIMS Reagent Name: Bacpi1000
Beryllium – 1000mg/L; LIMS Reagent Name: Becpi1000
Boron – 1000mg/L; LIMS Reagent Name: Bcpi1000
Cadmium – 1000mg/L; LIMS Reagent Name: Cdcpi1000
Calcium – 10000mg/L; LIMS Reagent Name: Caspx10000
Chromium – 1000mg/L; LIMS Reagent Name: Crcpi1000
Cobalt – 1000mg/L; LIMS Reagent Name: Cocpi1000
Copper – 1000mg/L; LIMS Reagent Name: Cucpi1000
Iron – 10000mg/L; LIMS Reagent Name: Fecpi10000
Lead – 1000mg/L; LIMS Reagent Name: Pbcpi1000
Magnesium – 10000mg/L; LIMS Reagent Name: Mgspx10000
Manganese – 1000mg/L; LIMS Reagent Name: Pbcpi1000
Mercury – 1000mg/L; LIMS Reagent Name: Hgspex1000
Molybdenum – 1000mg/L; LIMS Reagent Name: Mocpi1000
Nickel – 1000mg/L; LIMS Reagent Name: Nicpi1000
Potassium – 10000mg/L; LIMS Reagent Name: Kcpi10000
Selenium – 1000mg/L; LIMS Reagent Name: Secpi1000
Silver – 1000mg/L; LIMS Reagent Name: Agcpi1000
Sodium – 10000mg/L; LIMS Reagent Name: Nacpi10000

Strontium – 1000mg/L; LIMS Reagent Name: SrABS1000
Thallium – 1000mg/L; LIMS Reagent Name: Tlcpi1000
Tin – 1000mg/L; LIMS Reagent Name: Sncpi1000
Titanium – 1000mg/L; LIMS Reagent Name: Ticpi1000
Vanadium – 1000mg/L; LIMS Reagent Name: Vcpi1000
Zinc – 1000mg/L; LIMS Reagent Name: Zncpi1000

Storage: room temperature. Store away from sunlight, heat, water, and incompatible materials.
Expiration: opened and unopened containers are given the manufacturer's expiration date

7.3.2 Silica/Silicon Standards

Silicon (Si) stock solutions are usually purchased for this procedure. The following conversion is used to adjust any volumes or concentrations appropriately:

$$Si = \frac{SiO_2}{2.14}$$

7.3.2.1 Stock SiO_2 Standard, 10000mg/L Si / 21400mg/L SiO_2 – purchased from CPI.
LIMS Name: Sicpi10000_xxxxx
Storage: Store at room temperature in a cool, dry, ventilated storage area with acid resistant floors and good drainage. Store away from sunlight, heat, water, and incompatible materials.
Expiration: This standard must be used by the manufacturer's expiration date.

Silicon (Si) stock solutions are usually purchased for this procedure. The following conversion is used to adjust any volumes or concentrations appropriately:

$$Si = \frac{SiO_2}{2.14}$$

7.3.2.2 Intermediate SiO_2 Standard, 467mg/L Si / 1000mg/L SiO_2 – Add 20mL to 30mL of reagent water to a clean, plastic 100mL volumetric flask. Add the volume of the Stock SiO_2 Standard given in the table below to the volumetric flask. Dilute to volume with reagent water. Store the standard at room temperature. This standard must be used by its parent standard's expiration date or within 6 months of preparation, whichever comes first.

Element	Parent Concentration (mg/L)	Volume Added (mL)	Final Volume (mL)	Final Concentration (mg/L)
Silica (SiO_2) [Silicon (Si)]	21400 [10000]	4.67	100	1000 [467]

LIMS Name: P_SiO2_INT_xxxxx
Storage: Store in a cool, dry, ventilated storage area with acid resistant floors and good drainage. Store away from sunlight, heat, water, and incompatible materials.
Expiration: Prepare this solution every 180 days or sooner as needed or required. The expiration date must not exceed the expiration date of any of the components.

7.3.5 Spiking Solution 1 – Add approximately 50mL reagent water to a clean 100-mL volumetric flask. Add 2mL of concentrated nitric acid and 0.5mL of concentrated hydrochloric acid to the volumetric flask. The standard will have an acid concentration of 2% HNO_3 and 0.5% HCl when diluted to volume.

Add the volumes of the stock standards given in the following table to the volumetric flask:

Element	Parent Concentration (mg/L)	Volume Added (mL)	Final Volume (mL)	Final Concentration (mg/L)
Aluminum (Al)	10000	5	100	500
Antimony (Sb)	1000	5		5
Arsenic (As)	1000	1		10
Barium (Ba)	1000	1		10
Beryllium (Be)	1000	0.5		5
Boron (B)	1000	2		20
Cadmium (Cd)	1000	0.5		5
Calcium (Ca)	10000	5		500
Chromium (Cr)	1000	1		10
Cobalt (Co)	1000	0.5		5
Copper (Cu)	1000	1		10
Iron (Fe)	10000	5		500
Lead (Pb)	1000	5.0		50
Magnesium (Mg)	10000	5		500
Manganese (Mn)	1000	5		50
Molybdenum (Mo)	1000	1		10
Nickel (Ni)	1000	1		10
Potassium (K)	10000	5		500
Selenium (Se)	1000	1		10
Sodium (Na)	10000	5		500
Strontium (Sr)	1000	1		10
Thallium (Tl)	1000	0.4		4.0
Tin (Sn)	1000	2		20
Titanium (Ti)	1000	1		10
Vanadium (V)	1000	1		10
Zinc (Zn)	1000	1		10

Dilute to volume with reagent water.

LIMS Name: MS_LCS1_wk_xxxxx
Storage: room temperature Expiration: 6 months of preparation or sooner based on the manufacturer's expiration date.

7.3.6 Spiking Solution 2 – Add approximately 50mL reagent water to a clean 100mL volumetric flask. Add 10mL of concentrated hydrochloric acid to the volumetric flask. The standard will have an acid concentration of 10% HCl when diluted to volume.

Add the volumes of the stock standards given in the following table to the volumetric flask:

Element	Parent Concentration (mg/L)	Volume Added (mL)	Final Volume (mL)	Final Concentration (mg/L)
Mercury (Hg)	1000	0.05	100	0.5

Dilute to volume with reagent water.

LIMS Name: MS_lcs2_wk_xxxxx
Storage: room temperature
Expiration: 28 days of preparation or sooner based on the manufacturer's expiration date.

7.3.7 Spiking Solution 3 – Add approximately 50mL reagent water to a clean 100mL volumetric flask. Add 10mL of concentrated hydrochloric acid to the volumetric flask. The standard will have an acid concentration of 10% HCl when diluted to volume.

Add the volumes of the stock standards given in the following table to the volumetric flask:

Element	Parent Concentration (mg/L)	Volume Added (mL)	Final Volume (mL)	Final Concentration (mg/L)
Silver (Ag)	1000	0.5	100	5

Dilute to volume with reagent water.

LIMS Name: MS_Ag_LCS_SPKxxxxx
Storage: room temperature
Expiration: 6 months of preparation or sooner based on the manufacturer's expiration date.

8.0 Sample Collection, Preservation, Shipment, and Storage

8.1 Soil Samples

Soil samples are routinely collected in 8oz plastic soil containers.

Samples must be iced at the time of collection and maintained at 0-6°C (less than 6°C but not frozen) until the time of digestion/leaching. Samples for mercury must be digested/leached and analyzed within 28 days of collection. All other samples must be digested and analyzed within 6 months of collection. Digestates may be stored at room temperature until the time of analysis.

9.0 Quality Control

SOP SA-QA-017: *Evaluation of Batch QC Data* and the SOP Summary in Attachment 3 provide requirements for evaluating QC data.

9.1 Batch QC

A digestion batch consists of up to 20 environmental samples and the associated QC items. The default QC items performed for each digestion batch are: a method blank, a laboratory control sample (LCS), a matrix spike (MS), and a matrix spike duplicate (MSD) or sample duplicate (SD).

The routine container supplied for this method 8oz (soil) container. 1g is required for digestion. It is unlikely that insufficient sample would be provided to meet the batch QC frequency. If insufficient sample is provided, reduced sample initial weights may be used to achieve the required batch matrix spike frequency; however, the minimum extraction weight to be used for the matrix spike samples is 0.5g.

Note: Final volumes and spike amounts must be adjusted to compensate for these reduced initial volumes.

Note: Unless the client has specified which sample to use as the matrix spike, the matrix spike must be selected at random from the samples in the batch. Field QC (e.g., equipment blanks, trip blanks, and field blanks) must not be used for MS/MSD unless specifically requested to do so by the client or unless there is insufficient sample available for performing MS/MSD using an actual field sample.

If there is insufficient sample to perform the required matrix spike(s) and/or sample duplicates, the LCS must be prepared in duplicate (i.e., LCS/LCSD). An NCM must be initiated on all affected samples to denote this situation. Insufficient sample is defined as receiving less than a total of 2g.

Batch QC must meet the criteria given in Attachment 3 of this SOP.

9.2 Instrument QC

The instrument QC requirements for the analytical procedures associated with this digestion procedure are given in SOP SA-ME-070: *Elements by ICP* or SOP SA-ME-074: *Elements by ICP/MS.*

9.3 Corrective Action for Out-of-Control Data

When the quality control parameters do not meet the criteria set forth in this SOP, corrective action must be taken in accordance with SOP SA-QA-005: *Preventive and Corrective Action Procedures* the QC Summary Table in Attachment 3. SOP SA-QA-005 provides contingencies for out-of-control data and gives guidance for exceptionally permitting departures from approved policies and procedures. Nonconformance Memos must be initiated to document all instances where QC criteria are not met and all departures from approved policies and procedures.

10.0 Procedure

10.1 Sample Preparation

10.1.1 EPA 3050B Sample Preparation

10.1.1.1 Remove the samples from the refrigerator and allow them to come to room temperature.

10.1.1.2 Soil samples must be homogenized prior to preparation in accordance with SOP SA-QA-015: *Homogenization, Compositing, and Segregation of Samples*.

10.1.1.3 Weigh 1.0-1.2g (wet weight) of each homogeneous sample into a 100mL digestion vessel. The lab may weigh a larger aliquot equal to 1.0g of sample on a dry weight basis, if required.

Note: A smaller weight of sample may be digested and the sample brought to a final volume that is proportional to the 1g sample to 100mL final volume ratio. For example, if 0.50g is digested, the final volume of the digestate must be 50mL to achieve the same reporting limits; if 0.1g is digested, the final volume of the digestate must be 10mL. If the sample weight to final volume ratio is less than 1:100, the reporting limits will be higher than those listed in the LIMS MLGs. Adjust the volumes of spikes and reagents proportionately to compensate for the sample weight/final volume. For example, if 0.5g is digested, use ½ of the spike and reagent volumes listed above.

10.1.1.4 Add 5mL of reagent water, 5mL of concentrated HNO_3, and 2.5 mL of HCL to each digestion vessel and swirl the vessel to mix the contents. Perform this step under a fume hood.

10.1.1.3.1 Place the digestion vessels on the digestion block. The water in the digestion block must be 95°C +/- 5°C. Carefully heat the vessel until a gentle reflux is achieved. The sample is not heated to boiling; that is, bubbles are not formed in the liquid in the bottom of the digestion vessel. The sample/acid solution is refluxing when the liquid evaporates and drops of liquid condense on the sides of the digestion vessel and fall back into the digestion vessel. Do not allow the samples to boil. Reflux for 10-15 minutes.

NOTE: To verify temperature of the hotblock a digestion tube filled with DI water must be placed at random locations across each block used for digestion. This position must be changed daily. A single thermometer is transferred from block to block and a minimum of 10 minutes allowed for the thermometer to equilibrate before taking the reading. This temperature reading, uncorrected and corrected, is then recorded in the batch information.

10.1.1.6 Remove the digestion vessels from the digestion block, and allow them to cool to room temperature. Add 5mL of concentrated HNO_3 to each sample. Return the digestion vessels to the digestion block. Carefully heat the digestion vessels until a gentle reflux is achieved. Reflux the samples for at least 30 minutes. Do not allow the samples to boil.

If brown fumes are given off during reflux, remove the vessels from the digestion block, allow to cool, add a second 5mL portion of HNO_3, and reflux for at least 30 more minutes. Repeat this step until no brown fumes are given off.

10.1.1.7 Evaporate the sample digestate to approximately 5mL. Do not allow the bottom of the digestion vessels to go dry during the evaporation. Remove the samples from the digestion block, and allow the samples to cool to room temperature before continuing onto the next step.

Note: If the sample is still warm when the 30% hydrogen peroxide (H_2O_2) is added in the next step, the sample may "boil over" and the entire process must be started over.

10.1.1.8 Add 2mL of reagent water to each digestion vessel. Slowly and carefully add 3mL of 30% H_2O_2 to each digestion vessel. It is very important to add the hydrogen peroxide slowly to prevent loss of sample due to vigorous effervescence. Return the digestion vessels to the digestion block, and heat until the effervescence subsides. Cool the digestion vessels after the effervescence subsides.

10.1.1.9 Continue to add 30% H_2O_2 in 1-3mL aliquots to the sample digestate until the effervescence is minimal or until the general appearance of the digestate is unchanged. Warm the sample digestate after each addition of H_2O_2 on the digestion block.

Note: Do not add more than 10mL of hydrogen peroxide to each sample.

10.1.1.10 After the last addition of peroxide, return the samples to the digestion block and reduce the volume of the digestate to approximately 5mL without boiling and without allowing the bottom of the digestion vessel to go dry. Remove samples, allow to cool, and add 10mL of concentrated HCl to each sample digestate. Return the digestion vessels to the digestion block, and reflux the sample digestates for 10-15 minutes.

10.1.1.11 Remove samples from the digestion block, allow to cool, and wash down the inside of the digestion vessels with reagent water. Dilute the sample digestate to 100mL with reagent water.

10.1.1.4 Silica (DI Leach) Sample Preparation

Solid and waste samples for silica are extracted by performing a DI leaching procedure. Note: Any QC samples which need the DI leach procedure (i.e. LCS, MS/MSD, IDOCs/CDOCs, MDL studies, etc.) need to be appropriately spiked prior to the leaching procedure.

10.1.1.5 Remove the samples from the refrigerator and allow them to come to room temperature.

10.1.1.6 Soil samples must be homogenized prior to preparation in accordance with SOP SA-QA-015: *Homogenization, Compositing, and Segregation of Samples*.

10.1.1.7 To a 125mL plastic container weigh a 4.5-5.5g portion of homogenized sample. Note: Different initial weights may be used as long as the extraction fluid to sample ratio remain the same.

10.1.1.8 Add 100mL of reagent water to each sample container (or a volume equal to 20 times the weight of the samples used).

10.1.1.9 Agitate (leach) continuously for 18 ± 2 hours at 23-35rpm.

10.1.1.10 After the extraction period, allow the sample to settle and filter a portion for analysis through a 0.45um filter. The sample may be allowed to settle, centrifuged, decanted, or filtered through coarse filter paper before the final filtration to remove the solid phase. The method blank and laboratory control sample must be treated the same as the samples (i.e., same volumes and same number of filter pads) so that an adequate background, contamination, and recovery checks can be made.

10.2 QC Sample Preparation

10.2.1.1 EPA Method 3050B QC Sample Preparation

10.2.1.2 Method Blank – Weigh a 1.0-1.2g aliquot of blank matrix into a labeled digestion vessel and prepare as listed in Section 10.1.1.

10.2.1.3 Laboratory Control Sample – Weigh a 1.0-1.2g aliquot of blank matrix into a labeled digestion vessel, add 1.0mL of each spiking solution (Spike I, Spike 2 and Spike 3) and prepare as listed in Section 10.1.1.

10.2.1.4 Matrix Spike / Matrix Spike Duplicate – Weigh out 2 separate 1.0 -1.2-g aliquots of the sample chosen for the matrix spike into a labeled digestion vessel. Add 1.0mL of each spiking solution (Spike I, Spike 2, and Spike 3) and prepare as listed in Section 10.1.1.

10.2.2 Silica (DI Leach) QC Sample Preparation

10.2.2.1 Method Blank – Weigh a 4.5-5.5g aliquot of blank matrix into a labeled 125mL plastic container and continue as outlined in Section 10.1.2.4 through Section 10.1.2.6.

10.2.2.2 Laboratory Control Sample – Weigh a 4.5-5.5g aliquot of blank matrix into a labeled 125mL plastic container, add 1.0mL of the SiO_2 Intermediate Standard and continue as outlined in Section 10.1.2.4 through Section 10.1.2.6.

10.2.2.3 Matrix Spike / Matrix Spike Duplicate – Weigh out 2 separate 4.5-5.5g aliquots of the sample chosen for the matrix spike into a labeled 125mL plastic container. Add 1.0mL of the SiO_2 Intermediate Standard and continue as outlined in Section 10.1.2.4 through Section 10.1.2.6.

10.3 Analysis

The analytical procedures associated with this digestion procedure are given in SOP SA-ME-070: *Elements by ICP* or SOP SA-ME-074: *Elements by ICP/MS.*

11.0 Calculations / Data Reduction

11.1 Data Reduction

Data must be evaluated in accordance with SOP SA-QA-002: *Data Generation and Review*.

The data reduction procedures associated with this digestion procedure are given in SOP SA-ME-070: *Elements by ICP* or SOP SA-ME-074: *Elements by ICP/MS.*

11.1.1 Historical Data

Many of the laboratory's clients submit samples for repeat monitoring purposes. Prior to analysis, verify LIMS Worksheet Notes and/or use the Historical Data Tracker feature to determine if historical data is available for review.

11.1.2 Chemical Relationships

When available, the following chemical relationships must be evaluated for each sample. If these relationships are not met the Department Manager must be contacted immediately.

- Total Results are ≥ Dissolved results (e.g. metals)

11.2 Calculations

The calculations for the determination of metals by ICP and ICP/MS are given in the associated analytical SOPs (SOP SA-ME-070 or SOP SA-ME-074).

12.0 Method Performance

12.1 Reporting Limit Verification (RLV)

At a minimum, RLVs must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

For analytes and methods certified by DOD ELAP, RLVs must also be performed quarterly thereafter. For analytes and methods certified by NELAC, RLVs must also be performed annually thereafter. Exceptions may be made for project-specific non-routine analytes.

12.2 Method Detection Limit (MDL) Study

The MDL is the lowest concentration that can be detected for a given analytical method and sample matrix with 99% confidence that the analyte is present. MDLs reflect a calculated (statistical) value determined under ideal laboratory conditions in a clean matrix and may not be achievable in all environmental matrices. The current MDLs associated with this procedure are given in the Method Limit Group (MLG) in LIMS.

At a minimum, MDL Studies must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

12.3 Method Detection Limit Verification (MDLV)

At a minimum, MDLVs must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

For analytes and methods certified by DOD ELAP, MDLVs must also be performed quarterly thereafter. For analytes and methods certified by NELAC, MDLVs must also be performed annually thereafter.

Note: MDLVs are not required for non-routine analytes provided results are not reported below the RL (i.e., MDL equals RL in LIMS).

12.4 QC Limit Generation, Control Charting, and Trend Analysis

The control limits for the batch QC items (LCS and MS/MSD) for this procedure are specified in the reference method and cannot be broadened; therefore, the laboratory defaults to the method-defined limits and does not utilize in-house or laboratory-derived limits for the evaluation of batch QC items.

Although the laboratory must default to the method-defined QC limits, control charting is a useful tool and is performed to assess analyte recoveries over time to evaluate trends. Control charting must be performed periodically (at a minimum annually) in accordance with SOP SA-QA-017: *Evaluation of Batch QC Data.*

12.5 Demonstrations of Capability

Initial and continuing demonstration of capability must be performed in accordance with SOP SA-QA-006*: Training Procedures.*

Prior to performing this procedure unsupervised, each new analyst who performs this analysis must demonstrate proficiency per method/analyte combination by successful completion of an initial demonstration of capability. The IDOC is performed by the analysis of 4 consecutive laboratory QC check samples that meet the method criteria for accuracy and precision. The IDOC must be documented and routed to the QA Department for filing.

Annual continuing demonstrations of capability (CDOCs) are also required per analyst per method/analyte combination. The CDOC requirement may be met by the consecutive analysis of four LCS all in the same batch, by the analysis of four LCS analyzed in four consecutive batches (in different batches on different days), via acceptable results on a PT study, or analysis of client samples with statistically indistinguishable results when compared to another certified analyst. The CDOC must be documented and routed to the QA Department for filing.

12.6 Training Requirements

All training must be performed and documented in accordance with SOP SA-QA-006: *Training Procedures*.

Note: The SOPs listed in the Reference/Cross-Reference Section are applicable to this procedure. All employees performing this procedure must also be trained on these SOPs, and/or have a general understanding of these procedures, as applicable.

13.0 Pollution Control

It is Eurofins TestAmerica's policy to evaluate each method and look for opportunities to minimize waste generated (e.g., examining recycling options, ordering chemicals based on quantity needed, preparing reagents based on anticipated usage and reagent stability, etc.). Employees must abide by the policies in Section 13 of the Environmental Health and Safety Manual.

This procedure has been evaluated for opportunities to minimize the waste generated. Where reasonably feasible, pollution control procedures have been incorporated.

14.0 Waste Management

Waste management practices must be conducted consistent with all applicable federal, state, and local rules and regulations. All waste (i.e., excess reagents, samples, and method process wastes) must be disposed of in accordance with Section 9 of the Eurofins TestAmerica Savannah Addendum to the EHSM. Waste description rules and land disposal restrictions must be followed.

14.1 Waste Streams Produced by the Method

The following waste streams are produced when this method is carried out:

- Excess soil and solid samples – Transfer RCRA hazardous and non-hazardous samples to waste department for disposal via yardbox. The samples must be transferred in LIMs to the designated yardbox. PCB or Foreign Soil samples must be disposed per waste stream with waste coordinator.

- Samples within the prep lab must be placed in boxes to prevent possible breakage, and may be stacked and kept for a short time.

- Acidic sample digestions – Neutralize before disposal into drain/sewer system.

- Excess oil samples – Transfer to waste department for storage/disposal.

Neutralize the standard by passing with sodium bicarbonate before transferring the waste to the RCRA aqueous hazardous waste drum.

All other metals standards may be disposed, using copious amounts of water, down a sink that flows to the neutralization pit.

16.0 Method Modifications/Clarifications

16.1 Incorporation of Other Matrices

16.1.1 This procedure may be modified to analyze other matrices (e.g., wipe, waste, tissue, and filter samples) based on the needs of the client. This will need to be arranged by the Project Manager at the initiation of the project.

16.1.2 Wipe, waste, filter, and tissue matrices are non-routine, and the laboratory is not currently NELAC certified for these matrices. The laboratory uses its routine soil RLs (converted for initial and final volumes, etc.) and soil QC limits to evaluate wipe, waste, filter, and tissue samples. Soil DOCs can be used to satisfy analyst demonstrations of capability for these types of non-routine matrices. Teflon chips, Ottawa sand, or equivalent is used as the blank matrix for these non-routine matrices unless specifically requested otherwise by the project.

16.1.3 Waste samples may be collected in 8oz plastic soil jars. However, it should be noted that an alternate container may be required as some organic wastes (oils) may not be conducive to plastic. Tissue samples may be collected in 8oz plastic soil jars or plastic bags. Wipes and filters may be collected in a variety of different containers.

16.1.4 Wipe, waste, and filter samples must be iced at the time of collection and maintained at 0-6°C (less than 6°C but not frozen) until the time of digestion/leaching. Samples for mercury must be digested/leached and analyzed within 28 days of collection. All other samples must be digested and analyzed within 6 months of collection. Digestates may be stored at room temperature until the time of analysis.

16.1.5 Tissue samples must be iced at the time of collection and maintained at -10°C to -20°C for up to 6 months. Samples for mercury must be digested/leached and analyzed within 28 days of thawing. All other samples must be digested and analyzed within 6 months of thawing. Digestates may be stored at room temperature until the time of analysis.

16.1.6 Wipe, waste, filter, and tissue matrices are prepared in the same manner as soil samples with the following exceptions:

- The initial amount for wipe or filter samples is 1 wipe or 1 filter.
- The initial amount for tissue and waste samples is 1.0-1.2g.

16.2 Other Considerations

16.2.1 As allowed by EPA 3050B, an alternative determinative technique has been employed for samples analyzed by ICP/MS. The preparation procedures in the method are identical for ICP and ICP/MS samples up to the addition of concentrated HCl. SW-846 Method 3050B only requires this step for samples to be analyzed by ICP. The laboratory has adopted this procedure for both ICP and ICP/MS samples. All field samples and quality control samples (including MDLs, DOCs, and PT samples) have been prepared using this alternative technique.

16.2.2 The analyte list in Section 1.0 of EPA 3050B has been expanded to include all analytes currently performed by the laboratory.

16.2.3 EPA 3050B requires only a method blank, matrix spike, and matrix spike duplicate with each preparation batch; however, the analytical methods also require the analysis of a laboratory control sample taken through the entire preparation process. For this reason the laboratory includes the LCS as part of the required batch QC for SW-846 Method 3050B. The analytical methods also allow a sample duplicate to be performed in lieu of a matrix spike duplicate. The laboratory's procedures allow for this option; however, the MSD is performed as the default.

16.2.4 EPA 3050B requires a method blank be analyzed prior to use of nitric acid, hydrochloric acid, and hydrogen peroxide with results less than the MDL for all analytes of interest. The laboratory does not perform this analysis in advance. The vendor certificate of analysis is reviewed and approved prior to use. Method blanks are also analyzed with each batch as a check on the cleanliness of the reagents.

16.2.5 EPA 3050B includes a final filtration step prior to establishing the final volume. The laboratory does not routinely encounter interferences that could be eliminated by this step. Additionally, this filtration step introduces another source of contamination. Therefore, this step has not been included in this procedure.

16.2.6 EPA 3050B includes information on performing an alternate digest to obtain better recoveries for antimony. The laboratory has adjusted its default procedure to incorporate additional HNO_3 at the beginning of the digestion process to accommodate this analyte.

16.2.7 EPA 3050B requires digestates to be covered with a ribbed watch glass and heated until the volume has been reduced to approximately 5 mL or heated at 95 °C ± 5°C without boiling for two hours. The laboratory does not follow this practice.

16.2.8 Although not a SW-846 requirement, the laboratory requires that soil samples be submitted on ice to satisfy other state, regulatory and/or client requirements.

17.0 Attachments

The following Tables, Diagrams, and/or Validation Data are included as Attachments:

Attachment 1: SOP Summary
Attachment 2: Sample Collection, Preservation, and Holding Time Table
Attachment 3: QC Summary
Attachment 4: Instrument Maintenance and Troubleshooting
Attachment 5: Labware Cleaning Procedures

Attachment 1:
SOP Summary

Sample Preparation Summary
A known weight (approximately 1g) of the well-mixed sample is transferred to a suitable digestion vessel. The sample is digested with aliquots of nitric acid and hydrogen peroxide to break down the organics present in the sample. After the sample has been digested, as evidenced by a clear, pale yellow digestate, HCl is added to give an approximate acid concentration of 10% HCl and 5% HNO_3. Then the sample digest is diluted to 100mL with reagent water.

A smaller weight of sample may be digested and the sample brought to a final volume that is proportional to the 1g sample to 100mL final volume ratio. For example, if 0.50g is digested, the final volume of the digestate must be 50mL to achieve the same reporting limits.

Silica samples for EPA Method 6010C: Solid samples are extracted with reagent water using a DI Leach procedure and then filtered. The filtered solid extracts are analyzed by ICP.

Sample Analysis Summary
Prior to analysis by ICP, the sample must be digested using the sample preparation method appropriate to the matrix. Sample digestates are aspirated and nebulized into a spray chamber. A stream of argon gas carries the sample aerosol through the innermost of three concentric tubes and injects it into the middle of the donut-shaped plasma. The sample elements are dissociated, atomized, and excited to a higher energy level. As the elements fall to a lower energy level, radiation characteristic of the elements present in the plasma is emitted. The light is directed through an entrance slit, dispersed by the diffraction grating, and projected on to the photomultiplier tube (PMT) or charge coupled device (CCD) detector. The PMTs and CCD detectors convert the light energy to an electrical current. This signal is then digitized and processed by the data system. Background correction is required for trace element determination.

Prior to analysis by ICP-MS, the sample must be solubilized or digested using the sample preparation method appropriate to the matrix. Sample digestates are aspirated and nebulized into a spray chamber. A stream of argon gas carries the sample aerosol through the innermost of three concentric tubes and injects it into the middle of the donut-shaped plasma. The sample elements are dissociated, atomized, and excited to a higher energy level. The ions that are produced are entrained in the plasma gas and introduced, by means of an interface, into a mass spectrometer. The ions are sorted according to their mass to charge ratios and quantified with a channel mass spectrometer.

Attachment 2:
Sample Collection, Preservation, and Holding Time Table

Matrix	Routine Container	Routine Sample Size	Minimum Sample Size	Chemical Preservation	Thermal Preservation	Dechlorination Agent	Holding Time [1]
Soil	4oz or 8oz soil jar	1g 5g (Silica)	0.5g 2.5g (Silica)	None	<0-6°C	None	6 months (except for Hg which is 28 days)

[1] Inclusive of digestion and analysis.

Attachment 4:
Instrument Maintenance and Troubleshooting

Instrument Labeling

Each instrument must be labeled with its name or ID (e.g., MSA, ICP-D, etc.). Additionally, non-operational instruments must be isolated from service or marked as being out of service. Each piece of equipment has an "Operational / Not Operational" sticker that is used for this purpose.

Maintenance Log

A maintenance log must be established for each piece of equipment used in the laboratory. All maintenance that is performed on the instrument must be recorded in the log including:

- Type of maintenance performed (Note: This includes preventative/routine maintenance; non-routine maintenance; maintenance performed by an external vendor; updates to software versions; etc.)
- analyst or technician performing the maintenance
- date the maintenance was performed
- detailed explanation of the reason for the maintenance
- resolution of the problem and return to control
- all service calls from instrument representatives

Preventive Maintenance

Refer to the instrument manufacturer's guides for trouble-shooting items.

The temperature of the hot plate or digestion block must be monitored with each batch. If the temperature required for sample preparation cannot be maintained, the heating device must be removed from service and repaired or replaced.

Troubleshooting

Troubleshooting should be documented as outlined above. If possible, troubleshooting is best performed in a step-wise manner to systematically isolate instrument components. Refer to the instrument manufacturer's guides for specific information and strategies. Enlist assistance from technical and/or department management as needed.

Contingency Plan

In general, the laboratory has at least one backup unit for each critical unit. In the event of instrument failure, portions of the sample load may be diverted to duplicate instrumentation, the analytical technique switched to an alternate approved technique (such as manual colorimetric determination as opposed to automated colorimetric determination), or samples shipped to another properly certified or approved Eurofins TestAmerica location.

Attachment 5: Labware Cleaning Procedures

GLASSWARE CLEANING PROCEDURES METALS DEPARTMENT
Graduated Cylinders 1. Scrub with hot, soapy H_2O and brush. 2. Rinse thoroughly with tap H2O. 3. Rinse with 10% HNO_3 4. Rinse thoroughly with DI H_2O.
Volumetric Flasks 1. Empty contents of flask 2. Squirt a small amount of cleaning detergent directly into volumetric flask 3. Fill flask 1/3 full with **HOT** H_2O 4. Replace top and shake flask. 5. Empty flask and rinse with **HOT** H_2O until no soap remains in flask. 6. Add approximately 10mL concentrated HNO_3 to 50mL, 100mL, and 250mL flasks ---- replace top and shake well. For 500mL or 1000mL flasks use 25mL and for 10mL flasks use 2 - 5mL of concentrated HNO_3. 7. Rinse 3 times with DI H_2O, filling flask 1/3 full and replacing top. Store until needed. *** NEVER PLACE VOLUMETRIC FLASKS OR TOPS IN SINK OR DISHPAN WITH OTHER DIRTY DISHES.**
***Dispose of all acid waste in accordance with the Eurofins TestAmerica Savannah Addendum to the Corporate Safety Manual.**

FME023:03.11.09:3

18.0 Revision History

Summary of Changes for Revision 15A:

- Added Vendor name to Hydrochloric and Nitric Acid reagents.
- Revised Attachment 2 for sample containers.

Summary of Changes from Revision 15:

- Minor editorial, grammatical, and/or formatting changes made.
- Updated SOP signatories to reflect current responsibilities and titles.
- Updated company name where applicable.
- Replaced references of TALS to LIMS.
- Updated section 14.1 for current disposal practices.

ELEMENTS BY ICP

(Methods: EPA 200.7, EPA 6010C, EPA 6010D, SM2340B)

Approvals (Signature/Date):

1.0 Scope and Application

This SOP gives the procedures for the determination of metals (elements) by inductively coupled plasma (ICP) atomic emission spectroscopy.

The routine matrices for this procedure are waters and soils; however, this procedure may be adapted to accommodate other matrices as outlined in Section 16.1.

A complete target analyte list, the reporting limits (RL), the method detection limits (MDL), and the accuracy and precision criteria associated with this procedure are provided in the TALS Method Limit Groups (MLGs).

This SOP was written by and for Eurofins TestAmerica's Savannah laboratory.

2.0 Summary of Method

Prior to analysis by ICP, the sample must be digested/filtered using the sample preparation method appropriate to the analyte/matrix combination. Sample digestates/filtrates are aspirated and nebulized into a spray chamber. A stream of argon gas carries the sample aerosol through the innermost of three concentric tubes and injects it into the middle of the donut-shaped plasma. The sample elements are dissociated, atomized, and excited to a higher energy level. As the elements fall to a lower energy level, radiation characteristic of the elements present in the plasma is emitted. The light is directed through an entrance slit, dispersed by the diffraction grating, and projected on to the photomultiplier tube (PMT) or onto a charge-coupled device (CCD). The PMTs and CCDs, located behind the exit slits, convert the light energy to an electrical current. This signal is then digitized and processed by the data system. Background correction is required for trace element determination.

Note: Drinking water samples (EPA 200.7) only require digestion if the determination of silver (Ag) is requested or if the turbidity is greater than or equal to 1.0 NTU.

This SOP is based on the following methods: EPA 200.7, EPA 6010C, and EPA 6010D. The procedure for the determination hardness via the calculation method (i.e., SM2340B) is provided in Attachment 9.

3.0 Definitions

Refer to the Glossary Section of the *Quality Assurance Manual* (QAM) for a complete listing of applicable definitions and acronyms.

4.0 Interferences

4.1 Procedural Interferences

4.1.1 Interferences may be caused by contaminants in solvents, reagents, glassware, and other sample processing apparatus and can make identification and/or quantification of the target analytes difficult.

4.1.2 All sample collection containers are single-use disposable containers which limits the potential for contamination. All non-disposable labware must be scrupulously cleaned in accordance with the posted Labware Cleaning Instructions to ensure it is free from contaminants and does not contribute artifacts.

4.1.3 High purity reagents and solvents are used to help minimize interference problems. Hydrochloric acid and nitric acid must be verified prior to use in accordance with the Eurofins TestAmerica Solvent Lot Testing Program.

4.1.4 Instrument and/or method blanks are routinely used to demonstrate all reagents and apparatus are free from interferences under the conditions of the analysis.

4.1.5 Physical interferences are effects associated with the sample nebulization and transport processes. Changes in viscosity can cause significant inaccuracies, especially in samples containing high concentrations of dissolved solids or high acid concentrations. Typically, physical interferences are mitigated by the instrument's peristaltic pump and the use of internal standard.

4.2 Matrix Interferences

4.2.1 Matrix interferences may be caused by contaminants that are co-extracted from the sample matrix. The sample may require dilution prior to analysis to reduce or eliminate the interferences.

4.2.2 Interfering contamination may occur when a sample containing low concentrations of analytes is analyzed immediately following a sample containing relatively high concentrations of analytes. As such, samples known to be clean should be analyzed first. To prevent carryover into subsequent samples, analysis of reagent blanks may be needed after the analysis of a sample containing high concentrations of analytes.

4.2.3 Spectral interferences are caused by the overlap of a spectral line from another element, unresolved overlap of molecular band spectra, background contribution from continuous phenomena, and stray light from the line emissions of highly concentrated elements.

4.2.3.1 Spectral overlap may be compensated for by the use of inter-element correction factors.

4.2.3.2 Background contribution and stray light can be compensated for by a background correction adjacent to the analyte line.

4.2.3.3 The total recoverable sample digestion procedure is suitable for the determination of silver in aqueous samples containing concentrations up to 0.1mg/L and soil samples containing concentrations up to 50mg/kg. For samples containing higher concentrations of silver, succeeding smaller aliquots should be prepared until the digestate contains less than these levels of silver.

Similarly, soil samples digested via the total recoverable metals digestion procedure with a tin concentration that exceeds 1%, must be re-digested using a smaller aliquot.

Alternatively, samples may be digested using the total metals digestion procedure.

5.0 Safety

Employees must abide by the policies and procedures in the Eurofins TestAmerica Environmental Health and Safety Manual (EHSM), the Eurofins TestAmerica Savannah Addendum to the EHSM, and this document.

This procedure may involve hazardous materials, operations, and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user to follow appropriate safety, waste disposal, and health practices under the assumption that all samples and reagents are potentially hazardous.

The analyst must protect himself/herself from exposure to the sample matrix. Many of the samples that are tested may contain hazardous chemical compounds or biological organisms. The analyst must, at a minimum, wear protective clothing (lab coat), eye protection (safety glasses or face shield), disposable latex or nitrile gloves, and closed-toe, nonabsorbent shoes when handling samples.

5.1 Specific Safety Concerns or Requirements

The ICP plasma emits strong UV light and is harmful to vision. All analysts must avoid looking directly at the plasma.

The plasma generates high temperatures. Analysts must ensure that all equipment is shut down and cooled off before performing maintenance and troubleshooting in the plasma area.

Nitric and hydrochloric acids are extremely hazardous as oxidizers, corrosives, poisons, and are reactive. Inhalation of the vapors can cause coughing, choking, irritation of the nose, throat, and respiratory tract, breathing difficulties, and lead to pneumonia and

pulmonary edema. Contact with the skin can cause severe burns, redness, and pain. Nitric acid can cause deep ulcers, and staining of the skin to a yellow or yellow-brown color. These acid vapors are irritating and can cause damage to the eyes. Contact with the eyes can cause permanent damage.

Samples that contain high concentrations of carbonates or organic matter, or samples that are at elevated pH can react violently when acids are added. Acids must be added to samples under a hood to avoid splash/splatter hazards and/or possibly toxic vapors that will be given off when the samples are acidified.

5.2 Primary Materials Used

The following is a list of the materials used in this procedure, which have a serious or significant hazard rating, and a summary of the primary hazards listed in their MSDS/SDS.

NOTE: This list does not include all materials used in the procedure. A complete list of materials used in this procedure can be found in the Reagents and Standards Section and the Equipment and Supplies Section of this SOP

Employees must review the information in the MSDS/SDS for each material before using it for the first time or when there are major changes to the MSDS/SDS. Electronic copies of MSDS/SDS can be found using the "MSDS" link on the Oasis homepage, on the EH&S webpage on Oasis, and via TALS File System Shares.

Material	Hazards	Exposure Limit[1]	Signs and Symptoms of Exposure
Hydrochloric Acid[2]	Corrosive Poison	5ppm Ceiling	Inhalation of vapors can cause coughing, choking, inflammation of the nose, throat, and upper respiratory tract, and in severe cases, pulmonary edema, circulatory failure, and death. Can cause redness, pain, and severe skin burns. Vapors are irritating and may cause damage to the eyes. Contact may cause severe burns and permanent eye damage.
Nitric Acid[2]	Corrosive Oxidizer Poison	2ppm TWA 4ppm STEL	Nitric acid is extremely hazardous; it is corrosive, reactive, an oxidizer, and a poison. Inhalation of vapors can cause breathing difficulties and lead to pneumonia and pulmonary edema, which may be fatal. Other symptoms may include coughing, choking, and irritation of the nose, throat, and respiratory tract. Can cause redness, pain, and severe skin burns. Concentrated solutions cause deep ulcers and stain skin a yellow or yellow-brown color. Vapors are irritating and may cause damage to the eyes. Contact may cause severe burns and permanent eye damage.
[1]Exposure limit refers to the OSHA regulatory exposure limit.			
[2]Always add acid to water to prevent violent reactions.			

6.0 Equipment and Supplies

6.1 Equipment and Instrumentation

Varian 730 ES or other suitable inductively coupled plasma emission spectrometer. Data is evaluated and quantitated using TALS

Top-loading Balance – Verify in accordance with SOP SA-AN-100: *Laboratory Support Equipment (Verification and Use)*

6.2 Lab Supplies

Argon gas supply and appropriate fittings

Nitrogen Gas

Cooling water supply

Peristaltic Pump
pH paper

6.3 Analytical Data System/ Software / Hardware

The Quality Assurance Department maintains the Master Equipment Listing for the laboratory. This is a listing of all instrumentation utilized by the laboratory and includes details about the instrumentation including the software or firmware.

6.4 Volumetric Containers and Dispensers

All volumetric labware must be verified in accordance with SOP SA-AN-100: *Laboratory Support Equipment (Verification and Use).* Refer to Attachment 4 for Labware Cleaning Procedures.

Volumetric Labware	Volume	Type (Quantitative / Qualitative)	Use	Verification Frequency	Laboratory Verification Criteria
Autosampler Vials	14mL	Qualitative	Sample Introduction to Instrument	None	None
Mechanical Eppendorf-style Pipettes (w/ tips)	Various	QUANTITATIVE	Dilution and Standard Preparation	Initially, prior to first use then quarterly thereafter (Daily, for DOD)	Accuracy = 2% Precision = 1%
Volumetric Flasks (Class A)	Various	QUANTITATIVE	Standard Preparation	None (Class A)	None (Class A)
Digestion Vials	100mL	Qualitative	Standard Preparation and Storage	None	None

6.5 Sample Collection Containers

All sample collection containers are single-use disposable containers which limits the potential for contamination.

The routine sample collection containers provided by the laboratory are as follows:

Waters: 250mL Plastic – purchased with Certificate of Analysis attesting to purity.
Solids: 8oz Plastic or Glass Jar – purchased with Certificate of Analysis attesting to purity.

7.0 Reagents and Standards

The standards and reagents listed are those in use at the time this SOP was updated. Other standard and reagent stocks, vendors, and concentrations may be used provided they are fully documented and in compliance with method requirements.

7.1 Expiration Dates

Expiration dates (time from initial use or receipt to final use) for standard and reagent materials must be set according to the guidance in this SOP. Note: These are maximum expiration dates and are not to be considered an absolute guarantee of standard or reagent quality. Sound judgment must be used when deciding whether to use a standard or reagent. If there is doubt about the quality of a standard or reagent material, a new material must be obtained or the standard or reagent material verified. Data quality must not be compromised to extend a standard's life.

The expiration date of any standard must not exceed the expiration date of the standard that was used to prepare it.

Unless listed elsewhere in this SOP, the expiration dates given below apply.

7.1.1 The expiration date for unopened standards and reagents is the manufacturer's expiration date.

7.1.2 The expiration date for opened stock reagents is the manufacturer's expiration date or 5 years from the date opened, whichever is sooner.

7.1.3 The expiration date for opened stock standards is the manufacturer's expiration date.

7.1.4 The expiration date for prepared reagents is 6 months from the date prepared or the expiration date of the parent reagent, whichever is sooner.

7.1.5 The expiration date for prepared standards is 6 months from the date prepared or the expiration date of the parent standard, whichever is sooner.

7.2 Reagents

Reagents must be prepared and documented in accordance with SOP SA-AN-041: *Reagent and Standard Materials Procedures.*

Hydrochloric acid and nitric acid must be verified prior to use in accordance with the Eurofins TestAmerica Solvent Lot Testing Program.

7.2.1 Laboratory Reagent Water – ASTM Type I. The conductivity must be monitored in accordance with SOP SA-AN-100: *Laboratory Support Equipment (Verification and Use).*

7.2.2 Nitric acid (HNO_3) – reagent grade. Store in a cool, dry, ventilated storage area with acid resistant floors and good drainage. Store away from sunlight, heat, water, and incompatible materials. Stable under ordinary conditions of use and storage.

7.2.3 Hydrochloric acid (HCl) – reagent grade. Store in a cool, dry, ventilated storage area with acid resistant floors and good drainage. Store away from sunlight, heat, water, and incompatible materials. Stable under ordinary conditions of use and storage.

7.3 Standards

Standards must be prepared and documented in accordance with SOP SA-AN-041: *Reagent and Standard Materials Procedures.* Certificates of analysis or purity must be received with all purchased standards, and scanned and attached in TALS.

Refer to Attachments 5 and 6 for standard preparation information.

8.0 Sample Collection, Preservation, Shipment, and Storage

8.1 Aqueous Samples

Aqueous samples are routinely collected in 250mL plastic containers containing 1.5mL 1:1 nitric acid preservative or 500mL plastic containers containing 3.0mL 1:1 nitric acid preservative. The preservative must be sufficient to achieve a sample pH of less than 2.

If dissolved metals are requested, the sample must be filtered in the field. This filtration step must occur prior to the addition of the preservative.

If the laboratory is requested to filter the sample, then the sample must be collected in a 250mL plastic container without preservative. The samples are filtered upon receipt and are then acidified with 1.25mL concentrated nitric acid to a pH<2. Note: Samples must sit for 24 hours after the addition of the acid to verify pH is maintained, prior to digestion.

Note: The reference methods state that filtration must occur immediately; therefore, if the laboratory is requested to filter the samples – as opposed to a field filtration - appropriate narration must be included in the final report to denote this method deviation.

Samples are stored at room temperature until the time of digestion. Samples must be digested within 6 months of collection. Digestates are stored at room temperature until the time of analysis and must be analyzed within 6 months of collection.

8.2 Soil Samples

Soil samples are routinely collected in 8oz plastic or glass containers.

Samples must be iced at the time of collection and maintained at 4°C (less than 6°C but not frozen) until the time of digestion. Samples must be digested within 6 months of collection. Digestates are stored at room temperature until the time of analysis and analyzed within 6 months of collection.

9.0 Quality Control

SOP SA-QA-017: *Analytical Batching and Evaluation of QC Data* and the SOP Summary in Attachment 4 provide requirements for evaluating QC data.

9.1 Batch QC

9.1.1 EPA 200.7 – Drinking Water

A digestion batch consists of up to 20 environmental samples and the associated QC items digested together within a 24 hour period.

The laboratory's default minimum QC items performed for each digestion batch are: a method blank, a laboratory control sample (LCS), a low-level LCS (LLCS), a matrix spike (MS) to be performed on a minimum of 10% of samples or one per batch – whichever is greater, and a matrix spike duplicate (MSD).

This frequency equates to the following:

- For a batch of 10 or fewer samples, the default QC items are a method blank, an LCS, an LLCS, 1 matrix spike, and 1 matrix spike duplicate (MSD).
- For a batch of 11-20 samples, the minimum QC items are a method blank, an LCS, an LLCS, 1 matrix spike (from sample 1-10), another matrix spike (from sample 11-20), and a matrix spike duplicate (MSD).

9.1.2 EPA 200.7 – Clean Water Act

A digestion batch consists of up to 20 environmental samples and the associated QC items digested together within a 24 hour period.

The laboratory's default minimum QC items performed for each digestion batch are: a method blank, a laboratory control sample (LCS), a matrix spike (MS) to be performed on a minimum of 10% of samples or one per batch – whichever is greater, and a matrix spike duplicate (MSD).

This frequency equates to the following:

- For a batch of 10 or fewer samples, the default QC items are a method blank, an LCS, 1 MS, and 1 MSD.
- For a batch of 11-20 samples, the default QC items are a method blank, an LCS, 1 MS (from sample 1-10), another MS (from sample 11-20), and an MSD.

9.1.3 EPA 6010C

A digestion batch consists of up to 20 environmental samples and the associated QC items. The laboratory's default minimum QC items performed for each digestion batch are: a method blank, a laboratory control sample (LCS), a matrix spike (MS), and a matrix spike duplicate (MSD).

9.1.4 If there is insufficient sample provided to perform the required matrix spikes, the LCS must be prepared induplicate (i.e., LCS/LCSD). An NCM must be initiated to denote this situation.

Insufficient sample volume is defined as receiving less than a total of 50mL or 2g.

The routine container supplied for this method is a 250mL (water) or 8oz (soil) container. 50mL or 1g is required for digestion. Reduced sample initial volumes may be necessary to achieve the required batch matrix spike frequency; however, the minimum extraction volume to be used for the matrix spike samples is 25mL or 0.5g. Note: Final volumes and spike amounts must be adjusted to compensate for these reduced initial volumes.

Note: Unless the client has specified which sample to use as the matrix spike, the matrix spike must be selected at random from the samples in the batch. Field QC (e.g., equipment blanks, trip blanks, and field blanks) must not be used for MS/MSD unless specifically requested to do so by the client or unless there is insufficient sample available for performing MS/MSD using an actual field sample.

9.1.5 Batch QC must meet the criteria given in Attachment 3 of this SOP.

Note: If an LCS and LCSD are performed, both QC items must be evaluated and reported. Acceptable recoveries (as well as %RPD) for both LCS and LCSD are required.

9.1.6 Preparation SOPs

Refer to the following SOPs for specifics on the preparation process:

Matrix	SOP
Water Samples	SA-ME-050
Soil Samples	SA-ME-051

9.2 Instrument QC

9.2.1 Initial Calibration (ICAL)

The instrument must be calibrated in accordance with SOP SA-QA-016: *Evaluation of Calibration Curves.* This SOP provides requirements for establishing the calibration curve and gives the applicable formulas.

Instrument calibration is performed by analyzing a series of known standards. The calibration curve must consist of at least one standard (the high standard) and a blank. If a multi-point curve is requested, the calibration curve must consist of a minimum of 3 standards and a blank. The initial calibration standard concentrations currently in use in the laboratory for a multi-point curve are included in Attachment 5.

Note: Refer to Attachment 5 for the standard preparation instructions. Other standard concentrations may be used provided they support the reporting limit and are fully documented in accordance with SOP SA-AN-041.

The correlation coefficient (r) of the regression curve must be greater than or equal to 0.998 for the initial calibration curve to be acceptable.

If a multi-point calibration curve is used, the upper limit of the linear range is the concentration of the High Standard.

9.2.1.1 Determination of Linear Range of the ICP

If the instrument is not calibrated over its entire linear range for a particular element, a linear range standard must be analyzed immediately following the calibration to validate the linear range.

This standard must recover within +/- 10% of the true value and any sample that is greater than 90% of the concentration in the linear range standard must be diluted and reanalyzed.

9.2.2 High Standard Read Back

The highest concentration calibration standard must be reanalyzed as an “unknown” after the instrument is calibrated. The results for the re-analysis of the highest concentration calibration standard must be within ± 5% of the true value for each target analyte. If the result for any target analyte is outside of this range, the ICP may need to be "profiled" and the standardization/calibration repeated.

9.2.3 Second Source Initial Calibration Verification (ICV)

The calibration curve must be verified initially – prior to any sample analyses – in accordance with SOP SA-QA-016 with a standard obtained from a second source.

The ICV must be within 10% of the true value to be acceptable for EPA 6010C. The ICV must be within 5% of the true value to be acceptable for EPA 200.7, and must also have a %RSD ≤3% of the 3 replicates analyzed to be acceptable for EPA 200.7.

The initial calibration verification standard concentration currently in use in the laboratory is given in Attachment 5. Another standard concentration may be used provided it is mid-level and fully documented in accordance with SOP SA-AN-041.

9.2.4 Initial Calibration Blank (ICB) / Continuing Calibration Blank (CCB)

The instrument must be shown to be free from contamination by the analysis of calibration blanks. Initial calibration blanks are analyzed immediately following the initial calibration. Continuing calibration blanks must be analyzed immediately following each continuing calibration verification (CCV).

The absolute value of the initial and continuing calibration blanks must be <½RL to be acceptable.

9.2.5 Continuing Calibration Verification

The initial calibration curve must be verified every 10 samples with a mid-level standard.

The CCV must be within 10% of the true value to be acceptable and must also have a %RSD ≤5% of the 3 replicates.

The continuing calibration verification standard concentration currently in use in the laboratory is equivalent to half the concentration of the High Standard. Refer to Attachment 5 for the standard preparation instructions. Another standard concentration may be used provided it is mid-level and fully documented in accordance with SOP SA-AN-041.

9.2.6 Internal Standard (ISTD)

This procedure is an internal standard (ISTD) procedure. Yttrium is used as the primary internal standard; however, Scandium may also be used as an alternate ISTD.

The internal standard must be added to all standards, samples, and QC items prior to analysis. This is accomplished by means of an additional channel on the peristaltic pump and connected to the sample line with a 'T' or 'Y' connector fitting. This ensures constant concentration of the internal standard and eliminates the possibility of human spiking error. The concentration of the internal standard must be the same in all calibration samples, field samples, and QC samples. A concentration of 7mg/L is used for Yttrium and Scandium.

Any sample containing ISTD recoveries greater than 130% must be diluted and re-analyzed. Although ISTD recoveries less than 70% are extremely rare, the analyst should consider further dilution if this situation occurs.

9.2.6.1 Ionization Effects

High concentrations of some elements, such as Na, K, Ca, and Mg, can produce interferences from their ionization effects. The introduction of additional ions in abundance, such as Lithium, will minimize this interference. Therefore, Lithium is added to the internal standard solution, and is continually pumped at a constant rate.

See Attachment 5 for details on the preparation of the internal standard solution.

9.2.7 Reporting Limit Check Standard

A reporting limit (RL) check standard is used to demonstrate that the ICP is capable of detecting the target compounds at or below the reporting limit. EPA 200.7 requires this check only when utilizing a single point calibration. EPA 6010C requires this check for both single point and multi-point calibrations.

The concentrations in the RL check standard must be at levels that are less than or equal to the reporting limit for the samples being analyzed. The determined concentration must be detected within ±50% (for EPA 200.7), ±30% (for EPA 6010C) or ±20% with a RSD < 20% (for EPA 6010D) of the true concentration. The RL check standard must be analyzed at the beginning and end of an analysis run (i.e., all samples must be bracketed by this check standard), except for EPA 6010D and DOD QSM V5 which do not require a closing LLCCV.

Note: This RL Check Standard is referred to as the LLICV and LLCCV in EPA 6010C/6010D.

9.2.8 Interference Check Standards

The purpose of the Interference Check Standard is to prove that the instrument software is adequately correcting for common interferences through the use interelement correction factors. The concentrations of the target analytes must be within 20% of the true concentrations to be acceptable. The analyst must pay particular attention to false positives and false negatives for elements not present in the interference check solutions.

Note: Non-spiked analytes (aside from known contaminants) must be ≤ LLOQ, or RL.

9.2.9 Serial Dilution

A dilution must be prepared and analyzed on one sample per batch to determine if matrix interferences are present. Compare the results of the diluted and un-diluted aliquots of sample digestate for analytes that are present in the native sample at a concentration ≥50x IDL.

If the results of the dilution are within ±10% of the results of the undiluted sample, no matrix interference is present. If the results differ by greater than the amounts outlined above, a matrix interference should be suspected and the sample digestate should be subjected to a post-digestion spike.

9.2.10 Post-Digestion Spike

A post-digestion spike is performed on one sample per analytical batch to determine if matrix interferences are present. This post-digestion spike is evaluated if the serial dilution fails or if the analyte concentration is not at least 50 times the instrument detection limit. The sample selected as the post-digestion spike should be the same sample selected for serial dilution.

The post-digestion spike must be within 25% of the true value to be acceptable. If these criteria are not met, then the data are qualified.

9.2.11 % RSD of Multiple Exposures

Replicate analyses of a sample should agree within 30% RSD for samples with detections greater than the reporting limit. Replicates that are greater 30% RSD should be investigated for matrix interferences or differences in viscosity of the digest.

9.2.12 Interelement Correction Factors (IEC)

Interelement correction factors (IEC) for all elements must be determined every six months using the manufacturer's guidance.

The laboratory may combine the linearity study with the IEC study, thereby eliminating redundancy. (Single element linearity check solutions for each analyte should be closely evaluated for all non-spiked elements, and applicable correction factors should be applied according to the instrument's software. The analyst must be careful not to correct for any contamination which may be present in the actual solution.)

At a minimum the IECs must be verified at the beginning of each analytical sequence through the analysis of interferent check solutions ICSA and ICSAB. Note: Some protocols and project plans require the analysis of the ICSA and ICSAB standard at the beginning and end of an analysis sequence. The analyst must be aware of the requirements of the project before beginning the analysis.

Note: The reference methods require performance of single element spectral interference checks initially, when an instrument is set up, and at least every 6 months thereafter, to verify interelement correction factors. The laboratory combines this with the linear range study performed every 6 months to meet this requirement.

9.3 Corrective Action for Out-of-Control Data

When the quality control parameters do not meet the criteria set forth in this SOP, corrective action must be taken in accordance with SOP SA-QA-005: *Preventive and Corrective Action Procedures* the QC Summary Table in Attachment 3. SOP SA-QA-005 provides contingencies for out-of-control data and gives guidance for exceptionally permitting departures from approved policies and procedures. Nonconformance Memos must be initiated to document all instances where QC criteria are not met and all departures from approved policies and procedures.

10.0 Procedure

10.1 Sample Preparation

The sample preparation procedures are given in the following SOPs:

Matrix	SOP #
Water Samples	SA-ME-050
Soil Samples	SA-ME-051

10.2 QC Sample Preparation

Batch QC sample preparation procedures are given in the SOPs listed above. Additional QC items are listed below.

10.2.1 Serial Dilution

Dilute the digestate by a factor of five, and analyze the dilution using the same procedures used for the un-diluted aliquot.

10.2.2 Post Digestion Spike

Transfer 10mL of a digestate to a suitable vial. Spike the sample with 0.10mL of MS Cal Stk.

10.3 Analysis

All soil digestates and all water digestates containing particulates are filtered through a 0.45um filter prior to analysis.

Note: If digestates are filtered prior to analysis, then the applicable method blank and LCS/LCSD must also be filtered. This information must be captured via the Batch Data Types in TALS.

10.3.1 Instrument Operating Conditions

Turn the ICP on and allow it to become thermally stable before beginning to analyze the calibration standards. It will take about an hour for the instrument to warm up. If the optics were turned off, allow 2 hours warm up time. After the warm-up period, perform a torch alignment sequence to properly profile the instrument.

Instrument maintenance must be performed in accordance with Attachment 4 of this SOP.

10.3.2 Internal Standard (ISTD)

Prior to analysis, internal standard must be added to all standards, samples, and QC items. The concentration of the internal standard must be the same in all calibration samples, field samples, and QC samples.

10.3.3 Initial and Continuing Calibration

Calibrate the instrument using the standards and criteria described in Section 9.2.1. Once the calibration has been established and verified with a high level standard and an ICV in accordance with Sections 9.2.2 and 9.2.3, sample analysis may proceed.

Verify the calibration curve with a continuing calibration verification using the standards and criteria described given in Section 9.2.5.

10.3.4 Sample Analysis

Samples that are known to be relatively clean should be analyzed first. Samples suspected of containing high concentrations should be analyzed last. Instrument blanks may be analyzed after suspected high concentration samples to allow the complete removal of trace analytes. The instrument blanks would be included in the sample count in determining the maximum number of samples between CCVs/CCBs.

The default procedure is to include QC items (method blank, LCS, MS/MSD, and SD) in determining the maximum number of samples between CCVs/CCBs.

10.3.5 Example Analytical Sequence

An example analytical sequence is listed below.

Analytical Sequence for samples immediately following an initial calibration:

Description	Comments
Instrument Warm-up	
Torch Alignment	If torch is changed
Initial Calibration	
High Calibration Standard	Re-analyzed as a sample
ICV	Second Source
ICB	
Reporting Limit Check Standard	
ICP Interference Check Solution A (ICSA)	
ICP Interference Check Solution AB (ICSAB)	
CCV	
CCB	10-analysis count begins after analysis of the CCB
Samples & Batch QC Items	Up to 10 analyses, including QC
CCV	
CCB	10-analysis count begins after analysis of the CCB

Samples & Batch QC Items	Up to 10 analyses, including QC
CCV	
CCB	10-analysis count begins after analysis of the CCB
Samples & Batch QC Items	Up to 10 analyses, including QC
CCV	
CCB	10-analysis count begins after analysis of the CCB
Reporting Limit Check Standard	

Note: The analytical sequence continues as outlined above and must end with the analysis of the CCV and CCB. The 10 samples include all QC samples/standards with the exception of CCVs and CCBs.

11.0 Calculations / Data Reduction

11.1 Data Reduction

Data must be evaluated in accordance with SOP SA-QA-002: *Data Generation and Review*.

11.1.1 Dilutions

If the concentration of a sample is above the calibration range (or 90% of the linear range for single point curves) of the instrument the sample digestate must be diluted and reanalyzed.

Dilutions must be prepared in reagent water containing 5% hydrochloric acid and 1% nitric acid by volume.

Note: Samples digested via the total recoverable metals digestion procedure with a silver concentration >0.1mg/L or >50mg/kg must be diluted and re-digested. Smaller volume aliquots should be prepared until the results are below these values. Alternatively, samples may be digested using the total metals digestion procedure.

Note: Soil samples digested via the total recoverable metals digestion procedure with a tin concentration that exceeds 1%, must be re-digested using a smaller aliquot. Alternatively, samples may be digested using the total metals digestion procedure.

11.1.2 Historical Data

Many of the laboratory's clients submit samples for repeat monitoring purposes. Prior to analysis, the analyst must verify TALS Worksheet Notes and/or use the TALS Historical Data Tracker feature to determine if historical data is available for review.

11.1.3 Chemical Relationships

The analyst must be aware of the following chemical relationships:

- Total Results should be ≥ Dissolved results

If this relationship is not met, further evaluation is needed to rule out a laboratory error.

11.1.4 Evaluation of Batch QC and Samples for Matrix Interferences

Matrix interference is evaluated using three criteria: the recoveries of the matrix spike (MS) and matrix spike duplicate (MSD), the results of the serial dilution, and the recovery of the post digestion spike. This laboratory uses internal standard calibration and quantification which minimizes the need to use the method of standard additions (MSA) to quantify sample digests with known or suspect matrix interferences. MSA is used when the recoveries of the MS/MSD are less than 50% and there is no obvious reason for the poor recoveries (e.g., viscosity of digest, high dissolved solids, undigested solids, known high concentrations of inter-element interferences, etc.).

The primary indicator of matrix interference is the results of the MS/MSD. If the recoveries and precision of the MS/MSD are within acceptance limits, matrix interferences are not indicated and unacceptable results for the serial dilution and post-digestion spikes are likely due to poor preparation rather than matrix interference.

Use the following table to evaluate for the indication of matrix interferences.

MS	MSD	Serial dilution[1]	Post Digestion Spike[1]	Action
OK	OK	OK	OK	Report
OK	OK	Out	OK	Unlikely to occur; suspect preparation of serial dilution or post digestion spike
OK	OK	OK	Out	
OK	Out	OK	OK	Suspect preparation-qualify results
Out	OK	OK	OK	
Out	Out	Out	OK	Matrix interference confirmed-qualify results if recoveries >50% If MS/MSD recoveries <50% and there is no obvious reason, perform MSA as directed in section 11.1.5.
Out	Out	OK	Out	
Out	Out	Out	Out	

[1]Performed on un-spiked digest of the sample designated as the MS/MSD

11.1.5 Evaluation of Post-Digestion Spikes

Result of Post-Digestion Spikes	Action
Within 75-125% limits	None
>125% recovery	Re-spike and reanalyze if multiple analytes >125%. Repeat analysis of un-spiked sample and re-evaluate recoveries. Qualify results for affected analytes.
<75% recovery but >50% recovery	Qualify results for affected analytes. Dilute digestate and repeat spike for affected analytes. ***Treat all samples associated with spike in the same manner as the spiked sample (i.e., spike or dilute samples).*** If recoveries are not 75-125%, all associated samples may be re-analyzed by single point MSA. Note: High levels of target analytes may inhibit spike recovery. Consult the Department Manager in events where high levels of targets appear to be interfering.
<50% recovery	Dilute and re-spike. Elevate RL accordingly (for all associated samples). Spike and evaluate all associated samples. Spike and evaluate all associated samples by single point MSA. Qualify results for affected analytes.

Note: The >50% recovery of the post digestion spike is a benchmark below which samples may be biased high if corrected for spike recovery.

11.2 Calculations

11.2.1 The calculations associated with batch QC determinations are given in SOP SA-QA-017. Applicable calculations include accuracy (% recovery) and precision (%RPD and % difference).

11.2.2 The calculations associated with initial and continuing calibrations are given in SOP SA-QA-016. Applicable calculations include determination for correlation coefficient, slope, intercept, and percent recoveries.

11.2.3 The calculation to determine final concentration is given as follows:

$$FinalConcentration = CONC_{Sample} \otimes \frac{F}{I \times dw} \otimes D$$

Where:

$CONC_{Sample}$= Concentration of the sample
F = Final volume/weight
I = Initial volume/weight
D = Dilution factor
dw = % Solids decimal equivalent

Note: All dry weight corrections are performed automatically in TALS.

Note: This calculation assumes all applicable unit correction factors are applied.

11.2.4 Method of Standard Additions

The concentrations of both sample aliquots are measured and the sample concentration is calculated as follows:

$$C_x = \frac{S_2 V_s C_s}{(S_1 - S_2) V_x}$$

Where:

S_1 = Absorbance or concentration of the spiked aliquot
S_2 = Absorbance or concentration of the un-spiked aliquot
V_s = Volume of spike solution
V_x = Volume of sample aliquots
C_s = Spike solution concentration

Note: This calculation assumes all applicable unit correction factors are applied.

12.0 Method Performance

12.1 Reporting Limit Verification (RLV)

At a minimum, RLVs must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

For analytes and methods certified by DOD ELAP, RLVs must also be performed quarterly thereafter. For all other analytes and methods, RLVs must also be performed annually thereafter. Exceptions may be made for project-specific non-routine analytes.

12.2 Method Detection Limit (MDL) Study

The MDL is the lowest concentration that can be detected for a given analytical method and sample matrix with 99% confidence that the analyte is present. MDLs reflect a calculated

(statistical) value determined under ideal laboratory conditions in a clean matrix and may not be achievable in all environmental matrices. The current MDLs associated with this procedure are given in the Method Limit Group (MLG) in TALS.

At a minimum, MDL Studies must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

Note: MDL Studies are not required for non-routine analytes provided results are not reported below the RL (i.e., MDL equals RL in TALS).

12.3 Method Detection Limit Verification (MDLV)

At a minimum, MDLVs must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

For analytes and methods certified by DOD ELAP, MDLVs must also be performed quarterly thereafter. For all other analytes and methods, MDLVs must also be performed annually thereafter.

Note: MDLVs are not required for non-routine analytes provided results are not reported below the RL (i.e., MDL equals RL in TALS).

12.4 Determination of the Instrument Detection Limit (IDL)

The instrument detection limit (IDL) is the concentration of analyte that can be statistically distinguished from the background noise of the instrument. The IDL limit must be determined quarterly, at a minimum, for each analyte in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits (RLs, MDLs, and IDLs)*.

The IDL is defined as three times the average of the standard deviation of a minimum of seven replicate analyses of blank solution performed three times over non-consecutive days. The IDL may be elevated above the background noise (blank levels). The current IDL associated with this procedure is given in the Equipment Limit Group (ELG) in TALS.

12.5 QC Limit Generation, Control Charting, and Trend Analysis

The control limits for the batch QC items (LCS, MS/MSD) for this procedure are specified in the reference method and cannot be broadened; therefore, the laboratory defaults to the method-defined limits and does not utilize in-house or laboratory-derived limits for the evaluation of batch QC items.

Although the laboratory must default to the method-defined QC limits, control charting is a useful tool and is performed to assess analyte recoveries over time to evaluate trends. Control charting must be performed periodically (at a minimum annually) in accordance with SOP SA-QA-017: *Evaluation of Batch QC Data*.

12.6 Lower Limit of Quantitation Check Sample (LLQC)

EPA 6010C requires a lower limit of quantitation check sample (LLQC) analysis to demonstrate the required reporting limit capability. The laboratory shall prepare and analyze this solution on a yearly basis, in accordance with all applicable preparatory SOPs (i.e. the solution must be digested.) It is recommended that the laboratory utilize the RL Check solution (Section 9.2.7) by simply carrying it through the entire preparatory procedure for each of the prep methods associated with EPA 6010C. Digesting this solution on the same prep batch as the yearly MDL studies is preferred. The LLQC must recover within 70-130% to be acceptable, or a new (higher) reporting limit must be established.

12.7 Demonstrations of Capability

Initial and continuing demonstration of capability must be performed in accordance with SOP SA-QA-006*: Training Procedures.*

Prior to performing this procedure unsupervised, each new analyst who performs this analysis must demonstrate proficiency per method/analyte combination by successful completion of an initial demonstration of capability. The IDOC is performed by the analysis of 4 consecutive LCSs that meet the method criteria for accuracy and precision. The IDOC must be documented and routed to the QA Department for filing.

Annual continuing demonstrations of capability (CDOCs) are also required per analyst per method/analyte combination. The CDOC requirement may be met by the consecutive analysis of four LCS all in the same batch, by the analysis of four LCS analyzed in four consecutive batches (in different batches on different days), via acceptable results on a PT study, or analysis of client samples with statistically indistinguishable results when compared to another certified analyst. The CDOC must be documented and routed to the QA Department for filing.

12.8 Training Requirements

All training must be performed and documented in accordance with SOP SA-QA-006: *Training Procedures*.

Note: The SOPs listed in the Reference/Cross-Reference Section are applicable to this procedure. All employees performing this procedure must also be trained on these SOPs.

13.0 Pollution Control

It is Eurofins TestAmerica's policy to evaluate each method and look for opportunities to minimize waste generated (e.g., examining recycling options, ordering chemicals based on quantity needed, preparing reagents based on anticipated usage and reagent stability, etc.). Employees must abide by the policies in Section 13 of the Environmental Health and Safety Manual (EHSM) and the Savannah Addendum to the EHSM.

This procedure has been evaluated for opportunities to minimize the waste generated. Where reasonably feasible, pollution control procedures have been incorporated.

14.0 Waste Management

Waste management practices must be conducted consistent with all applicable federal, state, and local rules and regulations. All waste (i.e., excess reagents, samples, and method process wastes) must be disposed of in accordance with Section 9 of the Eurofins TestAmerica Savannah Addendum to the EHSM. Waste description rules and land disposal restrictions must be followed.

14.1 Waste Streams Produced by the Method

The following waste streams are produced when this method is carried out:

- Excess aqueous samples – Dispose according to characterization on the sample disposal sheets. Neutralize non-hazardous samples before disposal into drain/sewer. Transfer hazardous samples (identified on disposal sheets) to the waste department for disposal.

- Excess soil and solid samples – Dispose according to characterization on sample disposal sheets. Transfer non-hazardous samples to TCLP container for characterization in hazardous waste department. Transfer hazardous samples (identified on disposal sheets) to waste department for disposal.

- Acidic sample digestions – Neutralize before disposal into drain/sewer system.

Dispose of all metals standards with concentrations exceeding the TCLP threshold limits as a RCRA aqueous hazardous waste. The TCLP constituents and the respective threshold limits are:

Analyte	Disposal Limit (mg/L)
Arsenic	5.0
Barium	100
Cadmium	1.0
Chromium	5.0
Lead	5.0
Selenium	1.0
Silver	5.0
Mercury	0.20

Neutralize the standard by passing with sodium bicarbonate before transferring the waste to the RCRA aqueous hazardous waste drum.

All other metals standards may be disposed, using copious amounts of water, down a sink that flows to the neutralization pit.

16.0 Method Modifications/Clarifications

16.1 Incorporation of Non-Routine Matrices

This procedure may be modified to analyze other matrices (e.g., wipe, waste, tissue, filter, and TCLP/SPLP leachate samples) upon client request. This will need to be arranged by the Project Manager at the initiation of the project.

Wipe, waste, filter, and tissue matrices are non-routine, and the laboratory is not currently NELAC certified for these matrices. The laboratory uses its routine soil RLs (converted for initial and final volumes, etc.) and soil QC limits to evaluate wipe, waste, filter, and tissue samples. Soil DOCs can be used to satisfy analyst demonstrations of capability for these types of non-routine matrices. The laboratory uses its routine soil RLs (converted for initial and final volumes, etc.) and soil QC limits to evaluate TCLP/SPLP leachate samples. Water DOCs can be used to satisfy analyst demonstrations of capability for TCLP/SPLP matrices. Teflon chips, Ottawa sand, or equivalent is used as the blank matrix for wipes, wastes, filters, and tissues unless specifically requested otherwise by the project.

16.1.1 Collection and Handling Procedures for Non-Routine Matrices

Waste (oil) samples are collected in 500mL plastic containers. Waste (oil) samples are stored at room temperature until the time of digestion. Wipe samples are collected in 20mL scintillation vials. Wipe and filter samples must be iced at the time of collection and maintained at 4°C (less than 6°C but not frozen) until time of digestion. Waste (oil), wipe, and filter samples must be digested within 6 months of collection.

Tissue samples are collected in plastic containers with the size dependent upon the type of tissue being collected. Plastic jars or plastic baggies can be used. Upon receipt, tissue samples must be placed in the freezer at -10° to -20°C for up to 6 months if digestion cannot be completed that day. Tissue samples must be digested within 6 months of thawing.

Digestates for waste (oil), wipe, tissue, and filter samples are stored at room temperature until the time of analysis and must be analyzed within 6 months of collection.

Once the TCLP/SPLP extraction procedure has been performed, the TCLP/SPLP leachate must be transferred to a 500mL plastic container and preserved with 1.0mL nitric acid to a pH <2. Preserved TCLP/SPLP leachates are stored at room temperature until the time of digestion. The leachate sample must be digested within 6 months of completion of the TCLP/SPLP extraction. Digestates are stored at room temperature until the time of analysis and must be analyzed within 6 months of completion of the TCLP/SPLP extraction.

16.1.2 Preparation and Analytical Procedures for Non-Routine Matrices

Wipe, waste, filter, and tissue samples are prepared in the same manner as routine soil samples as outlined in SOP SA-ME-051. TCLP/SPLP matrices are prepared in the same manner as routine water samples as outlined in SOP SA-ME-050. Refer to the applicable preparation SOPs for more information.

Wipe, waste, filter, tissue, and TCLP/SPLP matrices are analyzed in the same manner as routine samples as outlined in this SOP.

16.2 Other Considerations

16.2.1 The EPA Manual for the Certification of Laboratories Analyzing Drinking Water requires a LFB at the MRL to be performed each day. The laboratory meets this requirement by preparing a low-level LCS (LLCS), spiked at the RL, in each EPA 200.7 batch of drinking water samples. The EPA DW Manual does not specify criteria for the low-level LCS; therefore, the laboratory requires this standard to be qualitatively identified to be acceptable.

16.2.2 The stock standards utilized for the Silica procedure are routinely purchased as Silicon (Si). Both Silica (SiO_2) and Silicon (Si) can be reported using this procedure. The following equation is used to convert between Silicon (Si) and Silica (SiO_2):

$$Si = \frac{SiO_2}{2.14}$$

16.2.3 The laboratory's default QC items incorporate an MSD to satisfy the Clean Water Act requirements and those clients who batch require precision to be reported. Additionally, if insufficient sample volume is provided to perform the MS/MSD, the LCS is routinely prepared in duplicate (i.e., LCS/LCSD).

16.2.4 Linear Range determinations are performed initially upon instrument set-up and when significant instrument changes are made. Linear Range verifications are performed quarterly as required by DOD QSM. This frequency is greater than that defined by the reference methods.

16.2.5 EPA Method 200.7 requires that IEC studies be performed annually. The laboratory defaults to a 6-month frequency. This frequency is greater than that defined by the reference method and is consistent with the requirement outlined in EPA Method 6010C.

16.2.6 The reference methods do not specify a %RSD criteria for replicate exposures of the CCV. The laboratory has incorporated an RSD criteria of 5% for all CCVs, as required by the DOD QSM.

16.2.7 The reference methods require IDLs to be performed annually. The laboratory performs IDLs quarterly as required by the DOD QSM.

16.2.8 The reference methods state that, for dissolved metals analysis, filtration must occur in the field. The laboratory may be requested to filter the samples upon receipt. If this occurs, then appropriate narration must be included in the final report to denote this method deviation.

Attachment 1:
SOP Summary

Sample Preparation Summary

Prior to analysis by ICP, the sample must be digested using the sample preparation method appropriate to the matrix. Samples should be prepared according to the appropriate matrix-specific SOP.

Matrix	SOP #
Aqueous Samples	SA-ME-050
Soil Samples	SA-ME-051

Sample Analysis Summary

Sample digestates are aspirated and nebulized into a spray chamber. A stream of argon gas carries the sample aerosol through the innermost of three concentric tubes and injects it into the middle of the donut-shaped plasma. The sample elements are dissociated, atomized, and excited to a higher energy level. As the elements fall to a lower energy level, radiation characteristic of the elements present in the plasma is emitted. The light is directed through an entrance slit, dispersed by the diffraction grating, and projected on to the photomultiplier tube (PMT) or on to a charge-coupled device (CCD). The PMTs and CCDs located behind the exit slits, convert the light energy to an electrical current. This signal is then digitized and processed by the data system. Background correction is required for trace element determination.

Analytical Sequence

Description	Comments
Instrument Warm-up	
Torch Alignment	If torch is changed
Initial Calibration	
High Calibration Standard	Re-analyzed as a sample
ICV	Second Source
ICB	
Reporting Limit Check Standard	
ICP Interference Check Solution A (ICSA)	
ICP Interference Check Solution AB (ICSAB)	
CCV	
CCB	10-analysis count begins after analysis of the CCB
Samples & Batch QC Items	Up to 10 analyses, including QC
CCV	
CCB	10-analysis count begins after analysis of the CCB
Samples & Batch QC Items	Up to 10 analyses, including QC
CCV	
CCB	10-analysis count begins after analysis of the CCB
Samples & Batch QC Items	Up to 10 analyses, including QC
CCV	
CCB	10-analysis count begins after analysis of the CCB
Reporting Limit Check Standard	Method criterion

Note: The analytical sequence continues as outlined above and must end with the analysis of the CCV and CCB. The 10 samples include all QC samples/standards with the exception of CCVs and CCBs.

Attachment 3:
QC Summary

QC Item	Frequency	Criteria	Corrective Action
Initial Calibration (ICAL)	Daily	Single Point: 1 standard and 1 blank Multi-point: Minimum 3 standards and 1 blank Correlation coefficient ≥0.998	Recalibrate
High Standard	Immediately after every calibration	Recoveries within ± 5% of expected values	New initial calibration
Initial Calibration Verification Standard (ICV)	At the beginning of the analysis	EPA 6010C: Within ±10% EPA 200.7: Within ± 5%, </= 3%RSD	Recalibrate
Continuing Calibration Verification Standard (CCV)	At the beginning and end of the analysis, and every 10 samples	Within ±10% of true value </=5%RSD	Terminate the analysis, correct the problem and reanalyze the previous 10 samples.
Calibration Blank (ICB/CCB)	After ICV and every CCV	Absolute value <½RL	Terminate the analysis, correct problem and reanalyze the previous 10 samples
Interference Check Standards (ICSA/ICSAB)	At the beginning of an analysis run	± 20% of the true values Pay attention to false positives and false negatives for elements not present in the solutions.	Terminate the analysis, correct the problem, recalibrate, and reanalyze all samples since the last ICS that was in control.
Batch Definition	Up to 20 field samples digested together within a 24-hr time period	Not Applicable	Not Applicable
Method Blank	One per batch of twenty samples or less	|result| <½RL or result <10% of the analyte level in the sample	Refer to SOP SA-QA-017

QC Item	Frequency	Criteria	Corrective Action
(MB)			
Laboratory Control Sample (LCS)	One per batch	TALS MLG	Refer to SOP SA-QA-017
Laboratory Control Sample Duplicate (LCSD)	One per batch, if insufficient sample provided for MS/MSD	TALS MLG	Refer to SOP SA-QA-017
Low-Level Laboratory Control Sample (LLCS) – at the RL	EPA 200.7 DW Only: One per batch of twenty samples or less for drinking water	Qualitatively detected	If the "regular" LCS meets criteria, initiate NCM and report data If the "regular" LCS does not meet criteria, redigest and reanalyze batch
Matrix Spike (MS)	EPA 200.7: 10% of samples prepared; i.e., 2 separate matrix spikes per batch EPA 6010C: 5% of samples prepared; i.e., 1 matrix spike per batch	TALS MLG	Refer to SOP SA-QA-017
Matrix Spike Duplicate (MSD)	One per batch	TALS MLG	Refer to SOP SA-QA-017
Serial Dilution (1/5 Dilution)	One per batch	Refer to Section 9.2.9	Refer to Section 9.2.9
Post Digestion Spike (PDS)	One per batch	Refer to Section 9.2.10	Refer to Section 9.2.10
Reporting Limit Check	At the beginning and end of an analysis run (Required for EPA	EPA 200.7: +/-50% of the true concentration	Opening:

QC Item	Frequency	Criteria	Corrective Action
Solution (also known as LLICV and LLCCV for EPA 6010C/6010D)	200.7 when using a single point calibration. Required for EPA 6010C when using both single point and multi-point calibrations.6010D and DOD do not require a closing analysis)	EPA 6010C: +/-30% of the true concentration 6010D +/-20% of TV; RSD < 20%	Stop the analysis, fix the problem, and reanalyze the affected samples. Capping: Qualify affected samples; reanalyze if required by project plan
%RSD (CV) of Multiple Exposures	Evaluate for all Calibration, QC, and samples	Conc. >= RL - Warning: <=20% - Acceptance: <=30%	-if CV>20 but <=30, review data for possible interferences; -if interference present, reanalyze digest -if no interference present, report average -if CV>=30%, reanalyze digest, report the result that has the lower precision value or dilute the digestion and reanalyze
		Conc. < RL -use professional judgment	-use professional judgment
Linear Range	Determined at least every 6 months in accordance with Attachment 7	% difference </=10%	-reanalyze at a lower concentration
Interelement Correction Factors (IEC)	Determined every 6 months. Verified at the beginning of an analysis run	Refer to ICSA, ICSAB criteria	See ICSA, ICSAB corrective action
Lower Limit of Quantitation Check Sample	Annually	EPA 6010C: 70-130%	- reanalyze at a higher concentration - elevate RL accordingly
Initial Demonstration of Capability (IDOC)	Initially, per analyst, per analyte/method/matrix combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006 Note: Unsupervised work must not begin

QC Item	Frequency	Criteria	Corrective Action
			until acceptable IDOC is obtained.
Continuing Demonstration of Capability (CDOC)	Annually, per analyst, per analyte/method combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006
Reporting Limit Verification (RLV)	Upon method/instrument set-up, per analyte/method/matrix combination. Then quarterly thereafter (for DOD ELAP) or annually thereafter (for non-DOD ELAP)	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007
Method Detection Limit Study (MDL)	Upon method/instrument set-up, per analyte/method/matrix combination	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007
MDL Verification (MDLV)	Upon method/instrument set-up, per analyte/method/matrix combination. Then quarterly thereafter (for DOD ELAP) or annually thereafter (for non-DOD ELAP)	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007
Instrument Detection Limit (IDL)	Upon method/instrument set-up, and then quarterly thereafter	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007

Attachment 4:
Preventative Maintenance and Troubleshooting

Preventive Maintenance

EQUIPMENT ITEM	Service Interval							SERVICE LEVEL
	D	W	M	Q	SA	A	AN	
ICAP Service Schedule								
Pump Tubing							X	Inspect and replace as needed (Recommend daily)
Nebulizer							X	Clean as needed
Filters							X	Clean or replace as needed (Recommend monthly)
Chiller Water Filter							X	Clean or replace as needed (Recommend every six months)
Injector Tip / Torch							X	Clean or replace as needed (Recommend Daily inspection)
Tubing Connectors							X	Replace as needed

D = daily; W = Weekly; M = monthly; Q = Quarterly; SA = semi-annually; A = annually; AN = as needed

Troubleshooting

Troubleshooting should be documented as outlined above. If possible, troubleshooting is best performed in a step-wise manner to systematically isolate instrument components. Refer to the instrument manufacturer's guides for specific information and strategies. Enlist assistance from technical and/or department management as needed.

Maintenance Log

A maintenance log must be established for each piece of equipment used in the laboratory. All maintenance that is performed on the instrument must be recorded in the log including:

- Type of maintenance performed (Note: This includes preventative/routine maintenance; non-routine maintenance; maintenance performed by an external vendor; updates to software versions; etc.)
- Analyst or technician performing the maintenance
- Date the maintenance was performed
- Detailed explanation of the reason for the maintenance
- Resolution of the problem and return to control
  all service calls from instrument representatives
- Resolution of the problem (i.e., the Return to Control)

Note: An electronic Maintenance Logbook has been established for these instruments.

Instrument Labeling

Each instrument must be labeled with its name or ID (e.g., MSA, ICP-D, etc.). Additionally, non-operational instruments must be isolated from service or marked as being out of service. Each piece of equipment has an "Operational / Not Operational" sticker that is used for this purpose.

Attachment 5:
Standard Preparation

Note: All standards must be stored at room temperature and have an expiration date of 6 months from date prepared.

Attachment 6:
Silica/Silicon Standard Preparation

Silicon (Si) stock solutions are usually purchased for this procedure. The following conversion is used to adjust any volumes or concentrations appropriately:

$$Si = \frac{SiO_2}{2.14}$$

- Stock SiO_2 Standard, 10000mg/L Si / 21400mg/L SiO_2 – purchased from CPI. Store at room temperature. This standard must be used by the manufacturer's expiration date.

- Stock Second Source SiO_2 Initial Calibration Verification (ICV), 50mg/L Si / 107mg/L SiO_2 QC7 Standard, purchased from Ultra. Store at room temperature. This standard must be used by the manufacturer's expiration date.

  Note: The ICV must be prepared from a stock standard that is obtained from a different source than the stock standard used to prepare the calibration standard. The second source must be from a separate vendor, unless a second vendor is unavailable, in which case a separate lot from the same vendor may be used.

- Intermediate SiO_2 Standard, 467mg/L Si / 1000mg/L SiO_2 – Add 20mL to 30mL of reagent water to a clean, plastic 100mL volumetric flask. Add the volume of the Stock SiO_2 Standard given in the table below to the volumetric flask. Dilute to volume with reagent water. Store the standard at room temperature. This standard must be used by its parent standard's expiration date or within 6 months of preparation, whichever comes first.

Element	Conc. Stock SiO_2 Std (mg/L)	Volume Stock SiO_2 Std (mL)	Final Volume (mL)	Final Conc. (mg/L)
Silica (SiO_2) [Silicon (Si)]	21400 [10000]	4.67	100	1000 [467]

- Initial Calibration Standards

  - Preparation of the Calibration Blank (ICB, CCB) – The calibration blank is reagent water. The calibration blank is used as the initial calibration blank (ICB) and the continuing calibration blank (CCB).

  - High Level SiO_2 Calibration Standard, 10mg/L SiO_2 – Add 20mL to 30mL of reagent water to a clean, plastic 100-mL volumetric flask. Add the volume of the Intermediate SiO_2 Standard given in the table, below, to the volumetric flask. Dilute to a final volume of 100mL with reagent water. Store the standard at room temperature. This standard must be used by its parent standard's expiration date or within 6 months of preparation, whichever comes first.

Element	Conc. SiO_2 Intermediate Std (mg/L)	Volume SiO_2 Intermediate Std (mL)	Final Volume (mL)	Final Conc. (mg/L)
Silica (SiO_2)	1000	1.0	100	10

- Mid Level SiO_2 Calibration Standard (also used as CCV solution), 5.0mg/L SiO_2 – Add 20mL to 30mL of reagent water to a clean, plastic 100mL volumetric flask. Add the volume of the stock standard given in the table, below, to the volumetric flask. Dilute to volume with reagent water. Store the standard at room temperature. This standard must be used by its parent standard's expiration date or within 6 months of preparation, whichever comes first.

Element	Conc. SiO_2 Intermediate Std (mg/L)	Volume SiO_2 Intermediate Std (mL)	Final Volume (mL)	Final Conc. (mg/L)
Silica (SiO_2)	1000	0.50	100	5

- Low Level SiO_2 Calibration Standard (also used as RL solution), 0.50mg/L – Add 20mL to 30mL of reagent water to a clean, plastic 100mL volumetric flask. Add the volume of the stock standard given in the table, below, to the volumetric flask. Dilute to volume with reagent water. Store the standard at room temperature. This standard must be used by its parent standard's expiration date or within 6 months of preparation, whichever comes first.

Element	Conc. SiO_2 Intermediate Std (mg/L)	Volume SiO_2 Intermediate Std (mL)	Final Volume (mL)	Final Conc. (mg/L)
Silica (SiO_2)	1000	0.050	100	0.50

- Second Source SiO_2 ICV Standard, 0.50mg/L SiO_2 / 1.07mg/L Si – Add 20mL to 30mL of reagent water to a clean, plastic 100mL volumetric flask. Add the volume of the stock standard given in the table to the volumetric flask. Dilute to volume with reagent water. Store the standard at room temperature. This standard must be used by its parent standard's expiration date or within 6 months of preparation, whichever comes first.

Element	Conc. of Stock Std (currently from Element) (mg/L)	Volume Stock Std (mL)	Final Volume of Cal Std mL)	Final Conc. (mg/L)
Silica (SiO_2) [Silicon (Si)]	107 [50]	1.0	100	1.07 [0.50]

Stock ICP Interference A Check Standard – purchased Interference A Stock Standard, from SPEX. Store the standard at room temperature. This standard must be used by its manufacturer's expiration date.

Note: This solution does not contain any SiO_2. Concentrations are as follows:

Aluminum (Al)	5000mg/L
Calcium (Ca)	5000mg/L
Magnesium (Mg)	5000mg/L
Iron (Fe)	2000mg/L

- ICP Interference A Check Standard, Working – Add 20mL to 30mL of reagent water to a clean 100-mL plastic volumetric flask. Add 10mL of the Stock ICP Interference A Check Standard to the volumetric flask. Dilute to a final volume of 100mL with reagent water. Store the standard at room temperature. This standard must be used by its parent standard's expiration date or within 6 months of preparation, whichever comes first.

  Note: This solution does not contain any SiO_2. Final concentrations are as follows:

Aluminum (Al)	500mg/L
Calcium (Ca)	500mg/L
Magnesium (Mg)	500mg/L
Iron (Fe)	200mg/L

- ICP Interference Check Solution AB – Add 20mL to 30mL of reagent water to a clean 100-mL plastic volumetric flask. Add 10mL of Stock ICP Interference A Check Standard and 0.50mL of the Intermediate SiO_2 Standard to the volumetric flask. Dilute to a final volume of 100mL with reagent water. Store the standard at room temperature. This standard must be used by its parent standard's expiration date or within 6 months of preparation, whichever comes first.

  The final concentrations of this solution should be as follows:

Aluminum (Al)	500mg/L
Calcium (Ca)	500mg/L
Magnesium (Mg)	500mg/L
Iron (Fe)	200mg/L
Silica (SiO_2)	5.0mg/L

- Linearity Check Solution, 100mg/L – P Add 20mL to 30mL of reagent water to a clean 100-mL plastic volumetric flask. Add 10mL of Intermediate SiO_2 Standard to the volumetric flask. Dilute to a final volume of 100mL with reagent water. Store the standard at room temperature. This standard must be used by its parent standard's expiration date or within 6 months of preparation, whichever comes first.

Note: Historically, the Linear Dynamic Range for silica has been 100mg/L; however, the instrument is dynamic. The concentration of this standard may need to be adjusted based how the instrument is performing. Prepare other volumes and/or concentrations according to the following equation:

$$Vs = \frac{Vlc \otimes Clc}{Cs}$$

where
V_s = volume of stock standard (mL)
C_s = concentration of stock standard (mg/L)
V_{lc} = volume of linearity check standard to prepare (mL)
C_{lc} = concentration of linearity check standard to prepare (mg/L)

Attachment 7:
Linear Dynamic Range Determination and Verification

Initial Linear Dynamic Range Determination:
The linear dynamic range (LDR) of each instrument must be determined initially, upon instrument set-up, and whenever significant instrument changes are made following the procedure outlined below:

- Prepare and analyze individual standards at concentrations (a minimum of three are recommended) that are expected to define the linear dynamic range of the instrument.

  Note: The calibration standards and the LDR standards must be matrix matched; that is, they must have the same percentage of hydrochloric and nitric acids.

- Compare the concentration of each standard with its true concentration as follows:

$$PercentDifference = \left| \frac{C_{cal} - C_{true}}{C_{true}} \right| \otimes 100$$

  Where:
  C_{cal} = concentration determined from analysis
  C_{true} = true concentration of the standard

- Continue analyzing increasing concentrations of standards (recommend increasing by a factor of two) until the percent difference is greater than 10%. The highest standard that meets the 10% criteria establishes the initial LDR of the instrument.

Note: The laboratory routinely utilizes a “working” LDR that is equivalent to the concentration of the High Standard of the calibration curve. This working LDR allows for consistency between instruments and must not be greater than the LDR established by the initial LDR study.

Linear Dynamic Range Verification:
The working LDR must be verified quarterly by analyzing a standard at this concentration. If the percent difference is less than or equal to 10%, the working LDR is confirmed at that concentration. If the percent difference is greater than 10%, repeat the initial LDR Study as outlined above.

Evaluation of Samples with Relation to the Linear Dynamic Range:
Samples with concentrations greater than 90% of the working LDR must be diluted to bring the concentration below 90% of the working LDR.

Attachment 8:
Element Wavelengths

Element	Wavelength ICP-E (nm)	Wavelength ICP-F (nm)

Cobalt (Co)	228.615	228.615
Copper (Cu)	324.754	324.754
Iron (Fe)	271.441	271.441
Lead (Pb)	220.353	220.353
Magnesium (Mg)	279.078	279.078
Manganese (Mn)	257.610	257.610
Molybdenum (Mo)	202.032	202.032
Nickel (Ni)	231.604	231.604
Potassium (K)	766.491	766.491
Selenium (Se)	196.026	196.026
Silver (Ag)	328.068	328.068
Sodium (Na)	330.237	330.237
Strontium (Sr)	216.596	216.596
Thallium (Tl)	190.794	190.794
Tin (Sn)	189.925	189.925
Titanium (W)	334.941	334.941
Vanadium (V)	292.401	292.401
Zinc (Zn)	206.200	206.200

Note: Other wavelengths may be used with DM and TM approval.

Attachment 9:
Hardness Calculation Work Instruction

eurofins | Environment Testing TestAmerica

Work Instruction
FME157:05.23.07:0
Page 1 of 1

CALCULATION OF HARDNESS

(as Calcium Carbonate)

Method: SM2340B

Summary of Procedure:

An aqueous sample is analyzed for calcium and magnesium using ICP by methods EPA 200.7 or 6010B (SOP ME70: *Elements by ICP)*, or using ICP/MS by methods EPA 200.8 or 6020 (SOP ME74*: Elements by ICP/MS)*. The concentrations of these elements are converted to equivalents of calcium carbonate using the equation below and added together to give the final result.

Calculation:

Determine the concentration of calcium and magnesium as described in SOP ME70 or ME74.

Calculate the hardness as calcium carbonate using the following equation:

Hardness (as mg/L calcium carbonate) = (4.118 X [Mg]) + (2.497 X [Ca])

where:
[Mg] = Concentration of magnesium (mg/L)
[Ca] = Concentration of calcium (mg/L)

Quality Control:

Report the method blank as the default QC unless otherwise requested.

Formal detection limit studies, as described in 40CFR Part 136B and SOP QA07: *Determination of Detection Limits,* are not required for SM2340B.

This procedure is a calculation based on another analytical procedure; therefore, demonstration of capability (DOC) is accomplished by successful completion of analytical DOCs. (i.e. If the analyst has a successful DOC on file for Ca and Mg by EPA 200.7/6010B or EPA 200.8/6020, proficiency has been shown for SM2340B by default.)

Attachment 10: Labware Cleaning Procedures

GLASSWARE CLEANING PROCEDURES METALS DEPARTMENT
Graduated Cylinders 1. Scrub with hot, soapy H_2O and brush. 2. Rinse thoroughly with tap H2O. 3. Rinse with 10% HNO_3 4. Rinse thoroughly with DI H_2O.
Volumetric Flasks 1. Empty contents of flask 2. Squirt a small amount of cleaning detergent directly into volumetric flask 3. Fill flask 1/3 full with **HOT** H_2O 4. Replace top and shake flask. 5. Empty flask and rinse with **HOT** H_2O until no soap remains in flask. 6. Add approximately 10mL concentrated HNO_3 to 50mL, 100mL, and 250mL flasks ---- replace top and shake well. For 500mL or 1000mL flasks use 25mL and for 10mL flasks use 2 - 5mL of concentrated HNO_3. 7. Rinse 3 times with DI H_2O, filling flask 1/3 full and replacing top. Store until needed. * **NEVER PLACE VOLUMETRIC FLASKS OR TOPS IN SINK OR DISHPAN WITH OTHER DIRTY DISHES.**
***Dispose of all acid waste in accordance with the Eurofins TestAmerica Savannah Addendum to the Corporate Safety Manual.**

17.0 Revision History

Summary of Changes

- Added section 6.3 to address the Master Equipment Listing maintained by the QA department.

Summary of Changes from Previous Revision 18:

- Minor editorial, grammatical, and/or formatting changes made.
- Updated SOP signatories to reflect current responsibilities and titles.
- Updated company name and logo as applicable.
- Updated forms for spelling and logo changes.

ELEMENTS BY ICP-MS

(Methods: EPA 200.8, EPA 6020A, and EPA 6020B)

Approvals (Signature/Date):

1.0 Scope and Application

This SOP gives the procedures for the determination of various metals by inductively coupled plasma mass spectrometry (ICP-MS).

Note: The routine matrices for this procedure are waters and soils; however, this procedure may be adapted to accommodate other matrices as outlined in Section 16.1.

A complete target analyte list, the reporting limits (RL), the method detection limits (MDL), and the accuracy and precision criteria associated with this procedure are provided in the TALS Method Limit Groups (MLGs).

This SOP was written by and for Eurofins TestAmerica's Savannah laboratory.

2.0 Summary of Method

Prior to analysis by ICP-MS, the sample must be solubilized or digested using the sample preparation method appropriate to the matrix. Sample digestates are aspirated and nebulized into a spray chamber. A stream of argon gas carries the sample aerosol through the innermost of three concentric tubes and injects it into the middle of the donut-shaped plasma. The sample elements are dissociated, atomized, and excited to a higher energy level. The ions that are produced are entrained in the plasma gas and introduced, by means of an interface, into a mass spectrometer. The ions are sorted according to their mass to charge ratios and quantified with a channel mass spectrometer.

This SOP is based on the following methods: EPA Method 200.8, EPA Method 6020A, and EPA Method 6020B.

3.0 Definitions

Refer to the Glossary Section of the *Quality Assurance Manual* (QAM) for a complete listing of applicable definitions and acronyms.

4.0 Interferences

4.1 Procedural Interferences

4.1.1 Interferences may be caused by contaminants in solvents, reagents, glassware, and other sample processing apparatus and can make identification and/or quantification of the target analytes difficult.

4.1.2 All sample collection containers are single-use disposable containers which limits the potential for contamination. All non-disposable labware must be scrupulously cleaned in accordance with the posted Labware Cleaning Instructions to ensure it is free from contaminants and does not contribute artifacts.

4.1.3 High purity reagents and solvents are used to help minimize interference problems. Hydrochloric acid and nitric acid must be verified prior to use in accordance with the Eurofins TestAmerica Solvent Lot Testing Program.

4.1.4 Instrument and/or method blanks are routinely used to demonstrate all reagents and apparatus are free from interferences under the conditions of the analysis.

4.2 Matrix Interferences

4.2.1 Matrix interferences may be caused by contaminants that are co-extracted from the sample matrix. The sample may require cleanup such as filtration or dilution prior to analysis to reduce or eliminate the interferences.

4.2.2 Interfering contamination may occur when a sample containing low concentrations of analytes is analyzed immediately following a sample containing relatively high concentrations of analytes. As such, samples known to be clean should be analyzed first. To prevent carryover into subsequent samples, analysis of reagent blanks may be needed after the analysis of a sample containing high concentrations of analytes.

4.2.3 Isobaric elemental interferences in the ICP-MS are caused by isotopes of different elements forming atomic ions with the same nominal mass-to-charge ratio (m/z) as the target analyte. These can be managed by the selection of an alternate isotope or by the use of elemental interference equations. Most isobaric interferences that could affect the ICP-MS analysis for elements in this SOP have been identified. The basic elemental interference equations are based on natural isotopic abundances. The most precise coefficients for an instrument must be determined from the ratio of the net isotope signals that are observed for a known standard solution at a concentration sufficient to produce suitable counting statistics.

4.2.4 Physical interferences are effects associated with the sample nebulization and transport processes as well as ion-transmission efficiencies. Changes in viscosity can cause significant inaccuracies, especially in samples containing high concentrations of dissolved solids or high acid concentrations. These changes in matrix can cause significant signal suppression or enhancement. Dissolved solids can deposit on nebulizer tips and interface cones (reducing the orifice size and the instrument's performance). Internal standards can be used to correct for physical interferences if they are carefully matched to the analyte so that both elements react similarly to the matrix changes.

4.2.5 Memory interferences can occur when analytes from a previous sample contribute to signals measured from subsequent samples. The memory effects can result from analyte deposition of sample on the sample tubing, joints, nebulizer, spray chamber, torch, and/or interface cones. Routine maintenance on the sample introduction system is necessary in order to minimize the memory interferences. The memory effects must be taken into account when setting up a suitable rinse times. The evaluation of a minimum of three replicate integrations will help to determine memory problems.

5.0 Safety

Employees must abide by the policies and procedures in the Eurofins TestAmerica Environmental Health and Safety Manual (EHSM), the Eurofins TestAmerica Savannah Addendum to the EHSM, and this document.

This procedure may involve hazardous materials, operations, and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user to follow appropriate safety, waste disposal, and health practices under the assumption that all samples and reagents are potentially hazardous.

The analyst must protect himself/herself from exposure to the sample matrix. Many of the samples that are tested may contain hazardous chemical compounds or biological organisms. The analyst must, at a minimum, wear protective clothing (lab coat), eye protection (safety glasses or face shield), disposable gloves, and closed-toe, nonabsorbent shoes when handling samples.

5.1 Specific Safety Concerns or Requirements

Nitric and hydrochloric acids are extremely hazardous as oxidizers, corrosives, poisons, and are reactive. Inhalation of the vapors can cause coughing, choking, irritation of the nose, throat, and respiratory tract, breathing difficulties, and lead to pneumonia and pulmonary edema. Contact with the skin can cause severe burns, redness, and pain. Nitric acid can cause deep ulcers, and staining of the skin to a yellow or yellow-brown color. These acid vapors are irritating and can cause damage to the eyes. Contact with the eyes can cause permanent damage.

Samples that contain high concentrations of carbonates or organic matter, or samples that are at elevated pH can react violently when acids are added. Acids must be added to samples under a hood to avoid splash/splatter hazards and/or possibly toxic vapors that will be given off when the samples are acidified.

5.2 Primary Materials Used

The following is a list of the materials used in this procedure, which have a serious or significant hazard rating, and a summary of the primary hazards listed in their MSDS/SDS.

NOTE: This list does not include all materials used in the procedure. A complete list of materials used in this procedure can be found in the Reagents and Standards Section and the Equipment and Supplies Section of this SOP

Employees must review the information in the MSDS/SDS for each material before using it for the first time or when there are major changes to the MSDS/SDS. Electronic copies of MSDS/SDS can be found using the “MSDS” button on the Oasis homepage, on the EH&S webpage on Oasis, and via TALS File System Shares.

Material	Hazards	Exposure Limit[1]	Signs and Symptoms of Exposure
Hydrochloric Acid[2]	Corrosive Poison	5ppm Ceiling	Inhalation of vapors can cause coughing, choking, inflammation of the nose, throat, and upper respiratory tract, and in severe cases, pulmonary edema, circulatory failure, and death. Can cause redness, pain, and severe skin burns. Vapors are irritating and may cause damage to the eyes. Contact may cause severe burns and permanent eye damage.
Nitric Acid[2]	Corrosive Oxidizer Poison	2ppm TWA 4ppm STEL	Nitric acid is extremely hazardous; it is corrosive, reactive, an oxidizer, and a poison. Inhalation of vapors can cause breathing difficulties and lead to pneumonia and pulmonary edema, which may be fatal. Other symptoms may include coughing, choking, and irritation of the nose, throat, and respiratory tract. Can cause redness, pain, and severe skin burns. Concentrated solutions cause deep ulcers and stain skin a yellow or yellow-brown color. Vapors are irritating and may cause damage to the eyes. Contact may cause severe burns and permanent eye damage.
[1]Exposure limit refers to the OSHA regulatory exposure limit.			
[2]Always add acid to water to prevent violent reactions.			

6.0 Equipment and Supplies

6.1 Equipment and Instrumentation

Agilent 7700 / 7900 (or equivalent) equipped with an Octopole Reaction System (ORS). The ORS is a small enclosed chamber that can be pressurized with a collision/reaction gas and mounted on-axis to the quadrapole for high ion transmission. The reaction gases used are:

Helium (UHP grade) - reduces both matrix based interferences, such as chlorides, and simple plasma based interferences, such as argon oxide or the doubly charged argon argon+, attributed from the argon plasma.

Hydrogen (UHP grade) - reduces the intense plasma-based interferences which the helium mode may not be efficient enough to correct for, such as argon hydride, argon gas, or argon oxide.

The ORS corrects for most of the interferences associated with a non-collision cell ICP-MS, but there are a few analytes that are evaluated in a “no gas” or normal mode that still require an interference equation. They are typically:

Cd 111: (1 * 111) - (0.00124 * 95)
Sn 115: (1 * 115) - (118 * 0.016)
Pb 208: (1 * 206) + (1 * 207) + (1 * 208)

If analyzing drinking water samples in "normal" mode only (no collision or reaction gas), then the following interference equations are recommended by the EPA. These equations are guidelines and can differ from instrument to instrument.

As 75: (1 * 75) - [(3.127 * 77) - (0.815 * 82)]
Cd 111: (1 * 111) - [(1.073 * 108) - (0.712 * 106)]
Pb 208: (1 * 206) + (1 * 207) + (1 * 208)
Mo 98: (1 * 98) - (0.146 * 99)
V 51: (1 * 51) - [(3.127 * 53) - (0.113 * 52)]
In 115: (1 * 115) - (0.016 * 118)

Data System: Chemstation and TALS are used to acquire, store, reduce, and output ICP mass spectral data. This software has the capability of processing stored ICP-MS data. The software allows for the calculation of concentrations of analytes using the calibration curve.
A Master Equipment Listing is maintained by the Quality Assurance Department. This listing contains information regarding software and firmware for all equipment utilized in the laboratory.

6.2 Volumetric Containers and Dispensers

All volumetric labware must be verified in accordance with SOP SA-AN-100: *Laboratory Support Equipment (Verification and Use).* Refer to Attachment 10 for Labware Cleaning Procedures.

Volumetric Labware	Volume	Type (Quantitative / Qualitative)	Use	Verification Frequency	Laboratory Verification Criteria
Autosampler Vials	50mL	Qualitative	Holding sample on instrument	None	None
Eppendorf-Style Mechanical Pipettes	Various	QUANTITATIVE	Preparing Dilutions, Standard and Reagent Preparation and Spiking	Quarterly (Daily for DOD)	Accuracy = 2% Precision = 1%
Volumetric Flasks (Class A)	Various	QUANTITATIVE	Preparing Dilutions, Standard and Reagent Preparation	None (Class A)	None (Class A)

6.3 Lab Supplies

Argon gas supply and appropriate fittings

Cooling water supply

Hydrogen gas (UHP)

Helium gas (UHP)

Detergent – Citranox or comparable cleaner, used for washing non-disposable labware.

Filters – 0.45um syringe filters, used to filter samples for dissolved metals in the lab. Also used to remove particulates from sample digestions.

6.4 Sample Collection Containers

All sample collection containers are single-use disposable containers which limits the potential for contamination.

The routine sample collection containers supplied by the laboratory are:

Waters:
Total Metals:
250mL plastic with nitric acid – purchased with Certificate of Analysis attesting to purity.
Dissolved Metals:
250mL plastic – purchased with Certificate of Analysis attesting to purity.

Soils:
8oz plastic soil jar – purchased with Certificate of Analysis attesting to purity.

7.0 Reagents and Standards

7.1 Expiration Dates

Expiration dates (time from initial use or receipt to final use) for standard and reagent materials must be set according to the guidance in this SOP. Note: These are maximum expiration dates and are not to be considered an absolute guarantee of standard or reagent quality. Sound judgment must be used when deciding whether to use a standard or reagent. If there is doubt about the quality of a standard or reagent material, a new material must be obtained or the standard or reagent material verified. Data quality must not be compromised to extend a standard's life.

The expiration date of any standard or reagent must not exceed the expiration date of the standard or reagent that was used to prepare it.

7.2 Reagents

Reagents must be prepared and documented in accordance with SOP SA-AN-041*: Reagent and Standard Materials Procedures.*

Hydrochloric acid and nitric acid must be verified prior to use in accordance with the Eurofins TestAmerica Solvent Lot Testing Program.

Laboratory Reagent Water – ASTM Type II or better; water from the Modulab filtration system (i.e., ASTM Type I) should be used as the default.

Nitric Acid (HNO_3) - trace metal grade.

Storage: Store in a cool, dry, ventilated storage area with acid resistant floors and good drainage. Store away from sunlight, heat, water, and incompatible materials. Stable under ordinary conditions of use and storage.
Expiration: Manufacturer's expiration date

Hydrochloric Acid (HCl) - trace metal grade.
Storage: Store in a cool, dry, ventilated storage area with acid resistant floors and good drainage. Store away from sunlight, heat, water, and incompatible materials. Stable under ordinary conditions of use and storage.
Expiration: Manufacturer's expiration date

7.3 Standards

Standards must be prepared and documented in accordance with SOP SA-AN-041*: Reagent and Standard Materials Procedures.* Certificates of analysis or purity must be received with all purchased standards, and scanned and attached in TALS.

7.3.1 Calibration Stock Standards

The following individual analytes are purchased at the concentrations listed:
Aluminum – 10000mg/L
Antimony – 1000mg/L
Arsenic – 1000mg/L
Barium – 1000mg/L
Beryllium – 1000mg/L
Boron – 1000mg/L
Cadmium – 1000mg/L
Calcium – 10000mg/L
Chromium – 1000mg/L
Cobalt – 1000mg/L
Copper – 1000mg/L
Iron – 10000mg/L
Lead – 1000mg/L
Magnesium – 10000mg/L
Manganese – 1000mg/L
Mercury – 1000mg/L
Molybdenum – 1000mg/L
Nickel – 1000mg/L
Potassium – 10000mg/L
Selenium – 1000mg/L
Silver – 1000mg/L
Sodium – 10000mg/L
Strontium – 1000mg/L
Thallium – 1000mg/L
Tin – 1000mg/L
Titanium – 1000mg/L
Vanadium – 1000mg/L
Zinc – 1000mg/L
Uranium – 1000ug/L
Thorium – 1000ug/L

Storage: room temperature
Expiration: opened and unopened containers are given the manufacturer's expiration date

7.3.2 Initial Calibration Verification Stock Standards

The following individual analytes are routinely purchased from Absolute standards (this standard must be purchased from a vendor different than the vendor of the calibration standards) at the concentrations listed:

Aluminum – 10000mg/L
Antimony – 1000mg/L
Arsenic – 1000mg/L
Barium – 1000mg/L
Beryllium – 1000mg/L
Boron – 1000mg/L
Cadmium – 1000mg/L
Calcium – 10000mg/L
Chromium – 1000mg/L
Cobalt – 1000mg/L
Copper – 1000mg/L
Iron – 10000mg/L
Lead – 1000mg/L
Magnesium – 10000mg/L
Manganese – 1000mg/L
Mercury – 100mg/L
Molybdenum – 1000mg/L
Nickel – 1000mg/L
Potassium – 10000mg/L
Selenium – 1000mg/L
Silver – 1000mg/L
Sodium – 10000mg/L
Strontium – 1000mg/L
Thallium – 1000mg/L
Tin – 1000mg/L
Titanium – 1000mg/L
Vanadium – 1000mg/L
Zinc – 1000mg/L
Uranium – 1000ug/L
Thorium – 1000ug/L

Storage: room temperature
Expiration: opened and unopened containers are given the manufacturer's expiration date

7.3.3 Interference Check Standard

A/B Stock Standards:

Solution Component	Concentration Solution A (mg/L)	Concentration Solution B (mg/L)
Aluminum (Al)	1000	
Calcium (Ca)	1000	
Iron (Fe)	1000	
Magnesium (Mg)	1000	
Sodium (Na)	1000	
Phosphorus (P)	1000	
Potassium (K)	1000	
Sulfur (S)	1000	
Carbon (C)	2000	
Chloride (Cl)	10000	
Molybdenum (Mo)	20	
Titanium (Ti)	20	
Arsenic (As)		10
Cadmium (Cd)		10
Chromium (Cr)		10
Cobalt (Co)		10
Copper (Cu)		10
Manganese (Mn)		10
Nickel (Ni)		10
Silver (Ag)		10
Zinc (Zn)		10

Storage: room temperature
Expiration: opened and unopened containers are given the manufacturer's expiration date

7.3.4 Internal Standard Stock Standard

The following elements are used as the internal standards: Bi, In, Li6, Sc, Tb, Y, Ho, and Ge. A mixed standard containing all elements is purchased from a vendor at a concentration of 10mg/L.

Storage: room temperature
Expiration: opened and unopened containers are given the manufacturer's expiration date

7.3.5 Prepared Standards

Refer to Attachment 7 for information on prepared standards.

8.0 Sample Collection, Preservation, Shipment, and Storage

8.1 Water Samples

8.1.1 Total Metals

Water samples are routinely collected in 250mL plastic containers containing 3mL of a 1:3 nitric acid preservative. The preservative should be sufficient to achieve a sample pH of less than 2.

Although no temperature preservation is required, samples are routinely iced at the time of collection at 0-6°C (less than 6°C but not frozen). Samples are stored at room temperature until the time of digestion. Samples must be digested and analyzed within 6 months of collection, unless mercury is requested. Samples for mercury analysis must be digested and analyzed within 28 days of sample collection. Digestates are stored at room temperature until the time of analysis.

NCMs must be initiated for samples collected in improper containers and containing improper or insufficient preservatives.

8.1.2 Dissolved Metals

Water samples for dissolved metals are routinely filtered at the time of sampling and collected in 250mL plastic containers containing 3mL of a 1:3 nitric acid preservative. The preservative should be sufficient to achieve a sample pH of less than 2.

Note: If the sample is to be filtered in the laboratory, the sample must be collected in 250mL plastic container with no preservatives. Once filtered, the laboratory will add nitric acid to obtain a pH of less than 2. Unpreserved water samples that are to be filtered in the laboratory must be iced at the time of collection at 0-6°C (less than 6°C but not frozen). The samples must be kept refrigerated until the time of filtration and preservation.

> Note: The reference methods state that filtration must occur immediately; therefore, if the laboratory is requested to filter the samples - as opposed to a field filtration - appropriate narration must be included in the final report to denote this method deviation.

Although no temperature preservation is required when the samples are preserved with nitric acid, samples are routinely iced at the time of collection at 0-6°C (less than 6°C but not frozen). Samples are stored at room temperature until the time of digestion. Samples must be digested and analyzed within 6 months of collection, unless mercury is requested. Samples for mercury analysis must be digested and analyzed within 28 days of sample collection. Digestates are stored at room temperature until the time of analysis.

NCMs must be initiated for samples collected in improper containers and containing improper or insufficient preservatives.

8.2 Soil Samples

Soil samples are routinely collected in 8oz plastic soil containers.

Samples must be iced at the time of collection and maintained at 0-6°C (less than 6°C but not frozen) until the time of digestion and analysis. Samples must be digested and analyzed within 6 months of collection, unless mercury is requested. Samples for mercury analysis must be digested and analyzed within 28 days of sample collection. Digestates are stored at room temperature until the time of analysis.

9.0 Quality Control

SOP SA-QA-017: *Evaluation of Batch QC Data* and the SOP Summary in Attachment 3 provide requirements for evaluating QC data.

9.1 Batch QC

9.1.1 EPA 200.8 – Drinking Water

A digestion batch consists of up to 20 environmental samples and the associated QC items digested together within a 24 hour period.

The minimum QC items required for each digestion batch are: a method blank, a laboratory control sample (LCS), a low-level LCS (LLCS), a matrix spike (MS) to be performed on a minimum of 10% of samples or one per batch – whichever is greater, and a matrix spike duplicate (MSD).

This frequency equates to the following:

- For a batch of 10 or fewer samples, the minimum QC items are a method blank, an LCS, an LLCS, 1 matrix spike, and 1 matrix spike duplicate.
- For a batch of 11-20 samples, the minimum QC items are a method blank, an LCS, an LLCS, 1 matrix spike (from sample 1-10), another matrix spike (from sample 11-20), and a matrix spike duplicate.

The routine container supplied for this method is a 250mL container. 50mL is required for digestion. Reduced sample initial volumes may be necessary to achieve the required batch matrix spike frequency; however, the minimum digestion volume to be used for the matrix spike samples is 25mL. Note: Final volumes and spike amounts must be adjusted to compensate for these reduced initial volumes.

If there is insufficient sample volume to perform the required matrix spike(s), the LCS must be prepared in duplicate (i.e., LCSD). An NCM must be initiated on all affected samples to denote this situation. Insufficient sample volume is defined as receiving less than a total of 100mL.

Note: If an LCS and LCSD are performed, both QC items must be evaluated and reported. Acceptable recoveries (as well as %RPD) for both LCS and LCSD are required.

The sample preparation and digestion procedures are listed in the following SOPs:

Matrix	SOP
Aqueous samples	SA-ME-050

Batch QC must meet the criteria given in Attachment 3 of this SOP.

9.1.2 EPA 200.8 – Clean Water Act

An extraction batch consists of up to 20 environmental samples and the associated QC items extracted together within a 24 hour period.

The minimum QC items required for each extraction batch are: a method blank, a laboratory control sample (LCS), a matrix spike (MS) to be performed on a minimum of 10% of samples or one per batch – whichever is greater, and a matrix spike duplicate (MSD).

This frequency equates to the following:

- For a batch of 10 or fewer samples, the minimum QC items are a method blank, an LCS, 1 matrix spike, and 1 matrix spike duplicate.
- For a batch of 11-20 samples, the minimum QC items are a method blank, an LCS, 1 matrix spike (from sample 1-10), another matrix spike (from sample 11-20), and a matrix spike duplicate.

The routine container supplied for this method is a 250mL container. 50mL is required for extraction. Reduced sample initial volumes may be necessary to achieve the required batch matrix spike frequency; however, the minimum extraction volume to be used for the matrix spike samples is 25mL. Note: Final volumes and spike amounts must be adjusted to compensate for these reduced initial volumes.

If there is insufficient sample volume to perform the required matrix spike(s), the LCS must be prepared in duplicate (i.e., LCSD). An NCM must be initiated on all affected samples to denote this situation. Insufficient sample volume is defined as receiving less than a total of 100mL.

Note: If an LCS and LCSD are performed, both QC items must be evaluated and reported. Acceptable recoveries (as well as %RPD) for both LCS and LCSD are required.

The sample preparation and digestion procedures are listed in the following SOPs:

Matrix	SOP
Aqueous samples	SA-ME-050

Batch QC must meet the criteria given in Attachment 3 of the associated analytical SOP.

9.1.3 EPA 6020A and EPA 6020B

A digestion batch consists of up to 20 environmental samples and the associated QC items. The minimum QC items required for each digestion batch are: a method blank, a laboratory control sample (LCS), a matrix spike (MS), and a matrix spike duplicate (MSD) or a sample duplicate.

If there is insufficient sample to perform the MS/MSD or sample duplicate, an NCM must be initiated on all affected samples to denote this situation.

The routine container supplied for this method is a 250mL container. 50mL is required for digestion. Reduced sample initial volumes may be necessary to achieve the required batch matrix spike frequency; however, the minimum digestion volume to be used for the matrix spike samples is 25mL. Note: Final volumes and spike amounts must be adjusted to compensate for these reduced initial volumes.

If there is insufficient sample volume to perform the required matrix spike(s), the LCS must be prepared in duplicate (i.e., LCSD). An NCM must be initiated on all affected samples to denote this situation. Insufficient sample volume is defined as receiving less than a total of 100mL.

Note: If an LCS and LCSD are performed, both QC items must be evaluated and reported. Acceptable recoveries (as well as %RPD) for both LCS and LCSD are required.

The sample preparation and digestion procedures are listed in the following SOPs:

Matrix	SOP
Water samples	SA-ME-050
Soil samples	SA-ME-051

Batch QC must meet the criteria given in Attachment 3 of this SOP.

9.2 Instrument QC

9.2.1 Initial Calibration (ICAL)

The instrument must be calibrated daily in accordance with SOP SA-QA-016: *Evaluation of Calibration Curves.* This SOP provides requirements for establishing the calibration curve and gives the applicable formulas.

Instrument calibration is performed by analyzing a series of known standards. The methods require the calibration curve to consist of a minimum of a single standard and a blank; however, a multi-point calibration is used for all analytes.

Refer to Attachment 7 for the standard preparation instructions. Other standard concentrations may be used provided they support the reporting limit and are fully documented in accordance with SOP SA-AN-041.

Tabulate the concentrations and corresponding responses for each analyte. Establish a calibration curve by plotting the concentration along the x-axis and the corresponding response along the y-axis.

The regression coefficient (r^2) of the regression curve must be greater than 0.998 for the initial calibration curve to be acceptable.

9.2.2 Second Source Initial Calibration Verification (ICV)

Each calibration curve must be verified initially – prior to any sample analyses – in accordance with SOP SA-QA-016 with a standard obtained from a second source.

The ICV must be within +/-10% to be acceptable.

Refer to Attachment 7 for the standard preparation instructions. Another standard concentration may be used provided it is mid-level and fully documented in accordance with SOP SA-AN-041.

9.2.3 Initial Calibration Blank (ICB) / Continuing Calibration Blank (CCB)

The instrument must be shown to be free from contamination by the analysis of calibration blanks. Initial calibration blanks are analyzed at the beginning of each analytical run immediately following the ICV. Continuing calibration blanks are analyzed every 10 analyses immediately following each CCV.

Initial and continuing calibration blanks must be <1/2RL to be acceptable.

9.2.4 Continuing Calibration Verification

The initial calibration curve must be verified before and after every 10 analyses with a mid-level standard.

The CCV must be within +/-10% to be acceptable.

Refer to Attachment 7 for the standard preparation instructions. Another standard concentration may be used provided it is mid-level and fully documented in accordance with SOP SA-AN-041.

9.2.5 Interference Check Standard (ICSA and ICSAB)

The purpose of the Interference Check Standard is to prove that the instrument software is adequately correcting for common interferences through the use interelement correction factors. This check must be performed at the beginning of each analysis run. The concentrations of the target analytes must be within 20% of the true concentrations to be acceptable. The analyst must pay particular attention to false positives and false negatives for elements not present in the interference check solutions. Unspiked analytes should be less than two times the RL.

Note: The vendor has acknowledged trace impurities in the ICSA and ICSAB solution for the following analytes: Cadmium, Cobalt, Chromium, Strontium, Lead, and Manganese. As such, the presence of these analytes is not indicative of a matrix interference.

Note: WI DNR requires qualification of results if there is any detection in the ICSA for unspiked elements at or above the absolute value of the WI LOQ (i.e., 3.3 times the MDL).

9.2.6 Internal Standard (ISTD)

This procedure utilizes internals standards. See Attachment 7 for the concentrations and masses of the internal standard elements.

The internal standard solution is added to all standards, samples, and QC items by way of a peristaltic pump, a “T” connector, and a mixing coil at the instrument. The solution used is 1mg/L for each of the internal standard elements. Other concentrations may be used provided it is mid-level and fully documented in accordance with SOP SA-AN-041.

9.2.6.1 EPA 200.8

The response of the internal standard in all samples and QC items must be within 60-125% of the response of the internal standard in the calibration blank. If the response is outside this range, flush the instrument with rinse blank and re-analyze the calibration blank. If the responses are within limits, re-analyze the samples at a dilution of 2.

9.2.6.2 EPA 6020A and EPA 6020B

The response of the internal standard in all samples and QC items must not fall outside 30-150% of the response of the internal standard in the initial calibration standard. If the response is outside this range for instrument QC, terminate the analysis, correct the problem, and re-calibrate. If the response is outside this range for samples, re-analyze the sample at a dilution of 5.

9.2.7 Post Digestion Spike (PDS)

A post-digestion spike is performed on one sample per analytical batch to determine if matrix interferences are present. This post-digestion spike is evaluated if the serial dilution fails or if the analyte concentration is not at least 50 times the instrument detection limit. This should be the same sample selected for the serial dilution in Section 9.2.7.

9.2.7.1 Transfer 10mL of a digestate to a suitable vial.

9.2.7.2 Spike the sample with 20uL of the ICP-MS Calibration Stock Standard.

9.2.7.3 Analyze the spiked aliquot and an un-spiked aliquot (the un-spiked may have been analyzed previously and does not need to be reanalyzed).

9.2.7.4 Calculate the percent recovery of the post digestion spike as follows:

$$\%REC = \frac{C_{ps} - C_s}{C_2} \times 100$$

Where: C_{ps} = concentration of post digestion spike (ug/L)
C_s = concentration of un-spiked sample (ug/L)
C_2 = theoretical concentration of spike (ug/L)
(Refer to Attachment 7)

9.2.7.5 Evaluate the recovery using the following decision matrix. Limits for post digestion spikes are 80-120%.

Result of Post Digestion Spikes	Action
Within 80-120% limits	None
>120% recovery	Repeat analysis. Remake spiking solutions, re-spike, and reanalyze. Reanalyze un-spiked sample.
<80% recovery but >50% recovery	1) Dilute and re-spike. Elevate RL accordingly (for all associated samples). 2) Spike and evaluate all associated samples. 3) Spike and evaluate all associated samples by single point MSA. 4) Qualify all associated samples.
<50% recovery	Dilute digestate and repeat spike. ***Treat all samples associated with spike in the same manner as the spiked sample (i.e., spike or dilute samples).*** If recoveries are not 80-120%, analyze all associated samples by single point MSA. Note – high level of target analytes may inhibit spike recovery. Consult the supervisor in events where high levels of targets appear to be interfering.

Note: The >50% recovery of the post digestion spike is a benchmark below which samples may be biased high if corrected for spike recovery.

9.2.7.6 The post digestion spike and the method of standard additions must not be applied to samples analyzed at a dilution that produces a significant negative response. The analyst must use good judgment when evaluating data where the sample response is negative. Where a significant negative response is present, the digestate should be diluted and reanalyzed to determine the extent of the matrix interferences. If necessary, adjust the interference corrections and reanalyze the samples.

9.2.8 Single Point Method of Standard Additions (MSA)

The Method of Standard Additions (MSA) is performed for TCLP samples and when the post-digestion spike is less than 50%. Perform the MSA as follows:

Two identical aliquots of the sample digest, V_x, are taken. One aliquot is spiked with a solution of known concentration, C_s. The second aliquot is analyzed un-spiked (the small volume of standard added to the spiked sample should be disregarded). The concentration of both aliquots is measured and the sample concentration, C_x, is calculated as follows:

$$C_x = \frac{S_2 V_s C_s}{(S_1 - S_2) V_x}$$

Where: S_1 = absorbance or concentration of the spiked aliquot
S_2 = absorbance or concentration of the un-spiked aliquot
Vs = volume of spike solution

Example:		
	Sample concentration (S_2):	523ug/L.
	Spike solution concentration (C_s):	50,000ug/L
	Volume of spike solution (V_s):	0.10mL
	Volume of sample aliquots (V_x):	10mL
	Spiked sample concentration (S_1):	951ug/L

C_x = [(523)*(0.10)*(50,000)] / [(951-523)*10)] = [2,615,000]/[4280] = 611 ug/L

9.2.9 Dilution Test (Serial Dilution)

A 1/5 dilution is prepared and analyzed on one sample per batch to determine if matrix interferences are present.

9.2.9.1 Select a sample digestate that contains one or more target analytes at concentrations greater than 50 times the method detection limit.

9.2.9.2 Dilute the digestate by a factor of 5, and analyze the dilution using the same procedures used for the un-diluted aliquot.

9.2.9.3 Compare the results of the diluted and un-diluted aliquots of sample digestate.

9.2.9.4 If the results of the dilution are within +/-10% of the results of the undiluted sample, no matrix interference is present. If the results differ by greater than +/-10%, matrix interference should be suspected.

9.2.10 Determination of Linear Range of the ICP-MS

If the instrument is not calibrated over its entire linear range for a particular element, a linear range standard must be analyzed daily to validate the linear range.

9.2.10.1 The ICSA solution is utilized as a linear range standard for those elements included in the solution. For elements not contained in the ICSA solution, a linear range standard must be prepared and analyzed.

9.2.10.2 Prepare the standard at concentrations that are expected to define the linear range of the instrument. The calibration standards and the linear range standards must be matrix matched; that is, they have the same percentage of hydrochloric and nitric acids.

9.2.10.3 Analyze the standard(s) after the initial calibration is validated.

9.2.10.4 Compare the concentration of the linear range standard with its true concentration using the following equation:

$$PercentDifference = \left| \frac{Ccal - Ctrue}{Ctrue} \right| \otimes 100$$

Where:
C_{cal} = concentration determined from analysis
C_{true} = true concentration of the standard

If the percent difference is less than or equal to 10%, the linear range is confirmed at that concentration. If the percent difference is greater than 10%, repeat the analysis with a lower concentration. For elements validated in this manner, data may be reported up to 90% of that linear range before a dilution is required.

9.3 Corrective Action for Out-of-Control Data

When the quality control parameters do not meet the criteria set forth in this SOP, corrective action must be taken in accordance with SOP SA-QA-005: *Preventive and Corrective Action Procedures* the QC Summary Table in Attachment 3. SOP SA-QA-005 provides contingencies for out-of-control data and gives guidance for exceptionally permitting departures from approved policies and procedures. Nonconformance Memos must be initiated to document all instances where QC criteria are not met and all departures from approved policies and procedures.

10.0 Procedure

10.1 Sample Preparation

The sample preparation procedures are given in the following SOPs:

Matrix	SOP #
Aqueous Samples	SA-ME-050
Soil Samples	SA-ME-051

10.2 QC Sample Preparation

The QC sample preparation procedures are given in the following SOPs:

Matrix	SOP #
Aqueous Samples	SA-ME-050
Soil Samples	SA-ME-051

10.3 Analysis

10.3.1 Instrument Operating Conditions

The instrument conditions listed in this SOP are provided for guidance purposes. The actual conditions used by the laboratory may be slightly different from those listed here and must be documented in the instrument maintenance log, data system, and/or run log.

Instrument maintenance must be performed in accordance with Attachment 4 of this SOP. Turn the ICP-MS on and initiate the tune screen. Start the tune screen to allow the instrument to become thermally stable before analyzing the calibration standards. While the instrument is warming up, if the sample and skimmer cones are new or have been cleaned, aspirate the interference check solution (or similar solution) for about 15 minutes to pre-condition the cones.

Aspirate a 1ppb solution containing Lithium 7, Cesium, Yttrium, and Thallium.
An autotune using the “Start Up” function is performed before every calibration. This autotune process will optimize the following:

- Torch Axis
- EM
- Plasma Correction
- Resolution / Axis
- Performance Report
- P/A (Pulse to Analog)

The performance report should be reviewed and should meet the following conditions:

- Sensitivity: should yield counts greater than 1500 for Li7 and 2500 for Y and Tl
- Precision: should be less than 10% RSD of 200 replicates
- Oxides: must be less than 3% as CeO
- Doubly charged ions: must be less than 10%

10.3.1.2 Analyze the calibration standards and calibrate the ICP-MS in accordance with SOP SA-QA-016: *Evaluation of Calibration Curves.*

10.3.2 Internal Standard (ISTD)

Prior to analysis, internal standards must be added to all standards, samples, and QC items. The concentration of the internal standard must be the same in all calibration samples, field samples, and QC samples. The internal standard solution is added at the time of analysis by using a peristaltic pump, a "T" connection, and a mixing coil that is inserted in the sample uptake line before the instrument's nebulizer. The concentration of the internal standard solution is listed in Attachment 7 of this document.

10.3.3 Initial and Continuing Calibration Verifications

Calibrate the instrument using the standards and criteria described given in Section 9.2. Once the calibration has been established and verified with an ICV in accordance with Section 9.2, sample analysis may proceed.

Verify the calibration curve with a continuing calibration verification using the standards and criteria described given in Section 9.2.

10.3.4 Sample Analysis

The samples/digestates must be analyzed using the same procedures as those used for the calibration standards.

Note: It is the laboratory's default procedure to analyze soil samples and non-drinking water samples at a dilution factor of 5. The dilution is prepared immediately preceding analysis by diluting 2mL of digestate to a 10mL final volume. These dilution factors are captured by adjusting the default final volume in the Method Limit Groups. Reporting limits and MDLs have been elevated accordingly.

The default procedure is to include QC items (method blank, LCS, MS/MSD, and SD) in determining the maximum number of samples in the sequence.

10.3.5 Example Analytical Sequence

Analytical Sequence for samples immediately following an initial calibration:

Description	Comments
Blank	
Initial Calibration	Lowest standard is at or below the RL
ICV	Second Source
ICB	
Samples & Batch QC Items	RL Check Standard, ICSA, ICSAB, up to 7 additional analyses.
CCV	
CCB	
Samples & Batch QC Items	Up to 10 analyses, including QC.
CCV	
CCB	

Analytical Sequence for samples not immediately following an initial calibration:

Description	Comments
CCV	
CCB	
Samples & Batch QC Items	ICSA, ICSAB (minimum of every 12 hours) Up to 8 additional analyses.
CCV	
CCB	
Samples & Batch QC Items	Up to 10 analyses, including QC.
CCV	
CCB	

Note: For EPA 6020A and EPA 6020B, if the analysis run proceeds for more than 12 hours after the preceding ICSA/ICSAB pair, the analyst must repeat the analysis of the ICSA and ICSAB solutions.

The "up to 10 analyses" includes analysis of all analytical and batch QC items with the exception of the CCV and CCB analyses.

11.0 Calculations / Data Reduction

11.1 Data Reduction

Data must be evaluated in accordance with SOP SA-QA-002: *Data Generation and Review*.

11.1.1 Dilutions

If the concentration of a sample is above the calibration range (or linear range for single point curves) of the instrument the sample digestate must be diluted and reanalyzed.

11.1.2 Historical Data

Many of the laboratory's clients submit samples for repeat monitoring purposes. Prior to analysis, verify TALS Worksheet Notes to determine if historical data is available for review.

11.1.3 Chemical Relationships

When available, the following chemical relationships must be evaluated for each sample. If these relationships are not met the Supervisor must be contacted immediately.

- Total Results are ≥ Dissolved results (e.g. metals)

11.1.4 Drinking Water Compliance Evaluation

Public water suppliers (PWS) are governed by EPA-specified Maximum Contaminant Levels (MCL) above which indicates noncompliance. Many analytes also have a Maximum Contaminant Level Goal (MCLG), which is often lower than the MCL. The MCLs and MCLGs associated with this procedure are given in Attachment 8.

11.2 Calculations

11.2.1 The calculations associated with batch QC determinations are given in SOP SA-QA-017. Applicable calculations include accuracy (% recovery) and precision (%RPD).

11.2.2 The calculations associated with initial and continuing calibrations and are given in SOP SA-QA-016. Applicable calculations include determination for: calibration factor, standard deviation, relative standard deviation, relative response factor, and relative standard deviation.

11.2.3 The calculation to determine final concentration is given as follows:

Regression Curve:

$$FinalConcentration = CONC_{Sample} \otimes \frac{F}{I \times dw} \otimes D$$

Where:

$CONC_{Sample}$= Concentration of the sample
F = Final volume/weight
I = Initial volume/weight
D = Dilution factor
dw = % Solids decimal equivalent

Note: All dry weight corrections are performed automatically in TALS.

Note: This calculation assumes all applicable unit correction factors are applied.

12.0 Method Performance

12.1 Reporting Limit Verification (RLV)

At a minimum, RLVs must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

For analytes and methods certified by DOD ELAP, RLVs must also be performed quarterly thereafter. For analytes and methods certified by NELAC, RLVs must also be performed annually thereafter. Exceptions may be made for project-specific non-routine analytes.

12.1.1 Lower Limit of Quantitation Check (QCS)

EPA 6020A and EPA 6020B require a Lower Limit of Quantitation Check (LLQC) to be performed after establishing the reporting limit and on an as needed basis to demonstrate sensitivity. As such, the laboratory requires a Low-Level LCS (spiked at the reporting limit) to be performed annually, at a minimum. The recovery of the LLCS must be within 70-130% of the true value, or the reporting limit must be re-evaluated and elevated accordingly.

12.2 Method Detection Limit (MDL) Study

The MDL is the lowest concentration that can be detected for a given analytical method and sample matrix with 99% confidence that the analyte is present. MDLs reflect a calculated (statistical) value determined under ideal laboratory conditions in a clean matrix and may not be achievable in all environmental matrices. The current MDLs associated with this procedure are given in the Method Limit Group (MLG) in TALS.

At a minimum, MDL Studies must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

Note: MDL Studies are not required for non-routine analytes provided results are not reported below the RL (i.e., MDL equals RL in TALS).

12.3 Method Detection Limit Verification (MDLV)

At a minimum, MDLVs must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

For analytes and methods certified by DOD ELAP, MDLVs must also be performed quarterly thereafter. For analytes and methods certified by NELAC, MDLVs must also be performed annually thereafter.

Note: MDLVs are not required for non-routine analytes provided results are not reported below the RL (i.e., MDL equals RL in TALS).

12.4 Determination of the Instrument Detection Limit (IDL)

The instrument detection limit (IDL) is the concentration of analyte that can be statistically distinguished from the background noise of the instrument. The IDL limit must be determined quarterly, at a minimum, for each analyte in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits.*

The IDL for EPA 6020A and EPA 6020B is defined as three times the standard deviation of seven replicate analyses of a blank solution analyzed over three non-consecutive days. The IDL for EPA 200.8 is defined as the concentration equivalent to the analyte signal which is equal to three times the standard deviation of a series of eight replicate measurements of the calibration blank signal at the selected mass (es). The IDL may be

elevated above the background noise (blank levels). The current IDL associated with this procedure is given in the Equipment Limit Group (ELG) in TALS.

12.5 QC Limit Generation, Control Charting, and Trend Analysis

The control limits for the batch QC items (LCS and MS/MSD) for this procedure are specified in the reference method and cannot be broadened; therefore, the laboratory defaults to the method-defined limits and does not utilize in-house or laboratory-derived limits for the evaluation of batch QC items.

Although the laboratory must default to the method-defined QC limits, control charting is a useful tool and is performed to assess analyte recoveries over time to evaluate trends. Control charting must be performed periodically (at a minimum annually) in accordance with SOP SA-QA-017: *Evaluation of Batch QC Data.*

12.6 Demonstrations of Capability

Initial and continuing demonstration of capability must be performed in accordance with SOP SA-QA-006*: Training Procedures.*

Prior to performing this procedure unsupervised, each new analyst who performs this analysis must demonstrate proficiency per method/analyte combination by successful completion of an initial demonstration of capability. The IDOC is performed by the analysis of 4 consecutive LCSs that meet the method criteria for accuracy and precision. The IDOC must be documented and routed to the QA Department for filing.

Annual continuing demonstrations of capability (CDOCs) are also required per analyst per method/analyte combination. The CDOC requirement may be met by the consecutive analysis of four LCS all in the same batch, by the analysis of four LCS analyzed in four consecutive batches (in different batches on different days), via acceptable results on a PT study, or analysis of client samples with statistically indistinguishable results when compared to another certified analyst. The CDOC must be documented and routed to the QA Department for filing.

12.7 Training Requirements

All training must be performed and documented in accordance with SOP SA-QA-006: *Training Procedures*.

Note: The SOPs listed in the Reference/Cross-Reference Section are applicable to this procedure. All employees performing this procedure must also be trained on these SOPs, and/or have a general understanding of these procedures, as applicable.

13.0 Pollution Control

It is Eurofins TestAmerica's policy to evaluate each method and look for opportunities to minimize waste generated (e.g., examining recycling options, ordering chemicals based on quantity needed, preparing reagents based on anticipated usage and reagent stability,

etc.). Employees must abide by the policies in Section 13 of the Environmental Health and Safety Manual (EHSM) and the Savannah Addendum to the EHSM.

This procedure has been evaluated for opportunities to minimize the waste generated. Where reasonably feasible, pollution control procedures have been incorporated.

14.0 Waste Management

Waste management practices must be conducted consistent with all applicable federal, state, and local rules and regulations. All waste (i.e., excess reagents, samples, and method process wastes) must be disposed of in accordance with Section 9 of the Eurofins TestAmerica Savannah Addendum to the EHSM. Waste description rules and land disposal restrictions must be followed.

14.1 Waste Streams Produced by the Method

The following waste streams are produced when this method is carried out:

- Excess aqueous samples – Dispose according to characterization on the sample disposal sheets. Neutralize non-hazardous samples before disposal into drain/sewer. Transfer hazardous samples (identified on disposal sheets) to the waste department for disposal.

- Excess soil and solid samples – Dispose according to characterization on sample disposal sheets. Transfer non-hazardous samples to TCLP container for characterization in hazardous waste department. Transfer hazardous samples (identified on disposal sheets) to waste department for disposal.

- Acidic sample digestions – Neutralize before disposal into drain/sewer system.

Dispose of all metals standards with concentrations exceeding the TCLP threshold limits as a RCRA aqueous hazardous waste. The TCLP constituents and the respective threshold limits are:

Analyte	Disposal Limit (mg/L)
Arsenic	5.0
Barium	100
Cadmium	1.0
Chromium	5.0
Lead	5.0
Selenium	1.0
Silver	5.0
Mercury	0.20

Neutralize the standard by passing with sodium bicarbonate before transferring the waste to the RCRA aqueous hazardous waste drum.

All other metals standards may be disposed, using copious amounts of water, down a sink that flows to the neutralization pit.

16.0 Method Modifications

16.1 Incorporation of Other Matrices

This procedure may be modified to analyze other matrices (e.g., wipe, waste, tissue, filter, and TCLP/SPLP leachate samples) based on the needs of the client. This will need to be arranged by the Project Manager at the initiation of the project.

Wipe, waste, filter, and tissue matrices are non-routine, and the laboratory is not currently NELAC certified for these matrices. The laboratory uses its routine soil RLs (converted for initial and final volumes, etc.) and soil QC limits to evaluate wipe, waste, filter, and tissue samples. Soil DOCs can be used to satisfy analyst demonstrations of capability for these types of non-routine matrices. The laboratory uses its routine soil RLs (converted for

initial and final volumes, etc.) and soil QC limits to evaluate TCLP/SPLP leachate samples. Water DOCs can be used to satisfy analyst demonstrations of capability for TCLP/SPLP matrices. Teflon chips, Ottawa sand, or equivalent is used as the blank matrix for wipes, wastes, filters, and tissues unless specifically requested otherwise by the project.

16.1.1 Collection and Handling Procedures for Non-Routine Matrices

Waste samples may be collected in 8oz plastic soil jars; however, it should be noted that an alternate container may be required as some organic wastes (oils) may not be conducive to plastic. Tissue samples may be collected in 8oz plastic soil jars. Wipes and filters may be collected in a variety of different containers.

Wipe, waste, and filter samples must be iced at the time of collection and maintained at 0-6°C (less than 6°C but not frozen) until the time of digestion/leaching. Samples for mercury must be digested/leached and analyzed within 28 days of collection. All other samples must be digested and analyzed within 6 months of collection. Digestates may be stored at room temperature until the time of analysis.

Tissue samples must be iced at the time of collection and maintained at -10°C to -20°C for up to 6 months. Samples for mercury must be digested/leached and analyzed within 28 days of thawing. All other samples must be digested and analyzed within 6 months of thawing. Digestates may be stored at room temperature until the time of analysis.

Wipe, waste, filter, and tissue matrices are prepared in the same manner as soil samples with the following exceptions:

- The initial amount for wipe or filter samples is 1 wipe or 1 filter.
- The initial amount for tissue and waste samples is 1.0-1.2g.

Once the TCLP/SPLP extraction procedure has been performed, the TCLP/SPLP leachate must be transferred to a 500mL plastic container and preserved with 1.0mL nitric acid to a pH <2. Preserved TCLP/SPLP leachates are stored at room temperature until the time of digestion. The leachate sample must be digested within 6 months of completion of the TCLP/SPLP extraction. Digestates are stored at room temperature until the time of analysis and must be analyzed within 6 months of completion of the TCLP/SPLP extraction.

16.1.2 Preparation and Analytical Procedures for Non-Routine Matrices

Wipe, waste, filter, and tissue samples are prepared in the same manner as routine soil samples as outlined in SOP SA-ME-051. TCLP/SPLP matrices are prepared in the same manner as routine water samples as outlined in SOP SA-ME-050. Refer to the applicable preparation SOPs for more information.

Wipe, waste, filter, tissue, and TCLP/SPLP matrices are analyzed in the same manner as routine samples as outlined in this SOP.

16.2 Other Considerations

16.2.1 EPA 6020A and 6020B note to use gold as a preservative for mercury; however, the laboratory has not implemented this preservative. The instrument manufacturer's recommendations do not include this reagent if HCl is used in standards and samples. Additionally, initial method validation did not indicate this preservative was necessary to prevent carryover as intended by the method.

16.2.3 EPA 200.8 requires the regression coefficient (r^2) of the regression curve to be greater than 0.995 for the initial calibration curve to be acceptable. EPA 6020A requires the r^2 of the regression curve to be greater than 0.998 for the initial calibration curve to be acceptable. The laboratory has adopted the 0.998 criteria for all three methods.

16.2.4 The EPA Manual for the Certification of Laboratories Analyzing Drinking Water requires a LFB at the MRL to be performed each day. The laboratory meets this requirement by preparing an LCS at the RL in each EPA 200.8 batch of drinking water samples. The EPA DW Manual does not specify criteria for the low-level LCS; therefore, the laboratory defaults to qualitative identification.

16.12 There is no method-defined batch precision requirement for EPA 200.8. The EPA does require precision for all samples analyzed under the Clean Water Act, and the laboratory routinely performs an MSD to support clients who require precision to be reported. If insufficient sample volume is provided to perform the MS/MSD, the laboratory performs the LCS in duplicate (i.e., LCS/LCSD).

16.13 It is the laboratory's default procedure to analyze samples at a dilution factor of 5. The dilution is prepared immediately preceding analysis by diluting 2mL of digestate to a 10mL final volume. These dilution factors are captured by adjusting the default final volume in the Method Limit Groups. Reporting limits and MDLs have been elevated accordingly.

16.2.5 The reference methods state that, for dissolved metals analysis, filtration must occur in the field. The laboratory may be requested to filter the samples upon receipt. If this occurs, then appropriate narration must be included in the final report to denote this method deviation.

16.2.6 EPA has acknowledged there is an error in the EPA 6020A reference method regarding the ISTD criteria (in one section the lower limit is listed as 30%, and in another section it is listed as 70%). The laboratory has adopted a lower limit of 30%, as is consistent with EPA Method 6020B. Additionally, there is no upper limit specified in the reference method. The laboratory has adopted an upper limit of 150% to ensure corrective action is taken when extremely high ISTD recovery is noted in samples.

17.0 Attachments

The following Tables, Diagrams, and/or Validation Data are included as Attachments:

Attachment 1: SOP Summary
Attachment 2: Sample Collection, Preservation, and Holding Time Table
Attachment 3: QC Summary
Attachment 4: Instrument Maintenance and Troubleshooting
Attachment 5: Analysis Masses, Internal Standards, and Tune Steps
Attachment 6: Element-specific Masses and Concentrations
Attachment 7: Standard Preparation
Attachment 8: Drinking Water MCLGs and MCLs
Attachment 9: Hardness Calculation Work Instruction
Attachment 10: Glassware Cleaning Procedures

Attachment 1:
SOP Summary

Sample Preparation Summary
Prior to analysis by ICP-MS, the sample must be solubilized or digested using the sample preparation method appropriate to the matrix.

Samples should be prepared according to the appropriate matrix-specific SOP.

Matrix	SOP
Aqueous Samples	SA-ME-050
Soil Samples	SA-ME-051

Sample Analysis Summary
Sample digestates are aspirated and nebulized into a spray chamber. A stream of argon gas carries the sample aerosol through the innermost of three concentric tubes and injects it into the middle of the donut-shaped plasma. The sample elements are dissociated, atomized, and excited to a higher energy level. The ions that are produced are entrained in the plasma gas and introduced, by means of an interface, into a mass spectrometer. The ions are sorted according to their mass to charge ratios and quantified with a channel mass spectrometer.

Analytical Sequence

Analytical Sequence for samples immediately following an initial calibration:

Description	Comments
Blank	
Initial Calibration	Lowest standard is at or below the RL
ICV	Second Source
ICB	
Samples & Batch QC Items	RL Check Standard, ICSA, ICSAB, up to 7 additional analyses.
CCV	
CCB	
Samples & Batch QC Items	Up to 10 analyses, including QC.
CCV	
CCB	

Analytical Sequence for samples not immediately following an initial calibration:

Description	Comments
CCV	
CCB	
Samples & Batch QC Items	ICSA, ICSAB Up to 8 additional analyses.
CCV	
CCB	
Samples & Batch QC Items	Up to 10 analyses, including QC.
CCV	
CCB	

Note: For EPA 6020A, if the analysis run proceeds for more than 12 hours after the ICSA/ICSAB pair, the analyst must repeat the analysis of the ICSA and ICSAB solutions.

The “up to 10 analyses” includes analysis of all analytical and batch QC items with the exception of the CCV and CCB analyses.

Attachment 2:
Sample Collection, Preservation, and Holding Time Table

Matrix	Routine Sample Container	Routine Sample Size	Minimum Sample Size	Dechlorination Agent	Chemical Preservation	Thermal Preservation	Holding Time[2]
Water	250mL plastic	50mL	25mL	Not Applicable	3mL 1:3 HNO3, to pH<2	Not Applicable	Mercury: 28 days Other Metals: 6 months
Soil	8oz plastic soil jar	1.0g	0.5g	Not Applicable	Not Applicable	0-6 °C[1]	Mercury: 28 days Other Metals: 6 months

[1]Samples are collected on ice and maintained at <6 °C with no frozen samples.
[2] Inclusive of digestion and analysis.

Note: If dissolved metals are requested, the sample must be filtered prior to the acid being added to the sample.

Attachment 3:
QC Summary

QC Item	Frequency	Criteria	Corrective Action
Initial Calibration: minimum 1 standard and 1 blank	Daily	Correlation ≥0.998 (for multipoint curves)	Recalibrate
Initial Calibration Verification Standard (ICV)	At the beginning of the analysis	Within ±10%	Recalibrate
Continuing Calibration Verification Standard (CCV)	At the beginning and end of the analysis, and every 10 samples	Within ±10% of the true value	Terminate the analysis, fix the problem and reanalyze the previous 10 samples.
Interference Check Standards (ICSA/ICSAB)	At the beginning of an analysis run	± 20% of the true values Unspiked analytes should be less than two times the RL. WI DNR requires qualification for analytes > LOQ (i.e., 3.3x MDL)	Terminate the analysis, correct the problem, recalibrate, and reanalyze all samples since the last ICS that was in control.
Calibration Blank (ICB/CCB)	After ICV and every CCV	<½ RL	Terminate the analysis, correct problem and reanalyze the previous 10 samples
Internal Standard	All samples and QC items	Refer to Section 9.2.5	Refer to Section 9.2.5
Batch Definition	Digested together w/in 24-hr timeframe; not to exceed 20 field samples	Not Applicable	Not Applicable
Method Blank	One per batch	|result|<RL DOD requires |result|<½ RL	Redigest and reanalyze batch

QC Item	Frequency	Criteria	Corrective Action
Laboratory Control Sample (LCS)	One per batch	TALS MLG	Redigest and reanalyze batch
Laboratory Control Sample Duplicate (LCSD)	One per batch, if insufficient sample provided for MS/MSD	TALS MLG	Redigest and reanalyze batch
Low-Level Laboratory Control Sample (LLCS) – spiked at the RL	EPA 200.8 DW: One per batch of 20 samples or less	Qualitatively identified	If the "regular" LCS meets criteria, initiate NCM and report data If the "regular" LCS does not meet criteria, redigest and reanalyze batch
Lower Limit of Quantitation Check (LLQC) – spiked at the RL	EPA 6020A / EPA 6020B: Annually, at a minimum, and as needed thereafter	EPA 6020A: 70-130% EPA 6020B: 80-120%	Re-evaluate RL and elevate accordingly
Matrix Spike (MS)	EPA 200.8: 10% of samples prepared; i.e., 2 separate matrix spikes per batch of twenty samples EPA 6020A: 5% of samples prepared; i.e., 1 matrix spike per batch of twenty samples	TALS MLG	Flag and report data
Matrix Spike Duplicate (MSD) or Sample Duplicate (SD)	EPA 200.8 (Clean Water Act), EPA 6020A: One MSD or sample duplicate per batch of twenty samples or less	TALS MLG	Flag and report data

QC Item	Frequency	Criteria	Corrective Action
Serial Dilution (1/5 Dilution)	One per batch of twenty samples or less	Refer to Section 9.2.7	Refer to Section 9.2.7
Post Digestion Spike (PDS)	One per batch of twenty samples or less	Refer to Section 9.2.6	Refer to Section 9.2.6
Reporting Limit Check Solution	EPA 200.8 and EPA 6020B: At the beginning of analysis run EPA 6020B: At beginning and end of analysis run.	EPA 200.8: Recovery +/-50% of the true concentration (if the instrument is not calibrated at or below the RL) EPA 6020A: 70-130% of the true concentration (if the instrument is not calibrated at or below the RL). EPA 6020B: 80-120% of the true concentration (if the instrument is not calibrated at or below the RL).	Stop the analysis, fix the problem and reanalyze the affected samples.
Initial Demonstration of Capability (IDOC)	Initially, per analyst, per analyte/method/matrix combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006 Note: Unsupervised work must not begin until acceptable IDOC is obtained.
Continuing Demonstration of Capability	Annually, per analyst, per analyte/method combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006

QC Item	Frequency	Criteria	Corrective Action
(CDOC)			
Reporting Limit Verification (RLV)	Upon method/instrument set-up, per analyte/method/matrix combination. Then quarterly thereafter (for DOD ELAP) or annually thereafter (for NELAC)	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007
Method Detection Limit Study (MDL Study)	Upon method/instrument set-up, per analyte/method/matrix combination	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007
MDL Verification (MDLV)	Upon method/instrument set-up, per analyte/method/matrix combination. Then quarterly thereafter (for DOD ELAP) or annually thereafter (for NELAC)	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007

Attachment 4:
Instrument Maintenance and Troubleshooting

Instrument Labeling

Each instrument must be labeled with its name or ID (e.g., MSA, ICP-D, etc.). Additionally, non-operational instruments must be isolated from service or marked as being out of service. Each piece of equipment has an "Operational / Not Operational" sticker that is used for this purpose.

Maintenance Log

A maintenance log must be established for each piece of equipment used in the laboratory.

All maintenance that is performed on the instrument must be recorded in the log including:

- analyst or technician performing the maintenance
- date the maintenance was performed
- detailed explanation of the reason for the maintenance
- resolution of the problem and return to control
- all service calls from instrument representatives

Preventive Maintenance

Refer to the instrument manufacturer's guides for trouble-shooting items.

LABORATORY EQUIPMENT PREVENTIVE MAINTENANCE SCHEDULE

EQUIPMENT ITEM	Service Interval							SERVICE LEVEL
	D	W	M	Q	SA	A	AN	
Cones							X	Clean, as needed.
Intake							X	Wipe down as needed.
Lenses							X	Clean or replace as needed.
Nebulizer							X	Clean, as needed.
Pump Oil							X	Replace as needed.
Pump Tubing							X	Change as needed

D = daily; W = Weekly; M = monthly; Q = Quarterly; SA = semi-annually; A = annually; AN = as needed

Troubleshooting

Troubleshooting should be documented as outlined above. If possible, troubleshooting is best performed in a step-wise manner to systematically isolate instrument components. Refer to the instrument manufacturer's guides for specific information and strategies. Enlist assistance from technical and/or department management as needed.

Contingency Plan

Maintenance contracts are carried for most instrumentation and close contact is maintained with service personnel to ensure optimal instrument functioning. An extensive spare parts inventory is maintained for routine repairs, consisting of detectors, pump tubing, cones, lenses, torches, and other common instrumentation components. Since instrumentation is standardized throughout the laboratory network, spare parts and components can be readily exchanged among the network.

In general, the laboratory has at least one backup unit for each critical unit. In the event of instrument failure, portions of the sample load may be diverted to duplicate instrumentation, the analytical technique switched to an alternate approved technique (such as manual colorimetric determination as opposed to automated colorimetric determination), or samples shipped to another properly certified or approved Eurofins TestAmerica location.

Attachment 5:
Recommended Analysis Masses, Internal Standards, and Tune Steps

The following are the recommended analysis masses, internal standards, and tune steps:

Element	IS	Tune Step	Element	IS	Tune Step
Be 9	Li 6	1	Zn 66	Ge 74	3
B 11	Li 6	1	As 75	Ge 74	-3
Na 23	Sc 45	3	Se 78	Ge 74	2
Mg 24	Sc 45	3	Sr 88	Y 89	3
K 39	Ge 74	3	Mo 95	In 115	3
Ca 40	Sc 45	2	Ag 107	In 115	3
Ti 47	Sc 45	3	Cd 111	In 115	3
V 51	Ge 74	3	Sn 118	In 115	3
Cr 52	Ge 74	3	Sb 121	In 115	3
Mn 55	Ge 74	3	Ba 137	In 115	3
Fe 56	Sc 45	2	Hg 202	Bi 209	3
Co 59	Ge 74	3	Tl 205	Tb 159	3
Ni 60	Ge 74	3	Pb 208*	Tb 159	3
Cu 63	Ge 74	-3	U 238	Bi 209	1
Ca 44	Sc 45	3			

* Pb 208 = Pb 208 + Pb 207 + Pb 206

Note: Different masses and internal standards may be utilized, as matrix issues deem necessary.

Note: Agilent ICP-MS 7700 currently does not run H_2 reaction mode; only He collision mode and normal mode (no gas).

Tune Steps:
1. Normal mode: No gas
2. H_2 reaction mode: typical flows of 2.0 to 5.8 mL/min of Hydrogen gas
3. He collision mode: typical flows of 2.0 to 5.8 mL/min of Helium gas

Tune Check Criteria:
Instrument tunes must be performed before each calibration. A solution at ~1ppb of Be, Mg, Co, In, and Pb is analyzed, and the precision, mass calibration, and resolution are checked.

The following limits are used to evaluate the tune:
Mass calibration: +/- 0.1amu
Resolution check: <0.9amu at 10% peak height (baseline resolution)
Stability (5 reps): <5%

Attachment 6:
Recommended Element-specific Masses and Concentrations

Element	Mass/ Mode #	Calibration Conc. (ug/L)	ICV/CCV Conc. (ug/L)	RL Std. Conc. (ug/L)	Linear Range Std. Conc. (ug/L)*	Matrix Spike / Post Spike Conc.	
						Water (ug/L)	Soil (mg/kg)
Aluminum (Al)	27 / #1	10000, 5000, 2500, 1000,10	400/500	10	100000	5000	500

Vanadium (V)	51 / #2	100,50,25,10,1.0	40/50	1.0	2000	100	10
Zinc (Zn)	66 / #3	100,50,25,10,4.0	40/50	4.0	2000	100	10

*For guidance only - instrument sensitivity will vary.

Attachment 7:
Standard Preparation

Note: All standards must be stored at room temperature. Standards containing mercury have a 28 day expiration date from the date prepared. All other standards have an expiration date of 6 months from date prepared.

All calibration standards and working standards are prepared using a rinse/blank solution containing 0.5% Hydrochloric Acid and 2% Nitric Acid by volume. The solution is prepared as follows:

Standard Final Volume (mL)	Hydrochloric acid (mL)	Nitric Acid (mL)
20000	100	400

Note: Adjustments to the final volume are acceptable provided that the acid by volume concentrations are adhered to.

CALIBRATION STANDARDS

Calibration Standard Stock Solution

Element	Parent Concentration (mg/L)	Volume Added (mL)	Final Volume (mL)	Final Volume (mg/L)
Aluminum (Al)	10000	1.0	100	100
Antimony (Sb)	1000	1.0		10
Arsenic (As)	1000	1.0		10
Barium (Ba)	1000	1.0		10
Beryllium (Be)	1000	1.0		10
Boron (B)	1000	2.0		20
Cadmium (Cd)	1000	1.0		10
Calcium (Ca)	10000	10		1000
Chromium (Cr)	1000	1.0		10
Cobalt (Co)	1000	1.0		10
Copper (Cu)	1000	1.0		10
Iron (Fe)	10000	10		1000
Lead (Pb)	1000	1.0		10
Magnesium (Mg)	10000	10		1000
Manganese (Mn)	1000	10		100
Mercury (Hg)	1000	0.050		0.50
Molybdenum (Mo)	1000	1.0		10
Nickel (Ni)	1000	1.0		10
Potassium (K)	10000	10		1000
Selenium (Se)	1000	1.0		10
Silver (Ag)	1000	1.0		10
Sodium (Na)	10000	10		1000
Strontium (Sr)	1000	1.0		10
Thallium (Tl)	1000	0.2		2.0
Thorium (Th)	1000	1.0		10
Tin (Sn)	1000	1.0		10
Titanium (Ti)	1000	1.0		10
Uranium (U)	1000	1.0		10
Vanadium (V)	1000	1.0		10
Zinc (Zn)	1000	1.0		10

The above standards may be grouped together into more than one stock standard to maximize the stability of the standards. For example, silver may need to be kept as a separate stock due to the stability of the silver in solution. Alternatively, a custom made vendor supplied Calibration Stock Standard may be purchased instead of making it in the laboratory.

WORKING CALIBRATION STANDARDS

Calibration Blank (ICB, CCB) – All standards are made up to the same acid concentrations as the calibration blank

Add 500mL to 600mL of reagent water to a clean 1L volumetric flask. Add 20mL of concentrated nitric acid (HNO_3) and 5.0mL of hydrochloric acid (HCl) to the volumetric flask. Dilute to a final volume of 1000mL with reagent water. Store the standard at room temperature. Other volumes may be prepared at the discretion of the lab. The nitric acid concentration must be 2% by volume, and the hydrochloric acid concentration must be 0.5% by volume.

Calibration Standards concentration (ug/L) – example for a final volume of 1000mL

Element	Standard 5 (10mL stock)	Standard 4 (5mL stock)	Standard 3 (2.5mL stock)	Standard 2 (1mL stock)
Aluminum (Al)	1000	500	250	100
Antimony (Sb)	100	50	25	10
Arsenic (As)	100	50	25	10
Boron (B)	200	100	50	20
Barium (Ba)	100	50	25	10
Beryllium (Be)	100	50	25	10
Cadmium (Cd)	100	50	25	10
Calcium (Ca)	10000	5000	2500	1000
Cobalt (Co)	100	50	25	10
Chromium (Cr)	100	50	25	10
Copper (Cu)	100	50	25	10
Iron (Fe)	10000	5000	2500	1000
Lead (Pb)	100	50	25	10
Magnesium (Mg)	10000	5000	2500	1000
Manganese (Mn)	1000	500	250	100
Mercury (Hg)	5.0	2.5	1.25	0.5
Molybdenum (Mo)	100	50	25	10
Nickel (Ni)	100	50	25	10
Potassium (K)	10000	5000	2500	1000
Selenium (Se)	100	50	25	10
Silver (Ag)	100	50	25	10
Sodium (Na)	10000	5000	2500	1000
Strontium (Sr)	100	50	25	10
Thallium (Tl)	20	10	5.0	2.0
Thorium (Th)	100	50	25	10
Tin (Sn)	100	50	25	10
Titanium (Ti)	100	50	25	10
Uranium (U)	100	50	25	10
Vanadium (V)	100	50	25	10
Zinc (Zn)	100	50	25	10

Note: The Standard 5 listed above is utilized when calibrating with a single standard and a blank.

Standard 1 is equivalent to the RL/PQL Working Standard described below.

CONTINUING CALIBRATION VERIFICATION (CCV) STANDARD

The calibration standard Level 4 is used as the continuing calibration verification standard.

INITIAL CALIBRATION VERIFICATION (ICV) SOLUTION

All ICV standards must be from a different source than those used for the calibration standards.
Note: ICV must be made fresh daily.

Preparation of the ICP-MS initial calibration verification solution

Element	Parent Concentration (mg/L)	Volume Added (mL)	Final Volume (mL)	Final Concentration (mg/L)
Aluminum (Al)	10000	0.40	100	40
Antimony (Sb)	1000	0.40		4.0
Arsenic (As)	1000	0.40		4.0
Boron (B)	1000	0.80		8.0
Barium (Ba)	1000	0.40		4.0
Beryllium (Be)	1000	0.40		4.0
Cadmium (Cd)	1000	0.40		4.0
Calcium (Ca)	10000	4.0		400.0
Cobalt (Co)	1000	0.40		4.0
Chromium (Cr)	1000	0.40		4.0
Copper (Cu)	1000	0.40		4.0
Iron (Fe)	10000	4.0		400.0
Lead (Pb)	1000	0.40		4.0
Magnesium (Mg)	10000	4.0		400.0
Manganese (Mn)	1000	1.0		40.0
Mercury (Hg)	100	0. 40		4.0
Molybdenum Mo)	1000	0.40		4.0
Nickel (Ni)	1000	0.40		4.0
Potassium (K)	10000	4.0		400.0
Selenium (Se)	1000	0.40		4.0
Silver (Ag)	1000	0.40		4.0
Sodium (Na)	10000	4.0		400.0
Strontium (Sr)	1000	0.40		4.0
Thallium (Tl)	1000	0.20		0.8
Tin (Sn)	1000	0.40		4.0
Thorium (Th)	1000	0.40		4.0
Titanium (Ti)	1000	0.40		4.0
Vanadium (V)	1000	0.40		4.0
Uranium (U)	1000	0.40		4.0
Zinc (Zn)	1000	0.40		4.0

Preparation of Initial Calibration Verification Working Standard

Dilute 1.0mL of the ICP-MS initial calibration verification solution to a final volume of 100mL using the same matrix solution as the calibration blank.

The final concentrations of the various elements are the same as listed in Table 1.

REPORTING LIMIT (RL) CHECK STANDARD

RL/PQL Stock A

Element	Parent Concentration (mg/L)	Volume Added (mL)	Final Volume (mL)	Final Concentration (mg/L)
Aluminum (Al)	10000	1.0	100	100
Antimony (Sb)	1000	1.0		10
Arsenic (As)	1000	0.5		5.0

Cadmium (Cd)	1000	0.10		1.0
Cobalt (Co)	1000	0.20		2.0
Chromium (Cr)	1000	2.5		25.0
Copper (Cu)	1000	1.0		10
Lead (Pb)	1000	0.30		3.0
Magnesium (Mg)	10000	1.0		100
Manganese (Mn)	1000	1.0		10
Molybdenum Mo)	1000	10		10
Nickel (Ni)	1000	1.0		10
Selenium (Se)	1000	1.0		10
Silver (Ag)	1000	0.20		2.0
Strontium (Sr)	1000	0.50		5.0
Thallium (Tl)	1000	0.5		5.0
Tin (Sn)	1000	1.0		10
Titanium (Ti)	1000	1.25		12.5
Vanadium (V)	1000	5.0		50
Aluminum (Al)	10000	2.5		250
Boron (B)	1000	25.0		250.0
Calcium	10000	12.5		1250.0
Iron (Fe)	10000	2.5		250
Potassium (K)	10000	10.0		1000
Sodium (Na)	10000	10.0		1000
Zinc	1000	5.0		50.0

Preparation of MDL Working Solutions:

Preparation of the MDL Working solution is as follows dilute 2.0mL of the MDL Intermediate stock solution and 2.0mL of the Mercury Intermediate Calibration standard and bring to a final volume of 100mL. The standard is now ready for digestion.

Linearity Check Solutions:
The linearity check solutions are prepared individually according to the following equation:

$$Vs = \frac{Vlc \otimes Clc}{Cs}$$

Where: Vs = volume of stock standard (mL)
Cs = concentration of stock standard (mg/L)
Vlc = volume of linearity check standard to prepare (mL)
Clc = concentration of linearity check standard to prepare (mg/L)

The linearity check solutions are prepared at the concentrations specified in Attachment 6. Prepare sufficient volume to perform the linearity check, maintaining the hydrochloric acid concentration at 0.5% by volume and the nitric acid concentration at 1% by volume.

Internal Standards:
A solution at 1mg/L is prepared for all elements. That solution is added in-stream by the use of a T-fitting. The sample is pumped into the T-fitting with a white/white peristaltic pump tube and the internal standard is pumped in using a blue/orange pump tube.

Attachment 8:
Drinking Water MCLGs and MCLs

Element	Regulation	MCLG (mg/L)	MCL (mg/L)	Secondary Standard (mg/L)
Antimony	National Primary Drinking Water Regulations	0.006	0.0060	
Arsenic		0	0.010	
Barium		2.0	2.0	
Beryllium		0.0040	0.0040	
Cadmium		0.0050	0.0050	
Chromium		0.10	0.10	
Copper [1]		1.3	Action Level = 1.3	
Lead [1]		0	Action Level = 0.015	
Mercury		0.0020	0.0020	
Selenium		0.050	0.050	
Thallium		0.00050	0.0020	
Uranium		0	0.030	
Aluminum	National Secondary Drinking Water Regulations			0.05 – 0.2
Copper				1.0
Iron				0.30
Manganese				0.050
Silver				0.10
Zinc				5.0

[1] Lead and copper are regulated by a Treatment Technique that requires systems to control the corrosiveness of their water. If more than 10% of tap water samples exceed the action level, water systems must take additional steps. For copper, the action level is 1.3 mg/L, and for lead is 0.015 mg/L.

Attachment 9:
Hardness Calculation Work Instruction

eurofins | Environment Testing TestAmerica

Work Instruction
FME157:05.23.07:0
Page 1 of 1

CALCULATION OF HARDNESS

(as Calcium Carbonate)

Method: SM2340B

Summary of Procedure:

An aqueous sample is analyzed for calcium and magnesium using ICP by methods EPA 200.7 or 6010B (SOP ME70: *Elements by ICP)*, or using ICP/MS by methods EPA 200.8 or 6020 (SOP ME74*: Elements by ICP/MS)*. The concentrations of these elements are converted to equivalents of calcium carbonate using the equation below and added together to give the final result.

Calculation:

Determine the concentration of calcium and magnesium as described in SOP ME70 or ME74.

Calculate the hardness as calcium carbonate using the following equation:

Hardness (as mg/L calcium carbonate) = (4.118 X [Mg]) + (2.497 X [Ca])

where:
[Mg] = Concentration of magnesium (mg/L)
[Ca] = Concentration of calcium (mg/L)

Quality Control:

Report the method blank as the default QC unless otherwise requested.

Formal detection limit studies, as described in 40CFR Part 136B and SOP QA07: *Determination of Detection Limits,* are not required for SM2340B.

This procedure is a calculation based on another analytical procedure; therefore, demonstration of capability (DOC) is accomplished by successful completion of analytical DOCs. (i.e. If the analyst has a successful DOC on file for Ca and Mg by EPA 200.7/6010B or EPA 200.8/6020, proficiency has been shown for SM2340B by default.)

Attachment 10:
Glassware Cleaning Procedures

GLASSWARE CLEANING PROCEDURES METALS DEPARTMENT
Graduated Cylinders 1. Scrub with hot, soapy H_2O and brush. 2. Rinse thoroughly with tap H2O. 3. Rinse with 10% HNO_3 4. Rinse thoroughly with DI H_2O.
Volumetric Flasks 1. Empty contents of flask 2. Squirt a small amount of cleaning detergent directly into volumetric flask 3. Fill flask 1/3 full with **HOT** H_2O 4. Replace top and shake flask. 5. Empty flask and rinse with **HOT** H_2O until no soap remains in flask. 6. Add approximately 10mL concentrated HNO_3 to 50mL, 100mL, and 250mL flasks ---- replace top and shake well. For 500mL or 1000mL flasks use 25mL and for 10mL flasks use 2 - 5mL of concentrated HNO_3. 7. Rinse 3 times with DI H_2O, filling flask 1/3 full and replacing top. Store until needed. *** NEVER PLACE VOLUMETRIC FLASKS OR TOPS IN SINK OR DISHPAN WITH OTHER DIRTY DISHES.**
***Dispose of all acid waste in accordance with the Eurofins TestAmerica Savannah Addendum to the Corporate Safety Manual.**

18.0 Revision History

Summary of Changes:

Added reference to the Master Equipment Listing maintained by QA to Section 6.1. ANAB Audit 2020.

Summary of Changes from Previous Revision 13:

- Minor editorial, grammatical, and/or formatting changes made.
- Updated SOP signatories to reflect current responsibilities and titles.
- Updated company name and logo where applicable.
- Updated Attachment 7, Attachment 5 and Attachment 6 with current information.
- Updated Attachment 9 with current logo.
- Updated section 10.3.1 with current instrument instructions.

ORGANOCHLORINE PESTICIDES AND POLYCHLORINATED BIPHENYLS (PCBs) BY GC/ECD

(Methods: EPA 608, EPA 608.3, EPA 8081B, and EPA 8082A)

Approvals (Signature/Date):

Kimberly Chamberlain 11/23/2021

1.0 Scope and Application

This SOP gives the procedures for the determination of organochlorine pesticides (including single component pesticides, toxaphene, and technical chlordane) and polychlorinated biphenyls (PCBs) as Aroclors via gas chromatography/electron capture detection (GC/ECD).

> Note: This SOP outlines two options for toxaphene quantitation. The first option is the laboratory's default option and includes single peak quantitation. The second option is utilized to meet project-specific objectives and includes quantitation via total area under the curve (TAUC).

The routine matrices performed by this procedure are waters and soils. Other matrices which may be performed include wipes, leachates, tissues, and wastes.

A complete target analyte list, the reporting limits (RL), the method detection limits (MDL), and the accuracy and precision criteria associated with this procedure are provided in the LIMS Method Limit Groups (MLGs).

This SOP was written by and for TestAmerica's Savannah laboratory.

2.0 Summary of Method

Liquid samples are extracted using continuous liquid-liquid or separatory funnel extraction with methylene chloride. The extract is concentrated, the solvent is exchanged to hexane, and the final volume of the extract is adjusted.

1. If the High Volume preparation procedure is requested, 1000mL of sample is extracted and concentrated to a final volume of 5mL.
2. If the Low Volume Initiative (LVI) preparation procedure is requested, 250mL of sample is extracted and concentrated to a final volume of 1mL

Soil samples are extracted using the microwave extraction procedure. Approximately 15g of the homogenized sample is dried with anhydrous sodium sulfate and extracted with 1:1 acetone/hexane. The extract is concentrated to a final volume of 5mL.

The preparation procedures may also incorporate copper (sulfur) clean-up or acid clean-up (used for PCBs and TUAC only), as outlined in the applicable preparation SOP.

> Note: Sulfuric acid clean-up is required for the Toxaphene TAUC analysis/projects.

The extract is analyzed by gas chromatography using dual capillary columns (different phases) and dual electron capture (EC) detectors. This configuration allows for simultaneous detection and confirmation of the target compounds. Identification of the target compounds in samples is performed by comparing the retention times of the peaks with standards analyzed under the same GC conditions. Quantitation is performed using the internal standard calibration technique.

This SOP is based on the following methods: EPA Methods 608, 608.3, 8081B, 8082A, the TAUC Method, and the Task Force Method 1.

3.0 Definitions

Refer to the Glossary Section of the *Quality Assurance Manual* (QAM) for a complete listing of applicable definitions and acronyms.

4.0 Interferences

4.1 Procedural Interferences

4.1.1 Interferences may be caused by contaminants in solvents, reagents, glassware, and other sample processing apparatus and can make identification and/or quantification of the target analytes difficult.

4.1.2 All sample collection containers are single-use disposable containers which limits the potential for contamination. All non-disposable labware must be scrupulously cleaned in accordance with the posted Labware Cleaning Instructions to ensure it is free from contaminants and does not contribute artifacts.

4.1.3 High purity reagents and solvents are used to help minimize interference problems. Acetone, hexane and methylene chloride must be verified prior to use in accordance with the TestAmerica Solvent Lot Testing Program.

4.1.4 Instrument and/or method blanks are routinely used to demonstrate all reagents and apparatus are free from interferences under the conditions of the analysis.

4.2 Matrix Interferences

4.2.1 Matrix interferences may be caused by contaminants that are co-extracted from the sample matrix. The sample may require cleanup or dilution prior to analysis to reduce or eliminate the interferences. All possible cleanup procedures are listed below. If matrix interferences continue after a cleanup has been performed, the sample is diluted as needed for data analysis. If a cleanup is used, the method blank and laboratory control standard must also be subjected to the cleanup.

Clean-up Procedure	Application	Effectiveness
Sulfuric acid	PCBs Toxaphene TAUC*	Eliminates polar and some unsaturated hydrocarbon interferences
Copper	Pest/PCBs	Eliminates elemental sulfur

*Sulfuric acid clean-up is required for the Toxaphene TAUC analysis/projects.

Copper is effective at removing elemental sulfur, which elutes as a very large peak in the middle of the chromatogram. Treatment with sulfuric acid is a very effective means of removing polar compounds and unsaturated compounds from the sample matrix. These two cleanups require fewer sample manipulations, and should have minimal negative impact on the recoveries of the target compounds and surrogates.

4.2.2 Interfering contamination may occur when a sample containing low concentrations of analytes is analyzed immediately following a sample containing relatively high concentrations of analytes. As such, samples known to be clean should be analyzed first. To prevent carryover into subsequent samples, analysis of reagent blanks may be needed after the analysis of a sample containing high concentrations of analytes.

5.0 Safety

Employees must abide by the policies and procedures in the TestAmerica Environmental Health and Safety Manual (EHSM), the TestAmerica Savannah Addendum to the EHSM, and this document.

This procedure may involve hazardous materials, operations, and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user to follow appropriate safety, waste disposal, and health practices under the assumption that all samples and reagents are potentially hazardous.

The analyst must protect himself/herself from exposure to the sample matrix. Many of the samples that are tested may contain hazardous chemical compounds or biological organisms. The analyst must, at a minimum, wear protective clothing (lab coat), eye protection (safety glasses or face shield), disposable nitrile gloves, and closed-toe, nonabsorbent shoes when handling samples.

5.1 Specific Safety Concerns or Requirements

Acetone and hexane are flammable solvents. They can cause irritation to the respiratory tract. Overexposure can cause fatigue, confusion, headache, dizziness, and drowsiness.

The gas chromatograph contains zones that have elevated temperatures. The analyst needs to be aware of the locations of those zones, and must cool them to room temperature prior to working on them.

There are areas of high voltage in the gas chromatograph. Depending on the type of work involved, either turn the power to the instrument off, or disconnect it from its source of power.

5.2 Primary Materials Used

The following is a list of the materials used in this procedure, which have a serious or significant hazard rating, and a summary of the primary hazards listed in their MSDS/SDS.

Note: This list does not include all materials used in the procedure. A complete list of materials used in this procedure can be found in the Reagents and Standards Section and the Equipment and Supplies Section of this SOP.

Employees must review the information in the MSDS/SDS for each material before using it for the first time or when there are major changes to the MSDS/SDS. Electronic copies of MSDS/SDS can be found using the "MSDS Online" button on the Oasis homepage, on the EH&S webpage on Oasis, and through LIMS File System Shares.

Material	Hazards	Exposure Limit[1]	Signs and Symptoms of Exposure
Acetone	Flammable	1000ppm TWA	Inhalation of vapors irritates the respiratory tract. May cause coughing, dizziness, dullness, and headache.
Hexane	Flammable Irritant	500ppm TWA	Inhalation of vapors irritates the respiratory tract. Overexposure may cause lightheadedness, nausea, headache, and blurred vision. Vapors may cause irritation to the skin and eyes.
[1]Exposure limit refers to the OSHA regulatory exposure limit.			

6.0 Equipment and Supplies

6.1 Equipment and Instrumentation

Analytical Balance – Verify in accordance with SOP SA-AN-100 *Laboratory Support Equipment (Verification and Use)*

Top-loading Balance – Verify in accordance with SOP SA-AN-100 *Laboratory Support Equipment (Verification and Use)*

Data System – CHROM and Chemstation software are used to acquire, store, reduce, and output gas chromatographic/electron capture data. The software have the capability of processing stored GC data by recognizing a GC peak within any given retention time window, comparing the retention time of the GC peak with retention time window of a known standard. The software also allows integration of the peak, calculation of response factors and/or construction of a linear regression calibration curve, calculation of response factor statistics (mean and standard deviation), and calculation of concentrations of analytes using either the calibration curve or the response factors.

Agilent Gas Chromatograph (6890 or 6890N) – equipped with dual detectors (an ECD pair) and an autosampler.

Recommended column pairs:

CLP I fused silica capillary column 30m x 0.25mm ID x 0.25um film
CLP II fused silica capillary column 30m x 0.25mm ID x 0.20um film

The recommended configuration is to connect two capillary columns to a single injection port via a y-splitter and a length of guard column. The ends of each column are connected to separate detectors. A single injection is split between the two columns to provide simultaneous detection and confirmation of the target compounds.

6.2 Volumetric Containers and Dispensers

All volumetric labware must be verified in accordance with SOP SA-AN-100: *Laboratory Support Equipment (Verification and Use).* Refer to Attachment 16 for Labware Cleaning Procedures.

Volumetric Labware	Volume	Type (Quantitative / Qualitative)	Use	Verification Frequency	Laboratory Verification Criteria
Glass Transfer Pipettes	Various	Qualitative	Extract Aliquotting	None	None
Glass Disposable Pipettes	Various	QUANTITATIVE	Extract Aliquotting; Dilution Preparation	Per Lot	Accuracy = 2% Precision = 1%
Mechanical Eppendorf-Style Pipettes	Various	QUANTITATIVE	Standard and Dilution Preparation	Initially, prior to first use, then quarterly thereafter (Daily per DOD)	Accuracy = 2% Precision = 1%
Extract Vials	12mL	Qualitative	Extract Storage	None	None
Autosampler Vials (w/ Septa & Cap)	2mL	Qualitative	Instrument Analysis	None	None
Gas Tight Syringes	Various	QUANTITATIVE	Standard Preparation	None, if received w/ COA	None, if received w/ COA
Volumetric Containers	Various	QUANTITATIVE	Standard Preparation	None, Class A	None, if received w/ COA

6.3 Lab Supplies

Detergent – FL70 or equivalent, used for washing non-disposable labware.

6.4 Sample Collection Containers

All sample collection containers are pre-cleaned, single-use disposable containers, which limits the potential for contamination. The routine sample collection containers supplied by the laboratory are:

High Volume preparation procedure = 1L amber without preservative.
Low Volume preparation procedure = 250mL amber without preservative

7.0 Reagents and Standards

7.1 Expiration Dates

Expiration dates (time from initial use or receipt to final use) for standard and reagent materials must be set according to the guidance in this SOP. Note: These are maximum expiration dates and are not to be considered an absolute guarantee of standard or reagent quality. Sound judgment must be used when deciding whether to use a standard or reagent. If there is doubt about the quality of a standard or reagent material, a new material must be obtained or the standard or reagent material verified. Data quality must not be compromised to extend a standard's life – i.e., when in doubt, throw it out.

The expiration date of any standard or reagent must not exceed the expiration date of the standard or reagent that was used to prepare it; that is, the "children may not outlive the parents".

Unless listed elsewhere in this SOP, the expiration dates given below apply.

7.2 Reagents

Reagents must be prepared and documented in accordance with SOP SA-AN-041: *Reagent and Standard Materials Procedures.*

Acetone, Hexane and methylene chloride must be verified prior to use in accordance with the TestAmerica Solvent Lot Testing Program.

Hexane - residue grade or better; J.T. Baker 9262-03 (4L)
Storage: Room temperature, Flammable Solvent cabinet
Expiration: Unopened: Manufacturer's expiration date
Opened: Manufacturer's expiration date

7.3 Standards

Standards must be prepared and documented in accordance with SOP SA-AN-041: *Reagent and Standard Materials Procedures.* Certificates of analysis (COAs) or purity must be received with all purchased standards, and scanned and attached to the standard in LIMS.

Attachment 9 contains the recipes for the calibration standards for the routine target compounds.

Note: Stock standards must be stored per the manufacturer's recommendations (i.e., room temperature, refrigerator, or freezer). Secondary dilutions and working standards must be stored at 0-6°C (less than 6°C but not frozen).

8.0 Sample Collection, Preservation, Shipment, and Storage

8.1 Aqueous Samples

Aqueous samples for the High Volume preparation procedure are routinely collected in unpreserved 1L amber glass containers. Aqueous samples for the Low Volume preparation procedure are routinely collected in unpreserved 250mL amber glass containers.

Samples must be iced at the time of collection and maintained at 0-6°C (less than 6°C but not frozen) until the time of preparation. Samples must be prepared within 7 days of collection. Extracts must be stored separately at 0-6°C (less than 6°C but not frozen) until the time of analysis and analyzed within 40 days of extraction.

Samples must be checked for pH and for the presence of residual chlorine prior to preparation. NCMs must be initiated for samples collected in improper containers, for samples with extreme pH, or for sample containing residual chlorine. Refer to the applicable preparation SOP for sample preservation check information.

Note: EPA SW-846 Update IV Chapter 4 re-defined the holding times for PCBs as "NONE". The EPA Methods Update Rule re-defined holding times for PCBs as one year from collection to extraction and one year from extraction to analysis. The laboratory has incorporated the extended preparation holding times for PCBs on a project-specific basis, as allowed by that particular state agency and client.

8.2 Soil Samples

Soil samples are routinely collected in 8oz glass soil jars.

Samples must be iced at the time of collection and maintained at 0-6°C (less than 6°C but not frozen) until the time of preparation. Samples must be prepared within 14 days of collection. Extracts must be stored separately at 0-6°C (less than 6°C but not frozen) until the time of analysis and analyzed within 40 days of extraction.

9.0 Quality Control

SOP SA-QA-017: *Evaluation of Batch QC Data* and the SOP Summary in Attachment 3 provide requirements for evaluating QC data.

9.1 Batch QC

An extraction batch consists of up to 20 environmental samples and the associated QC items extracted together within a 24 hour period.

The minimum QC items required for each extraction batch are as follows:

EPA 608:
a method blank and a laboratory control sample (LCS), a matrix spike (MS) per 10% of samples analyzed, and a matrix spike duplicate (MSD).

This frequency equates to the following:

- For a batch of 10 or fewer samples, the minimum QC items are a method blank, an LCS, 1 matrix spike, and 1 matrix spike duplicate.
- For a batch of 11-20 samples, the minimum QC items are a method blank, an LCS, 1 matrix spike (from sample 1-10), another matrix spike (from sample 11-20), and a matrix spike duplicate.

8000-series and EPA 608.3:
A method blank (MB) and a laboratory control sample (LCS), a matrix spike (MS), and a matrix spike duplicate (MSD).

The routine container supplied for the High Volume preparation procedure is a 1L container. The routine container supplied for the Low Volume preparation procedure is a 250mL container. The minimum sample volume required for the High Volume preparation procedure is 500mL. Reduced volumes are not applicable to the Low Volume preparation procedure.

Note: Final volumes and spike amounts must be adjusted to compensate for these reduced initial volumes.

If there is insufficient sample volume to perform the required matrix spike(s), an NCM must be initiated on all affected samples to denote this situation. Insufficient sample volume is defined as receiving less than a total of 2L for the High Volume preparation procedure or less than 3 full 250mL containers for the Low Volume (LVI) preparation procedure.

If there is insufficient sample volume available to perform the batch MS/MSD, the LCS must be prepared in duplicate (i.e., LCSD). If an LCS and LCSD are performed, both QC items must be evaluated and reported. Acceptable recoveries (as well as %RPD) for both LCS and LCSD are required. An NCM must be initiated on all samples within the batch to denote this situation.

Note: Unless the client has specified which sample to use as the matrix spike, the matrix spike must be selected at random from the samples in the batch. Field QC (e.g., equipment blanks, trip blanks, and field blanks) must not be used for MS/MSD unless specifically requested to do so by the client or unless there is insufficient sample available for performing MS/MSD using an actual field sample.

Batch QC must meet the criteria given in Attachment 3 of this SOP.

Note: The laboratory has defined the analyte listed in Attachment 11 as a poor or erratic performer and allows for exceptions to the LCS/LCSD, MS/MSD, and Sporadic Marginal Exceedance criteria for this analyte. An NCM must be initiated to denote this situation.

Note: The use of Sporadic Marginal Exceedances, as defined in SOP SA-QA-017, is not permitted for samples originating from South Carolina.

9.2 Instrument QC

9.2.1 PEVAL Breakdown Standard

The column(s) must be evaluated prior to the analysis of the calibration standards and once every 12-hour clock for EPA 8081B and once every 24-hour clock for EPA 608 and EPA 608.3. The column evaluation is performed by injecting a PEVAL standard that contains Endrin and p,p'-DDT and calculating the percent breakdown of these compounds. The standard used for determining the percent breakdown must not contain any compounds that coelute with Endrin, DDT, or any of the corresponding breakdown products.

Note: This column evaluation does not have to be performed if PCBs are the only target compounds required. PCBs are stable and not subject to breakdown in the injection port.

Inject the Endrin/DDT breakdown standard. Check the peak integrations and calculate the breakdown as follows:

$$\%\text{Breakdown Endrin} = \frac{\text{Response(Endrin Aldehyde + Endrin Ketone)}}{\text{Response(Endrin + Endrin aldehyde + Endrin Ketone)}} \otimes 100$$

$$\%\text{Breakdown DDT} = \frac{\text{Response(DDE + DDD)}}{\text{Response(DDT + DDE + DDD)}} \otimes 100$$

The response (area) must be used to evaluate the breakdown. Do not use concentrations and do not "undetect" peaks that are below the RL or MDL. All peaks detected by the data system must be included in the percent breakdown calculation.

Breakdown Criterion

EPA 8081B and EPA 608: The breakdown for each compound must be less than 15% to be acceptable.

EPA 608.3: The breakdown for each compound must be less than 20% to be acceptable.

If the breakdown exceeds criteria the instrument requires column and/or injector port maintenance. The maintenance may include, but is not limited to, replacing the septum, clipping the front of the guard column, replacing the glass injector sleeve, and scrubbing (cleaning) the injector port.

Note: If 2,4'-DDT and its degradates, 2,4'-DDD and 2,4'-DDE, are target compounds, the system must be tested for breakdown of 2,4'-DDT. The same % breakdown criterion is used to evaluate the column. Calculate the breakdown as follows:

$$\%\text{Breakdown}\,2,4'\text{-DDT} = \frac{\text{Response}(2,4'\text{-DDE} + 2,4'\text{-DDD})}{\text{Response}(2,4'\text{-DDT} + 2,4'\text{-DDE} + 2,4'\text{-DDD})} \otimes 100$$

9.2.2 Initial Calibration (ICAL)

The instrument must be calibrated in accordance with SOP SA-QA-016: *Evaluation of Calibration Curves.* This SOP provides requirements for establishing the calibration curve and gives the applicable formulas.

Instrument calibration is performed by analyzing a series of known standards. The calibration curve must consist of a minimum of 5 standards for the EPA 8000-series methods and a minimum of 3 standards for EPA 608 and EPA 608.3. The lowest level calibration standard must be at or below the reporting limit, and the remaining standards will define the working range of the analytical system.

Note: A minimum of 6 points is required for a quadratic curve. Higher order curves are not permitted. Some programs and agencies (e.g., SC DHEC) do not allow the use of quadratic curves. Refer to the Project Requirement Summary and/or Project Plan to determine if this curve type is prohibited.

The initial calibration standard concentrations currently in use in the laboratory are listed in Attachment 9. Refer to Attachment 9 for the standard preparation instructions. Other standard concentrations may be used provided they support the reporting limit and are fully documented in accordance with SOP SA-AN-041.

9.2.2.1 ICAL Linearity Criteria

The preferred method of quantitation is the average response factor. The relative standard deviation (%RSD) of the calibration standards must be <20% for the EPA 8000-series methods, <15% for EPA 608.3 and <10% for EPA 608 for the initial calibration curve to be acceptable.

Another initial calibration option is to evaluate a regression curve. If the regression curve option is chosen, the regression coefficient (r^2) must be greater than or equal to 0.990 to be acceptable.

If these criteria are not met, then re-calibration is required before sample analysis can proceed.

Note: There are several additional requirements that must be met for PCB analyses. These requirements include the following:

1. Selection of peaks of appropriate height.
   When selecting peaks for the quantitation of Aroclors all peaks selected must be 25% of the height of the largest peaks in the Aroclor pattern, except for Aroclor 1268 where the requirement is 10%. Additionally, the peaks selected should have relatively good peak shapes and have as little co-elution with other peaks in the pattern.

2. Resolution requirements.
   The mid-level AR1660 ICAL standard must meet a resolution criteria of <75% for the triplet near the end of the AR1260 pattern on at least one column. The preferred column will be the CLP-I column. The resolution is defined as:

   (Height of Valley / Average of the Two Peak Heights)*100%

   All pesticide analytes must be at least 80% baseline resolution on at least one column.

3. Non-AR1660 Standard Requirements
   A single point calibration is typically used to quantitate the non-AR1660 Aroclors. If this option is used, then the average response factor quantitation must be employed for these analytes.
   - When single point calibration is used for the non-AR1660 analytes, a quadratic curve fit may only be used for AR1660 **if** the %RSD criteria outlined above are met.
   - Additionally, if an Aroclor that is typically calibrated as a single-point is detected in a sample analyzed by EPA 608, then the sample must be reanalyzed after a multi-point curve has been established.
   - Alternatively, a multi-point calibration may be used for the non-AR1660 Aroclors. If this option is used, a quadratic curve may be employed when %RSD criteria exceeds that outlined above, provided the curve type chosen produces accurate quantitation over the entire working range of the instrument.
   - **Note:** DOD QSM requires a multi-point calibration to be used for quantitation of all detected Aroclors.

4. AR1016 Pattern Recognition Standard
   A single standard containing only AR1016 must be analyzed within the ICAL sequence, to establish pattern recognition of AR1016 versus AR1242.

Note: Refer to Attachment 11 for information on acceptance criteria for poor and/or erratic performing compounds.

9.2.2.2 ICAL Readback / % Error Criteria

Each calibration curve must be evaluated to ensure that the quantitation over the entire working range is accurate. This is accomplished via CHROM by reviewing the % Error for each analyte in each calibration level.

The re-calculated concentrations of each analyte should be within 50% for the low point and within 30% for the remaining points.

If these criteria are not met, an alternate curve type that meets criteria should be utilized to ensure a better fit, or another initial calibration curve should be performed.

9.2.3 Second Source Initial Calibration Verification (ICV)

The calibration curve must be verified after the initial calibration is established, prior to any sample analyses, in accordance with SOP SA-QA-016 with a standard obtained from a second source.

The initial calibration verification standard concentration currently in use in the laboratory is equivalent to Level 4 of the ICAL. Another standard concentration may be used provided it is mid-level and fully documented in accordance with SOP SA-AN-041.

EPA 608:
The ICV is acceptable if the %RSDs for all of the analytes in the ICV is less than 15%.

EPA 8081B and EPA 8082A and DODQSM V5:
The ICV is acceptable if the %RSDs for all of the analytes in the ICV is less than 20%.

EPA 608.3:
The ICV is acceptable if the %RSDs for all of the analytes in the ICV are within the method defined limits. These limits can be viewed in the LIMS MLG.

Note: Refer to Attachment 11 for information on acceptance criteria for poor and/or erratic performing compounds.

Note: ICVs are not required for the non-AR1660 PCBs. The AR1660 ICV is used to satisfy this evaluation.

9.2.4 Initial Calibration Blank (ICB) / Continuing Calibration Blank (CCB)

The instrument must be shown to be free from contamination by the analysis of calibration blanks. Initial calibration blanks are analyzed at the beginning of each sequence. Continuing calibration blanks are analyzed in each clock.

Initial and continuing calibration blanks must be <1/2RL to be acceptable.

9.2.5 Continuing Calibration Verification

An analytical clock is defined as 24 hours (for EPA 608 and EPA 608.3) or 12 hours (for EPA 8081B and EPA 8082A).

EPA 8081B and EPA 8082A require that no more than 20 field samples and/or batch QC items (total) be analyzed within an analytical clock. The default procedure is to include field and batch QC items (e.g., method blank, LCS, MS/MSD, and SD) in determining the maximum number of samples in an analytical clock. Instrument QC (e.g., CCVs, PEVAL, and instrument blanks) are not included in this count of 20.

For EPA 608, the initial calibration curve must be verified at the beginning of each 24-hour clock with a mid-level standard. As this is an internal standard method, a capping CCV is not required. The CCV must be within +/-15% to be acceptable.

For EPA 608.3, the initial calibration curve must be verified at the beginning and end of each 24-hour clock with a mid-level standard. The CCV must be within the method defined limits to be acceptable. An additional, reporting limit CCV (RLCCV) is incorporated into the procedure for EPA 608.3. This CCV can be analyzed at the end of each 24-hour after the mid-level standard for analytes outside method criteria. This can be used to demonstrate sensitivity at the reporting limit can be obtained. Samples requiring target analytes that are outside the acceptance criteria in the closing CCV may be reported if those analytes are qualitatively identified in the RLCCV and are non-detect in the samples. An NCM must be initiated to denote this situation. Refer to the applicable CCV section of Attachment 3 for more information on how the RLCCV is utilized.

For EPA 8081B and EPA 8082A, the initial calibration curve must be verified at the beginning of each 12-hour clock with a mid-level standard. As this is an internal standard method, a capping CCV is not required. The CCV must be within +/-20% to be acceptable.

For EPA 8082A, the opening CCV set must include the non-AR1660 single point mid-level standards for retention time updates and pattern recognition. If a sample has a positive detection for any non-AR1660 Aroclor, a CCV for that Aroclor must be analyzed and meet criteria prior to sample analysis. Additionally, the mid-level CCV standard must meet the resolution requirements outlined in Section 9.2.2.1.

For EPA 8081B and 8082A DODQSM V5: The CCV must be analyzed before sample analysis, after every 10 field samples and at the end of the sequence. Multi-component analytes (ie, Toxaphene, Chlordane and Arochlors, other than 1016/1260) are required before sample analysis. All must be within +/- 20% D.

- Corrective Action: Immediately analyze two consecutive CCVs. If both pass, samples may be reported. If either fails or two consecutive CCVS cannot be run, repeat analysis of CCV(s) and all associated samples. Recalibrate if necessary and reanalyze all associated samples since last acceptable CCV(s).

Note: Refer to Attachment 11 for information on acceptance criteria for poor and/or erratic performing compounds.

Note: If the CCV is high biased and samples are non-detect for the affected analyte, data may be reported with qualification. Additionally, if one column is marginally outside criteria for an analyte, this column may be used for qualitative identification, only, with quantitative results for that compound reported from the other, passing column. An NCM must be initiated to address this situation.

Refer to Attachment 8 for the standard preparation instructions. Another standard concentration may be used provided it is mid-level and fully documented in accordance with SOP SA-AN-041.

- Note: The routine CCV standards are the Pest single-peak mix, AR1660 standard, technical chlordane, and toxaphene.

- Note: For DOD samples which required a multi-point curve for all Aroclor detections, then an additional CCV is required for the Aroclor of concern.

- Note: For the Toxaphene TAUC analysis/projects, the initial calibration curve must be verified at the beginning of the 12-hour clock with a mid-level Toxaphene standard. The CCV must be within +/-20% to be acceptable.

9.2.6 Internal Standard (ISTD)

This procedure is an internal standard (ISTD) procedure. 1-Bromo-2-nitrobenzene (BNB) is the internal standard.

Prior to analysis, this internal standard must be added to all standards, samples, and QC items. The concentration of the internal standard must be the same in all calibration samples, field samples, and QC samples. A concentration of 0.08ug/mL is used.

The response of the ISTD in the ICV/CCV must be within 50-150% of the response of the ISTD in the CCV-level standard in the initial calibration sequence. If the response is outside of this range, the analysis of the CCV must be repeated and any samples associated with the CCV must also be re-analyzed. Repeated failure of the ISTD response will require re-calibration.

Some projects require the ISTD of the daily CCV to be within 30 seconds of the RT of the ICAL. Due to instrument maintenance, it is possible for the retention time of the daily CCV to be outside of this window even though all other criteria are met. As such, the laboratory updates the RT of the ISTD and all analytes daily with the first CCV in the sequence.

The response of the ISTD in the samples and batch QC items must be within 50-200% of the response and within 30 seconds of the previous CCV.

DODQSM V5: Retention time within 0.06RRT units from the retention time of the midpoint standard in the ICAL. Internal standard signal within -50% to + 100% of the ICAL midpoint. On days when ICAL is not performed, initial CCV is used.

If the response or retention time is outside of the ranges listed above, corrective action must be taken which can include reanalysis of the extract, re-spiking extract with ISTD and re-analysis, or re-calibration of the analytical system. Obvious matrix interferences are qualified and noted in an NCM.

9.2.7 Surrogate

This procedure uses 2 surrogates to evaluate the extraction process. Decachlorobiphenyl (DCB) and Tetrachloro-m-xylene (TCMX) are the surrogates. Prior to preparation, these surrogates are added to all samples and QC items. The concentration of the surrogate is the same in all field samples and QC samples. A concentration of 0.50ug/L for water samples, and a concentration of 16.7ug/kg is used for soil samples.

The percent recovery of the surrogate in all field samples and QC samples must be within the limits listed in the Method Limit Groups (MLGs) in LIMS. If the percent recovery is outside of this range, the analysis of the sample must be repeated. Barring obvious matrix interferences, repeated failure of the surrogate percent recovery may indicate re-extraction is necessary.

Note: If one of the surrogates is within the acceptance limits and the other surrogate recovery is >10%, a field sample is deemed acceptable and re-extraction and re-analysis is not automatically performed.

9.2.7.1 Surrogate Dilution Factor Threshold

Due to the level of dilution required for samples, surrogates may be diluted out. As such, recoveries will be reported as “0D” in dilutions greater than DF5. Control limits will not apply to samples analyzed at dilutions of greater than DF5.

An NCM must be initiated to denote this situation.

9.3 Corrective Action for Out-of-Control Data

When the quality control parameters do not meet the criteria set forth in this SOP, corrective action must be taken in accordance with SOP SA-QA-005: *Preventive and Corrective Action Procedures* the QC Summary Table in Attachment 3. SOP SA-QA-005 provides contingencies for out-of-control data and gives guidance for exceptionally permitting departures from approved policies and procedures. Nonconformance Memos must be initiated to document all instances where QC criteria are not met and all departures from approved policies and procedures.

10.0 Procedure

10.1 Sample Preparation

The sample preparation procedures are given in the following SOPs:

Matrix	SOP
Aqueous Samples	SA-EX-030
Soil Samples	SA-EX-040

10.2 Analysis

10.2.1 Instrument Operating Conditions

The instrument conditions listed in this SOP are provided for guidance purposes. The actual conditions used by the laboratory may be slightly different from those listed here and must be documented in the instrument maintenance log, data system, and/or run log.

Instrument maintenance must be performed in accordance with Attachment 4 of this SOP.

The goal is to have maximum separation between the target compounds in the shortest run time while maintaining sufficient sensitivity to detect the target compounds at the reporting limit and MDL (if required).

Two columns are connected to the injection port using a press-tight glass y-splitter and a guard column, a two-hole ferrule, or a glass tee to provide simultaneous detection and confirmation of the target analytes.

Example GC Parameters
Injector: 220-240°C
Detector: 300-320°C
Carrier Gas Flow: Helium at 2-5mL/min (per column)
Make-up Gas Flow: Nitrogen at 50-100mL/min (per detector) – see manufacturer's recommended flows

Initial pressure: 10.00psi for 2.5 minutes
Pressure program 1: 20psi/min to 35psi, hold 0 minutes
Pressure program 2: 25psi/min to 45psi, hold 0 minutes
Pressure rate: 13.00psi/minute
Final pressure: 55psi for 0 minutes

Total flow: 60.1mL/min (helium)

Temperature program
Initial Temp: 110°C
Initial Hold: 0.5 minutes
Program Rate1: 45°C per minute to 200°C, hold 0 minutes
Program Rate2: 12.5°C per minute to 230°C, hold 0 minutes
Program Rate3: 30°C per minute to 295°C, hold 0 minutes
Program Rate4: 25°C per minute to 330°C, hold 2.03 minutes
Maximum Temp: 340°C

Run Time: Approximately 9 minutes

Detector: Dual electron capture
Detector temperature: 325°C
Makeup flow: 60-100mL/min (nitrogen)

Signal data rate: 20hz

Auto-injector
Sample washes: 0
Sample pumps: 4
Injection volume: 1.0uL
Syringe size: 10uL
Post Injection Solvent A washes: 4
Post Injection Solvent B washes: 4 (use hexane as wash solvent)
Viscosity delay: 0 seconds
Plunger speed: fast
Pre-injection dwell: 0.00minutes
Post injection dwell: 0.00minutes

Note: These conditions and parameters are given for guidance. The columns/phases, GC conditions, and instrument parameters may be modified to optimize each analytical system.

10.2.1.1 Determination of Retention Time Windows

The procedure for the determination of retention time windows is given in SOP SA-QA-008: *Evaluation of Chromatographic Data*. Retention time windows (RTW), i.e., the length of time the instrument will scan for the analyte, must be established initially upon instrument set-up and verified annually.

Retention times (RT), i.e., the elution time of the analyte, are verified daily with the analysis of the ICAL or CCV. The retention time for the CCV must fall within the daily retention time window as defined in SOP SA-QA-008.

10.2.2 Initial and Continuing Calibration

Calibrate the instrument using the standards and criteria described in Section 9.2.2. Once the calibration has been established and verified with an ICV in accordance with Section 9.2.3, sample analysis may proceed.

Verify the calibration curve with a continuing calibration verification using the standards and criteria described given in Section 9.2.5.

10.2.3 Sample Analysis

The term “clock time” defines the continuing calibration verification frequency. The clock time starts at the injection of the PEVAL. The analysis of samples and batch QC items may continue until the clock time expires. A new PEVAL and CCV (i.e., a new clock) is required to proceed with the analysis of more samples and/or batch QC items. An analytical clock is defined as 24 hours (for EPA 608 and EPA 608.3) or 12 hours (for EPA 8081B and EPA 8082A).

EPA 8081B and EPA 8082A require that no more than 20 field samples and/or batch QC items (total) be analyzed within an analytical clock. The default procedure is to include field and batch QC items (e.g., method blank, LCS, MS/MSD, and SD) in determining the maximum number of samples in an analytical clock. Instrument QC (e.g., CCVs, PEVAL, and instrument blanks) are not included in this count of 20.

10.2.3.1 Remove the extracts from the refrigerator and allow them to come to room temperature.

Transfer 1.0mL of the extract to an autosampler vial and add 0.10mL of the internal standard solution to give an internal standard concentration of 0.08ug/mL. The concentration of the internal standard must be the same in all calibration samples, field samples, and QC samples.

The sample extract must be injected using the same injection volume used for the calibration standards. Samples that are known to be relatively clean should be analyzed first. Samples suspected of containing high concentrations should be analyzed last. Instrument blanks may be analyzed after suspected high concentration samples to allow the detector response to stabilize.

10.2.4 Example Analytical Sequence

Refer to Attachment 1 for an example analytical sequence.

Guidance for the evaluation of the calibration standards, field samples, and QC items are summarized in Section 9 and in Attachment 3.

11.0 Calculations / Data Reduction

11.1 Data Reduction

Data evaluation must be performed in accordance with SA-QA-008: *Evaluation of Chromatographic Data.* This SOP includes specific information regarding the evaluation of chromatographic data, including the requirements for performing manual integrations and the evaluation of retention times.

Data must be evaluated in accordance with SOP SA-QA-002: *Data Generation and Review*.

11.1.1 Target Analyte Identification

The judgment and experience of the analyst and his/her colleagues are important factors in the evaluation of chromatographic data. Inspect each chromatogram to ensure that the peaks are properly identified and that the correct areas have been associated with the corresponding standard peak RT in the data system tabulation.

The evaluation of chromatograms for target compounds must take into account the calibration of the analytical system (initial and continuing calibration response and retention times); the recovery and retention time shift of the surrogate compounds, whether the peak response falls within the working range of the calibration; and the integration of the peaks. The analyst must also take into account the results from the method blank and lab control sample before reporting quantitative data. SOP SA-QA-008: *Evaluation of Chromatographic Data* provides additional guidance for the evaluation of chromatographic data. This guidance is summarized in the following sections.

Refer to Attachment 6 and 7 for specific instructions on toxaphene identification and quantitation including the single peak option and the TAUC Method, respectively.

11.1.2 Manual Integrations

Manual integrations must be documented in accordance with SOP SA-QA-008. Data systems should be adjusted to minimize operator intervention. All chromatographic peaks must be evaluated for overall peak shape and “reasonableness” of integration. Under no circumstances should manual integrations be used to change reasonable data system integrations in order to meet calibration or QC criteria.

11.1.3 Dual Column Reporting

Refer to SOP SA-QA-008: *Evaluation of Chromatographic Data* for information on assessing and reporting data from dual columns.

11.1.4 Surrogate Evaluation

Two surrogates, TCMX and DCB, are spiked into each sample and QC item prior to preparation. Given the complicated nature of GC-ECD chromatograms, assessing surrogate recovery is frequently complicated by co-eluting positive and negative interferences. Evaluate the surrogates in the same manner as the target compounds using the guidance above.

Two surrogates are added to all samples and field samples. The laboratory's policy is:

- both surrogates must be within the recovery limits for method blanks and LCS
- one surrogate must fall within the recovery limits for all samples and the other surrogate must have a recovery of at least 10%.
- dilution cannot be used as a justification for not re-analyzing or re-extracting a field sample if the sample can be analyzed at a dilution factor of five or less.

TCX	DCB	Action
Within limits	Within limits	Evaluate and report data
Within limit	Below LCL but >10% recovery	Evaluate and report data
Below LCL but >10% recovery	Within limits	
Below LCL	Below LCL	-Reanalyze -Re-extract unacceptable samples
Above UCL	Above UCL	Evaluate and report data if not target compounds are detected and recovery is <50% above the UCL

LCL = lower control limit UCL = upper control limit

Note: For samples that contain Aroclor 1268, TCX is used to determine if the surrogate recovery is acceptable. DCB is a component of AR1268 and will bias the recovery high.

Refer to Section 11.1.5.1 for information on the surrogate dilution threshold factor.

11.1.5 Dilutions

If the response for an analyte exceeds the working range of the system, a dilution is required. Unless otherwise specified by a client QAPP, results from a single analysis are reported as long as the largest target analyte (when multiple analytes are present) is in the upper half if the calibration range. When reporting results from dilutions, appropriate data flags must be used or qualification in a case narrative provided to the client.

For clients who require the laboratory to provide lower detection limits, a general guide would be to report the dilution detailed above and one additional run at a dilution factor 1/10 of the dilution with the highest target in the upper half of the calibration curve. For example, if samples analyzed at a 1/50 dilution resulted in a target in the upper half of the calibration curve, the sample would be analyzed at a dilution factor of 5 to provide lower reporting limits.

Prepare dilutions for sample extracts where the target compounds exceed the calibration range as follows:

Dilution Factor (DF)	Volume of Sample Extract	Final Volume* (mL)
2	0.50	1.0
5	0.20	1.0
10	0.10	1.0
20	0.50	10
50	0.20	10
100	0.10	10
200	Perform DF10, then DF20	
500	Perform DF10, then DF50	
1000	Perform DF10, then DF100	
2000	Perform DF20, then DF100	
5000	Perform DF50, then DF100	
10000	Perform DF100, then DF100	
20000	Perform DF20, then DF1000	
50000	Perform DF50, then DF1000	
100000	Perform DF100, then DF1000	

* Final Solvent = Hexane

Transfer 1.0mL of the dilution to an autosampler vial and add 100uL of the internal standard.

11.1.5.1 Surrogate Dilution Threshold Factor

Surrogates may be diluted out if the concentration of target compounds is high or the presence of non-target compounds interferes with the quantification of the target compounds. Undetect surrogates in the sample when the dilution factor is greater than 5. As such, recoveries must be reported as “0D”, and control limits will not apply.

An NCM must be initiated to denote this situation.

11.1.5.2 Dilutions and MS/MSD Recoveries

Matrix spike recoveries are not reported for dilutions of greater than 5. An NCM is generated for instances where the dilution prohibits evaluation of the MS/MSD recoveries. In instances where the unspiked sample concentration is more than four times the concentration of the target compound spiked into the MS and MSD, the results are qualified with “4” or other suitable flag.

An NCM must be initiated to denote this situation.

11.1.6 Chemical Relationships

The analyst must be aware of the following chemical relationships:

Alpha-BHC, beta-BHC, delta-BHC, and gamma-BHC are isomers and will generally be present together in a sample. Gamma-BHC is usually the predominant isomer present and the only BHC isomer on the regulated drinking water list.

When 4,4'-DDT (p,p;-DDT) is present in a sample, its breakdown products, 4,4'-DDD and 4,4'-DDE will usually be present, too.

11.1.7 Historical Data

Many of the laboratory's clients submit samples for repeat monitoring purposes. Prior to analysis, verify LIMS Worksheet Notes and/or use the LIMS Historical Data Tracker feature to determine if historical data is available for review.

11.2 Calculations

11.2.1 The calculations associated with batch QC determinations are given in SOP SA-QA-017. Applicable calculations include accuracy (% recovery) and precision (%RPD).

11.2.2 The calculations associated with initial and continuing calibrations and are given in SOP SA-QA-016. Applicable calculations include determination for: calibration factor, standard deviation, relative standard deviation, relative response factor, and relative standard deviation.

11.2.3 The calculation to determine final concentration is given as follows:

$$FinalConcentration = CONC_{Sample} \otimes \frac{F}{I \times dw} \otimes D$$

Where:

$CONC_{Sample}$= Concentration of the sample
F = Final volume/weight
I = Initial volume/weight
D = Dilution factor
dw = % Solids decimal equivalent

Note: All dry weight corrections are performed automatically in LIMS.

Note: This calculation assumes all applicable unit correction factors are applied.

12.0 Method Performance

12.1 Reporting Limit Verification (RLV)

At a minimum, RLVs must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

For analytes and methods certified by DOD ELAP and TNI, RLVs must also be performed quarterly. Exceptions may be made for project-specific non-routine analytes.

12.2 Method Detection Limit (MDL) Study

The current MDLs associated with this procedure are given in the Method Limit Group (MLG) in LIMS.

At a minimum, MDL Studies must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

Replicates must be analyzed quarterly in accordance with SOP SA-QA-007.

Note: MDL Studies are not required for non-routine analytes provided results are not reported below the RL (i.e., MDL equals RL in LIMS).

12.3 Method Detection Limit Verification (MDLV)

At a minimum, MDLVs must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

For analytes and methods certified by DOD ELAP and Texas TRPP, MDLVs must also be performed quarterly.

Note: MDLVs are not required for non-routine analytes provided results are not reported below the RL (i.e., MDL equals RL in LIMS).

12.2 QC Limit Generation, Control Charting, and Trend Analysis

12.2.1 EPA 608 and EPA 608.3
The control limits for the batch QC items (LCS/LCSD and MS/MSD) for this procedure are specified in the reference method and cannot be broadened; therefore, the laboratory defaults to the method-defined limits and does not utilize in-house or laboratory-derived limits for the evaluation of batch QC items.

12.2.2 EPA 8081B and EPA 8082A
The control limits for the batch QC items (LCS/LCSD and MS/MSD) for this procedure are not specified by the reference method; therefore, the laboratory defaults to in-house and/or laboratory-derived limits for the evaluation of batch QC items.

12.2.3 Even when the laboratory must default to the method-defined QC limits, control charting is a useful tool and is performed to assess analyte recoveries over time to evaluate trends. Control charting must be performed periodically (at a minimum annually) in accordance with SOP SA-QA-017: *Evaluation of Batch QC Data.*

12.1 Demonstrations of Capability

Initial and continuing demonstration of capability must be performed in accordance with SOP SA-QA-006*: Training Procedures.*

Prior to performing this procedure unsupervised, each new analyst who performs this analysis must demonstrate proficiency per method/analyte combination by successful completion of an initial demonstration of capability. The IDOC is performed by the analysis of 4 consecutive LCSs that meet the method criteria for accuracy and precision. The IDOC must be documented and routed to the QA Department for filing.

Annual continuing demonstrations of capability (CDOCs) are also required per analyst per method/analyte combination. The CDOC requirement may be met by the consecutive analysis of four LCS all in the same batch, by the analysis of four LCS analyzed in four consecutive batches (in different batches on different days), via acceptable results on a PT study, or analysis of client samples with statistically indistinguishable results when compared to another certified analyst. The CDOC must be documented and routed to the QA Department for filing.

12.2 Training Requirements

All training must be performed and documented in accordance with SOP SA-QA-006: *Training Procedures*.

Note: The SOPs listed in the Reference/Cross-Reference Section are applicable to this procedure. All employees performing this procedure must also be trained on these SOPs, and/or have a general understanding of these procedures, as applicable.

13.0 Pollution Control

It is TestAmerica's policy to evaluate each method and look for opportunities to minimize waste generated (e.g., examining recycling options, ordering chemicals based on quantity needed, preparing reagents based on anticipated usage and reagent stability, etc.). Employees must abide by the policies in Section 13 of the Environmental Health and Safety Manual and the Savannah Addendum to the EHSM.

This procedure has been evaluated for opportunities to minimize the waste generated. Where reasonably feasible, pollution control procedures have been incorporated.

14.0 Waste Management

Waste management practices must be conducted consistent with all applicable federal, state, and local rules and regulations. All waste (i.e., excess reagents, samples, and method process wastes) must be disposed of in accordance with Section 9 of the TestAmerica Savannah Addendum to the EHSM. Waste description rules and land disposal restrictions must be followed.

14.1 Waste Streams Produced by the Method

The following waste streams are produced when this method is carried out:

- Excess aqueous samples – Dispose according to characterization on the sample disposal sheets. Neutralize non-hazardous samples before disposal into drain/sewer. Transfer hazardous samples (identified on disposal sheets) to the waste department for disposal.

- Excess soil and solid samples –All soil samples require incineration for disposal. Transfer RCRA hazardous and non-hazardous samples to the yard box for disposal. Samples classified as PCB hazardous are transferred to the waste coordinator for drumming. All samples classified as foreign soils are transferred to the waste coordinator for disposal. .

- Flammable waste (hexane and methanol from extracts, rinsings, and standards) - Transfer to a satellite container designated for flammable waste and transfer to waste disposal department when the container is full. Leave 10% of headspace in the satellite container.

- Methylene chloride extracts - Dispose according to characterization on sample disposal sheets. Transfer extract to chlorinated waste container.

- Samples treated with sulfuric acid- Transfer vials to Hexane Vial Waste container.

16.0 Method Modifications

16.1 Incorporation of Other Matrices

This procedure may be modified to analyze other matrices (e.g., wipe, waste, tissue, and TCLP/SPLP leachate samples) based on the needs of the client. This will need to be arranged by the Project Manager at the initiation of the project.

Wipe, waste, and tissue matrices are non-routine, and the laboratory is not currently NELAC certified for these matrices. The laboratory uses its routine soil RLs (converted for initial and final volumes, etc.) and default QC limits to evaluate wipe, waste, filter, and tissue samples. Soil DOCs can be used to satisfy analyst demonstrations of capability for these types of non-routine matrices. The laboratory uses its routine aqueous RLs (converted for initial and final volumes, etc.) and default QC limits to evaluate TCLP/SPLP leachate samples. Water DOCs can be used to satisfy analyst demonstrations of capability for TCLP/SPLP matrices. Teflon chips, Ottawa sand, or equivalent is used as the blank matrix for wipes, wastes, and tissues unless specifically requested otherwise by the project.

16.1.1 Collection and Handling Procedures

Waste (Oil) Samples:
Waste (oil) samples are routinely collected in 8oz soil containers with PTFE-lined lids. Waste (oil) samples must be iced at the time of collection and maintained at 4°C (less than 6°C but not frozen) until the time of preparation. Samples must be prepared within 14 days of collection. Extracts must be stored at 0-6°C (less than 6°C but not frozen) until the time of analysis and analyzed within 40 days of extraction.

Wipe Samples:
Wipe samples are routinely collected in 40mL VOA vials. Wipe samples must be iced at the time of collection and maintained at 4°C (less than 6°C but not frozen) until time of preparation. Samples must be prepared within 14 days of collection. Extracts must be stored at 0-6°C (less than 6°C but not frozen) until the time of analysis and analyzed within 40 days of extraction.

Tissue Samples:
Tissue samples are routinely collected in plastic containers with the size dependent upon the type of tissue being collected. Plastic jars or plastic baggies can be used. Upon receipt, samples must be placed in the freezer at -10° to -20°C if extraction/digestion cannot be completed that day and must be kept frozen until the time of preparation. A holding time of six months from the date of collection for frozen fish fillets is recommended by the Alabama Department of Environmental Management (ADEM) and will be used for all biological tissues. Once the tissue has been thawed it must be stored at 0-6°C (less than 6°C but not frozen) and preparation must take place within 14 days. Extracts must be stored at 0-6°C (less than 6°C but not frozen) until the time of analysis and analyzed within 40 days of extraction.

TCLP/SPLP Leachate Samples

Once the TCLP/SPLP extraction procedure has been performed, the leachate is transferred to a 1L glass container. TCLP/SPLP leachates must be stored at 0-6°C (less than 6°C with no frozen samples) until the time of preparation. The leachate sample must be prepared within 7 days of completion of the TCLP/SPLP extraction. Extracts must be stored at 0-6°C (less than 6°C but not frozen) until the time of analysis and analyzed within 40 days of extraction.

16.1.2 Preparation and Analytical Procedures

Wipe, waste, and tissue samples are prepared in the same manner as routine soil samples as outlined in SOP SA-EX-040 and SA-EX-042. TCLP/SPLP matrices are prepared in the same manner as routine water samples as outlined in SOP SA-EX-030. Refer to the applicable preparation SOPs for more information.

Waste oils are prepared by using 0.5g of sample and brought up to a final volume of 10mL.

Wipe, waste, filter, tissue, and TCLP/SPLP matrices are analyzed in the same manner as routine samples as outlined in this SOP.

16.2 Other Considerations

16.2.1 EPA Methods 608 and 608.3 were written specifically for industrial and municipal wastewater samples; however, the laboratory may perform other types of water samples using this procedure.

16.2.2 The procedures for chlorinated pesticides (EPA 8081B) and PCBs (EPA 8082A) are given as separate methods in SW-846. The extraction and the analysis are combined in this SOP to reduce the time of extraction and analysis, and to reduce the amount of solvent used in the procedures (one extraction instead of two). If interferences or high levels of non-PCB compounds are present, a portion of the extract may be subjected to the acid cleanup and reanalyzed.

16.2.3 The reference methods do not require the analysis of an ICV. NELAC requires an ICV; however, it does not list specific criteria. The laboratory has adopted the default criteria listed in Section 9 for ICVs for these methods.

16.2.4 The laboratory allows one surrogate compound to be outside acceptance limits, in field samples and MS/MSD, provided their recovery is greater than 10%.

16.2.5 The reference methods do not require the analysis of an instrument blank; however, the laboratory routinely analyzes instrument blanks items and has adopted in-house criteria as outlined in this SOP.

16.2.6 The laboratory has incorporated the minimum batch QC items as outlined in Section 9.1. Some additional QC items are routinely performed to satisfy common regulatory and/or client requests for precision data and/or to facilitate scheduling and data evaluation.

16.2.7 The laboratory has incorporated the evaluation of the breakdown check standard (PEVAL) for EPA 608, EPA 608.3 and the EPA 8000-series methods. This standard is required by EPA 608.3 and the EPA 8000-series methods, but is only recommended for EPA 608.

16.2.8 EPA SW-846 Update IV Chapter 4 re-defined the holding times for PCBs as "NONE". The EPA Methods Update Rule re-defined holding times for PCBs as one year from collection to extraction and one year from extraction to analysis. The laboratory has incorporated the extended preparation holding times for PCBs on a project-specific basis, as allowed by that particular state agency and client.

16.2.9 The laboratory's procedure has been modified from the project-specific Toxaphene TAUC reference documents as follows:

- Quantification of Toxaphene TAUC does not use "valley-to-valley" integration; instead it instructs the analyst to assign the baseline based on the instrument blank. "Valley-to-valley" integration excludes the unresolved components of toxaphene, commonly referred to as the "humpogram". The procedure in this SOP includes the humpogram as an integral part of the total area under the curve, since these unresolved peaks are part of the response for toxaphene.

- Due to advances in technology since the time the Toxaphene TAUC reference documents were written, the laboratory has incorporated the use of alternate GC instrument configuration and columns, and the microwave extraction technique. Additionally, the toxaphene reference standard is procured from a commercial vendor which may not be an exact match to the Hercules X16189-49 standard. For this reason any vendor standard purchased must be compared to the Hercules standard prior to use for the analysis of TAUC.

- Further procedure-specific information on integration, identification, and quantitation procedures for Toxaphene TAUC is given in Attachment 7.

16.2.10 The laboratory has defined the analytes listed in Attachment 11 as poor or erratic performers and allows for exceptions to the ICAL, ICV, CCV, LCS, MS/MSD, and Sporadic Marginal Exceedance criteria for this analyte as outlined in this SOP. An NCM must be initiated to denote this situation.

Note: The use of Sporadic Marginal Exceedances, as defined in SOP SA-QA-017, is not permitted for samples originating from South Carolina.

16.2.11 The laboratory allows for the following exceptions to the continuing calibration verification criteria. If the CCV is high biased and samples are non-detect for the affected analyte, data may be reported with qualification. Additionally, if one column is marginally outside criteria for an analyte, this column may be used for qualitative identification, only, with quantitative results for that compound reported from the other, passing column. An NCM must be initiated to address this situation.

16.2.12 Due to the complex nature of PCB analyses, the laboratory has incorporated some additional QC requirements for this procedure. These requirements include resolution checks, AR1016 pattern recognition standard, peak height criteria for peak assignment, etc., and will allow for better evaluation of these compounds.

16.2.13 EPA 608.3 requires a mid level standard to be analyzed at the end of each analytical clock. Due to the nature of the samples analyzed by this method it is highly likely that one or more analytes will not meet method criteria in the closing standard. Therefore, the laboratory allows for an additional reporting limit standard (RLCCV) to be analyzed after the mid level standard at the end of an analytical clock. This standard can be used to demonstrate sensitivity at the reporting limit can be obtained. Samples requiring target analytes that are outside the acceptance criteria in the closing CCV may be reported if those analytes are qualitatively identified in the RLCCV and are non-detect in the samples. An NCM must be initiated to denote this situation.

17.0 Attachments

The following Tables, Diagrams, and/or Validation Data are included as Attachments:

Attachment 1: SOP Summary
Attachment 2: Sample Collection, Preservation, and Holding Time Table
Attachment 3: QC Summary
Attachment 4: Instrument Maintenance and Troubleshooting
Attachment 5: Analysis of Multiple Peak Compounds - PCB as Aroclors
Attachment 6: Analysis of Multiple Peak Compounds - Toxaphene (Single Peak Method)
Attachment 7: Analysis of Multiple Peak Compounds - Toxaphene (TAUC Method)
Attachment 8: Analysis of Multiple Peak Compounds - Technical Chlordane
Attachment 9: Standard Preparation Recipes
Attachment 10: Example Retention Times and Relative Retention Times
Attachment 11: Poor and Erratic Performer Information
Attachment 12: Glassware Cleaning Procedures

Attachment 1: SOP Summary

Sample Preparation Summary
Liquid samples are extracted using continuous liquid-liquid extraction with methylene chloride. The extract is concentrated, the solvent is exchanged to hexane, and the final volume of the extract is adjusted.

5. If the High Volume preparation procedure is requested, 1000mL of sample is extracted and concentrated to a final volume of 5mL.
6. If the Low Volume Initiative (LVI) preparation procedure is requested, 250mL of sample is extracted and concentrated to a final volume of 1.0mL.

Soil samples are extracted using the sonication or microwave extraction procedure. Approximately 15g of the homogenized sample is dried with anhydrous sodium sulfate and extracted with 1:1 acetone/hexane. The extract is concentrated to a final volume of 5mL.

The preparation procedures may also incorporate copper (sulfur) clean-up and acid clean-up (used for PCBs and TAUC only).

Samples should be prepared according to the appropriate matrix-specific SOP.

Matrix	SOP
Aqueous Samples	SA-EX-030
Soil Samples	SA-EX-040

Sample Analysis Summary
The extract is analyzed by gas chromatography using dual capillary columns (different phases) and dual electron capture (EC) detectors. This configuration allows for simultaneous detection and confirmation of the target compounds. Identification of the target compounds in samples is performed by comparing the retention times of the peaks with standards analyzed under the same GC conditions. Quantitation is performed using the internal standards calibration technique.

Example Analytical Sequence

Analysis Item	Comments
Initial Calibration Sequence	PEVAL - Endrin/DDT Breakdown Check AR1016 AR1660 ICAL (6-pt) AR1660 ICV Remaining Aroclors (1-pt) Pesticide ICAL (6-pt) Pesticide ICV Toxaphene ICAL (6-pt) Toxaphene ICV

	Technical Chlordane ICAL (6-pt) Technical Chlordane ICV AP9 ICAL (6-pt) AP9 ICV
Instrument Blank	
Field Samples and Batch QC Items	Analyze until clock time expires. EPA 608 and EPA 608.3 = 24 hours EPA 8000-series = 12 hours (or 20 samples/batch QC, whichever comes first)
PEVAL	Endrin/DDT Breakdown Check
CCV	Pesticide CCV AR1660 CCV Toxaphene CCV Technical Chlordane CCV AP9 CCV (if requested) AR1221/1254 CCV (if needed) AR1232/1262 CCV (if needed) AR1242/1268 CCV (if needed) AR1248 CCV (if needed)
Instrument Blank	
Field Samples and Batch QC Items	Analyze until clock time expires. EPA 608 and EPA 608.3 = 24 hours EPA 8000-series = 12 hours (or 20 samples/batch QC, whichever comes first)
CCV	Pesticide CCV AR1660 CCV Toxaphene CCV Technical Chlordane CCV AP9 CCV (if requested) AR1221/1254 CCV (if needed) AR1232/1262 CCV (if needed) AR1242/1268 CCV (if needed) AR1248 CCV (if needed)

*Note 1 – PEVAL Breakdown Check is not required for PCB-only analyses
*Note 2 – For the TAUC Method, a Toxaphene CCV must be analyzed at the beginning every 12-hour clock. The Parlar 11/Parlar 69 RTW Standard must be analyzed at the start of every day for retention time determination
*Note 3 – For DOD, only 10 samples are allowed per clock.

Surrogates	All field, batch QC, & instrument QC samples	Within LIMS MLG limits Surrogate DTF = 5	Refer to SOP SA-QA-017
Retention Time Window (RTW) Determination	Annually, after major instrument maintenance, and with each new column	Refer to SOP SA-QA-008	Refer to SOP SA-QA-008
Initial Demonstration of Capability	Initially, per analyst, per analyte/method/matrix combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006

QC Item	Frequency	Criteria	Corrective Action
(IDOC)			Note: Unsupervised work must not begin until acceptable IDOC is obtained.
Continuing Demonstration of Capability (CDOC)	Annually, per analyst, per analyte/method/matrix combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006
Reporting Limit Verification (RLV)	Upon method/instrument set-up, per analyte/method/matrix combination. Then quarterly thereafter (for DOD ELAP) or annually thereafter (for non-DOD ELAP)	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007
Method Detection Limit Study (MDL)	Upon method/instrument set-up, per analyte/method/matrix combination	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007
MDL Verification (MDLV)	Upon method/instrument set-up, per analyte/method/matrix combination. Then quarterly thereafter (for DOD ELAP) or annually thereafter (for non-DOD ELAP)	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007

Attachment 4:
Instrument Maintenance and Troubleshooting

LABORATORY EQUIPMENT PREVENTIVE MAINTENANCE SCHEDULE								
	Service Interval							
EQUIPMENT ITEM	D	W	M	Q	SA	A	AN	SERVICE LEVEL
Guard Column/Injector							X	Change sleeve and cut front of guard column, recommended daily
Septum							X	Replace , recommended daily
Splitless Disc							X	Replace , recommended daily
Autosampler							X	Syringe cleaned or replaced as needed
Column							X	Change column

D = daily; W = Weekly; M = monthly; Q = Quarterly; SA = semi-annually; A = annually; AN = as needed

Troubleshooting

Troubleshooting should be documented as outlined above. If possible, troubleshooting is best performed in a step-wise manner to systematically isolate instrument components. Refer to the instrument manufacturer's guides for specific information and strategies. Enlist assistance from technical and/or department management as needed.

Contingency Plan

Maintenance contracts are carried for most instrumentation and close contact is maintained with service personnel to ensure optimal instrument functioning. An extensive spare parts inventory is maintained for routine repairs. Since instrumentation is standardized throughout the laboratory network, spare parts and components can be readily exchanged among the network.

In general, the laboratory has at least one backup unit for each critical unit. In the event of instrument failure, portions of the sample load may be diverted to duplicate instrumentation, the analytical technique switched to an alternate approved technique (such as manual colorimetric determination as opposed to automated colorimetric determination), or samples shipped to another properly certified or approved TestAmerica location.

Maintenance Log

A maintenance log must be established for each piece of equipment used in the laboratory. All maintenance that is performed on the instrument must be recorded in the log including:

- Type of maintenance performed (Note: This includes preventative/routine maintenance; non-routine maintenance; maintenance performed by an external vendor; updates to software versions; etc.)
- analyst or technician performing the maintenance
- date the maintenance was performed
- detailed explanation of the reason for the maintenance
- resolution of the problem and return to control
- all service calls from instrument representatives
- Resolution of the problem (i.e., the Return to Control)

Instrument Labeling

Each instrument must be labeled with its name or ID (e.g., MSA, ICP-D, etc.). Additionally, non-operational instruments must be isolated from service or marked as being out of service. Each piece of equipment has an “Operational / Not Operational” sticker that is used for this purpose.

Attachment 5:
Analysis of Multiple Peak Compounds

Evaluation of PCBs as Aroclors

PCBs are reported as Aroclors, which are mixtures of PCB congeners. The Aroclors are named by percentage of chlorine in each mixture with the prefix 12- to represent the biphenyl molecule.

Aroclor	% Chlorine by Weight
1221	21
1232	32
1016	41.5
1242	42
1248	48
1254	54
1260	60
1262	62
1268	68

The exception to this naming convention is AR1016, which is about 42% chlorine by weight. AR1016 and AR1242 have very similar chromatograms. Both Aroclors have almost the same weight of chlorine by weight and nearly the same PCB congeners.

Aroclors are identified by matching the pattern of the sample with standards analyzed under the same analytical conditions. Interference may occur due to the presence of non-target analytes or due to "weathering" or degradation of the Aroclor in the environment. The presence of multiple Aroclors will also complicate identification and quantitation. Many matrix interferences may be reduced or eliminated by treating the sample extract with copper and sulfuric acid prior to analysis. The applicable preparation SOPs detail this procedure.

Note: Do not use the acid cleanup **on the entire extract** if pesticides are also to be reported as many of the pesticides are not stable in acid or strong oxidizer. Use a separate aliquot of sample to subject to acid clean-up if pesticides and PCBs are required.

When a pattern matching an Aroclor is encountered, it is quantitated using 3-5 characteristic peaks. AR1016 and AR1260 are quantitated using the average RF/CF determined during initial calibration. The other Aroclors are quantitated against the RF/CF determined from their single-point analysis during initial calibration. Samples should be diluted when the amount of PCB in a sample extract exceeds the calibration range defined in initial calibration. Note that the AR1660 standard defines the working range for all the Aroclors (i.e., if AR1660 was calibrated from 0.05ug/mL to 1.5ug/mL, and a sample extract was analyzed containing 10ug/mL of AR1232, that extract would require dilution to get the amount of AR1232 to be less than 1.5ug/mL). If a sample contains any of the single point Aroclors (that is, Aroclors other than AR1016 and AR1260), then that associated standard must be run within 72 hours of the sample to determine retention time shifts and pattern recognition.

In the 3-5 peak approach, use each peak in the standard to calculate a calibration factor for that peak, using the total mass of PCB in the standard. These calibration factors are then used to calculate the concentration of each corresponding peak in the sample chromatogram and the 3-5 resulting concentrations are averaged to provide the final result for the sample.

"Weathering" is the loss of part of the Aroclor pattern due to biological or chemical degradation of individual PCBs. When weathering is suspected, try to match the later eluting peaks first. Flag the results for a weathered Aroclor pattern as tentatively identified or make a note in the case narrative.

The presence of multiple Aroclors can be a problem to identify since most Aroclors have at least a few peaks in common. The easiest case would be to have early and late eluting Aroclors present. The most difficult cases will involve the presence of Aroclors with the same relative chlorine level.

Note: When choosing individual peaks for quantitation, compare their responses in the sample and standard. If the peaks chosen do not correlate well (i.e. ratios to other peaks are close) between the sample and standard, review the chromatograms for other possible peaks for quantitation.

Calibration/Quantitation Peaks

The Aroclors are routinely calibrated and quantified in samples using five peaks on each column over the retention time range. The default peaks are listed the tables below. Note: The peaks used for quantitation are subject to change due to age of column, resolution with pesticide compounds, etc. The peaks selected should have a peak height at least 25% of the largest peak within the Aroclor.

Calibration Standards
Apply this guidance to both columns/detectors.

Adjust the baseline, if needed, to ensure a consistent integration between samples, standards, and QC items.

Inspect the peaks used for quantitation to make sure that the peaks are properly distinguishable from closely eluting peaks. Note: This step is important because as the column degrades resolution between the peaks may decrease and the integration parameters adjusted. Be sure to apply the same integration parameters to the calibration standards and samples.

ICAL: Update the method with the retention times and responses of the standards.

CCV: Update the method with the retention times of the standards.

Qualitative Identification
The Aroclors are subject to degradation in the environment; that is, exposure to the environment will cause loss of some of the peaks in the sample pattern that are present in the standard. In general, the peaks at the higher retention times are degraded by loss of chlorine from the PCB congeners, resulting in the loss of the peak and/or the formation of compounds with lower levels of chlorination, which elute at earlier retention times. Degradation may also occur as the lighter PCB congeners volatilize. Degradation of the Aroclor patterns makes qualitative identification difficult and biases the quantitation significantly if the peaks used for quantitation are if not present in the pattern.

Apply this guidance to both columns/detectors.

Adjust the baseline, if needed, to ensure a consistent integration between samples, standards, and QC items.

Compare the overall pattern of the sample to the most recently analyzed Aroclor standard. Since the AR1016/AR1260 mixture contains all of the PCB congeners in all of the other Aroclors and because it is analyzed in every clock, overlaying the sample with the AR1660 standard can help in the evaluation for the presence of PCB in the sample. If a substantial number of peaks line up with the AR1660 standard, locate the clock where the most recent Aroclor single points were analyzed to compare the sample with the patterns in the other Aroclors.

Evaluate the ratios of the 3-5 quantitation peaks identified by the data system and compare to the standard(s).

Inspect the peaks used for quantitation to make sure that the peaks are properly distinguishable from closely eluting peaks.

Manually integrate peaks where the data system did not integrate peaks in the same manner as the calibration standards. The most common types of manual integration involve “splitting

peaks" that are not resolved by the current integration parameters or identifying peaks as targets because of loss of resolution of peak symmetry.
Identify the Aroclor that most resembles the pattern of the sample and un-detect (mark as "not detected") in the data system quant file.

Inspect the chromatogram for the presence of interfering peaks from other target compounds or from non-target matrix interferences. The most common interference peaks will be from other Aroclors present in the sample matrix. Refer to Attachment 9 for guidance on retention times and relative retention times of potential interfering peaks.

"Un-assign" the quantitation peaks that are subject to interference.

Compare the average concentration (of the five quantitation peaks) from column 1 with the average concentration from column 2 and evaluate and qualify according to the guidance in the table for evaluating dual column results.

Attachment 6:
Analysis of Multiple Peak Compounds

Toxaphene
(Single Peak Method)

Toxaphene is a mixture of chlorinated camphenes and has a complex and characteristic pattern when analyzed by GC/ECD. This pattern will degrade in the environment with the most of the degradation coming from "reductive de-chlorination" where the higher molecular weight components lose chlorine and form components with lower molecular weights. This degradation makes identification and quantification of toxaphene residues very problematic as the pattern shifts "forward" as the lower molecular weight components become more prominent.

Calibration/Quantitation Peaks
Toxaphene is routinely calibrated and quantified in samples using five peaks on each column over the retention time range. The default peaks are provided in the table below:

Peak	Restek CLPesticides			Restek CLPesticides II		
	RT	RRT	Response Ratio	RT	RRT	Response Ratio
ISTD	2.843	1.000		2.607	1.000	
1	10.460	3.679	1.0	10.633	4.079	1.0
2	10.883	3.810	1.1	11.093	4.256	1.1
3	11.560	4.066	1.6	11.970	4.592	0.92
4	12.170	4.280	1.1	12.647	4.852	0.51
5	12.433	4.373	0.65	12.977	4.978	0.38

Calibration Standards:
Apply the following guidance to both columns/detectors:

Inspect the peaks used for quantitation to make sure that the peaks are properly distinguishable from closely eluting peaks.

Note: This is important because as the column degrades resolution between the peaks may decrease and the integration parameters adjusted. Be sure to apply the same integration parameters to the calibration standards and samples.

ICAL: Update the method with the retention times and responses of the standards.
CCV: Update the method with the retention times of the standards.

Qualitative Identification

Toxaphene is subject to degradation in the environment; that is, exposure to the environment will cause loss of some of the peaks in the sample pattern that are present in the standard. A procedure where the sample pattern matches the standard and a procedure where the sample pattern does not match the pattern but a "toxaphene-like" pattern is present are provided.

a. Samples where pattern matches standard pattern

- Apply the following guidance to both columns/detectors:
- Compare the overall pattern of the sample to the most recently analyzed toxaphene standard.
- If the sample and standard chromatograms agree well, quantify toxaphene using the five characteristic peaks used for calibration as follows:

    - Inspect the peaks used for quantitation to make sure that the peaks are properly distinguishable from closely eluting peaks.
    - Inspect the chromatogram for the presence of interfering peaks from other target compounds or from non-target matrix interferences. The most common interference peak is 4,4'-DDT on column 1 (RTX CLPesticides column).
    - Manually integrate peaks where the data system did not integrate peaks in the same manner as the calibration standards. The most common types of manual integration involve "splitting peaks" that are not resolved by the current integration parameters or identifying peaks as targets because of loss of resolution of peak symmetry.
    - "Undetect" the toxaphene quantitation peaks that are subject to interference. Again, the most common interference peak is 4,4'-DDT on column 1 (RTX CLPesticides column). If 4,4-DDT is present, "undetect" toxaphene peak 1. In this case, the quantitation will be based on the average of the remaining quantitation peaks.
    - Compare the average concentration (of the five quantitation peaks) from column 1 with the average concentration from column 2 and evaluate and qualify according to the guidance in the table for evaluating dual column results.
    - Provide an NCM describing the interference peaks, if present, and how the quantitation of toxaphene was affected.

Example:

Sample X contained toxaphene and 4,4-DDT. Since 4,4-DDT coelutes with the first peak used to quantify toxaphene on column 1, that toxaphene peak was "undetected" and not included in the quantification of toxaphene on column 1. The concentration of 4,4-DDT was most likely biased high on column 1 because it co-elutes with a peak from toxaphene and was reported from Column 2.

Samples where sample pattern does not matches standard pattern closely

- Apply the following guidance to both columns/detectors:
- Compare the overall pattern of the sample to the most recently analyzed toxaphene standard.
- If the sample and standard chromatograms do not agree well, that is, the pattern and ratios of the quantitation peaks are not similar, as is the case of degraded toxaphene, evaluate the data as follows:

  Note: Contact the supervisor, department manager, or Technical Director as soon as toxaphene is tentatively identified. The evaluation of samples for degraded toxaphene is difficult and will require the consultation of the most experienced analysts.

- Inspect the chromatogram for the presence of the peaks used for quantitation. The presence of three or more quant peaks on both columns, especially the first three, indicates that toxaphene may be present.
- Try to match all the peaks (not just peaks used for quantitation) in the sample to all the early peaks in the toxaphene standard. The ratios will not be the same but the presence of peaks in the sample eluting at the same RT as the peaks in the early part of the toxaphene chromatogram is additional evidence that degraded toxaphene is present.
- Inspect the chromatogram for the presence of interfering peaks from other target compounds or from non-target matrix interferences. The most common interference peak will be from 4,4-DDT, which co-elutes with toxaphene peak 1 on Column 1 and is often associated with the presence of toxaphene in the environment. Refer to Attachment 9 for guidance on retention times and relative retention times of potential interfering peaks.
- Identify the sample as containing degraded toxaphene if the overall pattern of the peaks is similar to the toxaphene standard but the peaks elute at earlier RT AND the peaks in the first part of the sample chromatogram correspond reasonably to the early eluting peaks in the toxaphene standard.
- Quantify degraded toxaphene using the total response of all peaks eluting within the pattern in the sample against the total response of all peaks between the first and last eluting peaks in the toxaphene standard.
- Compare the concentration from column 1 with the concentration from column 2 and evaluate and qualify according to the guidance in the table for evaluating dual column results.
- Additionally, qualify the data in an NCM, noting that toxaphene was identified even though the patterns of peaks did not match the standard exactly and that toxaphene quantified against a single standard using total response.

Example:
A pattern similar to toxaphene was present on both columns. The sample's chromatograms contained peaks that match the peaks eluting in the first part of the toxaphene standard pattern. The sample was quantified by comparing the total area of the peaks in the sample with the total area of the peaks in the toxaphene standard. The results were qualified with "J" to indicate that the concentration was estimated because the sample pattern does not match the standard pattern but there was sufficient evidence to identify the presence of toxaphene in the sample.

Attachment 7:
Analysis of Multiple Peak Compounds

Toxaphene
(TAUC Method)

This Attachment outlines the "total area under the curve" (TAUC) procedure for integrating calibration, quality control, and field sample chromatograms. This approach gives a conservative concentration; that is, the result is usually biased high when compared to the "five peak quantitation" described in Attachment 6. This approach quantitates all peaks within the retention time range from Parlar 11 to Parlar 69, regardless of qualitative identification.

Retention Time Window Determination

Establish the retention time window (RTW) for toxaphene using a time range from 0.10 minutes before Parlar 11 to 0.10 minutes after Parlar 69. This window will include all of the major and most of the minor peaks in toxaphene. This window was chosen based on client instruction and ensures that each analyst would use the same RT range for toxaphene. Use this window on both columns.

This RTW must be re-established at the beginning of every sequence via re-analysis of the RTW Standard (i.e., Parlar 11/Parlar 69).

Note: The surrogates and internal standard must fall outside of the retention time range of peaks in the toxaphene standard and, as such, will be excluded from the quantitation.

Attachment 8
Analysis of Multiple Peak Compounds

Technical Chlordane

Technical Chlordane is a mixture of at least 11 major components and 30 or more minor components that is used to prepare specific pesticide formulations. The following components are significant: α-chlordane and γ-chlordane, trans-nonachlor, and heptachlor. The α-chlordane and γ-chlordane isomers are the most prevalent and their detection as single components is a good indicator that technical chlordane may be present.

When the GC pattern of the sample resembles that of the Technical Chlordane standard, quantitate chlordane by comparing the area of 3 to 5 major peaks. Heptachlor and heptachlor epoxide should not be included in this quantitation but rather should be quantitated and reported separately.

Calibration/Quantitation Peaks
Technical chlordane is routinely calibrated and quantified in samples using five peaks on each column over the retention time range. The default peaks are provided in the tables below:

Peak	Restek CLPesticides			Restek CLPesticides II		
	RT	RRT	Response Ratio	RT	RRT	Response Ratio
ISTD	2.843	1.000		2.607	1.000	
1	6.387	2.246	1.0	6.353	2.437	1.0
2	7.323	2.576	1.4	7.483	2.871	1.4
3	8.443	2.970	3.7	8.637	3.313	3.5
4	8.693	3.057	5.4	8.927	3.425	3.0
5	10.130	3.563	0.92	10.570	4.055	0.94

Calibration Standards
Apply the following guidance to both columns/detectors:

- Inspect the peaks used for quantitation to make sure that the peaks are properly distinguishable from closely eluting peaks.

  Note: This is important because as the column degrades resolution between the peaks may decrease and the integration parameters adjusted. Be sure to apply the same integration parameters to the calibration standards and samples.

ICAL: Update the method with the retention times and responses of the standards.
CCV: Update the method with the retention times of the standards.

Qualitative Identification

Technical chlordane is subject to degradation in the environment; that is, exposure to the environment will cause loss of some of the peaks in the sample pattern that are present in the standard. In general, if alpha chlordane and gamma chlordane are detected in the sample and technical chlordane is a target compound, report the sample as containing technical chlordane.

b. Samples where pattern matches standard pattern

- Apply the following guidance to both columns/detectors:
- Compare the overall pattern of the sample to the most recently analyzed technical chlordane standard.
- If the sample and standard chromatograms agree well, quantify technical chlordane using the five characteristic peaks used for calibration as follows:
- Inspect the peaks used for quantitation to make sure that the peaks are properly distinguishable from closely eluting peaks.
- Inspect the chromatogram for the presence of interfering peaks from other target compounds or from non-target matrix interferences.
- Manually integrate peaks where the data system did not integrate peaks in the same manner as the calibration standards. The most common types of manual integration involve “splitting peaks” that are not resolved by the current integration parameters or identifying peaks as targets because of loss of resolution of peak symmetry.
- “Undetect“ the technical chlordane quantitation peaks that are subject to interference.
- Compare the average concentration (of the five quantitation peaks) from column 1 with the average concentration from column 2 and evaluate and qualify according to the guidance in the table for evaluating dual column results.

c. Samples where sample pattern does not matches standard pattern closely

- Apply this guidance to both columns/detectors.
- Compare the overall pattern of the sample to the most recently analyzed technical chlordane standard.
- If the sample and standard chromatograms do not agree well, that is, the pattern and ratios of the quantitation peaks are not similar, as is the case of degraded technical chlordane, evaluate the data as follows:

  Note: Contact the supervisor, department manager, or Technical Director as soon as technical chlordane is tentatively identified. The evaluation of samples for degraded technical chlordane is difficult and will require the consultation of the most experienced analysts.

  - Inspect the chromatogram for the presence of the peaks used for quantitation. The presence of three or more quant peaks on both columns, especially peaks TCHLOR-3 (gamma chlordane) and TCHLOR-4 (alpha chlordane), indicates that technical chlordane is present.
  - Try to match all the peaks (not just peaks used for quantitation) in the sample to the peaks in the standard. The ratios will most likely not agree but the presence of peaks in the sample eluting at the same RT along with the

presence of heptachlor and alpha and gamma chlordane is additional evidence that degraded technical chlordane is present.

- Inspect the chromatogram for the presence of interfering peaks from other target compounds or from non-target matrix interferences. Refer to Attachment 9 for guidance on retention times and relative retention times of potential interfering peaks.
- Identify the sample as containing technical chlordane if the overall pattern of the peaks is similar to the technical chlordane standard and peaks are present for alpha chlordane and gamma chlordane.

- Quantify technical chlordane as the average of the quantitation peaks present in the sample matrix. Alternatively, use the total response of all peaks eluting within the pattern in the sample against the total response of all peaks between the first and last eluting peaks in the technical chlordane standard.

- Compare the concentration from column 1 with the concentration from column 2 and evaluate and qualify according to the guidance in the table for evaluating dual column results.

- Additionally, qualify the data in an NCM, noting that technical chlordane was identified even though the patterns of peaks did not match the standard exactly and note how the quantitation was done: either by the average of the quantitation peaks present or that technical chlordane was quantified against a single standard using total response.

***Note**: These retention times are listed as guidance and reflect the retention times of the target compounds at the time this SOP was released. Changes in instrument configuration, length of column, etc. will affect these values.
***Note:** It has been found that in some situations the elution order of 4,4-DDe and endosulfan I can switch on CLP I column.

Attachment 11:
Poor Responder Information

The following analytes have been identified, in the reference method and/or via historical data, to be a poor and/or erratic performers:

Kepone
Chlorobenzilate (This analyte is impacted by the presence of Kepone due to its close elution.)

These analytes are exempt from the LCS, MS, MSD, Sporadic Marginal Exceedance, ICAL, ICV, and CCV criteria as listed in this SOP.

Note: The use of Sporadic Marginal Exceedances, as defined in SOP SA-QA-017, is not permitted for samples originating from South Carolina.

Attachment 12: Glassware Cleaning Procedures

GLASSWARE CLEANING PROCEDURES

SEMIVOLATILE GC LAB

1. Scrub with tap water and Liquinox.
2. Rinse 3 times thoroughly with tap water.
3. Rinse 3 times thoroughly with Acetone.
4. Place volumetric top-down within storage rack and allow to air dry.
5. Store in closed drawer.

FSG046:12.04.13:0

eurofins | Environment Testing TestAmerica

18.0 Revision History

Summary of Changes for Revision 24:
- Added reference to preparation via separatory funnel to section 2.0.
- Added containers to section 8.1 and 8.2. LVI prep is performed using 250mL amber unpreserved.
- Added 608.3 breakdown criteria to section 9.2 of 20%.
- Added DODQSM V5 criteria to section 9.2.3.
- Removed requirement for capping Toxaphene CCV when using TAUC reporting in section 9.2.5.
- Updated section 12.0 to reflect TNI2016, DOD and TRPP requirements.

Summary of changes for Revision 23:
- Updated expiration dates of purchased and intermediate standards. Standards purchased in flame-sealed ampules will expire 1 year from opening and intermediates or working standards will expire 6 months after preparation.
- Updated CCV analysis requirement for TAUC to be in line with SW-846 revision 4. Updates are in section 9.2.5 and Attachment 3.

Summary of Changes:
- Minor editorial, grammatical, and/or formatting changes made.
- Updated SOP signatories to reflect current responsibilities and titles.
- Added note that SC DHEC prohibits the use of sporadic marginal exceedances. This change stems from SC DHEC Technical Deficiency Letter dated 05/14/19. Section 9.1, Section 16.2.10, and Attachment 11
- Added %RSE requirement. (This change stems from SC DHEC Technical Deficiency Letter dated 05/14/19.) Section 9.2.2.2 and Attachment 3

SEMI-VOLATILE COMPOUNDS BY GC/MS

(Methods: EPA 625, EPA 625.1, EPA 8270D, EPA 8270E, EPA 8270D_LL, EPA 8270E_LL, EPA 8270D_LL_PAH, and EPA 8270E_LL_PAH)

Approvals (Signature/Date):

Brad Mullis — 10/27/2021

Brad Mullis — Date
Department Manager

1.0 SCOPE AND APPLICATION

This SOP contains the procedures for the determination of extractable semi-volatile organic compounds (SVOC) by gas chromatography/mass spectrometry (GC/MS).

The routine matrices performed by this procedure are waters and soils. Other matrices which may be performed include wipes, leachates, tissues, and wastes.

A complete target analyte list, the reporting limits (RL), the method detection limits (MDL), and the accuracy and precision criteria associated with this procedure are provided in the TALS Method Limit Groups (MLGs).

2.0 SUMMARY OF METHOD

A measured volume or weight of sample is extracted using continuous liquid-liquid or microwave extraction procedures. The extract is then analyzed by GC/MS. Qualitative identification of the target compounds in the extract is based on the retention time and the relative abundance of the characteristic masses determined from standards analyzed on the same GC/MS under the same conditions. Quantitative analysis is performed using the internal standard technique with a single characteristic ion.

This SOP is based on the following methods: EPA 625, EPA 625.1, EPA 8270E, and EPA 8270D.

Note: This SOP contains the procedures for several variations of the SW-846 methods. These variations include:

- EPA 8270D/EPA 8270E = Routine EPA 8270D/EPA 8270E method.
- EPA 8270D_LL/EPA 8270E_LL = Low-level EPA 8270D/EPA 8270E method, providing lower RLs and MDLs than the routine method. This low-level method can incorporate a polynuclear aromatic hydrocarbon (PAH) sublist option to accommodate low-level PAH reporting.
- EPA 8270D_LL_PAH/EPA 8270E_LL_PAH = Low-level EPA 8270D/ EPA 8270E PAH-only method, providing lower RLs and MDLs than the routine method. This method is used for low-level PAH analytes only and ,is used for DOD QSM V5 samples, and incorporates ortho-terphenyl (OTP) as the surrogate compound. Refer to the DOD QSM document for analytical specifications required in addition to those listed in this SOP.

These three sets of procedures incorporate slightly different standard concentrations, surrogate compounds, instrument configuration, and/or QC evaluation criteria, which are outlined separately in the applicable sections of this SOP.

This SOP also gives the procedures for analyzing and reporting samples using the MS in the Selective Ion Monitoring (SIM) mode.

3.0 DEFINITIONS

Refer to the Glossary Section of the *Quality Assurance Manual* (QAM) for a complete listing of applicable definitions and acronyms.

4.0 INTERFERENCES

4.1 Procedural Interferences

Interferences may be caused by contaminants in solvents, reagents, glassware, and other sample processing apparatus and can make identification and/or quantification of the target analytes difficult.

All sample collection containers are single-use disposable containers which limits the potential for contamination. All non-disposable labware must be scrupulously cleaned in accordance with the posted Labware Cleaning Instructions to ensure it is free from contaminants and does not contribute artifacts.

High purity reagents and solvents are used to help minimize interference problems. Acetone and methylene chloride must be verified prior to use in accordance with the TestAmerica Solvent Lot Testing Program.

Instrument and/or method blanks are routinely used to demonstrate all reagents and apparatus are free from interferences under the conditions of the analysis.

4.2 Matrix Interferences

Matrix interferences may be caused by contaminants that are co-extracted from the sample matrix. The extract may require dilution prior to analysis to reduce or eliminate the interferences.

Interfering contamination may occur when a sample containing low concentrations of analytes is analyzed immediately following a sample containing relatively high concentrations of analytes. As such, samples known to be clean should be analyzed first. To prevent carryover into subsequent samples, analysis of reagent blanks may be needed after the analysis of a sample containing high concentrations of analytes.

If there is interference with the primary ion, then secondary ions may be used for quantification. If a secondary ion is used for quantification, the linearity of the secondary ion must be established by meeting the criteria in Section 11.

The basic conditions of the initial extraction may cause hydrolysis and degradation of some target compounds. The degradation may be pronounced in phthalate esters.

Refer to Section 11.1.5 for more information on the chemical relationships of these compounds.

5.0 SAFETY

Employees must abide by the policies and procedures in the TestAmerica Environmental Health and Safety Manual (EHSM), the TestAmerica Savannah Addendum to the EHSM, and this document.

This procedure may involve hazardous materials, operations, and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user to follow appropriate safety, waste disposal, and health practices under the assumption that all samples and reagents are potentially hazardous.

The analyst must protect himself/herself from exposure to the sample matrix. Many of the samples that are tested may contain hazardous chemical compounds or biological organisms. The analyst must, at a minimum, wear protective clothing (lab coat), eye protection (safety glasses or face shield), disposable gloves, and closed-toe, nonabsorbent shoes when handling samples.

5.1 Specific Safety Concerns or Requirements

The toxicity or carcinogenicity of chemicals used in this method has not been precisely defined. Each chemical should be treated as a potential health hazard, and exposure to these chemicals should be minimized.

Methylene chloride is a carcinogen and an irritant. It causes irritation to the respiratory tract and has a strong narcotic effect with symptoms of mental confusion, light-headedness, fatigue, nausea, vomiting, and headache. It may be absorbed through the skin and can cause irritation and pain to the skin and eyes.

The gas chromatograph and mass spectrometer contain zones that have elevated temperatures. The analyst must be aware of the locations of those zones, and must cool them to room temperature prior to working on them.

The mass spectrometer is under deep vacuum. The mass spectrometer must be brought to atmospheric pressure prior to working on the source.

There are areas of high voltage in both the gas chromatograph and the mass spectrometer. Depending on the type of work involved, either turn the power to the instrument off, or disconnect it from its source of power.

5.2 Primary Materials Used

The following is a list of the materials used in this procedure, which have a serious or significant hazard rating, and a summary of the primary hazards listed in their MSDS/SDS.

NOTE: This list does not include all materials used in the procedure. A complete list of materials used in this procedure can be found in the Reagents and Standards Section and the Equipment and Supplies Section of this SOP

Employees must review the information in the MSDS/SDS for each material before using it for the first time or when there are major changes to the MSDS/SDS. Electronic copies of MSDS/SDS can be found using the "MSDS" link on the Oasis homepage and on the EH&S webpage on Oasis.

Material	Hazards	Exposure Limit [1]	Signs and Symptoms of Exposure
Acetone	Flammable	1000ppm TWA	Inhalation of vapors irritates the respiratory tract. May cause coughing, dizziness, dullness, and headache.
Methylene Chloride	Carcinogen Irritant	25ppm TWA 125ppm STEL	Causes irritation to respiratory tract. Has a strong narcotic effect with symptoms of mental confusion, light-headedness, fatigue, nausea, vomiting and headache. Causes irritation, redness and pain to the skin and eyes. Prolonged contact can cause burns. Liquid degreases the skin. May be absorbed through skin.
[1]Exposure limit refers to the OSHA regulatory exposure limit.			

6.0 EQUIPMENT AND SUPPLIES

6.1 Equipment and Instrumentation

Gas Chromatograph - Agilent 6890, 7890, or equivalent with compatible autosampler, split/splitless injector, and direct capillary interface.

Mass Spectrometer- Agilent 5973, 5975, or equivalent

Top-loading Balance – Verify in accordance with SOP SA-AN-100: *Laboratory Support Equipment (Verification and Use)*

6.2 Analytical Data System / Software / Hardware

Chemstation software is used on a Windows-based PC to schedule and acquire data. CHROM software is used on a Windows-based PC to store, reduce/evaluate, and output the data to the laboratory's LIMS system (i.e., TALS). CHROM software has the capability of processing stored GC/MS data by recognizing a GC peak within any given retention time window, comparing the mass spectrum from the GC peak with spectral data in a user-created data base, and generating a list of tentatively identified compounds with their retention times and scan numbers. The software also allows integration of the ion abundance of any specific ion between specified time or scan number limits, calculation of response factor , construction of a linear regression calibration curve, calculation of response factor statistics (mean and standard deviation), and calculation of concentrations of analytes using either the calibration curve or the response factors.

6.3 Volumetric Labware

Volumetric Containers must be verified in accordance with SOP SA-AN-100: *Laboratory Support Equipment (Verification and Use)*. Refer to Attachment 12 for Glassware Cleaning Procedures.

Volumetric Labware	Volume	Type (Quantitative / Qualitative)	Use	Verification Frequency	Laboratory Verification Criteria
Gas-Tight Microliter Syringes	Various	QUANTITATIVE	Dilution, Reagent, and Standard Preparation	None (if received with COA)	None (if received with COA)
Volumetric Flasks (Class A)	Various	QUANTITATIVE	Dilution, Reagent, and Standard Preparation	None (Class A)	None (Class A)
Disposable Transfer Pipettes	Various	Qualitative	Sample Transfer	None	None
Autosampler Vials (w/Crimp Cap)	1mL	Qualitative	Instrument Analysis	None	None
Standard Storage Vials (Amber, Glass, w/ Screw Cap)	2mL	Qualitative	Standard Storage	None	None

6.4 Lab Supplies

Column – Rxi-5 SilMS 30ms; 0.25mmx0.25um or equivalent

Injector Liner – 4mm ID quartz or 4mm glass, deactivated

7.0 REAGENTS AND STANDARDS

7.1 Expiration Dates

Expiration dates (time from initial use or receipt to final use) for standard and reagent materials must be set according to the guidance in this SOP. Note: These are maximum expiration dates and are not to be considered an absolute guarantee of standard or reagent quality. Sound judgment must be used when deciding whether to use a standard or reagent. If there is doubt about the quality of a standard or reagent material, a new material must be obtained or the standard or reagent material verified. Data quality must not be compromised to extend a standard's life.

The expiration date of any standard must not exceed the expiration date of the standard that was used to prepare it.

7.2 Reagents

Reagents must be prepared and documented in accordance with SOP SA-AN-041*: Reagent and Standard Materials Traceability.*

Acetone and methylene chloride must be verified prior to use in accordance with the TestAmerica Solvent Lot Testing Program.

Methylene chloride – pesticide grade, for preparation of analytical standards
Storage: Room temperature
Expiration: Unopened and Opened - Manufacturer's expiration date

Acetone – pesticide grade, for cleaning glassware.
Storage: Room temperature
Expiration: Unopened and Opened - Manufacturer's expiration date

7.3 Standards

Standards must be prepared and documented in accordance with SOP SA-AN-041*: Reagent and Standard Materials Traceability.* Certificates of analysis or purity must be received with all purchased standards, and attached to the standard in TALS.

Refer to Attachment 8 for the laboratory's current standards and recipes.

8.0 Sample Collection, Preservation, Shipment, and Storage

8.1 Aqueous Samples

Aqueous samples are routinely collected in 1L or 500mL amber glass containers with PTFE-lined lids.

Samples must be iced at the time of collection and maintained at 0-6°C (less than 6°C but not frozen) until the time of preparation. Samples must be prepared within 7 days of collection. Extracts must be stored in the refrigerator at 0-6°C until the time of analysis and analyzed within 40 days of extraction. Sample extracts must be allowed to come to room temperature prior to analysis.

Note: In the presence of samples containing residual chlorine, phenol-d5 has been known to react to form chlorinated phenolic compounds that are not detected as the original spiked surrogate. Therefore, aqueous samples must be evaluated for the presence of residual chlorine prior to extraction. The presence or absence of residual chlorine is documented on the preparation sheet completed at extraction.

8.2 Soil Samples

Soil samples are routinely collected in 8oz soil containers with PTFE-lined lids.

Samples must be iced at the time of collection and maintained at 0-6°C (less than 6°C but not frozen) until the time of preparation. Samples must be prepared within 14 days of collection. Extracts must be stored in the refrigerator at 0-6°C until the time of analysis and analyzed within 40 days of extraction. Sample extracts must be allowed to come to room temperature prior to analysis.

9.0 Quality Control

SOP SA-QA-017: *Evaluation of Batch QC Data* and the SOP Summary in Attachment 3 provide requirements for evaluating QC data.

9.1 Batch QC

An extraction batch consists of up to 20 environmental samples and the associated QC items.

For EPA 625, the laboratory's default QC items performed for each extraction batch are: a method blank, a laboratory control sample (LCS), a matrix spike (MS) per 10% of samples extracted, and a matrix spike duplicate (MSD).

For EPA 8270D, EPA 8270D_LL, EPA 8270D_LL_PAH, EPA 8270E, EPA 8270E_LL, EPA 8270E_LL_PAH, and EPA 625.1 the laboratory's default QC items performed for each extraction batch are: a method blank, a laboratory control sample (LCS), a matrix spike (MS), and a matrix spike duplicate (MSD).

Note: Unless the client has specified which sample to use as the matrix spike, the matrix spike must be selected at random from the samples in the batch. Field QC (e.g., equipment blanks, trip blanks, and field blanks) must not be used for MS/MSD unless specifically requested to do so by the client or unless there is insufficient sample available for performing MS/MSD using an actual field sample.

Note: LCS and LCSD are performed if insufficient sample is provided for MS/MSD. If an LCS and LCSD are performed, both QC items must be evaluated and reported. Acceptable recoveries (as well as %RPD) for both LCS and LCSD are required.

Refer to applicable preparation SOP listed in Section 10.1 for further information on batch QC.

Batch QC must meet the criteria given in Attachment 3 of this SOP.

9.1.1 Poor Performers

As indicated in SW-846 and/or via assessment of laboratory control sample (LCS) recoveries and control charts, the compounds listed in Attachment 10 are poor performers and/or behave erratically. These compounds will not be included in the LCS/LCSD/MS/MSD marginal exceedance count for EPA 8270D or EPA 8270E, as outlined in SOP SA-QA-017: *Evaluation of Batch QC Data,* provided they are qualitatively detected.

Note: An NCM must be initiated to denote this situation.

Note: The use of Sporadic Marginal Exceedances, as defined in SOP SA-QA-017, is not permitted for samples originating from South Carolina.

9.2 Instrument QC

9.2.1 DFTPP Tune

A solution containing DFTPP (decafluorotriphenyl phosphine) must be analyzed at the beginning of each analytical clock as a check on the tune of the instrument. The analytical clock begins with the injection of the DFTPP standard. The analytical clock is defined as 12 hours for EPA 8270D, EPA 8270D_LL, EPA 8270D_LL_PAH, EPA 8270E, EPA 8270E_LL, EPA 8270E_LL_PAH and EPA 625.1. The analytical clock is defined as 24 hours for EPA 625.

Meeting the DFTPP tuning criteria demonstrates that the instrument is measuring the proper masses in the proper ratios. The DFTPP analysis takes place under the same instrument conditions as the calibration standards and samples except that a different temperature program can be used to allow for the timely elution of DFTPP. All other instrument conditions including the mass range, scan rate, and multiplier voltage must be identical.

A 1uL aliquot of the 50ng/uL DFTPP/Column Evaluation solution is utilized for EPA 625, EPA 625.1, EPA 8270E and EPA 8270D. A 1uL aliquot of the 5ng/uL DFTPP/Column Evaluation solution is utilized for EPA 8270D_LL, EPA 8270D_LL_PAH, EPA 8270E_LL, and EPA 8270E_LL_PAH.

The DFTPP solution must also contain benzidine, pentachlorophenol, and p,p'-DDT at the following concentrations:

EPA 625, EPA 625.1, EPA 8270E and EPA 8270D – 50ug/mL
EPA 8270E_LL, EPA 8270E_LL_PAH, EPA 8270D_LL and 8270D_LL_PAH – 5ug/mL

Refer to Section 10 for the DFTPP evaluation criteria.

9.2.2 Initial Calibration (ICAL)

The instrument must be calibrated in accordance with SOP SA-QA-016: *Evaluation of Calibration Curves.* This SOP provides requirements for establishing the calibration curve and gives the applicable formulas.

Instrument calibration is performed by analyzing a series of known standards. The calibration curve must consist of a minimum of 3 standards for EPA 625 and a minimum of 5 standards for EPA 625.1, EPA 8270D, EPA 8270E, EPA 8270D_LL, EPA 8270E_LL, EPA 8270E_LL_PAH and EPA 8270D_LL_PAH. The lowest level calibration standard must be at or below the reporting limit, and the remaining standards will define the working range of the analytical system.

Note: A minimum of 6 points is required for a quadratic curve. Higher order curves are not permitted. Some programs and agencies (e.g., SC DHEC) do not allow the use of quadratic curves. Refer to the Project Requirement Summary to determine if this curve type is prohibited.

The initial calibration standard concentrations currently in use in the laboratory are as follows:

EPA 8270D / EPA 8270E/ EPA 625 / EPA 625.1

Standard Level	Concentration (ug/mL)
1	5
2	10
3	20
4	40
6	80
7	100
8	200

EPA 8270D_LL/ EPA8270D_LL_PAH/ EPA 8270E_LL/EPA_8270E_LL_PAH

Standard Level	Concentration (ug/mL)
1	0.10
2	0.20
3	1.0
4	2.0
5	5.0
6	10
7	15
8	20

Refer to Attachment 8 for the standard preparation instructions. Other standard concentrations may be used provided they support the reporting limit and are fully documented in accordance with SOP SA-AN-041.

ICAL evaluation steps and acceptance criteria vary between the methods. Refer to Attachment 1 for a summary of the method-specific requirements.

9.2.2.1 ICAL Readback / % Error Criteria

Each calibration curve must be evaluated to ensure that the quantitation over the entire working range is accurate. This is accomplished via CHROM by reviewing the % Error for each analyte in each calibration level.

The re-calculated concentrations of each analyte must be within 50%D for the low point and within 30%D for the remaining points.

If these criteria are not met, an alternate curve type that meets criteria should be utilized to ensure a better fit, or another initial calibration curve should be performed.

9.2.3 Instrument Blanks

The instrument must be shown to be free from contamination by the analysis of instrument blanks or method blanks. Instrument blanks are analyzed at the beginning of each clock before analysis of any samples. The instrument blanks should be analyzed following the ICV or CCV. Analysis of a batch method blank may substitute for the analysis of an instrument blank provided analysis is acceptable.

Instrument blanks must be <1/2RL to be acceptable.

9.2.4 Second Source Initial Calibration Verification (ICV)

The calibration curve must be verified initially – prior to any sample analyses – in accordance with SOP SA-QA-016 with a standard obtained from a second source.

Refer to Attachment 8 for the standard preparation instructions. Another standard concentration may be used provided it is mid-level and fully documented in accordance with SOP SA-AN-041.

ICV evaluation steps and acceptance criteria vary between the methods. Refer to Attachment 1 for a summary of the method-specific requirements.

9.2.5 Continuing Calibration Verification (CCV)

The initial calibration curve must be verified at the beginning of each clock with a mid-level standard. The analytical clock is defined as 12 hours for EPA 625.1, EPA 8270D, EPA 8270E, EPA 8270E_LL, EPA 8270E_LL_PAH, EPA 8270D_LL, and EPA 8270D_LL_PAH and is defined as 24 hours for EPA 625. The initiation of the clock begins with the injection of the DFTPP.

Refer to Attachment 8 for the standard preparation instructions. Another standard concentration may be used provided it is mid-level and fully documented in accordance with SOP SA-AN-041.

DODQSMV5.0 requires a closing calibration verification (CCVC) to be analyzed at the end of each 12hour clock. Analysis should occur within the 12 hour clock window.

RLCCV (reporting level calibration verification) is incorporated into the procedure for EPA 8270D, EPA 8270E, EPA 8270E_LL, EPA 8270E_LL_PAH, EPA 8270D_LL, and EPA 8270D_LL_PAH. This CCV is used to demonstrate sensitivity at the reporting limit can be obtained. Refer to the applicable CCV section of Attachment 1 for more information on how the RLCCV is utilized.

Note: CCV evaluation steps and acceptance criteria vary between the methods. Refer to Attachment 1 for a summary of the method-specific requirements.

9.2.6 Isomer Resolution Criteria

The GC resolution of structural isomers must be monitored in the ICAL and CCV. In the ICAL, use the calibration level that will be utilized as the CCV.

Structural isomers that produce very similar mass spectra should be identified as individual isomers if they have sufficiently different GC retention times. Sufficient GC resolution is achieved if the height of the valley between two isomer peaks is less than 50% of the average of the two peak heights. Otherwise, structural isomers are identified as isomeric pairs. These criteria are important for the identification of benzo(b)fluoranthene and benzo(k)fluoranthene.

Note: The resolution should be monitored utilizing the signal resolution of the extracted ion profiles for the quantitation ion for each analyte. Sufficient GC resolution is needed to identify the individual isomeric peaks by retention time. If the software is able to integrate and define separate peaks for the isomeric pairs, then sufficient resolution has been achieved. If there is sufficient evidence to support the identification of the individual component, then the component is identified, quantified, and reported.

9.2.7 Internal Standard (ISTD)

This procedure is an internal standard (ISTD) procedure. The internal standards used are 1,4-dichlorobenzene-d4, naphthalene-d8, acenaphthene-d10, phenanthrene-d10, chrysene-d12, and perylene-d12.

Prior to analysis, the internal standards must be added to all standards, samples, and QC items. The concentration of the internal standards must be the same in all calibration samples, field samples, and QC samples. A concentration of 40ug/mL is used for EPA 8270D, EPA 8270E, EPA 625 and EPA 625.1. A concentration of 2.0ug/mL is used for EPA 8270E_LL, EPA 8270E_LL_PAH, EPA 8270D_LL and EPA 8270D_LL_PAH.

9.2.7.1 ICV/CCV ISTD Criteria

The response of the ISTD in the ICV/CCVIS must be within a factor of 2 of the response of the ISTD in the CCV-level standard in the initial calibration sequence, identified as the ICIS. Due to the number of analytes reported in this method, multiple CCVs can be analyzed. The primary CCV is defined as the CCVIS and is used to monitor ISTD response in samples. If the response is outside of the required range, the analysis of the CCVIS must be repeated and any samples associated with the CCVIS must also be re-analyzed. Repeated failure of the ISTD response may require instrument maintenance, re-preparation of standards, and/or re-calibration.

9.2.7.2 Sample and Batch QC ISTD Criteria

The response of the ISTD in samples and batch QC items must be within a factor of 2 of the response of the CCVIS in the associated analytical clock. If the response is outside of this range, corrective action must be taken. Corrective actions include re-analysis (for field samples) and/or re-extraction (for batch QC items).

9.2.8 Surrogates

This procedure uses surrogates to evaluate the extraction process.

The surrogates for EPA 625, EPA 625.1, EPA 8270D, EPA 8270E, EPA 8270E_LL and EPA 8270D_LL are phenol-d5(acid), 2-fluorophenol (acid), 2,4,6-tribromophenol (acid), nitrobenzene-d5 (base), 2-fluorobiphenyl (base), and p-terphenyl-d14 (base),

The surrogate for EPA 8270D_LL_PAH and EPA 8270E_LL_PAH is ortho-terphenyl (OTP).

Prior to preparation, the surrogate analytes are added to all samples and QC items. The concentration of the surrogate is the same in all field samples and QC samples. A concentration of 100ug/mL is used for EPA 625, EPA 625.1, EPA 8270E and EPA 8270D. A concentration of 10ug/mL is used for EPA 8270D_LL and EPA 8270E_LL. A concentration of 2.0ug/mL is used EPA 8270D_LL_PAH and EPA 8270E_LL_PAH.

The percent recovery of the surrogate in all field samples and QC samples must be within the control limits listed in the Method Limit Groups (MLGs) in TALS.

9.2.8.1 Surrogate Dilution Factor Threshold

Due to the level of dilution required for samples, surrogates may be diluted out. As such, recoveries will be reported as “0D” in dilutions at 1:10 or greater. Control limits will not apply to samples analyzed at dilutions of 1:10 or greater.

An NCM must be initiated to denote this situation.

9.2.8.2 One Acid / One Base Surrogate Exception

The laboratory allows one acid and one base surrogate compound to be outside acceptance limits, in field samples and MS/MSD, provided their recovery is greater than 10%. All surrogate compounds must pass in method blanks and LCS/LCSD.

An NCM must be initiated to denote this situation.

Note: DODQSM does not permit this allowance. All surrogates must recover within limits established in the DODQSM.

Note: SC DHEC does not permit this allowance. All surrogates must meet criteria for samples originating from South Carolina.

9.3 Corrective Action for Out-of-Control Data

When the quality control parameters do not meet the criteria set forth in this SOP, corrective action must be taken in accordance with SOP SA-QA-005: *Preventive and Corrective Action Procedures* and the QC Summary Table in Attachment 3. SOP SA-QA-005 provides contingencies for out-of-control data and gives guidance for exceptionally permitting departures from approved policies and procedures. Nonconformance Memos must be initiated to document all instances where QC criteria are not met and all departures from approved policies and procedures.

10.0 Procedure

10.1 Preparation

10.1.1 Aqueous Sample Preparation

For continuous liquid-liquid extraction, the sample is transferred to a continuous liquid-liquid extractor or separatory funnel, adjusted to a specific pH, as required by the analyte list, and extracted using methylene chloride. The extract is concentrated to a predetermined final volume (typically 1mL) using the Zymark nitrogen blow-down concentrator procedure.

Refer to SOP SA-EX-030: *Liquid Extraction Procedures: Continuous Liquid-Liquid and Separatory Funnel* for specifics on the aqueous and leachate sample preparation process.

10.1.2 Soil Sample Preparation

For microwave extraction, the sample is transferred to a Teflon extraction vessel. A 1:1 acetone/methylene chloride mixture is added to the sample in the vessel. The vessel is placed on the instrument and the sample is extracted at an elevated temperature and pressure. The vessel is cooled to room temperature; the extract is passed through sodium sulfate to remove the water from the sample; and the extract is collected in a concentration tube. The extract is concentrated to a predetermined final volume (typically 1mL) in methylene chloride using the Zymark nitrogen blow-down concentrator procedure.

Refer to SOP SA-EX-040: *Soil Extraction Procedures (Microwave and Sonication)* for specifics on the soil sample preparation process.

10.2 Analysis

10.2.1 Instrument Operating Conditions

Note: The instrument conditions listed in this SOP are provided for guidance purposes. The actual conditions used by the laboratory may be slightly different from those listed here and must be documented in the instrument maintenance log, data system, and/or run log.

Instrument maintenance must be performed in accordance with Attachment 4 of this SOP.

The goal is to have maximum separation between the target compounds in the shortest run time while maintaining sufficient sensitivity to detect the target compounds at the MDL.

Example GC Parameters
Injector: 250-280°C
Injector Mode:

- Split – EPA 8270D, EPA 8270E, EPA 625, and EPA 625.1
- Splitless – EPA 8270E_LL, EPA 8270E_LL_PAH, EPA 8270D_LL and EPA 8270D_LL_PAH

Column – Rx-5SilMS 30M x 0.25mm x 0.25um; or equivalent

Carrier Gas Flow: Helium at 0.5-1.0mL/min (column)
Mass spectrometer interface: 280-300°C
Mass spectrometer source temperature: 230°C
Mass spectrometer quad temp: 150C
Mass range: 35-500amu, with a minimum scan time of 1.0 scan per second

Temperature Program:

Initial Temp:	55°C
Initial Hold:	1.5 min
Program Rate:	30°C/min to 190°C, 32°C/min to 320°C
Final Temp:	320°C (hold until elution time of Benzo(ghi)perylene or last eluting analyte)
Injected Volume:	1-2uL per column
Inlet Purge Time:	0.8 minutes

The injection volume must be the same for all standards and sample extracts.

10.2.2 DFTPP Analysis and Evaluation

The DFTPP standard must be analyzed at the beginning of each clock. The analytical clock is defined as 12 hours for EPA 625.1, EPA 8270D, EPA 8270E, EPA 8270E_LL, EPA 8270E_LL_PAH, EPA 8270D_LL, and EPA 8270D_LL_PAH, and is defined as 24 hours for EPA 625. The initiation of the clock begins with the injection of the DFTPP.

10.2.2.1 DFTPP Spectrum Criteria

The spectrum of the DFTPP must meet the criteria for each method listed in Attachment 5. Background subtraction is required, and must be accomplished using a single scan no more than 20 scans prior to the elution of DFTPP. CHROM software is programmed to perform this subtraction during processing of the DFTPP. The time utilized for the background subtraction is displayed on the tune report generated in CHROM.

Background subtraction is designed to eliminate column bleed and instrument background ions.

Note: The DFTPP analysis should be evaluated as to the relative size of the DFTPP peak under the m/z 198 profile. A benchmark area window should be established for each instrument and data system. Area outside of this window suggests instrumental problems such as a bad injection, clogged autosampler syringe, leaking injector, reduced or elevated detector sensitivity, improper electron multiplier voltage selection, wrong tune method or tune file selected for this analysis, PFTBA valve left open, etc.

If the DFTPP fails to meet the criteria, the instrument may require tuning (manually or automatically with PFTBA). Depending on the nature of the results from the DFTPP analysis, other corrective measures may include remaking the DFTPP standard, cleaning the mass spectrometer source, etc.

10.2.2.2 Peak Tailing Factor Criteria

The analysis of benzidine and pentachlorophenol serves as a check on the system performance. The tailing factor for pentachlorophenol and benzidine is calculated as outlined in Attachment 6 and must meet the following criteria:

EPA 625:
pentachlorophenol <5
benzidine <3

EPA 625.1, EPA 8270D, EPA 8270E, EPA 8270E_LL, EPA 8270E_LL_PAH, EPA 8270D_LL, and EPA 8270D_LL_PAH:
pentachlorophenol <2
benzidine <2

If the criteria above are not met, perform injector port and column maintenance and reanalyze the DFTPP standard.

10.2.2.3 DDT Breakdown Criteria

Percent breakdown is calculated using the areas from the total ion chromatogram using following equation:

$$\%DDTBreakdown = \frac{(areaDDE + areaDDD)}{(areaDDT + areaDDE + areaDDD)} x\,100$$

The percent breakdown of p,p'-DDT must not exceed 20% for the methods cited above.

Note: There is no DDT percent breakdown requirement for EPA 625.

10.2.3 Initial and Continuing Calibration

Calibrate the instrument using the standards and criteria described given in Section 9.2.2. Once the calibration has been established and verified with an ICV in accordance with Section 9.2.4, sample analysis may proceed.

Verify the calibration curve with a continuing calibration verification using the standards and criteria described given in Section 9.2.5 and Attachment 1.

10.2.4 Sample Analysis

The sample extract must be injected using the same injection volume used for the calibration standards. Samples that are known to be relatively clean should be analyzed first. Samples suspected of containing high concentrations should be analyzed last. Instrument blanks may be analyzed after suspected high concentration samples to allow the detector response to stabilize.

The clock time starts with the injection of the DFTPP. The analysis standards, QC and samples may continue until the clock time expires. Sample analysis must initiate within the clock time defined by the applicable method. For EPA 8270D, EPA 8270E, EPA 8270E_LL, EPA 8270E_LL_PAH, EPA 8270D_LL, and EPA 8270D_LL_PAH, the clock time is 12 hours. For EPA 625, the clock time is 24 hours.

Example Analytical Sequence

Description	Comments
DFTPP	Clock time begins.
Initial Calibrations	
ICVs	
Instrument Blank	Instrument Blank or Method Blank may be analyzed
Samples & Batch QC Items	EPA 625: Clock time ends at 24 hours from DFTPP EPA 625.1 EPA 8270D, EPA 8270E, EPA 8270E_LL, EPA8270E_LL_PAH, EPA 8270D_LL, and EPA 8270D_LL_PAH: Clock time ends at 12 hours from DFTPP
CCVC	Capping CCV for DODQSM
DFTPP	Clock time begins.
CCVs	
RL CCV	EPA 8270D, EPA 8270E, EPA 8270E_LL, EPA 8270E_LL_PAH, EPA 8270D_LL, and EPA 8270D_LL_PAH only
Instrument Blank	Instrument Blank or Method Blank may be analyzed
Samples & Batch QC Items	EPA 625: Clock time ends at 24 hours from DFTPP EPA 625.1 EPA 8270D, EPA 8270E, EPA 8270E_LL, EPA 8270E_LL_PAH, EPA 8270D_LL, and EPA 8270D_LL_PAH: Clock time ends at 12 hours from DFTPP
CCVC	Capping CCV for DODQSM

11.0 Calculations / Data Reduction

11.1 Data Reduction

Data evaluation must be performed in accordance with SA-QA-008: *Evaluation of Chromatographic Data.* This SOP includes specific information regarding the evaluation of chromatographic data, including the requirements for performing manual integrations and the evaluation of retention times.

Data review and reporting must be performed in accordance with SA-QA-002: *Data Generation and Review.*

11.1.1 Target Analyte Identification

A target compound is identified by the visual comparison of the sample mass spectrum with the mass spectrum of the target compound from the standard spectral library. CHROM utilizes the NIST/NBS library for reference spectra.

The following criteria must be met in order to positively identify a compound:

1) Elution of the sample component within +/-0.06 RRT (relative retention time) units of the daily standard containing that compound. RRT is calculated as follows:

$$RRT = \frac{retention time of the target compound}{retention time of the associated internal standard}$$

2) Correspondence of the target compound spectrum and the standard component mass spectrum.

   All ions present in the standard component mass spectrum at a relative intensity greater than 10% (most abundant ion = 100%) should be present in the sample component mass spectrum. Other ions may be present in the sample component. Coelution of a non-target compound with a target compound will make the identification of the target compound more difficult. Ions due to the non-target compound should be subtracted from the sample component spectrum as part of the background to account for the discrepancy between the sample spectrum and the standard spectrum.

   The relative intensities of the ions present in the sample component spectrum should agree within ±30% of the relative intensities of the ions in the standard reference spectrum. For example, an ion with an abundance of 50% in the reference spectrum should have a corresponding abundance between 20% and 80% in the sample component spectrum. The intensities of the ions in the standard reference spectrum are updated utilizing the continuing calibration standard. If the relative intensities are outside 30% in sample, the data will be flagged with an R by CHROM.

3) The intensities of the characteristic ions of a compound must maximize in the same scan or within one scan of each other. Selection of a peak by a data system target compound search routine where the search is based on the presence of a target chromatographic peak containing ions specific for the target compound at a compound-specific retention time will be accepted as meeting this criterion.

4) Structural isomers that produce very similar mass spectra should be identified as individual isomers if they have sufficiently different GC retention times. Sufficient GC resolution is achieved if the height of the valley between two isomer peaks is less than 50% of the average of the two peak heights. Otherwise, structural isomers are identified as isomeric pairs.

   If the above criteria are not met, the analyst should seek help from a senior analyst or Supervisor. If there is sufficient evidence to support the identification of the component, then the component is identified, quantified, and reported. If there is not sufficient evidence to support identification of the component, then an NCM must be generated to note that the isomers should be identified as the isomeric pair.

5) Ions present in the sample spectrum, but not in the reference spectrum, should be reviewed for possible subtraction from the sample spectrum because of over-lapping or co-eluting peaks.

   Ions present in the reference spectrum, but not in the sample spectrum, should be reviewed for possible subtraction from the sample spectrum because of co-eluting peaks.

11.1.2 Evaluation of Tentatively Identified Compounds (TICs)

For samples containing components not associated with the calibration standards, a library search on a reference library, such as the NIST/NBS, may be conducted in order to identify the non-target compounds. Note: TICs can not be provided from a SIM analysis.

Refer to SOP SA-QA-008: *Evaluation of Chromatographic Data* for the laboratory's TIC procedures.

11.1.3 Dilutions

It is acceptable to report results from a single analysis as long as the largest target analyte (when multiple analytes are present) is in the upper half of the calibration range. If the laboratory does not have historical data and acquires data for a sample with passing internal standards and surrogates but one or more analytes exceed the calibration range, the laboratory will report the over-range (i.e., E-values) with an "Acceptable" TALS status and re-analyze the extract only for the compounds that exceeded the calibration range. The secondary analysis will be reported as a "DL" in TALS, and surrogates will not be reported from this analysis. This is known as the "Condensed Dilution Format". When reporting results from dilutions, appropriate data flags must be used or qualification in a case narrative provided to the client.

For clients who require the laboratory to provide lower detection limits, a general guide is to report the dilution detailed above and one additional run at a dilution factor 1/10 of the dilution with the highest target in the upper half of the calibration curve. For example, if samples analyzed at a 1/50 dilution resulted in a target in the upper half of the calibration curve, the sample is re-analyzed at a dilution factor of 1/5 to provide lower reporting limits for the remaining compounds.

Note: If samples are analyzed at a dilution factor of 1:10 or greater, report the surrogate result as 0%D, to denote a dilution above the Dilution Threshold. Control limits will not apply to samples analyzed at dilutions of 1:10 or greater.
.

Dilute samples according to the following table:

Dilution Factor	Extract Aliquot (uL)	ISTD Aliquot (uL)		Final Volume* (mL)
		Routine	Low Level	
2	500	10	5	1.0
5	200	16	8	1.0
10	100	18	9	1.0
20	50	19	9.5	1.0
50	20	20	10	1.0
100	10	20	10	1.0

*Final solvent = methylene chloride

11.1.4 Historical Data

Many of the laboratory's clients submit samples for repeat monitoring purposes. Prior to analysis, verify TALS Notes and/or use the TALS Historical Data Tracker feature to determine if historical data is available for review.

11.1.5 Chemical Relationships

The analyst must be aware of the following chemical relationships:

- Several analytes reported as "total" are summed from the individual components. For example, Total Cresols are summed as follows:

  Total cresols = m/p-cresols + o-cresol

  Note that o-cresol and m/p-cresol are also reported as individual analytes.

- Several analytes are identified as summary analytes. These analytes break into multiple peaks upon analysis. Each component's response must be utilized to calculate a response for the summary analyte. The following are examples of summary analytes and their associated components.

  Aramite, Total = aramite peak 1 + aramite peak 2
  Diallate, Total = diallate peak 1 + diallate peak 2
  Isosafrole, Total = Isosafrole peak 1 and Isosafrole peak 2

- Chromatographically unresolved isomers are reported together since isomers cannot be resolved by differences in mass. For example, m-cresol and p-cresol are reported as m&p-cresols.

- It is important that closely eluting isomers be resolved chromatographically so that the analyte can be properly identified. The most critical separation is benzo(b)fluoranthene and benzo(k)fluoranthene.

- Acid/Base Compounds

  Basic Compounds: In aqueous samples, several target compounds are soluble in methylene chloride only at basic pH (>12). These compounds form methylene chloride insoluble salts at acidic pH and remain in the aqueous phase. When the pH is adjusted to basic, the ionic compound reverts to its original form and can be extracted out of aqueous solution. Examples of these compounds include pyridine (TCLP, AP9), benzidine (625PP), and a,a-dimethylphenethylamine (AP9). If acid-only extraction is performed, basic compounds will not be extracted and detected.

  Neutral Compounds: In aqueous samples, neutral compounds can extract into methylene chloride at either acidic pH (<2) or at basic pH (>12). That is, these compounds do not convert to salts or ionic forms at either acidic pH. If the acid pH is performed first, the compounds partition into the methylene chloride and would be detected in the acid fraction; if the basic pH extraction is performed first, these compounds partition into the methylene chloride and would be detected in the base fraction. Exceptions include the phthalate esters (e.g., dimethyl phthalate, diethyl phthalate) and other esters which may be irreversibly converted (hydrolyzed) to salts if subjected to the basic pH extraction first.

  Acid Compounds: In aqueous samples, the acidic compounds can be extracted into methylene chloride at acid pH (pH<2). The acidic compounds are the phenols and benzoic acid. At basic pH, the phenols forms water soluble salts which are not soluble in methylene chloride. When the pH is adjusted to <2 the salt is converted back to the phenol or acid form. Some phenols (2,4-dimethyl phenol and the cresols) do not completely ionize at basic pH and may be present in both the acid and base fractions of a dual pH extraction.

- Single pH (<2) Extractions

  Single pH extractions are performed at pH<2 and include the compounds that are soluble in methylene chloride at acidic pH. The primary application of the single pH extraction is for the routine compound list, which includes most of the compounds that are monitored for and are detected in field samples. The advantages of the single pH extraction are a shorter extraction time and efficient extraction of all phenolic compounds and compounds subject to hydrolysis under basic pH conditions. The drawback is that basic compounds are not extracted under single pH conditions.

- Dual pH Extractions

  Dual pH extractions may be performed with the basic pH extraction first followed by the acidic pH or the acidic pH extraction may be performed first followed by the basic pH extraction. The table below summarizes some of the positive and negative aspects of dual pH extractions.

Extraction	Pros	Cons
Acidic pH first followed by basic pH Examples: TCLP, Appendix IX	No hydrolysis of phthalate esters	Acid and base/neutral surrogates are both extracted into solvent at acidic pH. There is no surrogate to determine whether the sample pH was adjusted to basic pH, to determine the extraction efficiency of the basic pH extraction
Basic pH first followed by acidic pH Example: EPA 625 PP	Acid compounds (phenols) and base/neutral compounds can be separated into two extracts. The partitioning of the target analytes into separate extracts can sometimes help to minimize the effect of the sample matrix on the target compounds.	Some compounds may be partitioned into both the acid and base/neutral extracts. Examples include 2,4-dimethylphenol and the cresol compounds.
		Phthalate esters are converted (hydrolyzed) to salts under basic conditions which causes irreversible loss of the compounds. Dimethyl phthalate and diethyl phthalate are the most effected compounds.
		Some phenolic compounds may have reduced recoveries

- Compounds with similar structures and properties are often found together in a sample or in the samples from the same project or site. That is, when one of that type of compound is detected, the analyst should be looking for other compounds of that type. For example, when one PAH compound (e.g., naphthalene, phenanthrene, benzo(a)pyrene, etc.) is detected, the analyst should expect other PAH compounds to be present. When chlorinated benzenes (e.g., 1,2-DCB, 1,3-DCB, 1,4-DCB) are present, the analyst should be aware that other chlorinated benzenes may be present. When pentachlorophenol is detected, the analyst should also look for tetrachlorophenols and trichlorophenols.

11.1.6 Confirmation of GC Analyses

If required, GC/MS can be used to confirm some GC-only analytes. Based on the response of the standard, concentrate the SVOC GC extract to an appropriate final volume.

Note for SVOC: The pesticide extracts cannot be used to confirm the presence of herbicides since the extract has not been properly prepared.

- Add an appropriate volume of internal standard to the extract or sample to give the same concentration as in the calibration standard. Analyze the extract under the same conditions as the standard.

- Compare the retention time of the sample to the retention time of the standard.

If a peak is detected at the retention time of the target compound containing the selected masses in the same ratio as the standard, the peak is confirmed as the target

compound and the concentration is calculated. The relative intensities of the ions in the sample should agree within ±20% of the intensities of the ions in the standard.

If a peak is not present at the appropriate retention time or if the ratios of the ions are not the same as the standard, the analyte is not confirmed.

11.2 Calculations

11.2.1 The calculations associated with batch QC determinations are given in SOP SA-QA-017. Applicable calculations include accuracy (% recovery) and precision (%RPD).

11.2.2 The calculations associated with initial and continuing calibrations and are given in SOP SA-QA-016. Applicable calculations include determination for: calibration factor, standard deviation, relative standard deviation, and relative response factor.

11.2.3 The calculation to determine final concentration is given as follows:

$$FinalConcentration = CONC_{Sample} \otimes \frac{F}{I \times dw} \otimes D$$

Where:

$CONC_{Sample}$= Concentration of the sample
F = Final volume/weight
I = Initial volume/weight
D = Dilution factor
dw = % Solids decimal equivalent (applicable to soil samples, only)

- **Note: This calculation assumes all applicable unit correction factors are applied.**
- The calculation used for water samples is the same as above with the exception that there is no % Solids factor applied.
- All dry weight corrections are performed automatically in TALS.

12.0 Method Performance

12.1 Reporting Limit Verification (RLV)

At a minimum, RLVs must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

For analytes and methods certified by DOD ELAP, RLVs must also be performed quarterly thereafter. For all other analytes and methods, RLVs must also be performed annually thereafter. Exceptions may be made for project-specific non-routine analytes.

12.2 Method Detection Limit (MDL) Study

The MDL is the lowest concentration that can be detected for a given analytical method and sample matrix with 99% confidence that the analyte is present. MDLs reflect a calculated (statistical) value determined under ideal laboratory conditions in a clean matrix and may not be achievable in all environmental matrices. The current MDLs associated with this procedure are given in the Method Limit Group (MLG) in TALS.

At a minimum, MDL Studies must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

Note: MDL Studies are not required for non-routine analytes provided results are not reported below the RL (i.e., MDL equals RL in TALS).

12.3 Method Detection Limit Verification (MDLV)

At a minimum, MDLVs must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

For analytes and methods certified by DOD ELAP, MDLVs must also be performed quarterly thereafter

12.4 QC Limit Generation, Control Charting, and Trend Analysis

12.4.1 EPA 625 and EPA 625.1

The control limits for the batch QC items (LCS, MS/MSD, SD) for this procedure are specified in the reference method and cannot be broadened; therefore, the laboratory defaults to the method-defined limits and does not utilize in-house or laboratory-derived limits for the evaluation of batch QC items.

Although the laboratory must default to the method-defined QC limits, control charting is a useful tool and is performed to assess analyte recoveries over time to evaluate trends. Control charting must be performed periodically (at a minimum annually) in accordance with SOP SA-QA-017: *Evaluation of Batch QC Data.*

12.4.2 EPA 8270D, EPA 8270E, EPA 8270E_LL, EPA 8270E_LL_PAH, EPA 8270D_LL, and EPA 8270D_LL_PAH

The control limits for the batch QC items (LCS, MS/MSD, SD) for this procedure are not specified by the reference method; therefore, the laboratory defaults to in-house and/or laboratory-derived limits for the evaluation of batch QC items.

Control charting is a useful tool and is performed to assess analyte recoveries over time to evaluate trends. Control charting must be performed periodically (at a minimum annually) in accordance with SOP SA-QA-017: *Evaluation of Batch QC Data.*

12.5 Demonstrations of Capability

Initial and continuing demonstration of capability must be performed in accordance with SOP SA-QA-006*: Training Procedures.*

Prior to performing this procedure unsupervised, each new analyst who performs this analysis must demonstrate proficiency per method/analyte combination by successful completion of an initial demonstration of capability. The IDOC is performed by the analysis of 4 consecutive LCSs that meet the SOP criteria for accuracy and precision. The IDOC must be documented and routed to the QA Department for filing.

Annual continuing demonstrations of capability (CDOCs) are also required per analyst per method/analyte combination. The CDOC requirement may be met by the consecutive analysis of four LCS all in the same batch, by the analysis of four LCS analyzed in four consecutive batches (in different batches on different days), via acceptable results on a PT study, or analysis of client samples with statistically indistinguishable results when compared to another certified analyst. The CDOC must be documented and routed to the QA Department for filing.

Note: EPA 625.1 and EPA 625 has method specific DOC limits that must be met.
The DODQSM limits must be utilized if evaluating DOC for EPA 8270D or EPA 8270E

12.6 Training Requirements

All training must be performed and documented in accordance with SOP SA-QA-006: *Training Procedures*.

Note: The SOPs listed in the Reference/Cross-Reference Section are applicable to this procedure. All employees performing this procedure must also be trained on these SOPs, and/or have a general understanding of these procedures, as applicable.

13.0 Pollution Control

It is TestAmerica's policy to evaluate each method and look for opportunities to minimize waste generated (e.g., examining recycling options, ordering chemicals based on quantity needed, preparing reagents based on anticipated usage and reagent stability, etc.). Employees must abide by the policies in Section 13 of the Environmental Health and Safety Manual and the Savannah Addendum to the EHSM.

This procedure has been evaluated for opportunities to minimize the waste generated. Where reasonably feasible, pollution control procedures have been incorporated.

14.0 Waste Management

Waste management practices must be conducted consistent with all applicable federal, state, and local rules and regulations. All waste (i.e., excess reagents, samples, and method process wastes) must be disposed of in accordance with Section 9 of the TestAmerica Savannah Addendum to the EHSM. Waste description rules and land disposal restrictions must be followed.

14.1 Waste Streams Produced by the Method

The following waste streams are produced when this method is carried out:

- Excess samples, reagents, and standards must be disposed in accordance with the TestAmerica Savannah Addendum to the EHSM.
- Flammable waste (acetone from extracts, rinsings, and standards) – Transfer to a satellite container designated for flammable waste and transfer to waste disposal department when the container is full with 10% headspace.
- Methylene chloride extracts – Dispose in drums using Hexane Vial waste stream which has been coded for Methylene Chloride.
- Methylene chloride used to rinse glassware, etc. – Transfer to chlorinated waste container.
- Excess aqueous samples – Dispose according to characterization from sample disposal program. If non-hazardous, dispose down drain/sewer. If hazardous, transfer to hazardous waste department for drumming. PCB Hazardous require disposal via drumming. Do dispose of any samples containing oil or strong smells via the sewer system. Route these to the waste coordinator.
- Excess soil and solid samples – Dispose according to characterization from disposal program. Non-RCRA Hazardous and RCRA Hazardous may be disposed via yardbox. PCB and Foreign Soil Hazardous are routed to the waste coordinator.
- Excess oil samples – Transfer to waste department for storage/disposal

14.2 Waste Disposal

Material	Treatment	Destination
Samples (Non-Hazardous Water)	Neutralization if applicable	Sink
Samples (Hazardous Water)	Neutralization if applicable	RCRA Hazardous Water
Samples (Unconfirmed Soils)	None	Soil Yardbox
Samples (Hazardous Soils)	None	RCRA Soils Yardbox
Autosampler Vials	None	Hexane Vials
Excess Standards (Non-PCB)	None	Hexane Vials
Excess Standards (PCB)	None	PCB Waste

16.0 Method Modifications

16.1 Incorporation of Other Matrices

This procedure may be modified to analyze other matrices (e.g., wipe, waste, tissue, and TCLP/SPLP leachate samples) based on the needs of the client. This will need to be arranged by the Project Manager at the initiation of the project.

Wipe, waste, and tissue matrices are non-routine, and the laboratory is not currently NELAC certified for these matrices. The laboratory uses its routine soil RLs (converted for initial and final volumes, etc.) and default QC limits to evaluate wipe, waste, filter, and tissue samples. Soil DOCs can be used to satisfy analyst demonstrations of capability for these types of non-routine matrices. The laboratory uses its routine aqueous RLs (converted for initial and final volumes, etc.) and default QC limits to evaluate TCLP/SPLP leachate samples. Water DOCs can be used to satisfy analyst demonstrations of

capability for TCLP/SPLP matrices. Teflon chips, Ottawa sand, or equivalent is used as the blank matrix for wipes, wastes, and tissues unless specifically requested otherwise by the project.

16.1.1 Collection and Handling Procedures

Waste (Oil) Samples:
Waste (oil) samples are collected in 8oz soil containers with PTFE-lined lids. Waste (oil) samples must be iced at the time of collection and maintained at 0-6°C until the time of preparation. Samples must be prepared within 14 days of collection. Extracts must be stored in the refrigerator at 0-6°C until the time of analysis and analyzed within 40 days of extraction.

Wipe Samples:
Wipe samples are routinely collected in 40mL VOA vials. Wipe samples must be iced at the time of collection and maintained at 0-6°C until time of preparation. Samples must be prepared within 14 days of collection. Extracts must be stored in the refrigerator at 0-6°C until the time of analysis and analyzed within 40 days of extraction.

Tissue Samples:
Tissue samples are routinely collected in plastic containers with the size dependent upon the type of tissue being collected. Plastic jars or plastic baggies can be used. Upon receipt, samples must be placed in the freezer at <-10°C if extraction/digestion cannot be completed that day. Samples must be prepared within 14 days of defrosting. Extracts must be stored in the refrigerator at 0-6°C until the time of analysis and analyzed within 40 days of extraction.

TCLP/SPLP Leachate Samples
Once the TCLP/SPLP extraction procedure has been performed, the leachate is transferred to a 1L glass container. TCLP/SPLP leachates must be stored at 0-6°C until the time of preparation. The leachate sample must be prepared within 7 days of completion of the TCLP/SPLP extraction. Extracts must be stored in the refrigerator at 0-6°C until the time of analysis and analyzed within 40 days of extraction.

16.1.2 Preparation and Analytical Procedures

Wipe, waste, and tissue samples are prepared in the same manner as routine soil samples as outlined in SOP SA-EX-040. TCLP/SPLP matrices are prepared in the same manner as routine water samples as outlined in SOP SA-EX-030. Refer to the applicable preparation SOPs for more information.

Wipe, waste, filter, tissue, and TCLP/SPLP matrices are analyzed in the same manner as routine samples as outlined in this SOP.

16.2 Other Considerations

16.2.1 SW-846 allows alternate criteria to be used for DFTPP evaluation. As such the laboratory has incorporated criteria from the following method:

- EPA 8270D, EPA 8270E, EPA 8270E_LL, EPA 8270E_LL_PAH, EPA 8270D_LL, and EPA 8270D_LL_PAH tune criteria are taken from EPA 625.

16.2.2 The laboratory allows one acid and one base surrogate compound to be outside acceptance limits, in field samples and MS/MSD, provided their recovery is greater than 10%. All surrogate compounds must pass in method blanks and LCS/LCSD.

16.2.3 EPA Method 625 does not require the analysis of an ICV. NELAC requires an ICV; however, it does not list specific criteria. The laboratory has adopted the default criteria listed in Section 9.2.3 for ICVs for these methods.

Additionally, EPA Method 8270D lists recommended criteria of 30%D for the ICV and acknowledges that alternative acceptance limits may be appropriate based on project-specific data quality objectives. The laboratory defaults to the criteria outlined in this SOP; however, more stringent, project-specific requirements can be accommodated upon client request.

16.2.4 The laboratory has defined the analytes listed in Attachment 10 as poor or erratic performers and allows for exceptions to the ICV, CCV, LCS, MS/MSD, and Sporadic Marginal Exceedance criteria for these analytes by EPA method 8270D and EPA 8270E as outlined in this SOP.

Note: The use of Sporadic Marginal Exceedances, as defined in SOP SA-QA-017, is not permitted for samples originating from South Carolina.

16.2.5 EPA Method 8270D or EPA 8270E does not place a cap on an individual analyte's %D or %RSD when evaluating the CCV. The laboratory has adopted more stringent in-house requirements as outlined in this SOP.

16.2.6 Due to maintenance procedures, the laboratory allows internal standard retention times in continuing calibration checks (CCVs) for EPA 8270D, EPA 8270E, EPA 8270E_LL, EPA 8270E_LL_PAH, EPA 8270D_LL, and EPA 8270D_LL_PAH to vary by more than 30 seconds when compared to the retention time of the internal standards in the most recent initial calibration. A component of column maintenance is to remove a portion of the front of the column to eliminate reactive spots caused by injection of field samples. As the column is shortened, the retention times of the internal standards are also shortened. If peak resolution and sensitivity are maintained by meeting the CCV criteria, calibration of the analytical system is not required.

Note: This modification is used for CCVs only. The laboratory has made no similar modification to sample ISTD evaluation.

16.2.8 EPA Method 8270D and 8270E indicate indeno(1,2,3)pyrene and di-n-octylphthalate will be quantitated using ISTD Perylene-12. The laboratory uses Chrysene-d12 as this compound is more stable.

16.2.9 EPA Method 8270D states the method blank must be less than the MDL, 5% of the regulatory limit, or 5% of the sample result, whichever is greater. The laboratory's criteria for the method blank is <1/2RL. More stringent, project-specific requirements can be accommodated upon client request.

16.2.10 EPA Method 8270D specifies a reporting limit standard quantitation criteria of 30% when utilizing a linear fit for the ICAL. The laboratory defaults to EPA 8270E criteria which allows 50%D at the RL level and 30%D of all other levels.

16.2.11 EPA 8270D_LL_PAH and EPA 8270E_LL_PAH is performed for DOD samples only. This procedure incorporates the ortho-terphenyl surrogate included in the EPA 8310B reference method (i.e., PAHs via HPLC analysis).

16.2.12 Method 8270D states in section 11.6.1 The reference mass spectrum must be generated by the laboratory using the conditions of this method. The reference spectra utilized by the laboratory in CHROM for peak identification is generated by the NIST library. The mass ratios for the ions are updated by the continuing calibration analysis.

Attachment 13: Glassware Cleaning Procedures

Attachment 1:
SOP Summary

Sample Preparation Summary
Samples should be prepared according to the appropriate matrix-specific SOP.

Matrix	SOP
Water	SA-EX-030
Soil	SA-EX-040

Aqueous Sample Preparation:
For continuous liquid-liquid extraction, the sample is adjusted to a specific pH, as required by the analyte list, transferred to a continuous liquid-liquid extractor or separatory funnel, and extracted using methylene chloride. The extract is concentrated to a predetermined final volume (typically 1mL) using the Zymark nitrogen blow-down concentrator procedure.

Soil Sample Preparation:
For microwave extraction, the sample is transferred to a Teflon extraction vessel. A 1:1 acetone/methylene chloride mixture is added to the sample in the vessel. The vessel is placed on the instrument and the sample extracted at an elevated temperature and pressure. The vessel is cooled to room temperature, the extract is passed through sodium sulfate to remove the water from the sample, and the extract is collected in a concentration tube. The extract is concentrated to a specified final volume (typically 1mL) in methylene chloride using the Zymark nitrogen blow-down concentrator procedure.

Sample Analysis Summary
The extract is analyzed by GC/MS. Qualitative identification of the target compounds in the extract is based on the retention time and the relative abundance of the characteristic masses determined from NIST library. Quantitative analysis is performed using the internal standard technique with a single characteristic ion.

An example of the Analytical Sequence is given in Section XXX.

Initial and Continuing Calibration Requirements Summary

1.0 EPA 625

1.1 Initial Calibration (ICAL)

1.1.1 Linearity Criteria

All compounds must be evaluated for linearity. The following steps outline the evaluation:

1. The relative standard deviation (%RSD) of the calibration standards must be ≤35% for the initial calibration curve to be acceptable.
2. A minimum of 3 points is required. The lowest calibration point must be at or lower than the reporting limit (RL).
3. If the calibration is utilizing enough points to establish a linear or quadratic fit, then a regression curve may be used. Utilize a regression curve in accordance with SOP SA-QA-016. The criteria for the regression coefficient is r^2 ≥0.990. If the %RSD is less than 35%, a regression curve may still be used if it provides a better calibration model over the calibration range than the average RF.

1.2 Second Source Initial Calibration Verification (ICV)

The initial calibration verification (ICV) is acceptable if the %D is ≤35% for each analyte. If the %D criteria are not met, re-calibration is required.

1.3 Continuing Calibration (CCV)

All analytes in the CCV must be ≤20% of the true value to be acceptable.

2.0 EPA 8270D, EPA 8270E, EPA 8270E_LL, EPA 8270E_LL_PAH, EPA 8270D_LL, and EPA 8270D_LL_PAH

2.1 Initial Calibration (ICAL)

2.1.1 Minimum Relative Response Factor (RRF) Criteria

EPA 8270D: The minimum RRF criteria and control analytes are listed in Attachment 11. If the minimum RRF criteria for each compound in each level of the ICAL are not met, analysis of an RLCCV is required in each clock. An NCM is required to denote this situation.
EPA8270E: The minimum RRF criteria listed in Attachment 11 is advisory.

2.1.2 Linearity Criteria

All compounds must be evaluated for linearity. The following steps outline the evaluation:

1. Determine the %RSD for each compound. The %RSD of each compound must be ≤20% to be acceptable.

2. If the %RSD criteria are not met, the next option is to utilize a linear regression curve for that compound, in accordance with SOP SA-QA-016.

   For a linear regression curve to be acceptable, the regression coefficient (r^2) must be ≥0.990.

   For a quadratic curve to be acceptable, the regression coefficient (r^2) must be ≥0.990.

3. If the r^2 criteria are not met, the only remaining option is to utilize the average response factor and report that compound as estimated. In this situation, an NCM must be initiated to describe the issue.

   Note: SW-846 does not put a cap on an individual analyte's %RSD; however, the laboratory has adopted the requirement that no individual analyte can exceed 50% RSD. Therefore, if any analyte's %RSD is >50 %, then re-calibration is required.

4. If more than 10% of the analytes do not meet both the %RSD criteria or meet the r^2 criteria, then recalibration is required.

   Note: Several standard mixes are utilized to perform an initial calibration for the full list of target analytes (e.g., TCL, Appendix IX, etc). Each of these mixes constitutes its own initial calibration. Therefore, when evaluating the numbers of acceptable analytes, each mix will be evaluated separately. Re-calibration need only involve the affected mixes.

5. For any analyte associated with a calibration that does not meet RSD or 0.990 or minimum response factor, an RLCCV must be analyzed with each subsequent clock.

   The RLCCV is a CCV analyzed at the reporting limit for the affected analyte. The criterion for the RLCCV is detection only; however, the standard qualitative identification criteria in the method must be met.
   NOTE: An NCM must be initiated to denote this situation. Any positive results should be noted as estimated. Non-detect results for analyte may be reported without flagging if there has been an analysis of the RLCCV.

2.2 Second Source Initial Calibration Verification (ICV)

The initial calibration verification (ICV) is acceptable if the %D of each analyte in the ICV is less than or equal 30%.

DODQSMV5: ICV must be ≤ 20%D for all analytes. If criteria is not met, re-calibration is required.

2.2.1 ICV Poor Performers

Refer to Attachment 10 for the identification of poor and/or erratic performing analytes. These analytes are allowed a %D >30% but must be <50%D to be acceptable. If there are poor performers that exceed 50%D, the data may be reported provided results are noted as estimated. An NCM must be initiated to denote this situation.

DODQSMV5 does not address poor performers. ICV must be ≤ 20%D for all analytes

2.3 Continuing Calibration Verification (CCV)

2.3.1 Minimum RRF Criteria

The minimum RRF for each compound is listed in Attachment 11.

EPA 8270D: If the minimum RRF criteria are not met, analysis may proceed with the analysis of the RLCCV to demonstrate sensitivity. An NCM must be initiated for any detections associated with a minimum RRF failure.
EPA 8270E: RRF criteria is advisory.

Note: The RRF criteria for certain analytes have been modified for the EPA 8270D_LL method and are documented in Attachment 11.

2.3.2 %D Criteria

EPA 8270D and EPA 8270E : The CCV must be ≤ 20%D.

The reference method makes the exception, however, such that due to the large numbers of analytes in each CCV, some analytes may not meet these criteria.

- If more than 20% of the analytes in a CCV exceed the %D criteria, the CCV is unacceptable, and re-analysis is required.
- If less than 20% of the analytes in a CCV exceed the %D criteria, analyze an RLCCV.
- Analytes that do not meet CCV %D criteria may be reported if the affected analytes are qualitatively identified in the RL CCV.
- If the affected analyte is not detected in the associated client sample, the result is reported without qualification.
- If the affected analyte is detected in the associated client sample, the result must be reported as estimated.

Note: An NCM must be initiated to denote this situation
Note: SW-846 does not put a cap on an individual analyte's %D; however, the laboratory has the requirement that no individual analyte can exceed

50%D. Therefore, if any analyte's %D is >50%, then corrective action is required. Corrective actions include instrument maintenance, re-injection, and/or re-calibration.

DODQSMV5:

- All analytes in the CCV must be ≤ 20 %D. A closing CCV(CCVC) must be analyzed within the 12 hour clock and be ≤ 50% D.
- If the CCV does not meet acceptance criteria and corrective action is not taken, the analysis of 2 passing CCVs is required prior to the analysis of samples.

.

CCV Poor Performers

Refer to Attachment 10 for the identification of poor and/or erratic performing analytes. These analytes are allowed a %D >20% but must be <50 %D to be acceptable. If there are poor performers that exceed 50%D, the data may be reported provided results are noted as estimated. An NCM must be initiated to denote this situation. The poor performers must be counted in the total number of allowances within a CCV analysis.

DODQSMV5 does not address poor performers for EPA 8270D or EPA 8270E. Address via NCM if analyte is not considered a compound of concern.

3.0 EPA 625.1

3.1 Initial Calibration (ICAL)

All compounds must be evaluated for linearity. The following steps outline the evaluation:

1. The relative standard deviation (%RSD) of the calibration standards must be ≤35% for the initial calibration curve to be acceptable.
2. A minimum of 5 points are required. The lowest calibration point must be at or lower than the reporting limit (RL).
3. If the calibration is utilizing enough points to establish a linear or quadratic fit, then a regression curve may be used. Utilize a regression curve in accordance with SOP SA-QA-016. The criteria for the regression coefficient is r^2 ≥0.990. If the %RSD is less than 35%, a regression curve may still be used if it provides a better calibration model over the calibration range than the average RF.

3.2 Second Source Initial Calibration Verification (ICV)

The initial calibration verification (ICV) is acceptable if the recovery meets the method defined limits established in EPA 625.1. If the %D criteria are not met, re-calibration is required.

3.3 Continuing Calibration Verification (CCV)

All analytes in the CCV must meet the method defined recovery limits established in EPA 625.1. See Attachment 12

If the %D criteria are not met, then corrective action is required. Corrective actions include instrument maintenance, re-injection, and/or re-calibration.

Attachment 2:
Sample Collection, Preservation, and Holding Time Table

Matrix	Routine Sample Container	Routine Sample Size	Minimum Sample Size	Chemical Preservation	Thermal Preservation	Dechlorination Agent	Holding Time
Water	1L or 500mL amber glass	1L	500mL	None	0-6 °C[1]	None	7 days to extract 40 days to analyze
Soil	8oz glass soil jar	15g	15g	None	0-6°C[1]	None	14 days to extract 40 days to analyze

[1]Samples must be maintained at 0-6 °C, with no frozen samples.

Attachment 3:
QC Summary

QC Item	Method	Frequency	Criteria	Corrective Action
Clock Time	EPA 625	24 hours	Clock time starts with the injection of the DFTPP. Analysis of samples and QC items must conclude within expiration of clock time. Subsequent analysis requires new DFTPP.	Not applicable
	All Other Methods	12 Hours		
Tune/Column Evaluation Standard (DFTPP) - Spectrum Criteria	All Methods	At beginning of each clock	Spectrum Criteria: Refer to Attachment 5.	- Perform instrument maintenance - Re-tune.
Tune/Column Evaluation Standard (DFTPP) - Tailing Factor Criteria	EPA 625	At beginning of each clock	Pentachlorophenol <5 Benzidine <3	- Perform instrument maintenance - Re-tune.
	All Other Methods		Pentachlorophenol <2 Benzidine <2	
Tune/Column Evaluation Standard (DFTPP) - Breakdown Criteria	All Other Methods	At beginning of each clock	<20%	- Perform instrument maintenance - Re-tune.
	EPA 625		None	

QC Item	Method	Frequency	Criteria	Corrective Action
Initial Calibration (ICAL)	EPA 625	Upon instrument set-up, and after unsuccessful CCV	3-point Minimum %RSD <35%	-Re-analyze standard(s) -Prepare new standard(s) and reanalyze -Perform injector port maintenance and reanalyze standards -Replace column and/or clean source, and reanalyze standards
	EPA 625.1		5-point Minimum %RSD <35%	
	EPA 8270D EPA 8270E EPA 8270E_LL EPA 8270E_LL_PAH EPA 8270D_LL EPA 8270D_LL_PAH		5-point Minimum RRF per Attachment 11. %RSD ≤20%. If %RSD > 20%, use curve fit w/ r^2 ≥0.990; If linear fit, RL Level: 30% of true; If r^2 <0.990, use %RSD (allowed for <10% of total # analytes; no analyte >50% RSD). %RSE <50% for low point; <30% for all other points.	
	SIM		3-point Minimum r^2 ≥0.990	

Initial Calibration Verification (ICV) - Second Source	EPA 625	After each ICAL	%D <35%	-Reanalyze standard -Prepare new standard and reanalyze -Recalibrate
	EPA 625.1		Within method-defined limits (in TALS MLG)	
	EPA 8270D EPA 8270E EPA 8270E_LL EPA 8270E_LL_PAH EPA 8270D_LL EPA 8270D_LL_PAH		%D <30% Poor performers %D <50% as per Attachment 10. An NCM is required to denote analytes outside criteria. DODQSM: All analytes ≤ 20%D. No allowance for poor performers	

QC Item	Method	Frequency	Criteria	Corrective Action
Continuing Calibration Verification (CCV)	EPA 625	Per clock (Analyze after DFTPP)	%D ≤20%	-Reanalyze standard -Prepare new standard and reanalyze -Recalibrate Note 1: If <20% total # analytes >20%D, evaluate RL CCV. RL CCV must be qualitatively identified. - If client sample is ND for affected analyte, report unqualified result. - If client sample has detection for affected analyte, report result as estimated. DODQSMV5: If CCV is outside criteria, then analysis of two passing CCVs is required if no corrective action performed (ie reprep or maintenance)
	EPA 625.1		Within method-defined limits (in TALS MLG)	
	EPA 8270D EPA 8270E EPA 8270E_LL EPA 8270E_LL_PAH EPA 8270D_LL EPA 8270D_LL_PAH		RRF per Attachment 11. %D ≤20%. Poor performers per Attachment 10. See Note 1. DODQSM: All analytes ≤ 20%D.	
Reporting Limit Continuing Calibration Verification (RL CCV)	EPA 8270D EPA 8270E EPA 8270E_LL EPA 8270E_LL_PAH EPA 8270D_LL EPA 8270D_LL_PAH	Per clock, if needed. (Analyze after CCV) When RRF criteria is not met in ICAL, or CCV RRF or CCV %D criteria not met.	Affected analytes must be qualitatively identified.	- Perform instrument maintenance - Reanalyze affected samples. - Recalibrate

QC Item	Method	Frequency	Criteria	Corrective Action
Extraction Batch Definition	All Methods	Extracted together w/in 24-hr timeframe; not to exceed 20 field samples	Not Applicable	Not Applicable
Method Blank (MB)	All Methods	One per extraction batch	<1/2RL	Refer to SOP SA-QA-017
Laboratory Control Sample (LCS)	All Methods	One per extraction batch	Within TALS MLG Limits	Refer to SOP SA-QA-017
Laboratory Control Sample Duplicate (LCSD)	All Methods	One per extraction batch, when insufficient sample is provided for MS/MSD/SD	Within TALS MLG Limits	Refer to SOP SA-QA-017
Matrix Spike (MS)	All Methods	One per extraction batch	Within TALS MLG Limits	Refer to SOP SA-QA-017
Matrix Spike Duplicate (MSD)	All Methods	One per extraction batch	Within TALS MLG Limits	Refer to SOP SA-QA-017
Initial Demonstration of Capability (IDOC)	All Methods	Initially, per analyst, per analyte/method/matrix combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006 Note: Unsupervised work must not begin until acceptable IDOC is obtained.

QC Item	Method	Frequency	Criteria	Corrective Action
Continuing Demonstration of Capability (CDOC)	All Methods	Annually, per analyst, per analyte/method/matrix combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006
Reporting Limit Verification (RLV)	All Methods	Upon method/instrument set-up, per analyte/method/matrix combination. Then quarterly thereafter (for DOD ELAP) or annually thereafter (for non-DOD ELAP)	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007
Method Detection Limit Study (MDL)	All Methods	Upon method/instrument set-up, per analyte/method/matrix combination	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007
MDL Verification (MDLV)	All Methods	Upon method/instrument set-up, per analyte/method/matrix combination. Then quarterly thereafter (for DOD ELAP) or annually thereafter (for non-DOD ELAP)	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007

Attachment 4:
Preventative Maintenance and Troubleshooting

LABORATORY EQUIPMENT PREVENTIVE MAINTENANCE SCHEDULE								
EQUIPMENT ITEM	**Service Interval**							**SERVICE LEVEL**
	D	**W**	**M**	**Q**	**SA**	**A**	**AN**	
Septum							**X**	Replace, recommended daily
Splitless Disc							**X**	Replace, recommended daily
Column/Injector							**X**	Change sleeve and cut front of column, recommended daily
Autosampler							**X**	Clean syringe as needed; replace syringe as needed
Injector Port							**X**	Replace injector port as needed
Lines							**X**	Flush lines as needed; replace lines as needed
Column							**X**	Change column as needed
Mass Spectrometer							**X**	Clean as needed
Rough Pump							**X**	Change oil as needed

D = daily; W = Weekly; M = monthly; Q = Quarterly; SA = semi-annually; A = annually; AN = as needed

Troubleshooting

Troubleshooting should be documented as outlined above. If possible, troubleshooting is best performed in a step-wise manner to systematically isolate instrument components. Refer to the instrument manufacturer's guides for specific information and strategies. Enlist assistance from technical and/or department management as needed.

Contingency Plan

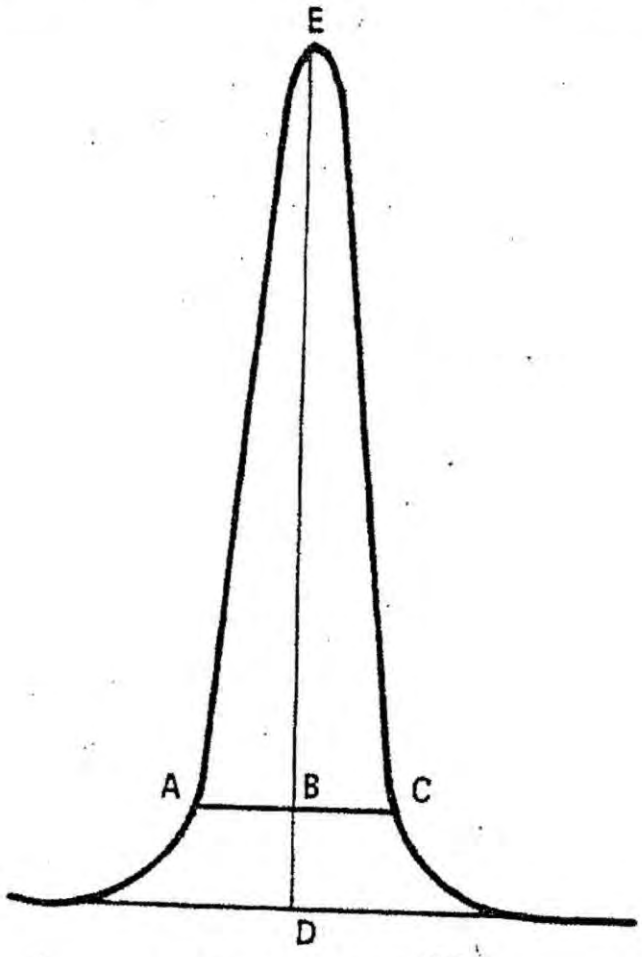
An extensive spare parts inventory is maintained for routine repairs. Since instrumentation is standardized throughout the laboratory network, spare parts and components can be readily exchanged among the network.

In general, the laboratory has at least one backup unit for each critical unit. In the event of instrument failure, portions of the sample load may be diverted to duplicate instrumentation, the analytical technique switched to an alternate approved technique (such as manual colorimetric determination as opposed to automated colorimetric determination), or samples shipped to another properly certified or approved TestAmerica location.

Maintenance Log

A maintenance log must be established for each piece of equipment used in the laboratory. All maintenance that is performed on the instrument must be recorded in the log including:

- Type of maintenance performed (Note: This includes preventative/routine maintenance; non-routine maintenance; maintenance performed by an external vendor; updates to software versions; etc.)
- analyst or technician performing the maintenance
- date the maintenance was performed
- detailed explanation of the reason for the maintenance
- resolution of the problem and return to control
- all service calls from instrument representatives
- Resolution of the problem (i.e., the Return to Control)



Instrument Labeling

Each instrument must be labeled with its name or identification. Additionally, non-operational instruments must be isolated from service or marked as being out of service. Each piece of equipment has an “Operational / Not Operational” sticker that is used for this purpose.

Attachment 5:
DFTPP Criteria

m/z	Ion Abundance Criteria
51	30-60% of mass 198
68	<2% of mass 69
70	<2% of mass 69
127	40-60% of mass 198
197	<1.0% of mass 198
198	Base peak, 100% relative abundance
199	5-9% of mass 198
275	10-30% of mass 198
365	>1% of mass 198
441	Present but less than mass 443
442	>40% of mass 198
443	17-23% of mass 442

Attachment 6:
Example Tailing Factor Calculation

$$\text{TAILING FACTOR} = \frac{BC}{AB}$$

Example calculation: Peak Height = DE = 100 mm
10% Peak Height = BD = 10 mm
Peak Width at 10% Peak Height = AC = 23 mm
AB = 11 mm
BC = 12 mm

$$\text{Therefore: Tailing Factor} = \frac{12}{11} = 1.1$$

Attachment 7:
Target Compound Information: Quant Ions and ISTDs*

PARAMETER	Quant Ion	Secondary Ions		ISTD	pH 2 (Only)	pH 2 *and* pH 11 (i.e., Dual pH Required)

Attachment 9:
Procedures for SIM Analyses

Analytical Procedures for SIM Analysis

The mass spectrometer (MS) may be used in the selected ion monitoring mode to increase the sensitivity of the GC/MS analysis. In SIM mode, the MS is set to monitor for only a few selected ions; therefore, more ions of the selected mass(es) can be filtered and counted, resulting in an increase of sensitivity of 10 to 100 fold over scan monitoring, depending on the compound. SIM GC/MS analysis sacrifices selectivity for sensitivity since only a few characteristic ions are monitored. A spectral match cannot be made against a reference library and tentatively identified compounds (TICs) cannot be determined from a SIM run. In general, the SIM analysis should be used only when a few compounds are required to be monitored. SIM can also be used to confirm the presence of a target compound determined by GC when the routine GC/MS scan analysis cannot provide confirmation.

The following procedures are based on the guidance in SW-846 Method 8270D/8270E. The analytical sequence is the same as is given in the associated analytical SOPs, with mass tune criteria and calibration verification every 12 or 24 hours.

- Analyze the 50 ug/mL DFTPP in the scan mode. Evaluate the DFTPP against the acceptance criteria given in previous sections in the SOP.

- Determine the approximate retention time of the target by analyzing the target analyte(s) by GC/MS scan.

- Set the MS to monitor for the characteristic ions (minimum of two ions) for the target analyte(s) and internal standard(s). The ion dwell time should be set to give at least six integrations across the peak. A dwell time of 50-100ms is common.

- Prepare and analyze a minimum of three calibration standards for the target compounds. The lowest standard should be at the required quantitation limit and the other two standards should define the working range of the GC/MS. The internal standard(s) should be at a concentration of approximately 4ug/mL for SVOC.

- Evaluate the resulting calibration curve according to the initial calibration procedures given in SOP SA-QA-016. If r^2 is >0.990, the calibration curve is acceptable.

  If the initial calibration criteria are not met, action must be taken to bring the analytical system into compliance with the criteria. This action may include injection port maintenance, source cleaning, changing the column, or replacement of injection port lines and assembly. In any case, if the criteria are not met, the initial calibration must be repeated. The analyst must be aware of the 24-hour clock for the DFTPP analysis in 625 SIM and the 12-hour clock for the DFTPP analysis in 8270 SIM.

SIM Analysis of Target Compounds

- Add an appropriate volume of internal standard to the extract or sample to give the same concentration as in the calibration standards. Analyze the extract or sample under the same conditions as the standard.

Note: It is advised that the extract be split before addition of ISTD solution. One split can be utilized for scan analysis and second split reserved for SIM analysis.

- Compare the retention time of the sample to the retention time of the standard.

  If a peak is detected at the retention time of the target compound containing the selected masses in the same ratio as the standard, the peak is confirmed as the target compound and the concentration is calculated. The relative intensities of the ions in the sample should agree within ±20% of the intensities of the ions in the standard.

  If a peak is not present at the appropriate retention time or if the ratios of the ions are not the same as the standard, the analyte is not confirmed

- If the concentration of the target compound exceeds the highest calibration standard, analyze a more dilute aliquot of the sample or extract, maintaining the internal standard concentration at the same level as the calibration standards.

Attachment 10:
Poor Responder Information

The following analytes have been identified, in the reference method and/or via historical data, to be poor and/or erratic performers:

1,2,4,5-Tetrachlorobenzene
1,3,5-Trinitrobenzene
1,3-Dinitrobenzene
1,4-Dinitrobenzene
1,4-dioxane
1,4-Naphthoquinone
1-Naphthylamine
2,3,4,6-Tetrachlorophenol
2,3,5,6-Tetrachlorophenol
2,4-dinitrophenol
2,6-Dichlorophenol
2-Acetylaminofluorene
2-Naphthylamine
2-Picoline
2-secbutyl-4,6-dinitrophenol (Dinoseb)
3&4-methylphenol
3,3'-Dimethylbenzidine
3'3-Dichlorobenzidine
3-Methylcholanthrene
4,4"-Methylenebis(2-chloroaniline)
4,4-methylenebis (2-chloroaniline)
4,6-Dinitro-2-methyl- phenol,
4-Aminobiphenyl
4-Chloroaniline,
4-nitrophenol
4-Nitroquinoline-1-oxide
5-Nitro-o-toluidine
6-Methylchrysene
7,12-Dimethylbenz(a)anthracene
a,a-Dimethyl-phenethylamine
Acrylamide
Aniline
Aramite (#1)
Aramite (#2)
Atrazine
Benzaldehyde
Benzidine
Benzoic Acid
Benzyl Alcohol
Biphenyl
Caprolactam
Chlorobenzilate
Diallate (#1)
Diallate (#2)
Dibenz(a,h)acridine
Dibenz(a,j)acridine
Dimethoate
Diphenylamine
Disulfoton
Dodecanol
Ethyl methanesulfonate
Famphur
Hexachlorocyclopentadiene
Hexachloroethane
Hexachlorophene
Hexachloropropene
Hydroquinone
Isodrin
Isosafrole (#1)
Isosafrole (#2)
Kepone
Methapyrilene
Methyl methanesulfonate
Methyl Parathion
N-Nitrosodiethylamine
n-Nitrosodimethylamine
n-Nitrosodi-n-butylamine
N-Nitrosomethylethylamine
N-Nitrosomorpholine
N-Nitrosopiperidine
N-Nitrosopyrrolidine
o,o,o-Triethylphosphorothioate
o-Toluidine
p-(Dimethylamino)azobenzene
Parathion
Pentachlorobenzene
Pentachloroethane
Pentachloronitrobenzene
Pentachlorophenol
Phenacetin
Phenol
Phorate
p-Phenylenediamine
Pronamide
Pyridine
Quinoline
Safrole
Sulfotepp
Thionazin

These analytes are exempt from the LCS, MS, MSD, Sporadic Marginal Exceedance, ICV, and CCV criteria for EPA method 8270D and EPA 8270E as listed in this SOP.

18.0 Revision History

Summary of Changes for Revision 11:
- Revised water and soil container volumes to Section 8.0 and Attachment 2.
- Revised section 9.2.2 for current calibration levels.
- Added ICAL readback criteria to section 9.2.2.1.
- Added DODQSM5 criteria to section 9.2.5 and 9.2.8.2.
- Added 625.1,625 and DODQSM requirements to section 12.5 for DOC.
- Revised section 14.1 for current disposal procedures.
- Added reference to 8000C in Section 15.
- Added DODQSM criteria to Attachment 1 and Attachment 3.
- Added Attachment 12 for 625.1 Recovery Criteria and revised Glassware Cleaning Procedures to Attachment 13.

Summary of Changes for Revision 10:
- Addition of standard level in section 9.2.2 to be consistent with current calibration levels used in the laboratory.

Summary of Changes from Previous Revision:
-Updated SOP signatories to reflect current responsibilities and titles.
-Incorporated references to EPA 8270E.
-Incorporated the following changes as per SC DHEC Technical Deficiency Letter dated 05/18/19:
-Added note the SC DHEC prohibits the use of sporadic marginal exceedance. Section 9.1.1 and Section 16.2.4
-Corrected spelling of decafluorotriphenyl phosphine. Section 9.2.1
-Clarified calculation to reference waters. Section 11.2.3.
-Added requirement to evaluate %RSE. Section 9.2.2.1 and Attachment 3

VOLATILE COMPOUNDS BY GC/MS

(Methods: EPA 624, EPA 624.1, EPA 8260B, EPA 8260C, EPA 8260D and SM6200B)

Approvals (Signature/Date):

1.0 SCOPE and APPLICATION

This SOP contains the procedures for the determination of volatile organic compounds (VOC) by purge and trap gas chromatography/mass spectrometry (GC/MS). This procedure is applicable to a wide variety of low molecular weight compounds that have low aqueous solubility and boiling points less than 200°C.

The routine matrices for this procedure are waters (EPA 624, EPA 624.1, EPA 8260B, EPA 8260C, EPA 8260D and SM6200B) and soils (for EPA 8260B, EPA 8260C, and EPA 8260D); however, this procedure may be adapted to accommodate other matrices as outlined in Section 16.1. This procedure may also be used to perform Custer Rule analyses for chloroform only (via a modified EPA 624 analysis).

Note: This SOP incorporates state-specific requirements for EPA 8260B and EPA 8260C soils collected in Alaska. The term "EPA 8260_AK" is used in this SOP to designate those requirements that differ from the standard procedure, which include a medium-level sample collection procedure, an additional surrogate fortified into the methanol in the out-going sample container, state-specific reporting limits, and initial calibration concentration levels.

A complete target analyte list, the reporting limits (RL), the method detection limits (MDL), and the accuracy and precision criteria associated with this procedure are provided in the LIMS Method Limit Groups (MLGs). Attachment 8 outlines the routine analytes and the associated ions.

2.0 SUMMARY OF METHOD

Volatile organic compounds (VOCs) are purged from the sample matrix with nitrogen. The VOCs are transferred from the sample matrix to the vapor phase. The vapor is swept through a sorbent tube where the VOCs are trapped. After the purging is completed, the trap is heated and backflushed with helium to desorb the VOCs onto a GC column. The GC is temperature-programmed to separate the VOCs, which are then detected by a mass spectrometer. Qualitative identification of the target compounds in the sample is based on the relative retention time and the mass spectra of the characteristic masses (ions) determined from standards analyzed on the same GC/MS under the same conditions. Quantitative analysis is performed using the internal standard technique with a single characteristic ion.

Water samples are routinely purged at ambient conditions; however, a heated purge may be used if required by the project. A 5mL purge volume is used as the default for EPA8260, EPA 624 and EPA 624.1. The calibration standards and the associated QC must be analyzed under the same conditions and volume. This sample introduction procedure is based on EPA 5030B, EPA 5030C, and EPA 624. For SM6200B a 20mL purge volume is utilized as the default.

Low-level (nominally<1mg/kg) soil samples are purged at 40°C in a purge and trap instrument designed to add water and internal standards to the vial containing the sample

without breaking the seal. The sample is stirred during purging to thoroughly mix the soil and water. The calibration standards and associated QC are purged under the same conditions. This sample introduction procedure is based on EPA 5030B or 5030C (for soil samples collected in bulk) and EPA 5035 or EPA 5035A (for soil samples collected via Encore/Terracore devices).

Medium level soils (nominally>1mg/kg), waste samples, and soil samples for EPA 8260_AK are extracted with methanol. An aliquot of the methanol extract is injected into reagent water. The methanol extract/reagent water is purged at a heated temperature (i.e., 40°C) for routine soils and at ambient temperature for wastes and EPA 8260_AK.

This SOP is based on EPA 624, EPA 624.1, EPA 8260B, EPA 8260C, EPA 8260D and SM6200B.

3.0 DEFINITIONS

Refer to the Glossary Section of the *Quality Assurance Manual* (QAM) for a complete listing of applicable definitions and acronyms.

4.0 INTERFERENCES

4.1 Procedural Interferences

4.1.1 Interferences may be caused by contaminants in solvents, reagents, glassware, and other sample processing apparatus and can make identification and/or quantification of the target analytes difficult.

4.1.2 All sample collection containers are single-use disposable containers which limits the potential for contamination. All non-disposable labware must be scrupulously cleaned in accordance with the posted Labware Cleaning Instructions (found in Attachment 14) to ensure it is free from contaminants and does not contribute artifacts.

4.1.3 High purity reagents and solvents are used to help minimize interference problems. Methanol and Hydrochloric Acid must be verified prior to use in accordance with the Eurofins TestAmerica Solvent Lot Testing Program.

4.1.4 Instrument and/or method blanks are routinely used to demonstrate all reagents and apparatus are free from interferences under the conditions of the analysis.

4.1.5 VOCs commonly used in the laboratory are potential sources of contamination. Methylene chloride, acetone, Freon-113, MEK, hexane, toluene, and isopropanol are used in the laboratory and tend to present the most problems.

4.1.5 The Teflon seals of the purge and trap device can absorb and outgas many of the compounds that are included in this method. These Teflon fittings should be periodically checked for integrity. If the contamination is suspected, the fittings may be heated at 105°C for one hour or replaced.

4.1.6 The addition of acid to the sample during collection will cause the degradation of several target compounds. Acrolein and acrylonitrile recovery may be reduced and 2-chloro-ethyl vinyl ether will be completely degraded. The recovery of 2-chloroethyl vinyl ether will also be reduced as the purge and trap lines become acidic. For this reason, unpreserved vials must be utilized if these analytes are requested.

4.2 Matrix Interferences

4.2.1 Matrix interferences may be caused by contaminants that are purged from the sample matrix.

Contamination by carryover can occur whenever high concentration samples and low concentration samples are analyzed sequentially. As such, samples known to be clean should be analyzed first. When practical, high concentration samples should be followed by a blank to check for cross-contamination. If the targets found in the highly concentrated sample are found in subsequent samples, the analyst must verify that the P/T systems are not contributing contamination to the subsequent samples. If the target compound(s) are not present in subsequent samples, the analysis of a blank is not required but may be a prudent preventative measure. Frequent trap bakeout and purging of the entire purging system may be necessary when carry-over is suspected. Reagent blanks must be analyzed when contamination is suspected to ensure that the system is free from contamination.

A common type of contamination is from samples containing high concentrations of hydrocarbons such as gasoline or mineral spirits. At high concentrations, these compounds may cause elevated baselines that can obscure the mass ion signals of target compounds with masses similar to the hydrocarbons. For example, a common mass in hydrocarbons is mass 43, which is also present in many ketones. Mineral spirits at high concentrations can be very problematic as it contains hydrocarbons beyond C12, which can linger in the purge and trap unit and carryover for quite a few samples. High concentrations of hydrocarbons can also degrade the trap much more quickly than would be expected.

4.2.3 The volatiles laboratory must be kept as free from contamination as possible. Highly contaminated samples must be segregated from routine samples. Contact with sections of the laboratory where solvents are used should be minimized. Refrigerator and freezer blanks must be prepared, stored, and analyzed to evaluate the sample storage areas for possible contamination. Guidance is provided in SOP SA-QA-015: *Homogenization, Compositing, and Segregation of Samples.*

4.2.4 Matrix interferences may be overcome by the use of the secondary ions for quantitation. An example of this is the use of mass 82 for quantitation with chlorobenzene-d5 internal standard when a potential co-eluter, 1,1,1,2-tetrachloroethane, is a target compound. One of the mass fragments of 1,1,1,2-tetrachloroethane is mass 117, which is the recommended quantitation ion for chlorobenzene-d5. The use of the secondary ions should be used for quantitation in such cases when the laboratory can clearly demonstrate matrix problems. Mass 58 is recommended for quantitation of acetone due to the elution of a hydrocarbon at the same retention time.

5.0 SAFETY

Employees must abide by the policies and procedures in the Eurofins TestAmerica Environmental Health and Safety Manual (EHSM), the Eurofins TestAmerica Savannah Addendum to the EHSM, and this document.

This procedure may involve hazardous materials, operations, and equipment. This SOP does not purport to address all of the safety problems associated with its use. It is the responsibility of the user to follow appropriate safety, waste disposal, and health practices under the assumption that all samples and reagents are potentially hazardous.

The analyst must protect himself/herself from exposure to the sample matrix. Many of the samples that are tested may contain hazardous chemical compounds or biological organisms. The analyst must, at a minimum, wear protective clothing (lab coat), eye protection (safety glasses or face shield), disposable gloves, and closed-toe, nonabsorbent shoes when handling samples. Note: Cut-resistant gloves must be worn, or other hand protection material used, when opening and closing VOA vials.

5.1 Specific Safety Concerns or Requirements

The gas chromatograph and mass spectrometer contain zones that have elevated temperatures. The analyst must be aware of the locations of those zones, and must cool them to room temperature prior to working on them.

The mass spectrometer is under deep vacuum. The mass spectrometer must be brought to atmospheric pressure prior to working on the source.

There are areas of high voltage in both the gas chromatograph and the mass spectrometer. Depending on the type of work involved, either turn the power to the instrument off, or disconnect it from its source of power.

The exit vent of the split injector must have a carbon trap in-line to collect the volatile compounds that are vented during the injection of the sample. The traps should be changed as needed and must be disposed of in accordance with Section 9 of the Eurofins TestAmerica Savannah Addendum to the EHSM.

Methanol is a flammable solvent. It can cause irritation to the respiratory tract. Overexposure can cause fatigue, confusion, headache, dizziness, and drowsiness.

Hydrochloric acid is extremely hazardous as an oxidizer, a corrosive, a poison, and is reactive. Inhalation of the vapors can cause coughing, choking, irritation of the nose, throat, and respiratory tract, breathing difficulties, and lead to pneumonia and pulmonary edema. Contact with the skin can cause severe burns, redness, and pain. Acid vapors are irritating and can cause damage to the eyes. Contact with the eyes can cause permanent damage. Concentrated acids should be used in a fully functional fume hood.

5.2 Primary Materials Used

The following is a list of the materials used in this procedure, which have a serious or significant hazard rating, and a summary of the primary hazards listed in their SDS/MSDS.

Note: This list does not include all materials used in the procedure. A complete list of materials used in this procedure can be found in the Reagents and Standards Section and the Equipment and Supplies Section of this SOP

Employees must review the information in the SDS/MSDS for each material before using it for the first time or when there are major changes to the SDS/MSDS. Electronic copies of SDS/MSDS can be found using the "MSDS" link on the Oasis homepage and on the EH&S webpage on Oasis.

Material	Hazards	Exposure Limit[1]	Signs and Symptoms of Exposure
Methanol	Flammable Poison Irritant	200ppm TWA	A slight irritant to the mucous membranes. Toxic effects exerted upon nervous system, particularly the optic nerve. Symptoms of overexposure may include headache, drowsiness and dizziness. Methyl alcohol is a defatting agent and may cause skin to become dry and cracked. Skin absorption can occur; symptoms may parallel inhalation exposure. Irritant to the eyes.
Hydrochloric Acid	Corrosive Poison	5ppm Ceiling	Inhalation of vapors can cause coughing, choking, inflammation of the nose, throat, and upper respiratory tract, and in severe cases, pulmonary edema, circulatory failure, and death. Can cause redness, pain, and severe skin burns. Vapors are irritating and may cause damage to the eyes. Contact may cause severe burns and permanent eye damage.
[1]Exposure limit refers to the OSHA regulatory exposure limit.			
Note: Always add acid to water to prevent violent reactions.			

6.0 EQUIPMENT AND SUPPLIES

6.1 Equipment and Instrumentation

A list of the instruments, with their basic configuration, is provided in Attachment 9. These instruments were in use at the time of SOP revision. Other instruments and configurations may be used provided they are fully documented and validated in accordance with laboratory procedures.

Top-loading Balance – Verify in accordance with SOP SA-AN-100: *Laboratory Support Equipment (Verification and Use)*

6.2 Analytical Data System / Software / Hardware

Chemstation software is used on a Windows-based PC to schedule and acquire data. CHROM software is used on a Windows-based PC to store, reduce/evaluate, and output the data to the laboratory's LIMS system. CHROM software has the capability of processing stored GC/MS data by recognizing a GC peak within any given retention time window, comparing the mass spectrum from the GC peak with spectral data in a user-created data base, and generating a list of tentatively identified compounds with their retention times and scan numbers. The software also allows integration of the ion abundance of any specific ion between specified time or scan number limits, calculation of response factors as or construction of a linear regression calibration curve, calculation of response factor statistics (mean and standard deviation), and calculation of concentrations of analytes using either the calibration curve or the response factors.

The QA department maintains a Master Equipment Listing for all equipment utilized by the laboratory. This listing provides information such as the model, serial number and the software or firmware utilized.

6.3 Lab Supplies

Supelco Vocarb 3000 trap or equivalent – Other traps may be used as long as the target compounds can be detected at the required quantitation limit.

Recommended Column: J&W DB-624: 20m x 0.18mm ID, 1.8um film

6.4 Volumetric Containers and Dispensers

All volumetric labware must be verified in accordance with SOP SA-AN-100: *Laboratory Support Equipment (Verification and Use).* Refer to Attachment 6 for Labware Cleaning Procedures.

Volumetric Labware	Volume	Type (Quantitative / Qualitative)	Use	Verification Frequency	Laboratory Verification Criteria
Volumetric Flasks (Class A)	Various	QUANTITATIVE	Standard Preparation	None (Purchased Class A)	None (Purchased Class A)
Gas-Tight Syringes	Various	QUANTITATIVE	Standard Preparation Spike Addition	None, if received with COA	None, if received with COA
Pump-Style Mechanical Pipettes	5mL	QUANTITATIVE	Reagent/Water Dispensing	Initially, prior to first use, then quarterly thereafter (Daily for DOD)	Accuracy = 2% Precision = 1%
VOA Vials*	40mL	QUANTITATIVE	Sample Collection Instrument Analysis	Per Lot	Accuracy = 2% Precision = 1%

*Note: The VOA vials used to collect samples have been verified to actually contain closer to 43mL. As such, spiking amounts for ISSU have been adjusted accordingly for instruments that are unable to automatically add ISSU during the sample transfer step of the autosampler. Standards are prepared in 50mL volumetric containers, and poured into the VOA vial for analysis on the instrument.

6.5 Sample Collection Containers

All sample collection containers are single-use disposable containers which limits the potential for contamination. Containers are received from vendors with a statement that the containers are suitable for the intended use and have been tested and certified to be free of contamination.

Refer to SOP SA-VO-001: *Preparation, Screening, and Storage of Volatiles Samples* for the containers routinely used to collect field samples.

7.0 REAGENTS AND STANDARDS

7.1 Expiration Dates

Expiration dates (time from initial use or receipt to final use) for standard and reagent materials must be set according to the guidance in this SOP. Note: These are maximum expiration dates and are not to be considered an absolute guarantee of standard or reagent quality. Sound judgment must be used when deciding whether to use a standard or reagent. If there is doubt about the quality of a standard or reagent material, a new material must be obtained or the standard or reagent material verified. Data quality must not be compromised to extend a standard's life.

The expiration date of any standard must not exceed the expiration date of the standard that was used to prepare it.

7.2 Reagents

Reagents must be prepared and documented in accordance with SOP SA-AN-041: *Reagent and Standard Materials Traceability.*

Methanol and Hydrochloric Acid must be verified prior to use in accordance with the Eurofins TestAmerica Solvent Lot Testing Program addressed in SOP SA-AN-041.

7.2.1 Reagent water – ASTM Type II; lab generated water

7.2.2 Blank Sand – Macro Chemicals; used as blank matrix for soil samples

7.2.3 Methanol – for purge and trap analysis; J.T. Baker 9077-02 (1L)

7.3 Standards

Standards must be prepared and documented in accordance with SOP SA-AN-041*: Reagent and Standard Materials Traceability.* Certificates of analysis or purity must be received with all purchased standards, and scanned and attached in LIMS.

The recipes for the preparation of standards are provided in Attachment 10. The recipes contain the stock standards, preparation steps, storage, and expiration dates for the routine target compounds.

8.0 SAMPLE COLLECTION, PRESERVATION AND HOLDING

Refer to Attachment 2 for a summary of the routine containers, holding times, preservation requirements, etc.

Refer to SOP SA-VO-001: *Preparation, Screening, and Storage of Volatiles Samples* for information on the preservation and dechlorination checks required for these methods.

9.0 QUALITY CONTROL

SOP SA-QA-017: *Evaluation of Batch QC Data* and the QC Summary in Attachment 3 provide requirements for evaluating QC data.

9.1 Batch QC

All batch QC must meet the criteria given in Attachment 3 of this SOP.

9.1.1 Soil Samples

A batch consists of up to 20 environmental samples and the associated QC items. The laboratory defaults to the following as the minimum QC items required for each batch: a method blank (MB), a laboratory control sample (LCS), a matrix spike (MS), and a matrix spike duplicate (MSD).

If there is insufficient sample to perform the MS/MSD, the LCS must be prepared in duplicate (i.e., LCS/LCSD). An NCM must be initiated on all affected samples to denote this situation. Insufficient sample is defined as receiving less than 30g for bulk samples or less than 4 Encores/Terracores.

Note: If an LCS and LCSD are performed, both QC items must be evaluated and reported. Acceptable recoveries (as well as %RPD) for both LCS and LCSD are required.
Note: Unless the client has specified which sample to use as the matrix spike, the matrix spike must be selected at random from the samples in the batch. Field QC (e.g., equipment blanks, trip blanks, and field blanks) must not be used for MS/MSD unless specifically requested to do so by the client or unless there is insufficient sample available for performing MS/MSD using an actual field sample.

9.1.2 Aqueous Samples

A batch consists of up to 20 environmental samples and the associated QC items. The minimum QC items required for each batch are as follows:

EPA 8260B, EPA 8260C, EPA 8260D and SM6200B:
Method blank (MB), a laboratory control sample (LCS), a matrix spike (MS), and a matrix spike duplicate (MSD).

EPA 624 and EPA 624.1:
Method blank (MB), a laboratory control sample (LCS), a matrix spike (MS) performed per 10% of samples analyzed, and a matrix spike duplicate (MSD). This equates to 1 MS and 1MSD for a batch of 10 or less samples or equates to 1 MS (from sample 1-10), 1 MS (from sample 11-20), and 1 MSD for a batch of 11-20 samples.

If there is insufficient sample to perform the required MS and/or MSD, the LCS must be prepared in duplicate (LCSD). An NCM must be initiated on all affected samples to denote when insufficient sample is provided to perform a MS/MSD. Insufficient sample is defined as receiving less than less than 4 vials.

Note: It is not uncommon to for the laboratory to be supplied with insufficient containers to perform MS/MSD; therefore, the laboratory routinely performs LCS/LCSD as a default. If an LCS and LCSD are performed, both QC items must be evaluated and reported. Acceptable recoveries (as well as %RPD) for both LCS and LCSD are required.

Note: Unless the client has specified which sample to use as the matrix spike, the matrix spike must be selected at random from the samples in the batch. Field QC (e.g., equipment blanks, trip blanks, and field blanks) must not be used for MS/MSD unless specifically requested to do so by the client or unless there is insufficient sample available for performing MS/MSD using an actual field sample.

9.1.3 Poor Performers / Erratic Compounds

As indicated in EPA 8260B, EPA 8260C and EPA 8260D and/or via assessment of laboratory control sample recoveries and control charts, the compounds listed in Attachment 11 are Poor Performers and/or behave erratically. T
hese compounds will not be included in the LCS/LCSD/MS/MSD marginal exceedance count, provided their %R is >10%.
Refer to SOP SA-QA-017 for information on marginal exceedance.

An NCM must be initiated to denote this situation.

Note: DOD QSM 5.3 does not identify poor performing analytes for EPA 8260. The laboratory will allow the use of the poor performer exception in LCS/LCSD/MS/MSD if the analytes are not identified as a compound of concern by the client.

Note: The state of South Carolina does not allow the use of marginal exceedances. Poor performers must meet a limit of 60-140%. South Carolina UST work must meet a limit of 70-130%.

9.2 Instrument QC

The term “clock time” or “analytical clock” refers to the amount of time that can pass before additional instrument QC items must be performed. The analytical clock begins with the injection of the BFB, and all subsequent injections must be completed before the clock time expires - at which point new instrument QC is performed and a new clock is initiated.

The clock times are defined as follows:

- EPA 8260B, EPA 8260C, EPA 8260D, and SM6200B = 12 hours
- EPA 624 = 24 hours
- EPA 624.1= 12 hours (clock time starts after the analysis of the MB but may not exceed 14 hours total)
- EPA 624 Cluster Rule (chloroform only) = 8 hours

Note: Due to instrument configurations employing dual concentrators, most of the laboratory instruments can analyze more than 20 injections within the designated clock times. An analytical batch is still defined as 20 field samples; therefore, if more than 20 field samples are analyzed within a clock, additional batch QC is required (i.e., another method blank, LCS, and LCSD or MS/MSD must be performed).

9.2.1 BFB Tune Check

9.2.1.1 For EPA 8260B, EPA 8260C, EPA 8260D, EPA 624, and EPA 624.1, Fifty nanograms of 4-BFB must be analyzed at the beginning of each clock as a check on the "tune" of the mass spectrometer. Meeting the tuning criteria ensures that the instrument is measuring the proper masses in the proper ratios. The 4-BFB analysis takes place under the same instrument conditions as the calibration standards and samples except that a different temperature program can be used to allow for the timely elution of 4-BFB. All other

instrument conditions must be identical - the mass range, scan rate, and multiplier voltage.

If the instrument is configured for direct injection, 50ng of 4-BFB may be injected directly on to the column. If the purge and trap is used to analyze the 4-BFB, the purge and trap conditions must be the same as for the calibration standards and samples.

For SM6200B, twenty-five nanograms of 4-BFB must be analyzed at the beginning of each clock as a check on the "tune" of the mass spectrometer. Meeting the tuning criteria ensures that the instrument is measuring the proper masses in the proper ratios. The 4-BFB analysis takes place under the same instrument conditions as the calibration standards and samples except that a different temperature program can be used to allow for the timely elution of 4-BFB. All other instrument conditions must be identical - the mass range, scan rate, and multiplier voltage.
If the instrument is configured for direct injection, 25ng of 4-BFB may be injected directly on to the column. If the purge and trap is used to analyze the 4-BFB, the purge and trap conditions must be the same as for the calibration standards and samples.

9.2.1.2 Evaluation of the 4-BFB peak

9.2.1.2.1 The chromatogram must exhibit acceptable baseline behavior and the 4-BFB peak must be symmetrical (i.e., Gaussian). A spectrum of the baseline that shows high abundances of mass 40 (Argon) and mass 44 (carbon dioxide) may indicate a leak or contaminated carrier gas.

9.2.1.2.2 The spectrum of the 4-BFB must meet the criteria listed in Attachment 7. Background subtraction must be straightforward and designed only to eliminate column bleed or instrumental background. Scans ±1 scan from the apex can be evaluated for the 4-BFB criteria. Consecutive scans within this range can be averaged to meet the criteria.

9.2.1.2.3 The 4-BFB analysis must be evaluated as to the relative size of the 4-BFB peak under the m/z 95 profile. A benchmark area window must be established for each instrument. Response outside of this window suggests instrumental problems such as a poor purge, clogged jet separator, leak in the Tekmar purging device, reduced or elevated detector sensitivity, improper electron multiplier voltage selection, wrong tune method or tune file selected for this analysis, PFTBA valve left open, or other anomalies.

9.2.1.2.4 If the 4-BFB fails to meet the acceptance criteria, the instrument may require tuning (manually or automatically with PFTBA). Depending on the nature of the results from the 4-BFB analysis, other corrective measures may include remaking the 4-BFB standard and/or cleaning the mass spectrometer source.

9.2.2 Trap Check Standard (Optional)

The trap check standard is used to evaluate the condition of the trap by monitoring the formation of chloromethane and bromomethane. Chloromethane and bromomethane may be formed on a degraded trap by thermal decomposition of halogenated compounds.

9.2.2.1 Prepare the trap check standard by injecting 2uL of a 50ug/mL bromoform standard into 5mL of reagent water. Other sample volumes may be used but the sample must transfer 100ng of bromoform to the column. Add the internal standards and surrogates. Analyze the sample using the same analytical system conditions used for samples and standards.

9.2.2.2 Evaluate the chromatogram for the presence of chloromethane and bromomethane. Compare the response to the 5.0 ug/L standard. The response must be less than or equal to the reporting limit.

Note: Ensure that the spectra match the reference spectra and that the most abundant ions are present for both compounds - chloromethane (m/z 50, 52) and bromomethane (94, 96).

9.2.2.3 If the trap check standard does not meet the acceptance criteria, the trap must be replaced and conditioned.

9.2.3 Initial Calibration (ICAL)

The instrument must be calibrated in accordance with SOP SA-QA-016: *Evaluation of Calibration Curves.* This SOP provides requirements for establishing the calibration curve and gives the applicable formulas.

Instrument calibration is performed by analyzing a series of known standards. The calibration curve must consist of a minimum of 5 standards. The lowest level calibration standard must be at or below the reporting limit, and the remaining standards will define the working range of the analytical system. A minimum of 6 standard is required for a non-linear or quadratic regression.

The initial calibration standard concentrations currently in use in the laboratory are as follows:

EPA 624, 624.1, 8260B, EPA 8260C and EPA 8260D:

Standard Level	Concentration (ng)	Final Concentration – Waters (ug/L)	Final Concentration – Soils (ug/kg)
1	5	1.0	5.0
2	10	2.0	10
3	25	5.0	25
4	50	10	50*
5	100	20	75
6	250	50*	100
7	500	100	150
8	1000	200	200

*CCV Level

SM6200B:

Standard Level	Concentration (ng)	Final Concentration – Waters (ug/L)
1	2.5	0.5
2	5	1.0
3	12.5	2.5
4	25	5
5	50	10
6	100	20
7	125	25
8	250	50

*CCV- Alternate throughout the batch

EPA 8260_AK Soils
(Incorporates 1:40 dilution associated with the methanol extraction)

Standard Level	Concentration (ng)	Final Concentration – Soils (ug/kg)
1	0.50	20
2	1.0	40
3	2.0	80
4	5.0	200
5	10	400*
6	25	1000
7	50	2000

*CCV Level

Refer to Attachment 10 for the standard preparation instructions. Other standard concentrations may be used provided they support the reporting limit and are fully documented in accordance with SOP SA-AN-041.

9.2.3.2 Initial Calibration (ICAL) Criteria

The instrument must be calibrated in accordance with SOP SA-QA-016: *Evaluation of Calibration Curves.* This SOP provides requirements for establishing the calibration curve and evaluation.

9.2.3.2.1 EPA 8260B ICAL:

The initial calibration is evaluated specifically for the calibration check compounds (CCC) and the system performance check compounds (SPCC). The CCC and SPCC criteria are given in Attachment 5 of this SOP. The %RSD criteria for CCC and minimum RRF for SPCC must be met before the analysis of samples can begin.

After the CCC and SPCC initial calibration criteria have been met, each target must be evaluated for linearity. The relative standard deviation of the calibration standards must be <15% for the initial calibration curve to be acceptable.

If one or more compounds do not meet the %RSD criterion, the next option is to evaluate a regression curve. The regression coefficient (r^2) of the regression curve must be greater than 0.990 for the initial calibration curve to be acceptable.

A minimum of 6 points is required for a quadratic curve. Higher order curves are not permitted.

Readback Criteria:
EPA 8260B does not specify read-back criteria. The laboratory requires that the low-level standard recover within 50% of true value and that all other calibration levels be within +/- 30% of the true concentration.

Note: Some programs and agencies (e.g., SC DHEC) do not allow the use of quadratic curves. Refer to the Project Requirement Summary and/or Project Plan to determine if this curve type is prohibited.

9.2.3.2.2 EPA 8260C and EPA 8260D ICAL:

RSD and regression Criteria: The relative standard deviation (RSD) must be less than 20% difference. If a compound exceeds 20% RSD, a regression curve must be employed. The regression coefficient (r^2) of the regression curve must be greater than 0.990 for the initial calibration curve to be acceptable.

Note: A minimum of 6 points is required for a quadratic curve. Higher order curves are not permitted. Some programs and agencies (e.g., SC DHEC) do not allow the use of quadratic curves. Refer to the Project Requirement Summary and/or Project Plan to determine if this curve type is prohibited.

RRF Criteria: A list of compounds with minimum relative response factor criteria is listed in Attachment 6. RRF criteria must be met for EPA 8260C and is advisory for EPA 8260D.

Note: 10% of the analytes in the calibration may be outside criteria. If analytes do meet criteria, they are considered estimated. An NCM must be initiated to denote analytes that do not meet the RSD or r^2 criteria.

RLCCV Criteria: For any analyte associated with a calibration or minimum response factor, an RLCCV must be analyzed with each subsequent clock. The analytes must be detected in the RLCCV analysis to be reported.
*An NCM must be initiated to denote this situation. Any positive results must be noted as estimated.

Readback Criteria:

EPA 8260C: All calibration levels be within +/- 30% of the true concentration.

EPA 8260D: Lowest calibration level must within 50% of the true concentration. All other levels must be within 30% of the true concentration.

9.2.3.2.3 EPA 624 and 624.1 ICAL

The relative standard deviation of the calibration standards must be <35% for the initial calibration curve to be acceptable. If one or more compounds do not meet the %RSD criterion of <35%, the next option is to evaluate a regression curve. The regression coefficient (r^2) of the regression curve must be greater than 0.990 for the initial calibration curve to be acceptable.

Readback Criteria:
The method does not state a requirement for readback. The laboratory requires that the low-level standard recover within 50% of true value and that all other calibration levels be within +/- 30% of the true concentration.

Note: EPA 624.1 allows a regression coefficient (r^2) of greater than 0.920 for the initial calibration curve to be acceptable. The lab has chosen to use stricter criteria. The regression coefficient (r^2) of the regression curve must be greater than 0.990 for the initial calibration curve to be acceptable.

9.2.3.2.4 SM6200B ICAL:

The relative standard deviation of the calibration standards must be <20% for the initial calibration curve to be acceptable. If one or more compounds do not meet the %RSD criterion of <20%, the next option is to evaluate a regression curve. The regression coefficient (r^2) of the regression curve must be greater than 0.994 for the initial calibration curve to be acceptable

Readback Criteria:
All points must be within 20% of the true value.

9.2.3.2.5 8260 DOD QSM 5.3 ICAL

The relative standard deviation (RSD) of the calibration standards must be ≤ 15%. If one or more compounds do not meet %RSD of ≤15% then a regression curve must be evaluated. The linear or quadratic regression coefficient (r^2) of the regression curve must be greater than or equal to 0.990 for the initial calibration curve to be acceptable.

Read-back Evaluation must be evaluated based on the source method utilized at login.

If EPA 8260B method version is utilized, the CCC and SPCC criteria must also be met.

If the method version requires RRF or RLCCV analysis, these additional requirements must be met (ie EPA 8260C and EPA 8260D).

DOD QSM5.3 does not address analytes that may be considered poor/erratic performers. The laboratory allows a **30%D** for these analytes listed in Attachment 11 only if the compounds are not identified as critical components of concern by the client.

9.2.4 Second Source Initial Calibration Verification (ICV)

The calibration curve must be verified initially – prior to any sample analyses – in accordance with SOP SA-QA-016 with a standard obtained from a second source.

The initial calibration verification standard concentration currently in use in the laboratory is equivalent to the CCV concentration. Refer to Attachment 10 for the standard preparation instructions. Another standard concentration may be used provided it is mid-level and fully documented in accordance with SOP SA-AN-041.

9.2.4.1 EPA 8260B ICV Criteria

All CCC compounds must be within 20% D with remaining analytes within 30%D for the ICV to be acceptable.

The analytes listed in Attachment 11 behave erratically and/or are poor performers. These analytes are allowed a %D >30%, but must be <50% to be acceptable. An NCM must be initiated to denote this situation.

9.2.4.2 EPA 8260C and EPA 8260D ICV Criteria

All compounds must be within 30%D for the ICV to be acceptable.

The analytes listed in Attachment 11 behave erratically and/or are poor performers. These analytes are allowed a %D >30%, but must be <50% to be acceptable.
*An NCM must be initiated to denote this situation.

9.2.4.3 EPA 624 and EPA 624.1 ICV Criteria

The initial calibration verification (ICV) for EPA 624 is acceptable if each analyte meets the criteria outlined in Attachment 12. The initial calibration verification (ICV) for EPA 624.1 is acceptable if each analyte meets the criteria outline in Attachment 13.

9.2.4.4 SM6200B ICV Criteria

All compounds must be within 30%D for the ICV to be acceptable. Analysis may not proceed until ICV criteria is met.

9.2.4.5 8260 DOD QSM 5.3 ICV Criteria

All compounds must be within 20%D for the ICV to be acceptable. Analysis may not proceed until ICV criteria is met.

DOD QSM5.3 does not address analytes that may be considered poor/erratic performers. The laboratory allows a **30%D** for these analytes listed in Attachment 11 only if the compounds are not identified as critical components of concern by the client.

9.2.5 **Continuing Calibration Verification (CCV)**

The initial calibration curve must be verified at the beginning of each clock with a mid-level standard.

The continuing calibration verification standard concentration currently in use in the laboratory is specified in Section 9.2.3. Refer to Attachment 10 for the standard preparation instructions. Another standard concentration may be used provided it is mid-level and fully documented in accordance with SOP SA-AN-041.

9.2.5.1 EPA 8260B CCV Criteria

For EPA 8260B, the CCC and SPCC criteria (Attachment 5) must be met for the CCV to be acceptable. For non-CCC and non-SPCC compounds, %D must be within 50 %D or the CCV to be acceptable.

Note: The lab will report samples with a reduced list of analytes with CCC analyte(s) outside 20%D provided that ALL reported analytes are ≤ 20%D in the CCV.
* An NCM will be initiated to denote this situation.

Note: The SPCC criteria must be met even if the regression curve option is used for quantitation.

9.2.5.2 EPA 8260C and EPA 8260D CCV Criteria

Response Factor Criteria:
EPA 8260C only, the minimum response factor criteria (RRF) as specified in Attachment 6 must be met. For EPA 8260D, the minimum response factor criteria are recommended and not required.
If the minimum RRF criteria are not met, sample analysis may proceed after the analysis of an RLCCV to demonstrate sensitivity.
*An NCM must be initiated for any detections associated with an RRF failure.

%D Criteria:
All analytes must be ≤ 20%D.

The reference method makes the exception, however, such that due to the large numbers of analytes in each CCV, some analytes may not meet these criteria.

-If more than 20% of the analytes in a CCV exceed the %D criteria, the CCV is unacceptable, and re-analysis is required.

- If less than 20% of the analytes in a CCV exceed the %D criteria, analyze an RLCCV, a standard whose concentration is at or below the reporting limit.
  Analytes that do not meet CCV %D criteria may be reported if the affected analytes are qualitatively identified in the RL CCV.
  - If the affected analyte is not detected in the associated client sample, the result is reported without qualification.
  - If the affected analyte is detected in the associated client sample, the result must be reported as estimated.
  - **Note: An NCM must be initiated to denote this situation.**

If the CCV recovery is outside 20%D, high biased, the laboratory will report data if analytes are not-detected in samples.
* An NCM must be initiated to denote this situation.

Note: SW-846 does not put a cap on an individual analyte's %D; however, the laboratory has the requirement that no individual analyte can exceed 50%D.

9.2.5.2 SM6200B CCV Criteria

Compounds must be within 30% of the true value (%difference for average or %drift for regression fits). Compounds identified as gases must be within +/- 40% D.
SM6200B also requires a CCV at the end of the clock to demonstrate instrument performance at the end of the batch. The capping CCV (CCVC) has the same limits as the opening CCV.

Note: The CCV concentration analyzed must be varied over the range of the calibration. Minimum concentration utilized should be two times the reporting limit (RL).

9.2.5.4 EPA 624 and EPA 624.1 CCV Criteria

For EPA Method 624, all target analytes must meet the criteria outlined in Attachment 12 to be acceptable. For EPA 624.1, all target analytes must meet the criteria outlined in Attachment 13.

9.2.5.5 DOD QSM 5.3 CCV Criteria

A CCV is required before sample analysis; after every 12 hours of analysis time; and at the end of the analytical batch run.
For the opening CCV, all target analytes and surrogates must within 20% of the true value.
For the closing CCV (CCCV), all target analytes and surrogates must be within 50%D.

If utilizing 8260C or 8260D, the response factor criteria must be met as defined in section 9.2.5.2.

Corrective Action if CCV does not meet acceptance: Immediately analyze two additional consecutive CCVs. If both pass, samples may be reported without re-analysis. If either fails or if consecutive CCVs cannot be run, repeat analysis of all associated samples.

9.2.5.5 CCV Poor Performers- EPA 8260B, EPA 8260C, EPA 8260D

Refer to Attachment 11 for the identification of poor and/or erratic performing analytes. These analytes are allowed to exceed the limit of 50%D , but must have a maximum %D limits of 100%D. If there are poor performers that exceed 50%D, the data may be reported and results are noted as estimated. The poor performers must be counted in the total number of allowances within a CCV analysis
****An NCM must be initiated to denote this situation**.

Note: DOD QSM 5.3 does not identify or address analytes that may have erratic response and be considered poor performers. The laboratory allows a 30%D for these analytes listed in Attachment 11 only if the compounds are not identified as critical components of concern by the client.

9.3 Internal Standard (ISTD)

9.3.1 EPA 8260B, EPA 8260C, EPA 8260D, EPA 624, EPA 624.1:

This procedure is an internal standard (ISTD) procedure. Fluorobenzene, 1,4-dichlorobenzene-d4, and chlorobenzene-d5 are the internal standards.

Prior to analysis, the internal standards must be added to all standards, samples, and QC items. The concentration of the internal standards must be the same in all calibration samples, field samples, and QC samples. A concentration of 50ug/L is used for each of the ISTD analytes.

The response of the ISTD in the ICV/CCV must be within -50% to +100% of the response of the ISTD in the CCV-level standard in the initial calibration sequence (denoted as ICIS), If the response is outside of this range, the analysis of the CCV must be repeated and any samples associated with the CCV must also be re-analyzed. Repeated failure of the ISTD response will require re-calibration.

The response of the ISTD in the samples and batch QC items must be within -50% to +100% of the response of the CCVIS. If the response is outside of this range, corrective action must be taken.

9.3.2 DOD QSM 5.3 ISTD Criteria

The response of the ISTD in the ICV/CCV must be within -50% to +100% of the response of the ISTD in the CCV-level standard in the initial calibration sequence which is denoted as ICIS.

The ISTD must elute within +/- 10 seconds from the retention time of the midpoint standard of the calibration, which is denoted as ICIS.

If the response or retention time is outside of this range, the analysis of the CCV must be repeated and any samples associated with the CCV must also be re-analyzed. Repeated failure of the ISTD response will require re-calibration.

On days when ICAL is not performed, the daily CCV, denoted as CCVIS, is used. The response of the ISTD in the samples and batch QC items must be within -50% to +100% of the response of the CCVIS. The ISTD must elute within +/10 seconds from the retention time of the CCVIS. If the response or retention time is outside of this range, corrective action must be taken.

9.3.3 SM6200B ISTD criteria:

This procedure is an internal standard (ISTD) procedure. Fluorobenzene, 1,4-dichlorobenzene-d4, and chlorobenzene-d5 are the internal standards.

Prior to analysis, the internal standards must be added to all standards, samples, and QC items. The concentration of the internal standards must be the same in all calibration samples, field samples, and QC samples. A concentration of 50ug/L is used for each of the ISTD analytes.

The response of the ISTD in the ICV/CCV must be within 70% to 130% of the response of the average ISTD in the List One initial calibration sequence (denoted as ICISAV), If the response is outside of this range, the analysis of the CCV must be repeated and any samples associated with the CCV must also be re-analyzed. Repeated failure of the ISTD response will require re-calibration.

9.4 Surrogates

This procedure uses surrogates to evaluate the analytical process.
Dibromofluoromethane, 1,2-dichloroethane-d4, toluene-d8, and p-BFB are the surrogates routinely used.

Prior to preparation, the surrogates must be added to all samples and QC items. The concentration of the surrogates must be the same in all field samples and QC samples. A concentration of 50ug/L is used for each of the surrogate analytes.

Note: The EPA 8260_AK method, which requires a medium-level methanol extraction for soils, requires an additional surrogate to be incorporated prior to sample collection. This surrogate, f_3-toluene, is supplied in the outgoing methanol vial.

The percent recovery of the surrogate in all field samples and QC samples must be within the limits listed in the Method Limit Groups (MLGs) in LIMS. If the percent recovery is outside of this range, the analysis of the sample must be repeated.
Repeated failure of the surrogate percent recovery may indicate re-calibration or maintenance is necessary.

9.5 **Corrective Action for Out-of-Control Data**

When the quality control parameters do not meet the criteria set forth in this SOP, corrective action must be taken in accordance with SOP SA-QA-005: *Preventive and Corrective Action Procedures* the QC Summary Table in Attachment 3. SOP SA-QA-005 provides contingencies for out-of-control data and gives guidance for exceptionally permitting departures from approved policies and procedures. Nonconformance Memos must be initiated to document all instances where QC criteria are not met and all departures from approved policies and procedures.

10.0 PROCEDURE

10.1 Preparation

10.1.1 Aqueous Sample Preparation

Remove the samples from the refrigerator and allow them to come to room temperature.

Several of the instruments in use are able to automatically add ISSU to the samples during the sample transfer step on the autosampler. For the instruments that can spike automatically, the room temperature vials are placed directly onto the instrument with no additional steps necessary.

For the instruments that are unable to spike the vials, using a 50uL syringe, add 43uL of the ISSU to the sample, injecting the solution through the vial septum. Invert the vial several times to mix. Transfer to the instrument.

10.1.2 Aqueous QC Preparation

The method blank and LCS are prepared in reagent water using a 50mL volumetric flask.

- For the method blank, add 50uL ISSU to 50mL reagent water. Pour into a VOA vial and place on the instrument.
- For the LCS, add 50uL ISTD, 50uL Mega Mix, and 150uL MeOH to 50mL reagent water. Pour into a VOA vial and place on the instrument.
- For the MS/MSD, add 43uL ISTD, 43uL Mega Mix, and 129uL MeOH into each sample vial selected for the MS and MSD. Place on the instrument.

10.1.3 Soil Sample Preparation

Refer to SOP SA-VO-001: *Preparation, Screening, and Storage of Volatiles Samples* for the soil specific sample preparation procedures. This information is summarized below:

For routine soil samples, three pre-weighed TerraCore kits and one bulk container are supplied for each soil sample. Two of the TerraCore kits contain water and are used for low level analysis. The remaining TerraCore kit contains methanol to be used for a medium-level analysis if the low-level samples exceed the calibration range. The bulk container is used for screening, and for the percent solids determination.

For EPA 8260_AK soil samples, one pre-weighed 4oz jar and is supplied for each soil sample along with a 40mL VOA vial containing 25mL of the methanol/surrogate solution. A 25g sample is collected into the jar, and then the methanol/surrogate solution is added.

At the time of analysis, the following steps are taken:

For routine low-level samples, 5mL reagent water and 5uL ISSU are added directly to the sample vial. The sample is then ready for analysis.

For routine medium-level samples, a dilution is prepared and analyzed. The default dilution is a DF40 (i.e., using 125uL of sample). 5uL VOA Surrogate Mix is added directly to the sample vial (if 5mL of MeOH were used) or 10uL VOA Surrogate Mix is added (if 10mL of MeOH were used). The sample is then ready for analysis on a soil instrument with a heated purge.

For EPA 8260_AK soil samples, a dilution is prepared and analyzed. The default dilution is a DF40 (i.e., prepared using 1.25mL of sample into 50mL water). 50uL ISSU is added directly to the volumetric flask before being transferred to the 40mL VOA vial. The sample is then ready for analysis on a liquid instrument with an ambient purge.

10.1.4 Soil QC Preparation

For routine low-level samples, the method blank and LCS are prepared using blank sand directly in a VOA vial.

- For the method blank, add 5g sand, a stir bar, 10mL reagent water, and 5uL ISSU.
- For the LCS, add 5g sand, a stir bar, 10mL reagent water, 5uL ISTD, 5uL Mega Mix, and 15uL methanol.
- For the MS/MSD, add 5mL water, 5uL ISTD, 5uL Mega Mix, and 15uL methanol directly to the selected sample.

For routine medium-level samples, the method blank and LCS are prepared using Ottawa sand directly in a VOA vial.

- For the method blank, add 5g blank sand and 5mL methanol. Remove a 125uL aliquot and add to 10mL reagent water spiked with 5uL ISSU.
- For the LCS, add 5g blank sand and 5mL methanol. Remove a 125uL aliquot and add to 10mL reagent water spiked with 5uL ISTD, 5uL Gas Intermediate, and 5uL Mega Mix.
- For the MS/MSD, remove a 125uL aliquot and add to 10mL reagent water spiked with 5uL ISTD, 5uL Gas Intermediate, and 5uL Mega Mix.

For EPA 8260_AK soil samples, the method blank and LCS are prepared using Ottawa sand directly in a VOA vial.

- For the method blank, add 25g blank sand and 25mL methanol. Remove a 1.25mL aliquot and add to 50mL reagent water spiked with 50uL ISSU.
- For the LCS, add 25g blank sand and 25mL methanol. Remove a 1.25mL aliquot and add to 50mL reagent water spiked with 50uL ISTD and 50uL Mega Mix.
- For the MS/MSD, remove a 1.25mL aliquot and add to 50mL reagent water spiked with 50uL ISTD and 50uL Mega Mix.

10.2 **Analysis:**

10.2.1 Instrument Operating Conditions

The instrument conditions listed in this SOP are provided for guidance purposes. The purge time must be 11 minutes. All other parameters are optimized by the lab for the target compounds and documented in the maintenance log. Therefore, the actual conditions used by the laboratory may be slightly different from those listed here and must be documented in the instrument maintenance log, data system, and/or run log.

Instrument maintenance must be performed in accordance with Attachment 4 of this SOP.

The goal is to have maximum separation between the target compounds in the shortest run time while maintaining sufficient sensitivity to detect the target compounds at the reporting limit and MDL (if required).

GC Parameters
Column: 20m x 0.18mm ID x 1.0um
Column: Flow: 0.5-1.0mL/min
Injector: Split/Splitless operated in the split mode with 1mm ID quartz insert
Split ratio (desorb to column flow): 40:1 to 80:1

MS Parameters
Mass spectrometer interface: 240°C (direct column interface)
Mass spectrometer source temperature: 250°C
Mass scan range: 35-300amu, with a minimum scan cycle of 1 scan per second
Injector: 250°C
Temperature Program:
Initial Temperature: 50°C
Program Rate: 18°C/minute
Final Temperature: 200°C

Example Purge and Trap Conditions
The purge and trap conditions listed in this section are for guidance. The lab must document the actual conditions used. The purge time must be 11 minutes. Other parameters may be varied to optimize the detection of the target compounds.

VOCARB 3000 trap
Purge Time: 11 minutes
Purge temperature: aqueous-ambient; soils-heated 40°C
Desorb time: 0.50 minutes
Desorb temperature: 250°C
Bake time: 4 to 6 minutes at 260°C
Purge flow: Approximately 30-40mL/minute
Valve temperature: 150°C
Transfer line: 150°C

The purge flow must be balanced for adequate sensitivity of the target compounds. If the purge flow is too high, the response of the gases will be low and not reproducible. The SPCC criteria for chloromethane may not be achieved if the purge flow is too high. If the purge flow is too low, the response of the more water-soluble targets - ketones, ethers, bromoform - may be low and the reporting limit may not be achieved on a routine basis.

10.2.2 Internal Standard (ISTD)

Prior to analysis, internal standard must be added to all standards, samples, and QC items. The concentration of the internal standard must be the same in all calibration samples, field samples, and QC samples. Instructions for the addition of the internal standard spiking mix are given in the previous sections.

10.2.3 BFB Tune Check

A BFB tune check must be analyzed at the beginning of each clock as a check on the "tune" of the mass spectrometer. This check must meet the criteria described given in Section 9.2.1.

EPA 8260B, EPA 8260C, EPA 8260D, EPA 624, EPA 624.1

If the instrument is configured for direct injection, inject 2uL of the 25ng/uL solution into the GC and analyze the 4-BFB using the instrument conditions listed in Section 10.1. A solvent delay should be set to allow the methanol to pass through the mass spectrometer while the MS is "off".

EPA 8260B, EPA 8260C, EPA 8260D, EPA 624, EPA 624.1

If the purge and trap is used to introduce the 4-BFB into the MS, add 1uL of the 50ng/uL solution to 5.0mL of reagent water. Transfer the 5.0mL to the purge and trap device and purge the sample using the same conditions used for sample analysis.

SM6200B:

If the instrument is configured for direct injection, inject 1uL of the 25ng/uL solution into the GC and analyze the 4-BFB using the instrument conditions listed in Section 10.1. A solvent delay should be set to allow the methanol to pass through the mass spectrometer while the MS is "off".

If the purge and trap is used to introduce the 4-BFB into the MS, add 1uL of the 25ng/uL solution to 20mL of reagent water. Transfer to the purge and trap device and purge the sample using the same conditions used for sample analysis.

10.2.4 Trap Check Standard

The trap check standard is used to evaluate the condition of the trap by monitoring the formation of chloromethane and bromomethane. Chloromethane and bromomethane may be formed on a degraded trap by thermal decomposition of halogenated compounds. This check must meet the criteria described given in Section 9.2.2.

10.2.5 Initial and Continuing Calibration

Calibrate the instrument using the standards and criteria described given in Section 9.2.3. Once the calibration has been established and verified with an ICV in accordance with Section 9.2.4, sample analysis may proceed.

Verify the calibration curve with a continuing calibration verification using the standards and criteria described given in Section 9.2.5

10.2.6 Sample Analysis

The sample/extract must be injected using the same injection volume used for the calibration standards. The samples can only be analyzed after the tune, the trap check, the calibration (initial or continuing), and the method blank and LCS criteria have been met. Samples that are known to be relatively clean should be analyzed first. Samples suspected of containing high concentrations should be analyzed last. Instrument blanks may be analyzed after suspected high concentration samples to allow the detector response to stabilize.

10.2.7 Example Analytical Sequence

A typical example analytical sequence is listed below.

Description	Comments
Blank	
BFB	Clock time begins with injection of the BFB
Initial Calibration	
ICV	Second Source
BFB	Clock time begins with injection of the BFB
CCV	
LCS	
LCSD	Required if insufficient sample provided for MS/MSD
Trap Check	
MB	
Samples & Batch QC Items	
Closing CCV	Applies to DOD QSM and SM6200B
BFB	Clock time begins with injection of the BFB
CCV	
LCS	
LCSD	Required if insufficient sample provided for MS/MSD
Trap Check	
MB	
Samples & Batch QC Items	
Closing CCV	Applies to DODQSM and SM6200B.

11.0 CALCULATIONS/DATA REDUCTION

11.1 Data Reduction

Data evaluation must be performed in accordance with SA-QA-008: *Evaluation of Chromatographic Data.* This SOP includes specific information regarding the evaluation of chromatographic data, including the requirements for performing manual integrations and the evaluation of retention times.

Data review and reporting must be performed in accordance with SA-QA-002: *Data Generation and Review.*

11.1.1 Target Analyte Identification

A target compound is identified by the visual comparison of the sample mass spectrum with the mass spectrum of the target compound from a reference spectrum of the target compound stored in a library from a standard spectral library such as the NIST/NBS.

11.1.1.1 Two criteria must be met in order to identify a target compound:

- Elution of the sample component within ±0.06 Relative Retention Time (RRT) units of the daily standard containing that compound. The RRT is calculated as follows:

$$RRT = \frac{retention\ time\ of\ the\ target\ compound}{retention\ time\ of\ the\ associated\ internal\ standard}$$

- Correspondence of the target compound spectrum and the standard component mass spectrum

11.1.1.2 All ions present in the standard component mass spectrum at a relative intensity greater than 10% (most abundant ion = 100%) must be present in the sample component mass spectrum. Other ions may be present in the sample component. Coelution of a non-target compound with a target compound will make the identification of the target compound more difficult. The ions due to the non-target compound should be subtracted from the sample component spectrum as part of the background to account for the discrepancy between the sample spectrum and the standard spectrum.

11.1.1.3 The relative intensities of the ions present in the sample component spectrum must agree within ± 30% of the relative intensities of the ions in the standard reference spectrum. For example, an ion with an abundance of 50% in the reference spectrum should have a corresponding abundance between 20% and 80% in the sample component spectrum. The intensities of the ions in the standard reference spectrum are updated utilizing the continuing calibration standard. If the relative intensities are outside 30% in sample, the data will be flagged with an R by CHROM.

11.1.1.4 If the above criteria are not met exactly, the analyst should seek help from a senior analyst or the Department Manager. If there is sufficient evidence to support the identification of the component, then the component is identified, quantified, and reported.

11.1.2 Dilutions

Samples may be screened prior to analysis as outlined in SOP SA-VO-001. This screening data provides qualitative information that is used to determine if dilutions are required for analysis.

Unless otherwise specified by a client QAPP, results from a single analysis are reported as long as the largest target analyte (when multiple analytes are present) is in the upper half if the calibration range. When reporting results from dilutions, appropriate data flags must be used or qualification in a case narrative provided to the client.

For clients who require we provide lower detection limits, a general guide would be to report the dilution detailed above and one additional run at a dilution factor 1/10 of the dilution with the highest target in the upper half of the calibration curve. For example, if samples analyzed at a 1/50 dilution resulted in a target in the upper half of the calibration curve, the sample would be analyzed at a dilution factor of 1/5 to provide lower reporting limits.

11.1.3 Historical Data

Many of the laboratory's clients submit samples for repeat monitoring purposes. Prior to analysis, verify LIMS Worksheet Notes or use the LIMS Historical Data Tracker feature to determine if historical data is available for review.

11.1.4 Chemical Relationships

Benzene, toluene, ethylbenzene, and the xylenes are generally present together in samples and indicate the presence of gasoline

m/p-Xylenes are generally higher than o-xylene

Hydrocarbons present is samples containing gasoline generally contain mass 43 and may co-elute with target analytes with mass 43 as the quant or confirmation ion or may skew the spectrum of a compound with mass 43 as part of the spectrum.

Cis-isomers are generally more prevalent than the trans- isomers

Pay particular attention to the retention time of isomer because the only way to positively identify them is by retention time. The isomers are:

1,1-dichloroethane and 1,2-dichloroethane
1,1-dichloroethene, cis-1,2-dichloroethene, and trans-1,2-dichloroethene
1,1,1-trichloroethane and 1,1,2-trichloroethane
ethyl benzene, m/p-xylene, and o-xylene
1,3-dichlorobenzene, 1,4-dichlorobenzene, and 1,2-dichlorobenzene
1,1-dichloropropene, cis-1,2-dichloropropene, and trans-1,2-dichloropropene
2-chlorotoluene and 4-chlorotoluene
1,2,3-trichlorobenzene and 1,2,4-trichlorobenzene
1.3.5-trimethylbenzene and 1,2,4-trimethylbenzene
4-methyl-2-pentanone (MIBK) and 2-hexanone
n-butylbenzene, sec-butylbenzene, tert-butylbenzene, and isopropylbenzene

Higher chlorinated alkanes and alkenes may have lower chlorinated alkanes or alkenes present due to degradation. The following table lists some common chlorinated compounds and their degradation products. Look for the degradation product(s) when the concentration of the compound in the left column is present at high concentrations.

Analyte	Degration Product
1,1,2,2-tetrachloroethane	trichloroethene (TCE) cis-1,2-dichloroethene (c-1,2-DCE) trans-1,2-dichloroethene (t-1,2-DCE) vinyl chloride 1,1,2-trichloroethane (1,1,2-TCA) 1,2-dichloroethane (1,2-DCA) Chloroethane
1,1,2-trichloroethane (1,1,2-TCA)	1,2-dichloroethane (1,2-DCA) Chloroethane
1,1,1-trichloroethane (1,1,1-TCA)	1,1-dichloroethene (1,1-DCE) 1,1-dichloroethane (1,1-DCA) Chloroethane
Carbon tetrachloride	Chloroform Methylene chloride Chloromethane
Tetrachloroethene (PCE) (PCE = perchloroethylene which is a common name for tetrachloroethene)	trichloroethene (TCE) cis-1,2-dichloroethene (c-1,2-DCE) trans-1,2-dichloroethene (t-1,2-DCE) Chloroethene
1,2,4-trichlorobenzene	1,4-dichlorobenzene (1,4-DCB) 1,2-dichlorobenzene (1,2-DCB) Chlorobenzene

11.1.5 Dry Weight/Moisture Content Correction

All routine soil samples are reported on a dry weight basis.
As outlined in EPA 8000D, for samples collected in methanol preserved containers; however, there is an additional methanol dry weight correction required. Since water and methanol are miscible, the nominal volume of methanol needs to be adjusted for moisture content as well.

11.2 Calculations

11.2.1 The calculations associated with batch QC determinations are given in SOP SA-QA-017. Applicable calculations include accuracy (% recovery) and precision (%RPD).

11.2.2 The calculations associated with initial and continuing calibrations and are given in SOP SA-QA-016. Applicable calculations include determination for: calibration factor, standard deviation, relative standard deviation, relative response factor, and relative standard deviation.

11.2.3 The calculation to determine final concentration is given as follows:

$$Final Concentration = CONC_{Sample} \otimes \frac{F}{I \times dw} \otimes D$$

Where:
$CONC_{Sample}$= Concentration of the sample extract (at the instrument)
F = Final volume of the extract
I = Initial volume/weight
dw = % Solids decimal equivalent
D = Dilution factor

All dry weight corrections are performed automatically in LIMS.

Note: This formula assumes all unit conversion factors are applied.
Note: Procedures for entering soil preparation and dilution data into LIMS and CHROM are given in Attachment 15 of this SOP.

11.2.4 Acceptance Criteria Independent of Calibration Model – Method 8000D

Method 8000D in SW-846 recommends the use of either the Percent Error or Relative Standard Error to evaluate the calibration model as described below.

Note: For South Carolina work, one of these methods of evaluation must be used.

11.2.4.1. Percent Error: The percent error assesses the refitting of the calibration data back to the model. The percent error between the calculated and expected amounts of an analyte must be ≤ 30% for all standards except for the lowest data point which must be ≤ 50%. Unless specified in the Analysis method, this limit will be utilized.

Calculation of the Percent Error

$$\%Error = \frac{x_i - x_i'}{x_i} \times 100$$

Where:

x'_i = Measured amount of analyte at calibration level *i*, in mass or concentration units

x'_i = True amount of analyte at calibration level i, in mass or concentration units

Relative Standard Error (RSE): Relative standard error provides a measure of the fit of the calibration that is independent of the calibration model. RSE is calculated using the following equation:

$$RSE = 100 \times \sqrt{\frac{\sum_{i=1}^{N}\left(\frac{x'_i - x_i}{x_i}\right)^2}{(n-p)}}$$

Where:

x'_i = Measured amount of analyte at calibration level *i*, in mass or concentration units

x_i = True amount of analyte at calibration level *i*, in mass or concentration units

p = Number of terms in the fitting equation *(average = 1, linear = 2, quadratic = 3, cubic = 4)*

n = Number of calibration terms

The RSE acceptance limit criterion is the same as the RSD limit.

12.0 METHOD PERFORMANCE:

12.1 Lower Limit of Quantitation (LLOQ)

The laboratory shall establish the LLOQ as the lowest concentration at which the laboratory has demonstrated target analytes can be reliably measured and reported with a certain degree of confidence, which must be ≥ the lowest point in the calibration curve. The LLOQ is equivalent to the standard reporting limit (RL). The required LLOQ verification is performed at a concentration of 0.5-2 times the LLOQ (or RL).

12.2 Reporting Limit Verification (RLV) aka Lower Limit of Quantitation Verification (LLOQV)

At a minimum, RLVs/LLOQVs must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

For analytes and methods certified by DOD ELAP, RLVs/LLOQVs must also be performed quarterly thereafter. For all compounds analyzed by Method 8260, LLOQVs must be performed annually for compliance with Method 8000D, SW-846 Update V.

Recovery of target analytes in the LLOQV must be within established in-house limits. Until the laboratory has sufficient data to determine acceptance limits, the LCS criteria ± 20% may be used for the LLOQ.

Exceptions may be made for project-specific non-routine analytes.

12.3 Method Detection Limit (MDL) Study

The MDL is the lowest concentration that can be detected for a given analytical method and sample matrix with 99% confidence that the analyte is present. MDLs reflect a calculated (statistical) value determined under ideal laboratory conditions in a clean matrix and may not be achievable in all environmental matrices. The current MDLs associated with this procedure are given in the Method Limit Group (MLG) in LIMS.

At a minimum, MDL Studies must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

Note: MDL Studies are not required for non-routine analytes provided results are not reported below the RL (i.e., MDL equals RL in LIMS).

12.4 Method Detection Limit Verification (MDLV)

At a minimum, MDLVs must be performed initially upon method set-up in accordance with SOP SA-QA-007: *Determination and Verification of Detection and Reporting Limits*.

For analytes and methods certified by DOD ELAP, MDLVs must also be performed quarterly thereafter. For all other analytes and methods, MDLVs must also be performed annually thereafter.

Note: MDLVs are not required for non-routine analytes provided results are not reported below the RL (i.e., MDL equals RL in LIMS).

12.5 QC Limit Generation, Control Charting, and Trend Analysis

12.5.1 EPA 624 and EPA 624.1

The control limits for the batch QC items (LCS/LCSD and MS/MSD) for this procedure are specified in the reference method and cannot be broadened; therefore, the laboratory defaults to the method-defined limits and does not utilize in-house or laboratory-derived limits for the evaluation of batch QC items.

12.5.2 EPA 8260B, EPA 8260C and EPA 8260D

The control limits for the batch QC items (LCS/LCSD and MS/MSD) for this procedure are not specified by the reference method; therefore, the laboratory defaults to in-house and/or laboratory-derived limits for the evaluation of batch QC items.

12.5.3 SM6200B

The control limits for the batch QC items (LCS/LCSD and MS/MSD) for this procedure are specified in the reference method and cannot be broadened; therefore, the laboratory defaults to the method-defined limits and does not utilize in-house or laboratory-derived limits for the evaluation of batch QC items.

Control charting is a useful tool and is performed to assess analyte recoveries over time to evaluate trends. Control charting must be performed periodically (at a minimum annually) in accordance with SOP SA-QA-017: *Evaluation of Batch QC Data.*

12.6 Demonstrations of Capability

Initial and continuing demonstration of capability must be performed in accordance with SOP SA-QA-006*: Training Procedures.*

Prior to performing this procedure unsupervised, each new analyst who performs this analysis must demonstrate proficiency per method/analyte combination by successful completion of an initial demonstration of capability (IDOC). The IDOC is performed by the analysis of 4 consecutive LCSs that meet the method criteria for accuracy and precision. The IDOC must be documented and routed to the QA Department for filing.

Annual continuing demonstrations of capability (CDOCs) are also required per analyst per method/analyte combination. The CDOC requirement may be met by the consecutive analysis of four LCS all in the same batch, by the analysis of four LCS analyzed in four consecutive batches (in different batches on different days), via acceptable results on a PT study, or by the analysis of client samples with statistically indistinguishable results when compared to another certified analyst. The CDOC must be documented and routed to the QA Department for filing.

The laboratory utilizes DOD QSM limits were applicable for IDOC criteria.

12.7 Training Requirements

All training must be performed and documented in accordance with SOP SA-QA-006: *Training Procedures*.

Note: The SOPs listed in the Reference/Cross-Reference Section are applicable to this procedure. All employees performing this procedure must also be trained on these SOPs, and/or have a general understanding of these procedures, as applicable.

13.0 POLLUTION CONTROL

It is Eurofins TestAmerica's policy to evaluate each method and look for opportunities to minimize waste generated (e.g., examining recycling options, ordering chemicals based on quantity needed, preparing reagents based on anticipated usage and reagent stability, etc.). Employees must abide by the policies in Section 13 of the Environmental Health and Safety Manual.

This procedure has been evaluated for opportunities to minimize the waste generated. Where reasonably feasible, pollution control procedures have been incorporated.

14.0 WASTE MANAGMENT

Waste management practices must be conducted consistent with all applicable federal, state, and local rules and regulations. All waste (i.e., excess reagents, samples, and method process wastes) must be disposed of in accordance with Section 9 of the Eurofins TestAmerica Savannah Addendum to the EHSM. Waste description rules and land disposal restrictions must be followed.

14.1 Waste Streams Produced by the Method

The following waste streams are produced when this method is carried out:

- Excess samples, reagents, and standards must be disposed in accordance with the Eurofins TestAmerica Savannah Addendum to the EHSM.
- Methanolic waste from rinsings and standards – Transfer to satellite container for methanolic (flammable) waste. Transfer to hazardous waste section when satellite container is full.
- Excess aqueous samples – Dispose according to characterization on the sample disposal sheets. Neutralize non-hazardous samples before disposal into drain/sewer. Transfer hazardous samples (identified on disposal sheets) to the waste department for disposal.
- Excess soil and solid samples – Dispose according to characterization on sample disposal sheets. Transfer non-hazardous and RCRA hazardous samples to the yard box. Transfer any PCB hazardous or Foreign Soil hazardous to the waste coordinator.
- Excess Soils with Methanol- Samples should be disposed via Drum marked as “Soil Vials with Methanol”.

16.0 METHOD MODIFICATIONS AND CLARIFICATIONS

16.1 Incorporation of Other Matrices

This procedure may be modified to analyze other matrices (e.g., wipe, waste, and TCLP/SPLP leachate samples) based on the needs of the client. This will need to be arranged by the Project Manager at the initiation of the project.

Wipe and waste matrices are non-routine, and the laboratory is not currently NELAC certified for these matrices. The laboratory uses its routine soil RLs (converted for initial and final volumes, etc.) and default QC limits to evaluate waste samples and its routine water RLs (converted for initial and final volumes, etc.) and default QC limits to evaluate wipe samples. Soil and/or water DOCs can be used to satisfy analyst demonstrations of capability for these types of non-routine matrices, as applicable. The laboratory uses its routine aqueous RLs (converted for initial and final volumes, etc.) and default QC limits to evaluate TCLP/SPLP leachate samples. Water DOCs can be used to satisfy analyst demonstrations of capability for TCLP/SPLP matrices. Ottawa sand is used as the blank matrix for wipes and wastes unless specifically requested otherwise by the project.

16.1.1 Collection and Handling Procedures

Waste (oil) samples are routinely collected in 40mL VOA vials. Waste (oil) samples must be iced at the time of collection and maintained at 0-6°C (i.e., less than 6°C with no frozen samples) until time of preparation. Samples must be analyzed within 14 days of collection.

Wipe samples are routinely collected in 40mL VOA vials. Wipe samples must be iced at the time of collection and maintained at 0-6°C (i.e., less than 6°C with no frozen samples) until time of preparation. Samples must be analyzed within 14 days of collection.

Once the TCLP/SPLP extraction procedure has been performed, the leachate is transferred to a Tedlar bag. TCLP/SPLP leachates must be stored at 0-6°C (i.e., less than 6°C with no frozen samples) until time of preparation. The leachate sample must be analyzed within 14 days of completion of the TCLP/SPLP extraction.

16.1.2 Preparation and Analytical Procedures

Wipe samples are analyzed in the same fashion as water samples. Refer to Work Instruction FQA088: *Wipe Tests: Sampling and Analysis* for additional information on wipe procedures.

Waste samples are prepared and analyzed in the same fashion as medium-level soil samples. Note: Waste samples often require large dilutions.

TCLP/SPLP matrices are prepared and analyzed in the same manner as routine water samples; however, a default dilution factor of 20 is used.

16.2 Other Considerations

16.2.1 EPA Method 8260B does not contain calibration verification criteria for non-CCC analytes nor does it require non-CCC analytes to be evaluated for response; however, the laboratory has adopted in-house criteria for non-CCC analytes as outlined in this SOP.

16.2.2 EPA Method 8260B does not require the analysis of an ICV. NELAC requires an ICV; however, it does not list specific criteria. The laboratory has adopted in-house criteria for ICVs for EPA 8260B as outlined in this SOP. The laboratory satisfies this requirement via the ICV performed with each ICAL.

16.2.3 EPA Method 8260B, EPA 8260C and EPA 8260D allows alternate criteria to be used for the BFB evaluation. As such the laboratory has incorporated criteria from the CLP OLMO4.0 (January 1998) method.

16.2.4 The laboratory has defined the analytes listed in Attachment 11 as poor or erratic performers and allows for exceptions to the ICV, CCV, LCS/LCSD, MS/MSD, and Sporadic Marginal Exceedance criteria for these analytes as outlined in this SOP. **These exceptions are not permitted for QC associated with samples originating in SC**.

16.2.5 It has been determined that increased methanol concentrations can suppress the response of the gas compounds, leading to erratic recovery and reduced linearity. As such, the laboratory normalizes the volume of methanol in all standards and QC items to minimize this effect. By introducing a constant volume of methanol to initial calibration standards, CCV/ICV, LCS, and MS/MSD, better sensitivity and recovery of these analytes is achieved.

16.2.6 The 7-day holding time for samples with pH>2 is listed in EPA 624 and EPA 624.1 but is not included in the SW-846 methods. The laboratory has adopted this as internal guidance for EPA 8260B, EPA 8260C and EPA 8260D as is common industry practice and will make every effort to analyze samples with pH>2 within 7 days.

16.2.7 Historical standard practice for most laboratories was to combine all analytes into one analysis using a single acid preserved container. This practice is still acceptable in those cases where the compounds of interest are not adversely affected by the addition of the hydrochloric acid (HCl) preservative; however, EPA 624, EPA 624.1, and Chapter 4 of SW-846 all list special preservation requirements for acrolein, acrylonitrile, and 2-chloroethylvinyl ether (2-CEVE). Although these analytes are rarely found in the environment, preservation at pH<2 (as achieved using HCl preservative) breaks down these analytes and may result in a significantly low bias and/or non-detect value.

The reference methods suggest to preserve these analytes to a pH between 4-5. Achieving this narrow pH range is problematic; therefore, the only other alternative is to use an unpreserved container for these analytes. As such, if acrolein, acrylonitrile, and/or 2-CEVE are on the requested target analyte list, the laboratory now defaults to using an unpreserved container. The other target analytes reported for these methods are not adversely affected by using an unpreserved container provided they are analyzed within the shorter, method-prescribed holding times (HT) defined for unpreserved samples. Specific information on VOA holding times, preservation requirements, and analyte-specific requirements is given in Attachment 2.

16.2.8 The 40mL VOA vials used by the laboratory have been demonstrated to actually contain approximately 43mL. As such, standard spiking amounts have been adjusted accordingly to accommodate for this volume (e.g., spiking 43uL instead of 40uL).

16.2.9 The laboratory has incorporated the batch QC items as outlined in Section 9.1. Some additional QC items are performed which differ from those specified in the reference methods (e.g., LCSD or MSD) to satisfy common state regulatory requirements and/or client requests for precision data and/or to facilitate scheduling and data evaluation. The method-specified batch QC items are as follows:

EPA 8260B, EPA 8260C, EPA 8260D and SM6200B :
Method blank, LCS, MS, and sample duplicate or MSD

EPA 624 and EPA 624.1
Method blank, LCS, MS per 10% of samples analyzed

16.2.10 EPA Method 624 specifies a required concentration range criteria for the evaluation of QC items (i.e., the Q-Table). The laboratory has converted these values into percent recovery limits to be used to assess CCV, ICV, LCS/LCSD, and MS/MSD.

16.2.11 The EPA 8260B reference method specifies a 1-week expiration date for the gas standards. The laboratory prepares a 25mL volume of MegaMix standard and splits it into five 5mL Mini-nert vials. Each vial is assigned a 1-week expiration date from the date that vial is opened, not to exceed 14 days from the preparation date of the 25mL volume. **Note: This expiration date is a maximum. Shorter expiration dates may be used based on evidence of gas compound volatility as evaluated via CCVs.**

16.2.12 Due to client requests, the analyte list utilized by the laboratory may be different than those listed in the reference methods.

16.2.13 The minimum response factors (RFs) required for Acetone, 2-Butanone (MEK), 4-Methyl-2-pentanone (MIBK), and 2-Hexanone have been expanded from those listed in the EPA 8260C reference method.

16.2.14 The EPA 8260B reference method specifies that the reference mass spectra must be generated by the laboratory using the conditions of this method. The reference spectra utilized by the laboratory in CHROM for peak identification is generated by the NIST library. The mass ratios for the ions are updated by the continuing calibration analysis.

16.2.15 The EPA 624 reference method specifies a desorb time of 4 minutes. The laboratory employs a desorb time of about 0.50 minutes. The EPA Methods Update Rule and subsequent memo allow a laboratory the flexibility to modify CWA methods. This memo states that if the underlying chemistry and determinative technique were the same as the unmodified method, then the modified method is considered an equivalent and acceptable alternative; thus this desorb time modification is an allowable modification for EPA 624 under this rule.

16.2.16 SM6200B reference method specifies an Internal Standard Concentration of 1.0ug/L. The laboratory is using a concentration of 50ug/L.

Attachment 1:
SOP Summary

Sample Preparation Summary
Aqueous samples are routinely purged at ambient conditions; however, a heated purge may be used if required by the project. A 5mL purge volume is used as the default. The calibration standards and the associated QC must be analyzed under the same conditions and volume.

Low-level soil samples are purged at 40°C in a purge and trap instrument designed to add water and internal standards to the vial containing the sample without breaking the seal. The sample is stirred during purging to thoroughly mix the soil and water. The calibration standards and associated QC are purged under the same conditions.

Medium-level soils, waste samples, and soil samples for EPA 8260_AK are extracted with methanol. An aliquot of the methanol extract is injected into reagent water. The methanol extract/reagent water is purged at a heated temperature (i.e., 40□C) for routine soils and at ambient temperature for wastes and EPA 8260_AK, using the same instrument conditions and calibration used for aqueous samples.

Sample Analysis Summary
VOCs are purged from the sample matrix with nitrogen. The VOCs are transferred from the sample matrix to the vapor phase. The vapor is swept through a sorbent tube where the VOCs are trapped. After the purging is completed, the trap is heated and backflushed with helium to desorb the VOCs onto a GC column. The GC is temperature-programmed to separate the VOCs, which are then detected by a mass spectrometer. Qualitative identification of the target compounds in the sample is based on the relative retention time and the mass spectra of the characteristic masses (ions) determined from standards analyzed on the same GC/MS under the same conditions. Quantitative analysis is performed using the internal standard technique with a single characteristic ion.

Attachment 2:
Sample Collection, Preservation, and Holding Time Table

Aqueous samples are routinely collected in three 40mL VOA vials. The table below outlines the laboratory's default procedures for aqueous samples:
:

Method	Acrolein, Acrylonitrile, or 2-CEVE Requested?	Chemical Preservation	Thermal Preservation	Holding Time
EPA 8260B EPA 8260C	Yes	None	0-6°C	7 days
EPA 8260B EPA 8260C	No	HCl (pH<2)	0-6°C	14 days
EPA 624 EPA 624.1	Yes	None	0-6°C	3 days*
EPA 624 EPA 624.1	No	HCl (pH<2)	0-6°C	14 days

*Note: 3-day HT is specific to acrolein. If acrolein is not requested, 7 days is used for the remaining target compounds.

- **Samples originating in SC for which acrolein and/or acrylonitrile are requested, must be preserved to a pH of 4-5 SU unless the Quality Assurance Project Plan (QAPP) or site sampling plan specify otherwise.**

The table below outlines the sample collection options for soil samples:

Sample Container	Chemical Preservation	Thermal Preservation	Holding Time
TerraCore Kit (Routine): 1 x 5g TerraCore sampler, 2 x pre-weighed 40mL VOA vial w/ H2O, 1x pre-weighed 40mL VOA vial w/ MeOH, 1 x 4oz bulk jar	H_2O & MeOH (added in field)	<-10°C	48 hours to freeze, 14 days to analyze
EPA 8260_AK Soils: 1 x 4oz bulk jar, 1 x 40mL VOA vial w/ 25mL MeOH + Surrogate	MeOH (+ Surrogate; added in field)	0-6°C	14 days to analyze
EnCore Kit (Non-Routine) 3 x 5g EnCore samplers, 3 x 40mL VOA vial, 1 x 4oz bulk jar	$NaHSO_4$, H_2O, or MeOH (added in lab)	0-6°C	48 hours to preserve, 14 days to analyze
EnCore Kit (Non-Routine) 3 x 5g EnCore samplers, 2 x pre-weighed 40mL VOA vial w/ NaHSO4, 1 x pre-weighed 40mL VOA w/ MeOH, 1 x 4oz bulk jar	$NaHSO_4$ or MeOH (added in field)	0-6°C	48 hours to preserve, 14 days to analyze

Attachment 3:
QC Summary

QC Item	Frequency	Criteria	Corrective Action
Clock Time	EPA 8260B, EPA 8260C, and EPA 8260D and SM6200B : 12 hours EPA 624: 24 hours EPA 624 Cluster Rule (Chloroform Only): 8 Hours EPA 624.1: 12 hours (time starts after analysis of the MB but may not exceed 14 hours total)	Clock time starts with the injection of the BFB. Analysis of samples and QC items must conclude within expiration of clock time. Subsequent analysis requires new BFB.	Not applicable
Tune Standard (BFB)	At beginning of each clock	Refer to Attachment 7.	- Perform instrument maintenance - Re-tune.
Trap Check Standard (Optional)	At beginning of each clock	<RL (Chloromethane & Bromomethane)	- Perform instrument maintenance. - Change trap.

QC Item	Frequency	Criteria	Corrective Action
Initial Calibration (ICAL) - Minimum of 3 points for EPA 624 and 624.1. - Minimum of 5 points for EPA 8260B, EPA 8260C and EPA 8260D and SM6200B.	Upon instrument set-up, and after unsuccessful CCV	<u>EPA 624 and EPA 624.1</u>: %RSD < 35% If %RSD > 35%, use curve fit w/ r^2>0.990. <u>EPA 8260B:</u> - CCC: %RSD < 30% - SPCC: RRF_{avg} > Attachment 5 - If %RSD >15%, use curve fit with r^2 > 0.990. <u>EPA 8260C and EPA 8260D</u> -5-point Minimum RRF per Attachment 6. %RSD < 20%. If %RSD > 20%, use curve fit w/ r^2 > 0.990; EPA 8260C- Read back criteria for all levels of +/- 30% of true value. EPA 8260D- Readback criteria is +/- 50% for RL level and +/- 30% for all others. <u>SM6200B</u> - 5pt minimum RSD<20%. If >20% use curve fit with r^2 > 0.994.	-Reanalyze standard(s) -Prepare new standard(s) and reanalyze -Perform injector port maintenance and reanalyze standards -Retune and reanalyze standards -Replace column and reanalyze standards -Clean source and reanalyze standards

QC Item	Frequency	Criteria	Corrective Action
Initial Calibration Verification (ICV) - Second Source	After each ICAL	EPA 624: Attachment 12 EPA 624.1: Attachment 13 EPA 8260B: CCC ≤ 20%D All other analytes ≤ 30%D Poor Performer %D ≤50%-as per Attachment 11 EPA 8260C and EPA 8260D: %D ≤ 30% Poor Performer %D <50% as per Attachment 11. SM6200B %D ≤30%	-Reanalyze standard -Prepare new standard and reanalyze -Recalibrate

QC Item	Frequency	Criteria	Corrective Action
Continuing Calibration Verification (CCV)	After BFB	EPA 624: Attachment 12 EPA 624.1 Attachment 13 EPA 8260B: - CCC: %D < 20% - SPCC: RRF > Attachment 5 - Non-CCC and non-SPCC: %D <60%; EPA 8260C and EPA 8260D: EPA 8260C -Meet minimum RF criteria in Attachment 6. EPA 8260D does not mandate minimum RF criteria. All Analytes %D ≤ 20%, no analyte >50%D. Poor Performer %D may be >50%D as per Attachment 11. RLCCV is required to report NDs for analytes outside 20%D or RRF criteria. An NCM is required to denote analytes outside criteria. SM6200B: %D < 30%D CCV required at beginning and end of sequence with alternating levels used.	-If CCV %D is above control limits, except 8260B CCC analytes, and there are no detections in the samples, the laboratory will report the non-detect results with an NCM -Reanalyze standard -Prepare new standard and reanalyze -Recalibrate

QC Item	Frequency	Criteria	Corrective Action
Internal Standards (ISTD)	Spiked in all CCVIS, samples, and batch QC items	EPA 8260B/C/D, EPA 624, EPA 624.1 CCVIS: - Area -50% to +100% CCV level in ICAL. - RT +/-10 seconds from ICAL. Samples & batch QC items: - Area within -50% to +100% of previous CCVIS. SM6200B Area +/- 30% from mean of calibration	-Evaluate chromatogram, spectra, and integrations -Reanalyze extract -Perform instrument maintenance and reanalyze extract -Re-extract and reanalyze if sufficient sample available
Surrogate Compounds	Spiked in all samples and batch QC items.	Within MLG limits	-Evaluate chromatogram, spectra, and integrations -Reanalyze sample, if sufficient sample available
Analytical Batch Definition	Analyzed together w/in 24-hr timeframe; not to exceed 20 field samples	Not Applicable	Not Applicable
Method Blank (MB)	One per batch	No analytes detected ≥ ½ RL or > 1/10th the amount measured in a sample.	Refer to SOP SA-QA-017

QC Item	Frequency	Criteria	Corrective Action
Laboratory Control Sample (LCS)	One per batch	Within LIMS MLG Limits[1]	Refer to SOP SA-QA-017
Laboratory Control Sample Duplicate (LCSD)	One per batch, when insufficient sample is provided for MS/MSD	Within LIMS MLG Limits[1]	Refer to SOP SA-QA-017
Matrix Spike (MS)	EPA 8260B, EPA 8260C, EPA 8260D and EPA624.1: One per batch EPA 624: 1 per 10% of samples	Within LIMS MLG Limits	Refer to SOP SA-QA-017
Matrix Spike Duplicate (MSD)	One per batch	Within LIMS MLG Limits	Refer to SOP SA-QA-017
Initial Demonstration of Capability (IDOC)	Initially, per analyst, per analyte/method/matrix combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006 Note: Unsupervised work must not begin until acceptable IDOC is obtained.
Continuing Demonstration of Capability (CDOC)	Annually, per analyst, per analyte/method/matrix combination	Refer to SOP SA-QA-006	Refer to SOP SA-QA-006

QC Item	Frequency	Criteria	Corrective Action
Reporting Limit Verification (RLV)	Upon method/instrument set-up, per analyte/method/matrix combination. Then quarterly thereafter (for DOD ELAP) or annually thereafter (for non-DOD ELAP)	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007
Method Detection Limit Study (MDL)	Upon method/instrument set-up, per analyte/method/matrix combination	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007
MDL Verification (MDLV)	Upon method/instrument set-up, per analyte/method/matrix combination. Then quarterly thereafter (for DOD ELAP) or annually thereafter (for non-DOD ELAP)	Refer to SOP SA-QA-007	Refer to SOP SA-QA-007

[1]South Carolina requires 70-130% LCS recovery limits for all target analytes with the exception of poor performers, which have acceptance criteria of 60-140%. All target analytes must pass LCS criteria.
For South Carolina UST program, all analytes must meet accuracy limits of 70-130% and precision of <20%. The use of poor performer limits is not permitted.

Attachment 4:
Preventative Maintenance and Troubleshooting

Instrument Labeling

Each instrument must be labeled with its name or ID (e.g., MSA, ICP-D, etc.). Additionally, non-operational instruments must be isolated from service or marked as being out of service. Each piece of equipment has an "Operational / Not Operational" sticker that is used for this purpose.

Maintenance Log

A maintenance log must be established for each piece of equipment used in the laboratory. All maintenance that is performed on the instrument must be recorded in the log including:

- type of maintenance performed (Note: This includes preventative/routine maintenance; non-routine maintenance; maintenance performed by an external vendor; updates to software versions; etc.)
- analyst or technician performing the maintenance
- date the maintenance was performed
- detailed explanation of the reason for the maintenance
- resolution of the problem and return to control
- all service calls from instrument representatives
- resolution of the problem (i.e., the Return to Control)

Preventive Maintenance

LABORATORY EQUIPMENT PREVENTIVE MAINTENANCE SCHEDULE								
	Service Interval							
EQUIPMENT ITEM	D	W	M	Q	SA	A	AN	SERVICE LEVEL
Injector Port							X	Replace septum, sleeve, inlet seal, and washer (Recommend every 2 weeks)
Sparge Tubes							X	Clean (Recommend every 3 months)
Column							X	Change column (Recommend annually)

D=daily; W=Weekly; M=monthly; Q=Quarterly; SA=semi-annually; A=annually; AN=as needed

Troubleshooting

Troubleshooting must be documented as outlined above. If possible, troubleshooting is best performed in a step-wise manner to systematically isolate instrument components. Refer to the instrument manufacturer's guides for specific information and strategies. Enlist assistance from technical and/or department management as needed.

Contingency Plan

Close contact is maintained with service personnel to ensure optimal instrument functioning. An extensive spare parts inventory is maintained for routine repairs. Since instrumentation is standardized throughout the laboratory network, spare parts and components can be readily exchanged among the network.

In general, the laboratory has at least one backup unit for each critical unit. In the event of instrument failure, portions of the sample load may be diverted to duplicate instrumentation, the analytical technique switched to an alternate approved technique (such as manual colorimetric determination as opposed to automated colorimetric determination), or samples shipped to another properly certified or approved Eurofins TestAmerica location.

Attachment 5:
EPA 8260B Calibration Criteria: SPCCs and CCCs

Calibration Check Compounds (CCCs)

Initial Calibration	Continuing Calibration
<=30% RSD	<=20% difference from initial calibration

System Performance Check Compounds (SPCCs)

SPCC	Minimum RRF
Chloromethane	0.10
1,1-Dichloroethane	0.10
Chlorobenzene	0.30
Bromoform	>0.10
1,1,2,2-Tetrachloroethane	0.30

Note: The CCC and SPCC criteria must be met even if the calibration curve option is used for quantitation. If the CCC and SPCC criteria do not pass, a new calibration curve must be prepared and analyzed.

Calibration Check Compounds (CCCs)
Vinyl chloride
1,1-Dichloroethene
Chloroform
1,2-Dichloropropane
Toluene
Ethylbenzene

System Performance Check Compounds (SPCCs)
Chloromethane
1,1-Dichloroethane
Chlorobenzene
Bromoform
1,1,2,2-Tetrachloroethane

Attachment 6:
EPA 8260C Minimum Response Factors

Compound	Minimum RRF
Dichlorodifluoromethane	0.100
Chloromethane	0.100
Vinyl Chloride	0.100
Bromomethane	0.100
Chloroethane	0.100
Trichlorofluoromethane	0.100
1,1-Dichloroethene	0.100
Freon-113	0.100

Attachment 10
Standard Information and Recipes

Store standards in glass vials fitted with Teflon-lined caps in standards-only refrigerator at <-10C. Choose a container volume that will have minimal headspace when standard is added. Mark the level on the outside of the container so that evaporation of the solvent will be apparent.

The expiration dates represent the maximum time a standard can be maintained. Standards that exhibit obvious signs of degradation must be replaced sooner.

Routine Target Compounds

Stock Standard Mixes

Stock/Mix	LIMS ID	Vendor/Part Number	Concentration (ug/mL)
8260 List 1/ Std #1 Mega Mix	571992	Restek 571992	2500 (majority of compounds)
8260 List 1/ Std #2 Ketones	569721	Restek 569721	12,500
8260 List 1/Std #3 Gases	569722	Restek 569722	2500

50mL final volume for all levels. Expiration: 24 hours

The laboratory normalizes the methanol content of the initial calibration standards to minimize methanol suppression of the early eluting analytes caused by varying amounts of methanol contained in the working standards. For example, the high level initial calibration standard is created by the addition of 450uL of the stock standards brought up to 50mL with reagent water. This contributes 450uL of methanol to the standard. The low level initial calibration standard is created by the addition of 54uL of the stock standards bought up to 50mL with reagent water. This contributes 54uL of methanol to the standard. The laboratory adds an additional 396uL of methanol to the low level standard to normalize its methanol content with that of the high level standard (i.e., for a total of 450uL). This methanol normalization is a common industry practice and allows for more consistent responses of those analytes co-elute with methanol.

Poor Performers

As indicated in EPA 8260B/C/D via assessment of laboratory control sample recoveries and control charts, the compounds listed below are poor performers and/or behave erratically.

** Note for South Carolina the poor performers must recover with 60-140%. For SouthCarolina UST work all analytes must recover 70-130%.

Note: An NCM must be initiated to denote this situation.

Poor Performer List

1,1,2-Trichloro-1,2,2-Trifluoroethane
1,2-Dibromo-3-Chloropropane

Glassware Cleaning Procedures

GLASSWARE CLEANING PROCEDURES

VOLATILES DEPARTMENT

1. Rinse glassware 3 times thoroughly with DI water.
2. Rinse once with methanol and then rinse once more with DI water.
3. Place glassware, top-down, within storage rack and allow to air dry.
4. If glassware was used to prepare waste sample, use FL-70 and water to scrub glassware and follow previous steps.

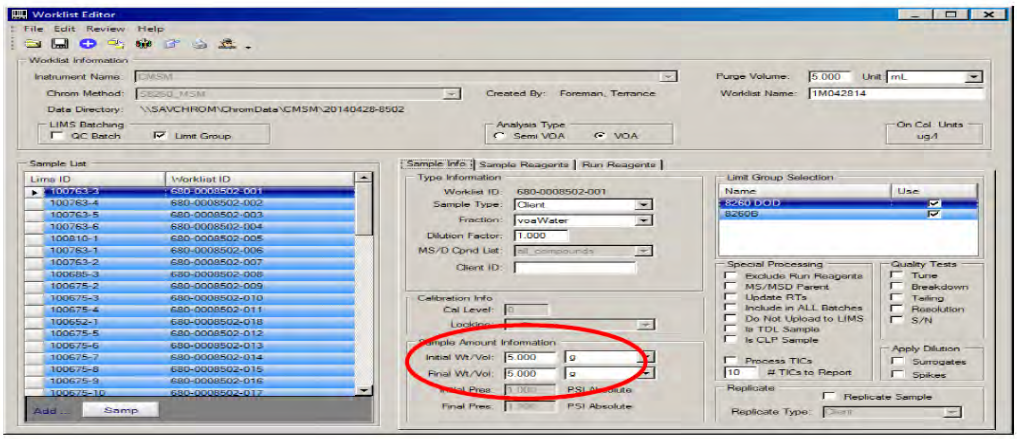
Data Entry Procedures for Soil Preparations and Dilutions (EPA 8260B, EPA 8260C, and EPA 8015C_GRO)

Summary
For EPA 8260B, EPA 8260C, and EPA 815C_GRO, the majority of soil samples are collected in 3 pre-weighed, pre-preserved vials. Two vials contain DI water or sodium bisulfate to be used for low-level analyses (i.e., analyzed straight). One vial contains methanol to be used for medium-level analyses (i.e., analyzed at dilution factor of 20 to 40, or higher). A preparation batch (i.e., a weight batch) is utilized to capture initial/final weights and volumes. Dilutions are captured via CHROM and are automatically transferred to the TALS analytical batch.

Note: The initial and final weight/volume entered in the TALS analytical batch must always be 5g and 5mL. The dilution factor is used to adjust calculations for Medium-Level soil samples. Adjustment/entry of initial volumes in TALS to reflect the MeOH sample aliquot (e.g., 125uL for a DF40) must not be performed as this will result in double-calculation of the dilution factor and miscalculation of final results.

Entry of Values in to the Weight Batch

1. Record the tare weight, which is found on the vial label, in the "Tare Weight" column.
2. Weigh the vial to determine the combined weight of the vial and sample. Enter into "Vial & Sample" column.
3. TALS automatically calculates Initial Amount by subtracting the Tare Weight from the Vial & Sample weight.
4. Enter purge volume in the "Final Amount" column. Note: Purge volume is always equivalent to 5mL.
5. Record preservative type in Worksheet Notes section - i.e., DI Water (DI), sodium bisulfate (SB), or Methanol (MEOH).



#	Sample LabId	Preservatio Value	Tare Weight Value	Tare Weight Units	Vial & Sample Value	Vial & Sample Units	Initial Amount Value	Initial Amount Units	Final Amount Value	Final Amount Units	
1	680-99832-E-1 (680-35085		+027.554	g	34.60	g	7.046	g	5	mL	MEOH
2	680-99832-F-1 (680-35085		31.42	g	36.71	g	5.29	g	5	mL	SB
3	680-99832-G-1 (680-3508		31.51	g	39.06	g	7.55	g	5	mL	SB
4	680-99832-E-3 (680-35085		+027.286	g	33.48	g	6.194	g	5	mL	MEOH
5	680-99832-F-3 (680-35085		31.40	g	41.12	g	9.72	g	5	mL	SB
6	680-99832-G-3 (680-3508		31.40	g	40.16	g	8.76	g	5	mL	SB
7	680-99832-B-4 (680-35085		+027.149	g	32.23	g	5.081	g	5	mL	MEOH

Company Confidential & Proprietary

Low-Level Soil Procedure

Note: Vials designated as DI or SB are used for the Low-Level analysis.

In the CHROM Worklist, enter 5g for the Initial Wt./Vol. and 5g as the Final Wt./Vol. (as shown below). This information is automatically transferred to the worksheet section of the analytical batch in TALS.

FVO085:09.01.16:1

Medium-Level Soil Procedure

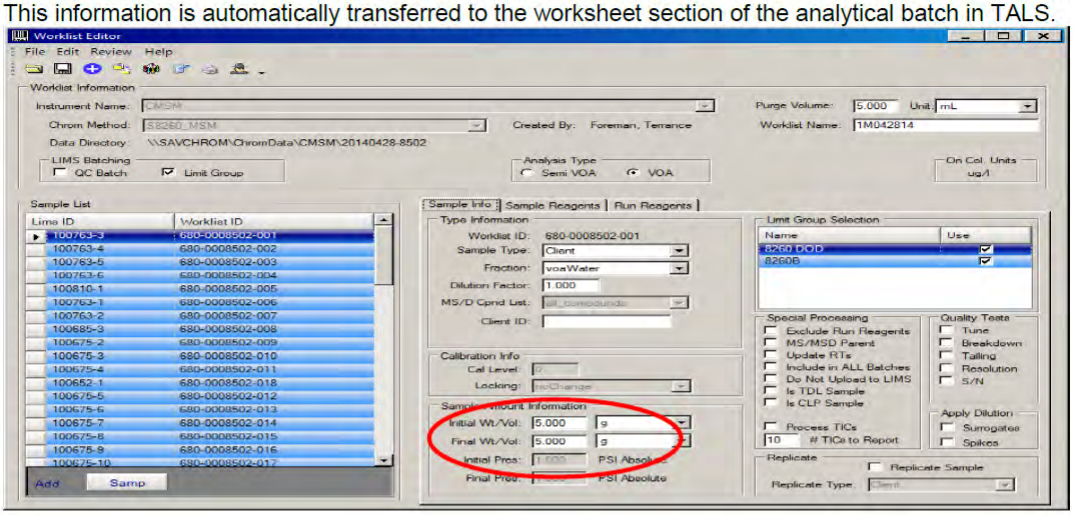
Note: Vials designated as MEOH are used for the Medium-Level analysis. An aliquot of sample is taken from the MeOH vial and diluted in water.

The default (i.e., lowest) dilution for Medium-Level analyses is prepared as follows:

Method	Sample Aliquot (uL)	Final Volume (mL)	Dilution Factor
EPA 8260B / EPA 8260C	125	5	40
EPA 8015C_GRO	250	10	20*

Higher dilutions are prepared as follows:

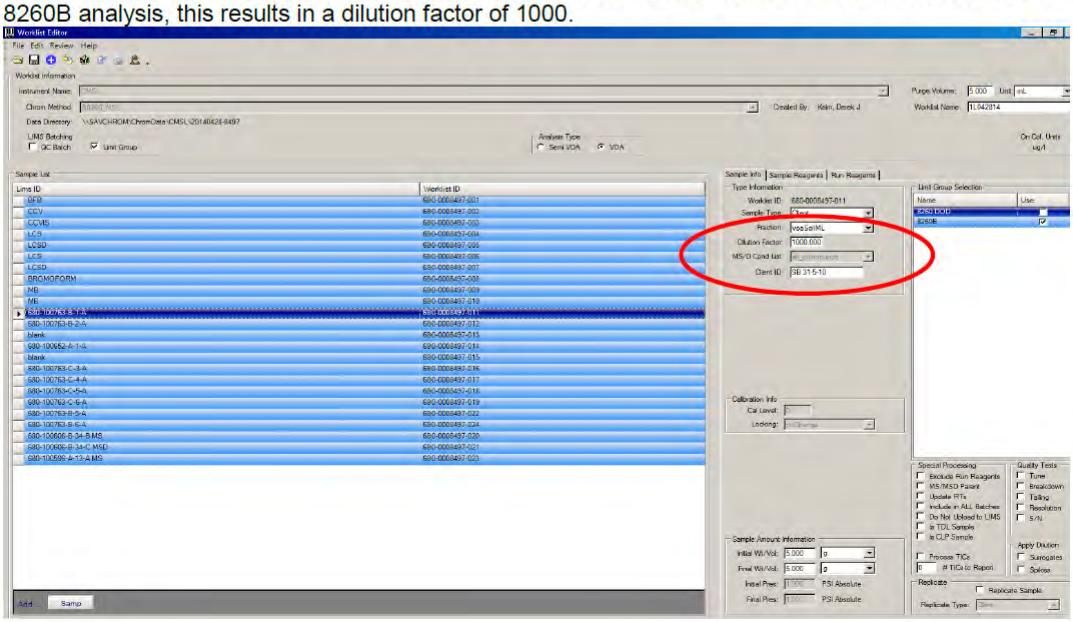
Method	Sample Aliquot (uL)	Final Volume (mL)	Dilution Factor
EPA 8260B / EPA 8260C	100	5	50
EPA 8260B / EPA 8260C	50	5	100
EPA 8260B / EPA 8260C	25	5	200
EPA 8260B / EPA 8260C	10	5	500
EPA 8260B / EPA 8260C	5	5	1000
EPA 8015C_GRO	100	10	50*
EPA 8015C_GRO	50	10	100*
EPA 8015C_GRO	20	10	250*
EPA 8015C_GRO	10	10	500*
EPA 8015C_GRO	5	10	1000*
EPA 8015C_GRO	1	10	5000*
EPA 8015C_GRO	0.5	10	10000*



* = Due to differences in the autosampler types utilized for EPA 8260B and EPA 8260C versus EPA 8015C_GRO, there is a difference in the water volume added to the sample to prepare the dilution. The autosamplers utilized for EPA 8260B and EPA 8260C add 5mL of water upon sampling of the vial. The autosamplers utilized for EPA 8015C_GRO do not perform this action. As such, an additional 5mL of water is added to the EPA 8015C_GRO sample vial upon preparation of the dilution (i.e., the dilution is prepared in 10mL of water).

Note: The dilution factor obtained is based on the 5mL purge volume. (e.g., for EPA 8015C_GRO, a 250uL MeOH sample aliquot diluted into 10mL of water is equivalent to a dilution factor of 20.)

Note: Dilutions larger than those listed in the table require the use of a serial dilution.



FVO085:09.01.16:1

In the CHROM Worklist, enter 5g for the Initial Wt./Vol. and 5g as the Final Wt./Vol. (as shown below). This information is automatically transferred to the worksheet section of the analytical batch in TALS.

Enter the dilution factor in CHROM to reflect the dilution prepared (as shown below). This information is automatically transferred to the worksheet section of the analytical batch in TALS.

In this example, a 5uL aliquot was taken from the MeOH vial and added to 5mL of water. For EPA 8260B analysis, this results in a dilution factor of 1000.

Appendix B
2019

Table B-4. Organic Analysis by Gas Chromatography/Mass Spectrometry (GC/MS)

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action	Flagging Criteria	Comments
Tune Check	Prior to ICAL and prior to each 12-hour period of sample analysis.	Specific ion abundance criteria of BFB or DFTPP from method.	Retune instrument and verify.	Flagging is not appropriate.	No samples shall be analyzed without a valid tune.
Performance Check (Method 8270 only)	At the beginning of each 12-hour period, prior to analysis of samples.	Degradation ≤ 20% for DDT. Benzidine and pentachlorophenol shall be present at their normal responses and shall not exceed a tailing factor of 2.	Correct problem, then repeat performance checks.	Flagging is not appropriate.	No samples shall be analyzed until performance check is within criteria. The DDT breakdown and Benzidine/ pentachlorophenol tailing factors are considered overall system checks to evaluate injector port inertness and column performance and are required regardless of the reported analyte list.
Initial calibration (ICAL) for all analytes (including surrogates)	At instrument set-up and after ICV or CCV failure, prior to sample analysis.	Each analyte must meet one of the three options below: Option 1: RSD for each analyte ≤ 15%; Option 2: linear least squares regression for each analyte: $r^2 \geq 0.99$; *(continued next page)*	Correct problem then repeat ICAL.	Flagging is not appropriate.	Minimum 5 levels for linear and 6 levels for quadratic. No samples shall be analyzed until ICAL has passed.

Page **145** of **367**

DoD/DOE QSM 5.3
Appendix B
2019

Table B-4. Organic Analysis by Gas Chromatography/Mass Spectrometry (GC/MS)

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action	Flagging Criteria	Comments
Initial calibration (ICAL) for all analytes (including surrogates) *(Continued)*		Option 3: non-linear least squares regression (quadratic) for each analyte: $r^2 \geq 0.99$.			If the specific version of a method requires additional evaluation (e.g., RFs or low calibration standard analysis and recovery criteria) these additional requirements must also be met.
Retention Time window position establishment	Once per ICAL and at the beginning of the analytical sequence.	Position shall be set using the midpoint standard of the ICAL curve when ICAL is performed. On days when ICAL is not performed, the initial CCV is used.	NA.	NA.	Calculated for each analyte and surrogate.
Evaluation of Relative Retention Times (RRT)	With each sample.	RRT of each reported analyte within ± 0.06 RRT units.	Correct problem, then rerun ICAL.	NA.	After maintenance is performed which may affect retention times, RRTs may be updated based on the daily CCV. RRTs shall be compared with the most recently updated RRTs.
Initial Calibration Verification (ICV)	Once after each ICAL, analysis of a second source standard prior to sample analysis.	All reported analytes within ± 20% of true value.	Correct problem. Rerun ICV. If that fails, repeat ICAL.	Flagging is not appropriate.	No samples shall be analyzed until calibration has been verified with a second source.

DoD/DOE QSM 5.3
Appendix B
2019

Table B-4. Organic Analysis by Gas Chromatography/Mass Spectrometry (GC/MS)

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action	Flagging Criteria	Comments
Continuing Calibration Verification (CCV)	Daily before sample analysis; after every 12 hours of analysis time; and at the end of the analytical batch run.	All reported analytes and surrogates within ± 20% of true value. All reported analytes and surrogates within ± 50% for end of analytical batch CCV.	Immediately analyze two additional consecutive CCVs. If both pass, samples may be reported without reanalysis. If either fails or if two consecutive CCVs cannot be run, perform corrective action(s) and repeat CCV and all associated samples since last successful CCV. Alternately, recalibrate if necessary; then reanalyze all associated samples since the last acceptable CCV.	If reanalysis cannot be performed, data must be qualified and explained in the Case Narrative. Apply Q-flag to all results for the specific analyte(s) in all samples since last acceptable calibration verification.	Results may not be reported without valid CCVs. Flagging is only appropriate in cases where the samples cannot be reanalyzed. If the specific version of a method requires additional evaluation (e.g., average RFs) these additional requirements must also be met.
Internal Standards (IS)	Every field sample, standard, and QC sample.	Retention time within ± 10 seconds from retention time of the midpoint standard in the ICAL; EICP area within – 50% to +100% of ICAL midpoint standard. On days when ICAL is not performed, the daily initial CCV can be used.	Inspect mass spectrometer and GC for malfunctions and correct problem. Reanalysis of samples analyzed while system was malfunctioning is mandatory.	If corrective action fails in field samples, data must be qualified and explained in the Case Narrative. Apply Q-flag to analytes associated with the non-compliant IS. Flagging is not appropriate for failed standards.	NA.

2019

Table B-4. Organic Analysis by Gas Chromatography/Mass Spectrometry (GC/MS)

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action	Flagging Criteria	Comments
Method Blank (MB)	One per preparatory batch.	No analytes detected > ½ LOQ or > 1/10th the amount measured in any sample or 1/10th the regulatory limit, whichever is greater. Common contaminants must not be detected > LOQ.	Correct problem. If required, reprep and reanalyze MB and all QC samples and field samples processed with the contaminated blank.	If reanalysis cannot be performed, data must be qualified and explained in the Case Narrative. Apply B-flag to all results for the specific analyte(s) in all samples in the associated preparatory batch.	Results may not be reported without a valid Method Blank. Flagging is only appropriate in cases where the samples cannot be reanalyzed.
Laboratory Control Sample (LCS)	One per preparatory batch.	A laboratory must use the DoD/DOE QSM Appendix C Limits for batch control if project limits are not specified. If the analyte(s) are not listed, use in-house LCS limits if project limits are not specified.	Correct problem, then reprep and reanalyze the LCS and all samples in the associated preparatory batch for failed analytes if sufficient sample material is available.	If reanalysis cannot be performed, data must be qualified and explained in the Case Narrative. Apply Q-flag to specific analyte(s) in all samples in the associated preparatory batch.	Must contain all surrogates and all analytes to be reported. Results may not be reported without a valid LCS. Flagging is only appropriate in cases where the samples cannot be reanalyzed.

Revision History

Summary of Changes for Revision 11:

- Revised Attachment 3 and 11 to include the requirement that all target analytes must be evaluated for precision and accuracy.
- Revised Attachment 3 and 11 that South Carolina UST must meet 70-130% limits for LCS/LCSD/MS/MSD.

Summary of Changes for Revision 10A:

- Removed South Carolina state specific requirements for poor performers.

Summary of Changes for Revision 10:

- Added reference to Attachment 8 in Section 1.0. FLDOH Review 2021
- Updated Attachment 9 for current instrument configurations. FLDOH Review 2021.
- Updated ICAL readback criteria in section 9.2.3.2.3 for EPA 624 and 624.1 to be consistent with SOP SA-QA-006.

Summary of Changes in Revision 9:

- Revised limit of poor performers from 60%D to 50%D for CCV and ICV. Poor performers for DOD QSM 5.3 have a 30%D limit unless identified as compounds of concern.
- Updated ICV and CCV language regarding Poor Performer Exceptions.
- DOD QSM 5.3 criteria has been added to all applicable sections.
- DOD QSM 5.3 Table B-4 has been added as Attachment 16 for laboratory reference.
- DOD QSM 5.3 criteria has been added to applicable sections of the SOP.
- Updated language in SOP from “should” to “must” in applicable sections.
- Updated calibration concentrations in Section 9.2.3 to levels currently utilized.
- Added the Readback criteria for calibrations to Section 9.2.3.
- Added 8260B CCV criteria to Section 9.2.5.1 for reduced list of analytes.
- Added to Section 9.2.5.2 that the CCV for SM6200B must be varied of the range of the calibration.
- Added Maximum %D limit for poor performers of 100%D to section 9.2.5.5.
- Revised section 10.2.3 for BFB Tune for SM6200B. 20ml volume is needed for a purge of BFB.
- Removed requirement for Closing CCV for EPA 860C and 8260D in Section 10.27.
- Added Section 12.5.3 to address control limits for SM6200B.
- Revised References in Section 15 in order to incorporate SW846 Updates and Revisions.
- Updated Attachment 2 with Preservation and Holding Times.
- Revised Attachment 3 to include Readback criteria.
- Removed requirement for closing CCV from Attachment 3 for EPA 8260C and EPA 8260D. Closing CCV required for DOD QSM5.3.
- Revised Poor Performer List in Attachment 11.
- Added comment to Section 16 that a concentration of 50ug/L is used for SM6200B.

Summary of Changes from Previous Revision 8:

- Added reference and criteria for SM6200B in all applicable sections of this SOP.
- Added information regarding the Master Equipment listing to Section 6.2.

Summary of Changes from Previous Revision 7:

- Minor editorial, grammatical, and/or formatting changes made.
- Updated SOP signatories to reflect current responsibilities and titles.
- Updated company name and logo where applicable.
- Updated ISTD references in Attachment 9 to reflect ISTD references in CHROM method.
- Updated mechanism of ISTD addition in sections 6.4 and 10.1.1.
- Clarified CCV criteria in section 9.2.5.1 and 9.2.5.2 for poor performers. Updated Attachment 10 for standard preparation to reflect current procedures.

3.0 INTRODUCTION, SCOPE AND APPLICABILITY

3.1 Introduction and Compliance References

Eurofins TestAmerica Savannah's Quality Assurance (QA) Manual is a document prepared to define the overall policies, organization objectives and functional responsibilities for achieving the laboratory's QA Program. Governing SOPs are in place within the organization to ensure the proper execution of this QA Manual (refer to Appendix 1). This manual and referenced documents are required reading for all personnel.

The laboratory is a team of people who work together to serve the health and environmental needs of society through science and technology. We offer comprehensive expertise in environmental laboratory applications and client relations and maintain a national perspective in terms of quality.

As such, this QA Manual has been prepared to assure compliance with The NELAC Institute (TNI) Standard, dated 2009 and 2016; ISO/IEC Guide 17025:2005 and 2017; and the Department of Defense (DoD) Quality Systems Manual (QSM). The policies and procedures listed in Appendix 1 are compliant with the National Divisional Support Center (NDSC) Quality Management Plan (QMP) for Eurofins TestAmerica and the various accreditation and certification programs which are held by the laboratory to support environmental work (Appendix 2). The QMP provides a summary of Eurofins TestAmerica's quality and data integrity system. It contains requirements and general guidelines under which all Eurofins TestAmerica facilities shall conduct their operations.

Refer to Appendix 3 for a list of additional references for which this QA Manual is compliant; and Appendix 4 for the compliance crosswalk of this manual to the TNI and ISO/IEC Guide 17025 requirements.

3.2 Terms and Definitions

A QA Program is a system designed to ensure that data produced by the laboratory conforms to the standards set by state and/or federal regulations. The program functions at the local management level through company goals, from guidance at the executive management level, and at the analytical level through Standard Operating Procedures (SOPs) and quality control.

Our program is designed to minimize systematic error, encourage constructive, documented problem solving, and provide a framework for continuous improvement within the organization to better serve our clients.

Refer to Appendix 5 for a list of Terms and Acronyms.

3.3 Scope / Fields of Testing

The laboratory analyzes a broad range of environmental and industrial samples. Sample matrices vary among drinking water, effluent water, groundwater, hazardous waste, sludge, and soils. The

QA Program contains specific procedures and methods to test samples of differing matrices for chemical and physical parameters. The Program also contains guidelines on maintaining documentation of analytical processes, reviewing results, servicing clients, and tracking samples through the laboratory. The technical and service requirements of all analytical requests are thoroughly evaluated before commitments are made to accept the work. Measurements are made using published reference methods or methods developed and validated by the laboratory.

The methods covered by this manual include the most frequently requested methodologies needed to provide analytical services in the United States and its territories. The specific list of test methods used by the laboratory can be found in the methods Listing housed in the laboratory's information management system (i.e., LIMS). Our areas of expertise include Volatiles, Semivolatiles, Metals, Pesticides/PCBs/Herbicides, Petroleum Hydrocarbons, Waste Characterization, Non-Potable Water Testing, Drinking Water Testing, Soil and Surface Water Testing, Sediment and Tissue Testing, and Method Development.

Note: All current certificates and scopes of accreditation are available on the laboratory's website.

The approach of this manual is to define the minimum level of quality assurance and quality control necessary to meet these requirements. All methods performed by the laboratory shall meet these criteria as appropriate. In some instances, quality assurance project plans (QAPPs), project specific data quality objectives (DQOs) or local regulations may require criteria other than those contained in this manual. In these cases, the laboratory will abide by the requested criteria following review and acceptance of the requirements by the Laboratory Director, Business Unit Manager (BUMa), and/or the Quality Assurance (QA) Manager. In some cases, QAPPs and DQOs may specify less stringent requirements. The Laboratory Director and/or Business Unit Manager and the QA Manager must determine if it is in the lab's best interest to follow the less stringent requirements.

3.4 Management of the Manual

3.4.1 Review Process

The template on which this manual is based is reviewed annually by Eurofins National Divisional Support Center (NDSC) which houses the Quality Assurance leadership team for Eurofins Environment Testing America. NDSC QA will assure that the template remains in compliance with Section 3.1. This manual itself is reviewed annually by senior laboratory management to assure that it reflects current practices and meets the requirements of the laboratory's clients and regulators as well as the QMP. Occasionally, the manual may need changes in order to meet new or changing regulations and operations. The QA Manager will review the changes in the normal course of business and incorporate changes into revised sections of the document. All updates will be reviewed by the senior laboratory management staff. The laboratory updates and approves such changes according to our document control procedures (refer to SOP SA-QA-001.

4.0 MANAGEMENT REQUIREMENTS

4.1 Overview

Eurofins TestAmerica Savannah is a local operating unit of Eurofins Environment Testing America. The laboratory's operational and support staff have the day-to-day independent operational authority under the direction of the Laboratory Director and Business Unit Manager and is supported by the NDSC QA team. The laboratory management staff includes department managers and supervisors. The organizational chart of the management staff is presented in Figure 4-1. Individual departmental staff lists are maintained in the laboratory's internal intranet.

4.2 Roles and Responsibilities

In order for the QA Program to function properly, all members of the staff must clearly understand and meet their individual responsibilities as they relate to the quality program. The responsibility for quality resides with every employee of the laboratory. All employees have access to the QA Manual, are trained to this manual, and are responsible for upholding the standards therein. Each person carries out his/her daily tasks impartially and in a manner consistent with the goals and in accordance with the procedures in this manual and the laboratory's SOPs. The following descriptions briefly define each role in its relationship to the Quality Assurance Program.

4.2.1 Vice President of Quality and Environmental Health and Safety (VP-QA/EHS)

The Vice President (VP) of QA/EHS reports directly to Eurofins Environment Testing America Chief Operating Officer (COO). With the aid of the NDSC Quality Team Members, Business Unit Managers, and Laboratory Directors, the VP-QA/EHS has the responsibility for the establishment, general overview and maintenance of the Quality Assurance and EH&S Programs within Eurofins Environment Testing America. Additional responsibilities include:

- Review of QA/QC and EHS aspects of NDSC Official Documents, national projects and expansions or changes in services.
- Work with various organizations outside of the laboratory to further the development of quality standards and represent the laboratory at various trade meetings.
- Prepare monthly reports for quality and EH&S metrics across the environmental testing laboratories and a summary of any quality and EH&S related initiatives and issues.
- With the assistance of the Executive Management and the EHS Managers, maintenance and implementation of the Eurofins Environment Testing America Environmental, Health and Safety Program.

4.2.2 Quality Directors

The Quality Directors within NDSC report directly to the VP-QA/EHS. The Quality Directors have oversight of the general overview and maintenance of the QA Program within the Eurofins Environment Testing America laboratories. Supported tasks include:

- Monitors laboratory internal audit findings;
- Identifies common laboratory weaknesses and monitors corrective action closures.
- Develops NDSC quality guidance documents and management tools for ensuring and improving compliance;
- Monitors and communicates DoD/DoE requirements;
- Monitors and communicates regulatory and certification requirements;
- Training and OnBoarding
- Laboratory assessments, mentoring, and interventions
- Track/drive root cause investigations and corrective action plans
- Builds knowledge base for preventive actions

4.2.3 Quality Information Manager

The Quality Information Manager works directly with the NDSC Quality Directors and EHS Managers, and reports directly to the VP-QA/EHS. The Quality Information Manager is responsible for the management of:

- NDSC Official Documents
- TALS/LIMS Certification Module Data
- Company's Intranet website
- Company's Regulatory Limits Database
- Subcontract laboratory and approved vendor information
- Internal and External client support for various company groups (e.g., Client Services, EH&S, Legal, IT, Sales) for both quality and operational functions
- Communication of regulatory information and lists

4.2.4 Environmental Health and Safety (EH&S) Managers

The EH&S Managers within NDSC report directly to the VP-QA/EHS. The EH&S Managers have oversight of the general overview and maintenance of the EH&S Program within the Eurofins Environment Testing America laboratories. Supported tasks include:

- Consolidation and tracking all safety and health-related information and reports for the company, and managing compliance activities for Eurofins Environment Testing America locations.
- Coordination/preparation of the Environmental Health and Safety Manual Template that is used by each laboratory to prepare its own laboratory-specific Safety Manual/CHP.
- Preparation of information and training materials for laboratory EHS Coordinators.
- Assistance in the coordination of employee exposure and medical monitoring programs to insure compliance with applicable safety and health regulations.
- Serving as Department of Transportation (DOT) focal point and providing technical assistance to location management.
- Serving as Hazardous Waste Management main contact and providing technical assistance to location management.

4.2.5 Ethics and Compliance Officers (ECOs)

The NDSC VP-QA/EHS and Corporate Counsel are the designated Ethics and Compliance Officers (ECOs). Each ECO acts as a back-up to the other ECO and both are involved when data investigations occur. Each ECO has a direct line of communication to the entire executive management personnel and lab management staff.

The ECOs monitor and audit procedures to determine compliance with policies and to make recommendations for policy enhancements to the President, COO, Laboratory Director or other appropriate individuals within the laboratory. The ECO will assist the laboratory QA Manager in the coordination of internal auditing of ethical policy related activities and processes within the laboratory, in conjunction with the laboratory's regular internal auditing function.
The ECOs will also participate in investigations of alleged violations of policies and work with the appropriate internal departments to investigate misconduct, remedy the situation, and prevent recurrence of any such activity.

4.2.6 Laboratory Director

The Laboratory Director is responsible for the overall quality, safety, financial, technical, human resource and service performance of the whole laboratory and reports to their business unit President. The Laboratory Director is also responsible for any service centers connected with their laboratory that perform analytical tests, such as short holding time analyses for pH. The Laboratory Director provides the resources necessary to implement and maintain an effective and comprehensive Quality Assurance and Data Integrity Program.
Specific responsibilities include, but are not limited to:

- Provides one or more Technical Managers for the appropriate fields of testing. If the Technical Manager is absent for a period of time exceeding 15 consecutive calendar days, the Laboratory Director must designate another full time staff member meeting the qualifications of the Technical Manager to temporarily perform this function. If the absence exceeds 35 consecutive calendar days, the primary accrediting authority must be notified in writing.
- Ensures that all analysts and supervisors have the appropriate education and training to properly carry out the duties assigned to them and ensures that this training has been documented. Works with Eurofins Environment Testing Human Resources for hiring of new personnel.
- Ensures that personnel are free from any commercial, financial and other undue pressures which might adversely affect the quality of their work.
- Ensures company human resource policies are adhered to and maintained.
- Ensures that sufficient numbers of qualified personnel are employed to supervise and perform the work of the laboratory. Assesses laboratory capacity and workload.
- Ensures that appropriate corrective actions are taken to address analyses identified as requiring such actions by internal and external performance or procedural audits. Procedures that do not meet the standards set forth in the QA Manual or laboratory SOPs may be temporarily suspended by the Laboratory Director.
- May review and approve SOPs prior to their implementation and ensures all approved SOPs are implemented and adhered to.

- Pursues and maintains appropriate laboratory certification and contract approvals. Supports ISO 17025 requirements.
- Ensures client specific reporting and quality control requirements are met.
- Contributes to the continuous improvement of the laboratory operations.
- Maintains an awareness of technical developments and regulatory requirements.
- Captains the management team, consisting of the QA Manager, the Technical Manager(s), and the Operations Manager as direct reports.

4.2.7 Quality Assurance (QA) Manager

The QA Manager has responsibility and authority to ensure the continuous implementation of the quality system at the laboratory where they work based on ISO/IEC 17025, DoD ELAP, and TNI. The QA Manager is also responsible for any service centers connected with their laboratory that perform analytical tests, such as short holding time analyses for pH.

The QA Manager is independent of production and reports directly to the Laboratory Director and their NDSC Quality Director. This position is able to evaluate data objectively and perform assessments without outside (e.g., managerial) influence. The NDSC QA Team may be used as a resource in dealing with regulatory requirements, certifications, and other quality assurance related items. The QA Manager directs the activities of the QA Department to accomplish specific responsibilities, which include, but are not limited to:

- Serving as the focal point for QA/QC in the laboratory.
- Having functions independent from laboratory operations for which he/she has quality assurance oversight.
- Having documented training and/or experience in QA/QC procedures and the laboratory's Quality System.
- Having a general knowledge of the analytical test methods for which data audit/review is performed (and/or having the means of obtaining this information when needed).
- Arranging for or conducting internal audits on quality systems and the technical operation
- Notifying laboratory management of deficiencies in the quality system and ensuring corrective action is taken.
- Maintaining and updating the QA Manual.
- Monitoring and evaluating laboratory certifications; scheduling proficiency testing samples.
- Monitoring and communicating regulatory changes that may affect the laboratory to management.
- Training and advising the laboratory staff on quality assurance/quality control procedures that are pertinent to their daily activities.
- Maintaining records of all ethics-related training, including the type and proof of attendance.
- Maintaining, improving, and evaluating the corrective action database and the corrective and preventive action systems.
- Objectively monitoring standards of performance in quality control and quality assurance without outside (e.g., managerial) influence.
- Coordinating of document control of SOPs, MDLs, control limits, and miscellaneous forms and information.
- Performing technical data audits and method audits to ensure consistency and compliance with regulatory requirements.

- Reviewing external audit reports and data validation requests.
- Follow-up with audits to ensure client QAPP requirements are met.
- Establishing reporting schedule and preparation of various quality reports for the Laboratory Director, clients and/or NDSC QA Team.
- Developing suggestions and recommendations to improve quality systems.
- Researching current state and federal requirements and guidelines.
- Participating in the vendor and supplier approval process, including subcontractors.
- Managing the QA team to enable communication and to distribute duties and responsibilities.
- Communicating to relevant regulatory authorities when there are management or facility changes that impact the laboratory.
- Ensuring communication and monitoring standards of performance to ensure that systems are in place to produce the level of quality as defined in this document.
- Evaluating the thoroughness and effectiveness of training.
- Ensuring compliance with ISO 17025 and the DoD QSM.

4.2.8 Technical Manager

The Technical Manager reports directly to the Laboratory Director. The Technical Manager is accountable for all analyses and analysts under their experienced supervision and for compliance with the ISO 17025:2017 Standard and DoD QSM. The scope of responsibility ranges from the new-hire process and existing technology through the ongoing training and development programs for existing analysts and new instrumentation. Specific responsibilities include, but are not limited to:

- Exercising day-to-day supervision of laboratory operations for the appropriate field of accreditation and reporting of results. Coordinating, writing, and reviewing preparation of all test methods (i.e., SOPs) with regard to quality, integrity, regulatory requirements, and optimum and efficient production techniques, and subsequent analyst training and interpretation of the SOPs for implementation and evaluation of unusual project samples. The Technical Manager ensures the SOPs are properly managed and adhered to at the bench. He develops standard costing of SOPs to include supplies, labor, overhead, and capacity (design vs. demonstrated versus first-run yield) utilization.
- Reviewing and approving, with input from the QA Manager, proposals from marketing, in accordance with an established procedure for the review of requests and contracts.
- Monitoring the validity of the analyses performed and data generated in the laboratory. This activity begins with reviewing and supporting all new business contracts, insuring data quality, analyzing internal and external non-conformances to identify root cause issues and implementing the resulting corrective and preventive actions, facilitating the data review process (training, development, and accountability at the bench), and providing technical and troubleshooting expertise on routine and unusual or complex problems.
- Providing training and development programs to applicable laboratory staff as new hires and, subsequently, on a scheduled basis. Training includes instruction on calculations, instrumentation management to include troubleshooting and preventive maintenance.
- Enhancing efficiency and improving quality through technical advances and improved LIMS utilization. Capital forecasting and instrument life cycle planning for second generation methods and instruments as well as asset inventory management.

- Coordinating sample management from “cradle to grave,” insuring that no time is lost in locating samples.
- Scheduling all QA/QC-related requirements for compliance, e.g., MDLs, etc.
- Managing department personnel to communicate quality, technical, personnel, and instrumental issues for a consistent team approach.
- Coordinating audit responses with the QA Manager.
- Ensuring compliance with ISO 17025 and the DoD QSM.

4.2.10 Project Manager (PM)

Members of the laboratory Client Services/Project Management Group are responsible for organizing and managing client projects. Clients are assigned a project manager who serves as their primary contact at the laboratory. It is the PM’s responsibility to act as the client advocate by communicating client requirements to laboratory personnel and ensuring that clients provide complete information needed by the laboratory to meet those requirements – including all verbal communications. Responsibilities include:

- Scheduling sample submissions, sample container orders and sample pick-up via the laboratory courier service.
- Confirming certification status
- Coordinating and communicating turnaround time (TAT) requirements for high priority samples/projects.
- Answering common technical questions, facilitating problem resolution and coordinating technical details with the laboratory staff.
- Ensuring that client specifications, when known, are met by communicating project and quality assurance requirements to the laboratory.
- Notifying the supervisors of incoming projects and sample delivery schedules.
- Accountable to clients for communicating sample status reports or results prior to receipt of the final report.
- Monitoring the status of all data package projects in-house to ensure timely and accurate delivery of reports.
- Informing clients of data package-related problems and resolve service issues.

4.2.11 Department Supervisors

Supervisors are responsible to:

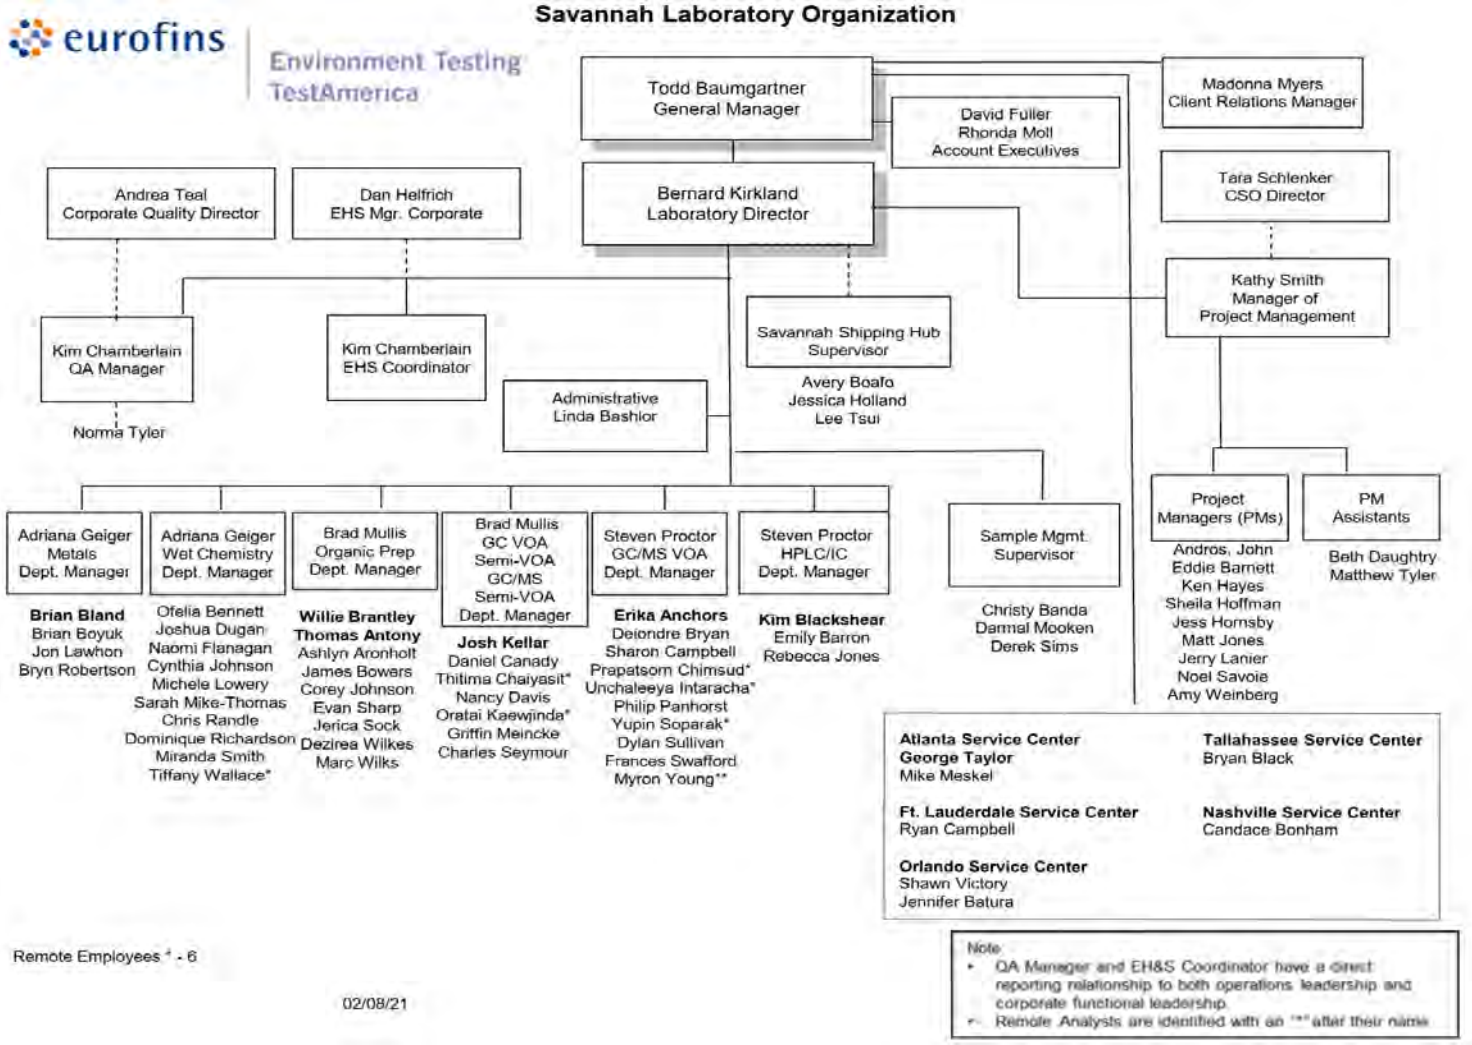
- Ensure that analysts in their department adhere to applicable SOPs and the QA Manual. They perform frequent SOP and QA Manual review to determine if analysts are in compliance and if new, modified, and optimized measures are feasible and should be added to these documents.
- With regard to analysts, participates in the selection, training, development of performance objectives and standards of performance, appraisal (measurement of objectives), scheduling, counseling, discipline, and motivation of analysts and documents these activities in accordance with systems developed by the QA and Human Resources Departments. They evaluate staffing sufficiency and overtime needs. Training consists of familiarization with SOP, QC, Safety, and computer systems.

- Encourage the development of analysts to become cross-trained in various methods and/or operate multiple instruments efficiently while performing maintenance and documentation, self-supervise, and function as a department team.
- Provide guidance to analysts in resolving problems encountered daily during sample prep/analysis in conjunction with the Technical Manager, Laboratory Director, and/or QA Manager.
- Perform data review and documentation of non-conformance issues, the timely and accurate completion of performance evaluation samples and MDLs, for his department.
- Ensure all logbooks are maintained, current, and properly labeled or archived.
- Report all non-conformance conditions to the QA Manager, Technical Manager, and/or Laboratory Director.
- Ensure that preventive maintenance is performed on instrumentation as detailed in the QA Manual or SOPs. He is responsible for developing and implementing a system for preventive maintenance, troubleshooting, and repairing or arranging for repair of instruments.
- Maintain adequate and valid inventory of reagents, standards, spare parts, and other relevant resources required to perform daily analysis.
- Achieve optimum turnaround time on analyses and compliance with holding times.
- Conduct efficiency and cost control evaluations on an ongoing basis to determine optimization of labor, supplies, overtime, first-run yield, capacity (designed vs. demonstrated), second- and third-generation production techniques/instruments, and long-term needs for budgetary planning.
- Develop, implement, and enhance calibration programs.
- Provide written responses to external and internal audit issues.

4.2.12 Laboratory Analysts

Laboratory analysts are responsible for conducting analysis and performing all tasks assigned to them by the group leader or supervisor. The responsibilities of the analysts are listed below:

- Perform analyses by adhering to analytical and quality control protocols prescribed by current SOPs, this QA Manual, and project-specific plans honestly, accurately, timely, safely, and in the most cost-effective manner.
- Document standard and sample preparation, instrument calibration and maintenance, data calculations, sample matrix effects, and any observed non-conformance on worklists, bench sheets, lab notebooks and/or the Non-Conformance database.
- Report all non-conformance situations, instrument problems, matrix problems and QC failures, which might affect the reliability of the data, to their supervisor, the Technical Manager, and/or the QA Manager or member of QA staff.
- Perform 100% review of the data generated prior to entering and submitting for secondary level review.
- Suggest method improvements to their supervisor, the Technical Manager, and the QA Manager. Ideas for the optimum performance of their assigned area, for example, through the proper cleaning and maintenance of the assigned instruments and equipment, are encouraged.
- Work cohesively as a team in their department to achieve the goals of accurate results, optimum turnaround time, cost effectiveness, cleanliness, complete documentation, and personal knowledge of environmental analysis.



4.3 Business Continuity and Contingency Plans and Deputy Assignments

Various policies and practices are in place to address continuity of business and contingency plans to ensure continued operations or minimal disruption in operations should unplanned events (natural disasters, unexpected management changes, etc.) occur. Deputies are identified for all key management personnel. Deputies would temporarily fill a role if the primary is absent for more than 15 consecutive calendar days. The deputies must meet the same qualifications as the primary person should they be required to take on the responsibilities. The QA Manager communicates to the relevant regulatory authorities when there are management or facility changes that impact the laboratory. Changes in the technical director must be communicated within a period of time and in the manner dictated by each regulatory authority.

The following table defines who assumes the responsibilities of key personnel in their absence:

Key Personnel	Deputy
Laboratory Director	QA Manager
QA Manager	Laboratory Director
Department Manager	Laboratory Director
Technical Manager	Laboratory Director
EHS Coordinator	Laboratory Director

Figure 4-1. Laboratory Organization Charts

5.0 PERSONNEL

5.1 Overview

The laboratory's management believes that its highly qualified and professional staff is the single most important aspect in assuring a high level of data quality and service. The staff consists of professionals and support personnel.

All personnel must demonstrate competence in the areas where they have responsibility. Any staff that is undergoing training shall have appropriate supervision until they have demonstrated their ability to perform their job function on their own. Staff shall be qualified for their tasks based on appropriate education, training, experience and/or demonstrated skills as required.

The laboratory employs sufficient personnel with the necessary education, training, technical knowledge and experience for their assigned responsibilities.

All personnel are responsible for complying with all QA/QC requirements that pertain to the laboratory and their area of responsibility. Each staff member must have a combination of experience and education to adequately demonstrate a specific knowledge of their particular area of responsibility. Technical staff must also have a general knowledge of lab operations, test methods, QA/QC procedures and records management.

Laboratory management is responsible for formulating goals for lab staff with respect to education, training, and skills, and ensuring that the laboratory has a policy and procedures for identifying training needs and providing training of personnel. The training shall be relevant to the present and anticipated responsibilities of the lab staff.

The laboratory only uses personnel that are employed by or under contract to, the laboratory. Contracted personnel, when used, must meet competency standards of the laboratory and work in accordance to the laboratory's quality system.

5.2 Education and Experience Requirements for Technical Personnel

The laboratory makes every effort to hire analytical staffs that possess a college degree (e.g., AA, BA, BS) in an applied science with some chemistry in the curriculum. Exceptions can be made based upon the individual's experience and ability to learn. Selection of qualified candidates for laboratory employment begins with documentation of minimum education, training, and experience prerequisites needed to perform the prescribed task. Minimum education and training requirements for laboratory employees are outlined in job descriptions maintained by the Eurofins Environment Testing America Human Resources Department.

Experience and specialized training are occasionally accepted in lieu of a college degree (basic lab skills such as using a balance, pipette, etc., are also considered).

As a general rule for analytical staff:

Specialty	Education	Experience
Extractions, Digestions, some electrode methods (pH, DO, Redox, etc.), or Titrimetric and Gravimetric Analyses	H.S. Diploma	On the job training (OJT)
CVAA, Single component or short list Chromatography (e.g., Fuels, BTEX-GC, IC)	A college degree in an applied science or 2 years of college and at least 1 year of college chemistry	Or 2 years prior analytical experience is required
ICP, ICPMS, Long List or complex chromatography (e.g., Pesticides, PCB, Herbicides, HPLC, etc.), GCMS	A college degree in an applied science or 2 years of college chemistry	Or 5 years of prior analytical experience
Spectra Interpretation	A college degree in an applied science or 2 years of college chemistry	And 2 years relevant experience Or 5 years of prior analytical experience
Technical Manager (General)	Bachelor's Degree in an applied science or engineering with 24 semester hours in chemistry An advanced (MS, PhD.) degree may substitute for one year of experience	And 2 years' experience in environmental analysis of representative analytes for which they will oversee
Technical Manager (Wet Chem Only) (No advanced instrumentation)	Associates degree in an applied science or engineering or 2 years of college with 16 semester hours in chemistry	And 2 years relevant experience

Specialty	Education	Experience
Technical Manager (Microbiology)	Bachelor's degree in applied science with at least 16 semester hours in general microbiology and biology An advanced (MS, PhD.) degree may substitute for one year of experience	And 2 years of relevant experience

When an analyst does not meet these requirements, they can perform a task under the direct supervision of a qualified analyst, peer reviewer or Technical Manager, and are considered an analyst in training. The person supervising an analyst in training is accountable for the quality of the analytical data and must review and approve data and associated corrective actions.

5.3 Training

The laboratory is committed to furthering the professional and technical development of employees at all levels.

Orientation to the laboratory's policies and procedures, in-house method training, and employee attendance at outside training courses and conferences all contribute toward employee proficiency. Below are examples of various areas of required employee training:

Required Training	Time Frame	Employee Type
Environmental Health & Safety	Prior to lab work	All
Ethics (Comprehensive)	60 days of hire	All
Data Integrity	60 days of hire	Technical and PMs
Quality Assurance	90 days of hire	All
Ethics (Comprehensive Refresher)	Annually	All
Initial Demonstration of Capability (IDOC)	Prior to unsupervised method performance	Technical

The laboratory maintains records of relevant authorization/competence, education, professional qualifications, training, skills and experience of technical personnel (including contracted personnel) as well as the date that approval/authorization was given. These records are kept on file at the laboratory. Also refer to Demonstration of Capability information in Section 19.

The training of technical staff is kept up to date by:

- Each employee must have documentation in their training file that they have read, understood and agreed to follow the most recent version of the laboratory QA Manual and SOPs in their area of responsibility. This documentation is updated as SOPs are updated.
- Documentation from any training courses or workshops on specific equipment, analytical techniques or other relevant topics.
- Documentation of proficiency (refer to Section 19).
- An Ethics Agreement signed by each staff member (renewed each year) and evidence of annual ethics training.
- A Confidentiality Agreement signed by each staff member signed at the time of employment.
- Human Resources maintains documentation and attestation forms on employment status and records; benefit programs; timekeeping/payroll; and employee conduct (e.g., ethics violations). This information is maintained in the employee's secured personnel file.

Evidence of successful training could include such items as:

- Adequate documentation of training within operational areas, including one-on-one technical training for individual technologies, and particularly for people cross-trained.
- Analyst's knowledge to refer to QA Manual for quality issues.
- Analysts following SOPs, i.e., practice matches SOPs.
- Analysts regularly communicate to supervisors and QA if SOPs need revision, rather than waiting for auditors to find problems.

Further details of the laboratory's training program are described in SOP SA-QA-006*: Training Procedures.*

5.4 Data Integrity and Ethics Training Program

The laboratory's Ethics and Data Integrity Program is discussed in Section 6.2. Employees are trained as to the legal and environmental repercussions that result from data misrepresentation.

Key topics covered in the presentation include:

- Organizational mission and its relationship to the critical need for honesty and full disclosure in all analytical reporting.
- Ethics Policy
- How and when to report ethical/data integrity issues. Confidential reporting.
- Record keeping.
- Discussion regarding data integrity procedures.
- Specific examples of breaches of ethical behavior (e.g. peak shaving, altering data or computer clocks, improper macros, etc., accepting/offering kickbacks, illegal accounting practices, unfair competition/collusion)
- Internal monitoring. Investigations and data recalls.
- Consequences for infractions including potential for immediate termination, debarment, or criminal prosecution.
- Importance of proper written narration / data qualification by the analyst and project manager with respect to those cases where the data may still be usable but are in one sense or another partially deficient.

Additionally, a data integrity hotline (1-800-736-9407) is maintained by the NDSC and can be used for anonymous reporting.

6.0 ACCOMMODATIONS AND ENVIRONMENTAL CONDITIONS

6.1 Overview

The laboratory is a 55,000 ft^2 secure laboratory facility with controlled access and designed to accommodate an efficient workflow and to provide a safe and comfortable work environment for employees. All visitors sign in and are escorted by laboratory personnel. Access is controlled by various measures.

The laboratory is equipped with structural safety features. Each employee is familiar with the location, use, and capabilities of general and specialized safety features associated with their workplace. The laboratory provides and requires the use of protective equipment including safety glasses, protective clothing, gloves, etc., OSHA and other regulatory agency guidelines regarding required amounts of bench and fume hood space, lighting, ventilation (temperature and humidity controlled), access, and safety equipment are met or exceeded.

Traffic flow through sample preparation and analysis areas is minimized to reduce the likelihood of contamination. Adequate floor space and bench top area is provided to allow unencumbered sample preparation and analysis space. Sufficient space is also provided for storage of reagents and media, glassware, and portable equipment. Ample space is also provided for refrigerated sample storage before analysis and archival storage of samples after analysis. Laboratory HVAC and deionized water systems are designed to minimize potential trace contaminants.

The laboratory is separated into specific areas for sample receiving, sample preparation, volatile organic sample analysis, non-volatile organic sample analysis, inorganic sample analysis, and administrative functions

6.2 Environment

Laboratory accommodation, test areas, energy sources, and lighting are adequate to facilitate proper performance of tests. The facility is equipped with heating, ventilation, and air conditioning (HVAC) systems appropriate to the needs of environmental testing performed at this laboratory.

The environment in which these activities are undertaken does not invalidate the results or adversely affect the required accuracy of any measurements.

The laboratory provides for the effective monitoring, control, and recording of environmental conditions that may affect the results of environmental tests as required by the relevant specifications, methods, and procedures.

When any of the method or regulatory required environmental conditions change to a point where they may adversely affect test results, analytical testing will be discontinued until the environmental conditions are returned to the required levels.

Environmental conditions of the facility housing the computer network and LIMS are regulated to protect against raw data loss.

When the laboratory performs laboratory activities at sites or facilities outside its permanent control, it shall ensure that the requirements related to facilities and environmental conditions of this document are met.

Specific requirements for facility and environmental conditions, as well as periodic monitoring of conditions, are given in the Environmental Health and Safety Manual plus each laboratory's Facility Addendum.

6.3 Work Areas

There is effective separation between neighboring areas when the activities therein are incompatible with each other. Examples include:

- Volatile organic chemical handling areas, including sample preparation and waste disposal, and volatile organic chemical analysis areas.
- Access to and use of all areas affecting the quality of analytical testing is defined and controlled by secure access to the laboratory building as described below in the Building Security section.
- Adequate measures are taken to ensure good housekeeping in the laboratory and to ensure that any contamination does not adversely affect data quality. These measures include regular cleaning to control dirt and dust within the laboratory. Work areas are available to ensure an unencumbered work area. Work areas include:
- Access and entryways to the laboratory.
- Sample receipt areas.
- Sample storage areas.
- Chemical and waste storage areas.
- Data handling and storage areas.
- Sample processing areas.
- Sample analysis areas.

6.4 Responding to Emergencies

Employees must be aware of procedures to respond to all emergencies that might occur in the workplace. Employees must be familiar with the location and proper operation of all emergency equipment, evacuation routes and designated assembly areas for all areas where they work. Refer to the NDSC EH&S Manual Document No. CW-E-M-001. Sec. 7 and the laboratory's local EH&S Addendum for complete details. These documents provide direction for situations where normal operations of the laboratory are not possible (e.g., electrical failures, heating/air conditioning failures, fire/building evacuation, computer failures, hazardous material spills, injury to employees, pandemic flu, disruption of phone service, etc.)

In the event that the building or information technology (IT) systems would be severely challenged, a designated disaster recovery team, which includes Facility Management, Maintenance, Safety, Laboratory/Executive Management, Public Relations, IT, QA and other applicable personnel depending on the scope of the disaster, would assemble at a designated area to assess the situation and formulate a plan.

6.5 Building Security

The laboratory is considered a secure facility. All outside doors are locked during normal business hours to prevent unauthorized entry. Building keys and alarm codes are distributed to employees as necessary. Employees wear photographic identification name cards while on the premises.

All visitors to the laboratory must sign in and out in a visitor's logbook. A visitor is defined as any person who visits the laboratory who is not an employee of the laboratory. In addition to signing into the laboratory, the Environmental Health and Safety Manual contains requirements for visitors and vendors. There are specific safety forms that must be reviewed and signed.

Visitors (with the exception of company employees) are escorted by laboratory personnel at all times, or the location of the visitor is noted in the visitor's logbook.

7.0 QUALITY SYSTEM

7.1 Quality Policy Statement

The Quality Policy statement gives employees clear requirements for the production of analytical data. As an organization, all personnel are committed to high quality professional practice, testing and data, and service to our clients.

We strive to provide the highest quality data achievable by:

- Reading and understanding all of the quality documents applicable to each position and implementing the process in our work.
- Following all recordkeeping requirements; describing clearly and accurately all activities performed; recording "real time" as the task is carried out; understanding that it is never acceptable to "back date" entries and should additional information be required at a later date, the actual date and by whom the notation is made must be documented.
- Ensuring data integrity through the completeness, consistency, impartiality and accuracy of the data generated. Data is attributable, legible, contemporaneously recorded, original or a true copy, and accurate (ALCOA). This applies to manual paper documentation and electronic records.
- Providing accountability and traceability for each sample analyzed through proper sample handling, labeling, preparation, instrument calibration/qualification/validation, analysis, and reporting; establishing an audit trail (the who, what, when, and why) that identifies date, time, analyst, instrument used, instrument conditions, quality control samples (where appropriate and/or required by the method), and associated standard material.
- Emphasizing a total quality management process which provides impartiality, accuracy, and strict compliance with agency regulations and client requirements, giving the highest degree of confidence; understanding that meeting the requirements of the next employee in the work flow process is just as important as meeting the needs of the external client.
- Providing thorough documentation and explanation to qualify reported data that may not meet all requirements and specifications, but is still of use to the client; understanding this occurs only after discussion with the client on the data limitations and acceptability of this approach.
- Responding immediately to indications of questionable data, out-of-specification occurrences, equipment malfunctions, and other types of laboratory problems, with investigation and applicable corrective action; documenting these activities completely, including the reasons for the decisions made.
- Providing a work environment that ensures accessibility to all levels of management and encourages questions and expression of concerns on quality issues to management. Eurofins recognizes that the implementation of a quality assurance program requires management's commitment and support as well as the involvement of the entire staff
- Continually improve systems and manage risk to support quality improvement efforts in laboratory, administrative and managerial activities

Every staff member at the laboratory plays an integral part in quality assurance and is held responsible and accountable for the quality of their work. It is, therefore, required that all laboratory personnel are trained and agree to comply with applicable procedures and requirements established by this document, the ISO/IEC 17025:2017(E) International Standard,

the 2009 TNI Standard, and the DOD/DOE QSM, and to continually improve the effectiveness of the quality management system.

7.2 Ethics and Data Integrity

Eurofins Environment Testing America is committed to ensuring the integrity of its data and meeting the quality needs of its clients. The laboratory operates our Ethics and Data Integrity program under the guidance of Eurofins Key Guidance Document (KGD).

The elements of the our program include:

- An Ethics Policy (NDSC Document No. CW-L-P-004) and Employee Ethics Statements.
- Ethics and Compliance Officer/s (ECOs).
- A Training Program.
- Self-governance through disciplinary action for violations.
- A confidential mechanism for anonymously reporting alleged misconduct and a means for conducting internal investigations of all alleged misconduct. (NDSC Document No. CW-L-S-002).
- Procedures and guidance for recalling data if necessary (NDSC Document No. CW-Q-S-005).
- Effective external and internal monitoring system that includes procedures for internal audits (Section 17).
- Production of results, which are accurate and include QA/QC information that meets client pre-defined Data Quality Objectives (DQOs).
- Presentation of services in a confidential, honest and forthright manner.
- Provide employees with guidelines and an understanding of the Ethical and Quality Standards of our Industry.
- Provide procedures and guidance to ensure the impartiality and confidentiality of all data and customer information.
- Operate our facilities in a manner that protects the environment and the health and safety of employees and the public.
- Obey all pertinent federal, state and local laws and regulations and encourage other members of our industry to do the same.
- Educate clients as to the extent and kinds of services available.
- Assert competency only for work for which adequate personnel and equipment are available and for which adequate preparation has been made.
- Promote the status of environmental laboratories, their employees, and the value of services rendered by them.

7.3 Quality System Documentation

The laboratory's Quality System is communicated through a variety of documents.

- Quality Assurance (QA) Manual – Each laboratory has a lab-specific QA manual.
- NDSC Official Documents – Each laboratory may use the Guidance (instructional use) documents at their discretion. Template documents are process documents that the laboratories need to implement locally by using the document as is or as an outline to define their internal practices that meet the minimum requirements of the template. Required documents need to be implemented as is and listed in the laboratory's document control list.

- Key Guidance Documents (KGDs) - Documents compiled at the Group Service Centre (GSC) level by Functional Leaders (document owners) aimed at providing specific Eurofins groups of employees with guidelines necessary for the good conduct of their respective work.
- Laboratory SOPs and Policies – General and Technical
- Work Instructions – A subset of procedural steps, tasks or forms associated with an operation of a management system (e.g., checklists, preformatted bench sheets, forms).

7.3.1 Order of Precedence

In the event of a conflict or discrepancy between policies, the order of precedence is as follows:

- Quality Management Plan (QMP)
- NDSC Guidance Documents
- KGDs
- Laboratory Quality Assurance Manual (QA Manual)
- Laboratory SOPs and Policies
- Other (Work Instructions (WI), memos, flow charts, etc.)

Note: The laboratory has the responsibility and authority to operate in compliance with regulatory requirements of the jurisdiction in which the work is performed. Where the QMP conflicts with those regulatory requirements, the regulatory requirements of the jurisdiction shall hold primacy. The laboratory's QA Manual shall take precedence over the QMP in those cases.

7.4 QA/QC Objectives for the Measurement of Data

Quality Assurance (QA) involves developing planned activities whose purpose is to provide assurance to all levels of management that a quality program is in place within the laboratory, and that it is functioning in an effective manner that is consistent with the requirements of NELAP, ISO 17025, DoD, and any other regulatory agencies (i.e., states) in which the laboratory maintains accreditation.

Quality Control (QC) is generally understood to be limited to the analyses of samples and to be synonymous with the term *"analytical quality control"*. QC refers to the routine application of statistically based procedures to evaluate and control the accuracy of results from analytical measurements. The QC program includes procedures for estimating and controlling precision and bias and for determining reporting limits.

Request for Proposals (RFPs) and Quality Assurance Project Plans (QAPP) provide a mechanism for the client and the laboratory to discuss the data quality objectives in order to ensure that analytical services closely correspond to client needs. In order to ensure the ability of the laboratory to meet the Data Quality Objectives (DQOs) specified in the QAPP, clients are advised to allow time for the laboratory to review the QAPP before being finalized. The client is responsible for developing the QAPP; however, the laboratory will provide support to the client for developing the sections of the QAPP that concern laboratory activities.

Historically, laboratories have described their QC objectives in terms of precision, accuracy, representativeness, comparability, completeness, selectivity and sensitivity (PARCCSS). Each laboratory SOP defines the required QC indicators.

7.4.1 Precision

The objective is to meet the performance for precision demonstrated for the methods on similar samples and to meet DQOs of the EPA and/or other regulatory programs. Precision is defined as the degree of reproducibility of measurements under a given set of analytical conditions (exclusive of field sampling variability). Precision is documented on the basis of replicate analysis, usually duplicate or matrix spike (MS) duplicate samples.

7.4.2 Accuracy

The objective is to meet the performance for accuracy demonstrated for the methods on similar samples and to meet DQOs of the EPA and/or other regulatory programs. Accuracy is defined as the degree of bias in a measurement system. Accuracy may be documented through the use of laboratory control samples (LCS) and/or MS. A statement of accuracy is expressed as an interval of acceptance recovery about the mean recovery.

7.4.3 Representativeness

The objective is to provide data which is representative of the sampled medium. Representativeness is defined as the degree to which data represent a characteristic of a population or set of samples and is a measurement of both analytical and field sampling precision. The representativeness of the analytical data is a function of the procedures used in procuring and processing the samples. The representativeness can be documented by the relative percent difference between separately procured, but otherwise identical samples or sample aliquots.

The representativeness of the data from the sampling sites depends on both the sampling procedures and the analytical procedures. Refer to laboratory SOPs for subsampling and homogenization techniques appropriate to the analytical method.

7.4.4 Comparability

The objective is to provide analytical data for which the accuracy, precision, representativeness, and reporting limit statistics are similar to these quality indicators generated by other laboratories for similar samples, and data generated by the laboratory over time.
Comparability is documented by inter-laboratory studies carried out by regulatory agencies or carried out for specific projects or contracts, by comparison of periodically generated statements of accuracy, precision, and reporting limits with those of other laboratories.

7.4.5 Completeness

The completeness objective for data is 90% (or as specified by a particular project), expressed as the ratio of the valid data to the total data over the course of the project. Data will be

considered valid if they are adequate for their intended use. Data usability will be defined in a QAPP, project scope, or regulatory requirement. Data validation is the process for reviewing data to determine its usability and completeness. If the completeness objective is not met, actions will be taken internally and with the data user to improve performance. This may take the form of an audit to evaluate the methodology and procedures as possible sources for the difficulty or may result in a recommendation to use a different method.

7.4.6 Selectivity

Selectivity is defined as the capability of a test method or instrument to respond to a target substance or constituent in the presence of non-target substances. Target analytes are separated from non-target constituents and subsequently identified/detected through one or more of the following, depending on the analytical method: extractions (separation), digestions (separation), interelement corrections (separation), use of matrix modifiers (separation), specific retention times (separation and identification), confirmations with different columns or detectors (separation and identification), specific wavelengths (identification), specific mass spectra (identification), and specific electrodes (separation and identification).

7.4.7 Sensitivity

Sensitivity refers to the amount of analyte necessary to produce a detector response that can be reliably detected (above the Method Detection Limit) or quantified (above the Reporting Limit).

7.5 Criteria for Quality Indicators

The laboratory maintains Method Limit Groups in LIMS that summarize the precision and accuracy acceptability limits for performed analyses. This summary includes an effective date, is updated each time new limits are generated, and are managed by the laboratory's QA Department. Unless otherwise noted, limits within these tables are laboratory generated. Some acceptability limits are derived from US EPA methods when they are required. Where US EPA method limits are not required, the laboratory has developed limits from evaluation of data from similar matrices. Criteria for development of control limits are contained in SOP SA-QA-017: *Evaluation of Batch QC Data*.

7.6 Statistical Quality Control

Statistically-derived precision and accuracy limits are required by selected methods (such as SW-846) and programs. The laboratory routinely utilizes statistically-derived limits to evaluate method performance and determine when corrective action is appropriate. The analysts use the current limits entered into LIMS. The QA department maintains an archive of all limits used within the laboratory. If a method defines the QC limits, the method limits are used.

If a method requires the generation of historical limits, the lab develops such limits from recent data in the QC database of the LIMS following the guidelines described in Section 26. All calculations and limits are documented and dated when approved and effective. On occasion, a client requests contract-specified limits for a specific project.

Current QC limits are entered and maintained in the LIMS analyte database. As sample results and the related QC are entered into LIMS, the sample QC values are compared with the limits in LIMS to determine if they are within the acceptable range. The analyst then evaluates if the sample needs to be rerun or re-extracted/rerun or if a comment should be added to the report explaining the reason for the QC outlier.

7.6.1 QC Charts

Control charting is a useful tool and is performed to assess analyte recoveries over time to evaluate trends. Control charting must be performed periodically (recommended annually) in accordance with SOP SA-QA-017: *Evaluation of Batch QC Data.* The QA Manager evaluates control charts to determine if adjustments need to be made or for corrective actions to methods. All findings are documented and kept on file.

7.7 Quality System Metrics

In addition to the QC parameters discussed above, the entire Quality System is evaluated on a monthly basis through the use of specific metrics (refer to Section 18). These metrics are used to drive continuous improvement in the laboratory's Quality System.

8.0 DOCUMENT CONTROL

8.1 Overview

The QA Department is responsible for the control of documents used in the laboratory to ensure that approved, up-to-date documents are in circulation and out-of-date (obsolete) documents are archived or destroyed. The following documents, at a minimum, must be controlled:

- Laboratory Quality Assurance (QA) Manual
- Laboratory Standard Operating Procedures (SOP)
- Laboratory Policies
- Work Instructions and Forms
- NDSC Documents[1]
- KGDs[1]

[1]Includes locally implemented documents that are document controlled within the laboratory's document control system.

The NDSC and/or KGD documents are only considered controlled when they are read on the intranet site. Printed copies are considered uncontrolled unless the laboratory physically distributes them as controlled documents. A detailed description of the procedure for issuing, authorizing, controlling, distributing, and archiving NDSC Official Documents is found in document No. CW-Q-S-001: *NDSC Document Control and Archiving*. The laboratory's internal document control procedure is defined in SOP No. SA-QA-001.

The laboratory QA Department also maintains access to various references and document sources integral to the operation of the laboratory. This includes reference methods and regulations. Instrument manuals (hard or electronic copies) are also maintained by the laboratory.

The laboratory maintains control of records for raw analytical data and supporting records such as audit reports and responses, logbooks, standard logs, training files, MDL studies, Proficiency Testing (PT) studies, certifications and related correspondence, and corrective action reports.

Raw analytical data consists of bound logbooks, instrument printouts, any other notes, magnetic media, electronic data, and final reports.

8.2 Document Approval and Issue

The pertinent elements of the document control system includes a unique document title and number, pagination, the total number of pages of the item or an 'end of document' page, the effective date, revision number, and the laboratory's name. The QA personnel are responsible for the maintenance of this system.

Controlled documents are authorized by the QA Department. In order to develop a new document, an employee submits an electronic draft to the QA Department for suggestions and approval before use. Upon approval, QA personnel add the identifying version information to the document and retain that document as the official document on file. That document is then

provided to all applicable operational units. Controlled documents are identified as such and records of their distribution are kept by the QA Department. Document control may be achieved by either electronic or hardcopy distribution.
The QA Department maintains a list of the official versions of controlled documents.

Quality System Policies and Procedures will be reviewed at a minimum of every year and revised as appropriate. Changes to documents occur when a procedural change warrants.

8.3 Procedures for Document Control Policy

For changes to the QA Manual, refer to SOP SA-QA-001: *Document Control Program.* Uncontrolled copies must not be used within the laboratory. Previous revisions and back-up data are stored by the QA Department. Electronic controlled pies are stored on the Public server in the QA folder.

For changes to SOPs, refer to SOP SA-QA-001: *Document Control Program.*
Electronic copies of current documents (including QA Manuals, SOPs, Forms, Work Instructions, etc.) are maintained by the QA Department and distributed electronically via the LIMS File System Shares.

8.4 Obsolete Documents

All invalid or obsolete documents are removed, or otherwise prevented from unintended use. The laboratory has specific procedures as described above to accomplish this. In general, obsolete documents are collected from employees according to distribution lists and are marked obsolete on the cover or destroyed. At least one copy of the obsolete document is archived according to SOP SA-QA-001: *Document Control Program.*

9.0 SERVICE TO THE CLIENT

9.1 Overview

The laboratory has established procedures for the review of work requests and contracts, oral or written. The procedures include evaluation of the laboratory's capability and resources to meet the contract's requirements within the requested time period. All requirements, including the methods to be used, must be adequately defined, documented and understood. For many environmental sampling and analysis programs, testing design is site or program specific and does not necessarily fit into a standard laboratory service or product. It is the laboratory's intent to provide both standard and customized environmental laboratory services to our clients.

A thorough review of technical and QC requirements contained in contracts is performed to ensure project success. The appropriateness of requested methods, and the lab's capability to perform them must be established. Projects, proposals, and contracts are reviewed for adequately defined requirements and the laboratory's capability to meet those requirements. Alternate test methods that are capable of meeting the clients' requirements may be proposed by the lab. A review of the lab's capability to analyze non-routine analytes is also part of this review process.

All projects, proposals and contracts are reviewed for the client's requirements in terms of compound lists, test methodology requested, sensitivity (detection and reporting levels), accuracy, and precision requirements (% Recovery and RPD). The reviewer ensures that the laboratory's test methods are suitable to achieve these requirements and that the laboratory holds the appropriate certifications and approvals to perform the work. The laboratory and any potential subcontract laboratories must be certified, as required, for all proposed tests.

Electronic or hard copy deliverable requirements are evaluated against the laboratory's capacity for production of the documentation.

If the laboratory cannot provide all services but intends to subcontract such services, whether to another Eurofins facility on the same LIMS or to an outside firm, this will be documented and discussed with the client prior to contract approval. (Refer to Section 10 for Subcontracting Procedures.)

The laboratory informs the client of the results of the review if it indicates any potential conflict, deficiency, lack of accreditation, or inability of the lab to complete the work satisfactorily. Any discrepancy between the client's requirements and the laboratory's capability to meet those requirements is resolved in writing before acceptance of the contract. It is necessary that the contract be acceptable to both the laboratory and the client. Amendments initiated by the client and/or Eurofins are documented in writing.

All contracts, QAPPs, Sampling and Analysis Plans (SAPs), contract amendments, and documented communications become part of the project record.

The same contract review process used for the initial review is repeated when there are amendments to the original contract by the client, and the participating personnel are informed of the changes.

9.2 Review Sequence and Key Personnel

Appropriate personnel will review the work request at each stage of evaluation.

For routine projects and other simple tasks, a review by the Project Manager (PM) is considered adequate. The PM confirms that the laboratory has any required certifications, that it can meet the clients' data quality and reporting requirements, and that the lab has the capacity to meet the clients turn around needs.

For new, complex or large projects, the proposed contract is given to the Sale Directors, who will decide which lab will receive the work based on the scope of work and other requirements, including certification, testing methodology, and available capacity to perform the work. The contract review process is outlined in NDSC Document CA-L-P-002: *Contract Compliance Policy.*

This review encompasses all facets of the operation. The scope of work is distributed to the appropriate personnel, as needed based on scope of contract, to evaluate all of the requirements shown above.

The Laboratory Director reviews the formal laboratory quote and makes final acceptance for their facility.

The Sales Director, Contract Administrator, Account Executive or Proposal Coordinator then submits the final proposal to the client.

In the event that one of the designated personnel is not available to review the contract, his back-up will fulfill the review requirements.

9.3 Balancing Laboratory Capacity and Workload

Evaluating laboratory capacity to perform specific projects is the responsibility of the Business Unit Manager and Laboratory Director. Many analysts are cross-trained to perform a variety of tests, and there is redundant equipment available in case of malfunctions. This minimizes the need to evaluate small and medium size projects against capacity available to complete them. Large and complex projects are reviewed against capacity estimates before bids are submitted to ensure that the client's analysis schedule is met. Regularly scheduled meetings are held between laboratory management, Client Services, and QA personnel to review progress with current projects, as well as special requirements of new work scheduled for the laboratory. Laboratory capacity and backlog is tracked on a continuous basis using information from the Laboratory Information Management System (LIMS) including turnaround time, and work in-house.

9.4 Documentation

The Contracts Department maintains copies of all signed contracts. Locally, the Quality Assurance Specialist maintains copies.

Appropriate records are maintained for every contract or work request. All stages of the contract review process are documented and include records of any significant changes. These records are maintained by the Quality Assurance Specialist.

The contract will be distributed to and maintained by the appropriate sales/marketing personnel and the Account Executive. A copy of the contract and formal quote will be filed with the laboratory PM and the Laboratory Director.

Records are maintained of pertinent discussions with a client relating to the client's requirements or the results of the work during the period of execution of the contract.

9.4.1 Project-Specific Quality Planning

Communication of contract specific technical and QC criteria is an essential activity in ensuring the success of site specific testing programs. To achieve this goal, a PM is assigned to each client. It is the PM's responsibility to ensure that project-specific technical and QC requirements are effectively evaluated and communicated to the laboratory personnel before and during the project. QA department involvement may be needed to assist in the evaluation of custom QC requirements.

PMs are the primary client contact and they ensure resources are available to meet project requirements. They coordinate opportunities and work with laboratory management and supervisory staff to ensure available resources are sufficient to perform work for the client's project.

Prior to work on a new project, the dissemination of project information and/or project opening meetings may occur to discuss schedules and unique aspects of the project. Items to be discussed may include the project technical profile, turnaround times, holding times, methods, analyte lists, reporting limits, deliverables, sample hazards, or other special requirements. The PM introduces new project information to maximize production and client satisfaction, while maintaining quality. Project notes may be associated with each sample batch as a reminder upon sample receipt and analytical processing.

Any change that may occur within an active project is agreed upon between the client/regulatory agency and the PM/laboratory. These changes (e.g., use of a non-standard method or modification of a method) and approvals must be documented prior to implementation. Documentation pertains to any document (e.g., letter, e-mail, variance, contract addendum), which has been signed by both parties.

Such changes are also communicated to the laboratory during production meetings. The laboratory staff is then introduced to the modified requirements via the PM or the individual laboratory Technical Manager.

The laboratory strongly encourages client visits to the laboratory and for formal/informal information sharing session with employees in order to effectively communicate ongoing client needs as well as project specific details for customized testing programs.

9.5 Special Services

The laboratory cooperates with clients and their representatives to monitor the laboratory's performance in relation to work performed for the client. It is the laboratory's goal to meet all client requirements in addition to statutory and regulatory requirements. The laboratory has procedures to ensure confidentiality to clients (Section 17 and 25).

The laboratory's standard procedures for reporting data are described in Section 25. Special services are also available and provided upon request. These services include:

- Reasonable access for our clients or their representatives to the relevant areas of the laboratory for the witnessing of tests performed for the client.
- Assisting client-specified third party data validators as specified in the client's contract.
- Supplemental information pertaining to the analysis of their samples. Note: An additional charge may apply for additional data/information that was not requested prior to the time of sample analysis or previously agreed upon.

When the client requests a statement of conformity to a specification or standard based on the analysis performed by the laboratory (e.g., pass/fail, in-tolerance/out-of-tolerance), the decision rule shall be clearly defined. Unless inherent in the requested specification or standard, the decision rule selected shall be communicated to the client. Associated reporting requirements are addressed in Section 25.2.18.

9.6 Client Communication

PMs are the primary communication link to the clients. They shall inform their clients of any delays in project completion as well as any non-conformances in either sample receipt or sample analysis. Project management will maintain ongoing client communication throughout the entire client project.

Technical Managers are available to discuss any technical questions or concerns that the client may have.

9.7 Reporting

The laboratory works with our clients to produce any special communication reports required by the contract.

9.8 Client Feedback and Surveys

The laboratory assesses both positive and negative client feedback. The results are used to improve overall laboratory quality and client service. Eurofins Sales and Marketing teams periodically develop lab and client specific surveys to assess client satisfaction.

When a complaint is received, we determine, to the best of our ability, the extent of the issue and what data is in question. The person receiving the complaint documents this information and promptly forwards it to the appropriate management personnel where the work in question was performed. If a data reporting error is discovered, the final report and/or data must be regenerated with the correct value(s).

The QA Department is responsible for entering client concerns into ICAT where a CAR is initiated to address and document the situation. While an individual issue may not warrant a formal investigation, QA monitors these issues for potential trends and will issue a CAR if a trend is evident.

10.0 SUBCONTRACTING OF TESTS

The laboratory may subcontract tests to other laboratories if the requested testing is not routinely performed in our facility. To a lesser extent, samples may also need to be subcontracted to an overflow laboratory to ensure holding times and/or turn-around-times (TAT) are met.

Testing is only subcontracted with the client's knowledge and approval. The Project Manager must notify the client in writing when any of their requested analyses will be subcontracted to another lab. Client approval must be obtained in writing before samples are shipped.

Subcontract laboratories are selected based on their qualifications and accreditations. The subcontractor is requested to sign a Laboratory Analytical Services Subcontract. Refer to form Q-EQA-FRM6867 to review details of the contract terms and information requested from the subcontract laboratory. If projects require a specific agency certification (e.g., individual state agencies, NELAP, DoD, ISO 17025, etc.), only an appropriately accredited laboratory is used. The client may also have a list of laboratories to be used for subcontracting. In these cases, the evaluation of the subcontract laboratory is made by the client.

Data obtained from subcontract laboratories is clearly marked as such when reported by the laboratory. The data are submitted to the client in the format obtained from the subcontractor.

10.1 Overview

For the purpose of this quality manual, the phrase subcontract laboratory refers to a laboratory external to the Eurofins laboratories and those not on TALS. The phrase "work sharing" refers to internal transfers of samples between the Eurofins laboratories on TALS. The term outsourcing refers to the act of subcontracting tests.

When contracting with our clients, the laboratory makes commitments regarding the services to be performed and the data quality for the results to be generated. When the need arises to outsource testing for our clients because project scope, changes in laboratory capabilities, capacity, or unforeseen circumstances, we must be assured that the subcontractors or work sharing laboratories understand the requirements and will meet the same commitments we have made to the client. Refer to the NDSC Documents on Subcontracting Procedures (CW-L-S-004) and the Work Sharing Process (CA-C-S-001).

When outsourcing analytical services, the laboratory will assure, to the extent necessary, that the subcontract or work sharing laboratory maintains a program consistent with the requirements of this document, the requirements specified in TNI/ISO 17025 and/or the client's Quality Assurance Project Plan (QAPP). All QC guidelines specific to the client's analytical program are transmitted to the subcontractor and agreed upon before sending the samples to the subcontract facility. Additionally, work requiring accreditation will be placed with an appropriately accredited laboratory. The laboratory performing the subcontracted work will be identified in the final report, as will non-TNI accredited work where required.

PMs or other responsible Client Service members, for the export lab (i.e., the Eurofins TestAmerica laboratory that transfers samples to another laboratory) are responsible for obtaining client approval prior to subcontracting any samples. The laboratory will advise the client of a subcontract arrangement in writing and when possible approval from the client shall be obtained and retained in the project folder. Standard Eurofins TestAmerica Terms & Conditions include the flexibility to subcontract samples within the Eurofins TestAmerica laboratories. Therefore, additional advance notification to clients for intra-laboratory subcontracting is not necessary unless specifically required by a client contract.

Note: In addition to the client, some regulating agencies (e.g., USDA) or contracts (e.g., DoD projects) require notification prior to placing such work**.**

10.2 Qualifying and Monitoring Subcontractors

Whenever a PM becomes aware of a client requirement or laboratory need where samples must be outsourced to another laboratory, the other laboratory(s) shall be selected based on the following:

- Subcontractors specified by the client - In these circumstances, the client assumes responsibility for the quality of the data generated from the use of a subcontractor.
- Subcontractors reviewed by Eurofins TestAmerica – Firms which have been reviewed by the company and are known to meet standards for accreditations (e.g., State, TNI and DoD/DOE); technical specifications; legal and financial information.

A listing of vendors is available on the Eurofins TestAmerica intranet site.

All Eurofins TestAmerica laboratories are pre-qualified for work sharing provided they hold the appropriate accreditations and can adhere to the project/program requirements. Client approval is not necessary unless specifically required by the contract. In these cases, the client must provide acknowledgement that the samples can be sent to that facility (an e-mail is sufficient documentation or if acknowledgement is verbal, the date, time, and name of person providing acknowledgement must be documented). The originating laboratory is responsible for communicating all technical, quality, and deliverable requirements as well as other contract needs. (NDSC Document No. CA-C-S-001, Work Sharing Process)

10.2.1 When the potential subcontract laboratory has not been previously approved, Account Executives or PMs may nominate a laboratory as a subcontractor based on need. The decision to nominate a laboratory must be approved by the Client Relations Manager (CRM) or Laboratory Director. The CRM or Laboratory Director requests that the PM begins the process of approving the subcontract laboratory as outlined in NDSC Document No. CW-L-S-004, Subcontracting Procedures.

Once the appropriate accreditation and legal information is received by the laboratory, it is evaluated for acceptability and forwarded to the NDSC Quality Information Manager (QIM) for review. After the NDSC QIM reviews the documents for completeness, the information is forwarded to the Finance Department for formal signature and contracting with the laboratory. The approved vendor will be added to the approved subcontractor list on the intranet site, and the finance group is concurrently notified.

The client will assume responsibility for the quality of the data generated from the use of a subcontractor they have requested the lab to use. The qualified subcontractors on the intranet site are known to meet minimal standards. Eurofins TestAmerica does not certify laboratories. The subcontractors on our approved list can only be recommended to the extent that we would use them.

10.3 Oversight and Reporting

The status and performance of qualified subcontractors will be monitored by NDSC QA Department, and includes an annual review process (see NDSC Document No. SOP CW-L-S-004). Any problems identified will be brought to the attention of NDSC QA and Procurement personnel.

- Complaints shall be investigated. Documentation of the complaint, investigation, and corrective action will be maintained in the subcontractor's file on the intranet site. Complaints are posted using the Vendor Performance Report.
- Information shall be updated on the intranet when new information is received from the subcontracted laboratories.
- Subcontractors in good standing will be retained on the intranet listing. Client Service personnel will notify all TestAmerica laboratories, NDSC QA and Contracts Departments if any laboratory requires removal from the intranet site. This notification will be posted on the intranet site and e-mailed to all Client Service Personnel, Laboratory Directors, QA Managers, and Sales Personnel.

Prior to initially sending samples to the subcontracted laboratory, the PM confirms their certification status to determine if it's current and scope-inclusive. The information is documented within the project records.

The laboratory's certifications can be viewed on the company's website.

10.3.1 All subcontracted samples must be accompanied by a Eurofins TestAmerica Chain-of-Custody (COC). A copy of the original COC sent by the client must be available in LIMS for all samples workshares within Eurofins TestAmerica. Client COCs are only forwarded to external subcontractors when samples are shipped directly from the project site to the subcontractor lab. Under routine circumstances, client COCs are not provided to external subcontractors.

Through communication with the subcontracted laboratory, the PM monitors the status of the subcontracted analyses, facilitates successful execution of the work, and ensures the timeliness and completeness of the analytical report.

Non-TNI accredited work must be identified in the subcontractor's report as appropriate. If TNI accreditation is not required, the report does not need to include this information.

Reports submitted from subcontractor laboratories are not altered and are included in their original form in the final project report. This clearly identifies the data as being produced by a subcontractor facility. If subcontract laboratory data is incorporated into the laboratory's EDD (i.e., imported), the report must explicitly indicate which lab produced the data for which methods and samples.

Note: The results submitted by a Eurofins TestAmerica work sharing laboratory may be transferred electronically and the results reported by the Eurofins TestAmerica work sharing lab are identified on the final report. The report must explicitly indicate which lab produced the data for which methods and samples. The final report must include a copy of the completed COC for all work sharing reports.

10.4 Contingency Planning

The full qualification of a subcontractor may be waived to meet emergency needs. This decision and justification must be documented in the project files, and the 'Purchase Order Terms And Conditions For Subcontracted Laboratory Services' must be sent with the samples and COC.

In the event this provision is utilized, the laboratory (e.g., PM) will be required to verify and document the applicable accreditations of the subcontractor. All other quality and accreditation requirements will still be applicable, but the subcontractor need not have signed a subcontract agreement with Eurofins TestAmerica at this time.

The use of any emergency subcontractor will require the PM to complete a New Vendor Add Form in order to process payment to the vendor and add them to LIMS. This form requires the user to define the subcontractor's category/s of testing and the reason for testing.

10.5 Use of NELAP and A2LA Logo

It is not laboratory policy to use these logos on any company letterhead, including analytical reports.

11.0 PURCHASING SERVICES AND SUPPLIES

11.1 Overview

Evaluation and selection of suppliers and vendors is performed, in part, on the basis of the quality of their products, their ability to meet the demand for their products on a continuous and short term basis, the overall quality of their services, their past history, and competitive pricing. This is achieved through evaluation of objective evidence of quality furnished by the supplier, which can include certificates of analysis, recommendations, and proof of historical compliance with similar programs for other clients. To ensure that quality critical consumables and equipment conform to specified requirements, which may affect quality, all purchases from specific vendors are approved by a member of the supervisory or management staff. Capital expenditures are made in accordance with NDSC Document No. CW-F-S-007, Eurofins TestAmerica's Fixed Asset Acquisition, Retention and Safeguarding.

Contracts will be signed in accordance with the laboratory's authorization matrix, NDSC Document No. CW-F-P-002, Company-Wide Authorization Matrix Policy. Requests for Proposals (RFPs) will be issued where more information is required from the potential vendors than just price. Process details are available in NDSC Document No. CW-F-P-004, Guidance on Procurement and Contracts Policy. RFPs allow the laboratory to determine if a vendor is capable of meeting requirements such as supplying all of the laboratory facilities, meeting required quality standards and adhering to necessary ethical and environmental standards. The RFP process also allows potential vendors to outline any additional capabilities they may offer.

11.2 Glassware

Glassware used for volumetric measurements must be Class A or verified for accuracy according to laboratory procedure. Pyrex (or equivalent) glass should be used where possible. For safety purposes, thick-wall glassware should be used where available.

11.3 Reagents, Standards, and Supplies

Purchasing guidelines for equipment, consumables, and reagents must meet the requirements of the specific method and testing procedures for which they are being purchased. Solvents and acids are pre-tested in accordance with NDSC Document No. CA-Q-S-001 *Solvent and Acid Lot Testing and Approval.* Approval information for the solvents and acids tested under Document No. C-Q-S-001 is stored on the laboratory's shared files under Solvent Approvals. A master list of all tested materials, as well as the certificates of analysis for the materials, is stored in the same location.

11.3.1 Purchasing

Chemical reagents, solvents, glassware, and general supplies are ordered as needed to maintain sufficient quantities on hand. Materials used in the analytical process must be of a known quality. The wide variety of materials and reagents available makes it advisable to specify recommendations for the name, brand, and grade of materials to be used in any determination. This information is contained in the method SOP.

11.3.2 Receiving

It is the responsibility of the shipping/receiving department to receive the shipment. It is the responsibility of the analyst who ordered the materials to document the date materials were received. Once the ordered reagents or materials are received, the analyst compares the information on the label or packaging to the original order to ensure that the purchase meets the quality level specified. This is documented through the addition of the received date and initials to the information present on the order log.

The department verifies the lot numbers of received solvents and acids against the pre-approval lists. If a received material is listed as unapproved, or is not listed, it is sequestered and returned to the vendor. Alternatively, the laboratory may test the material for the intended use, and if it is acceptable, document the approval on the approval list. Records of any testing performed locally are maintained on the shared "public" folder on the computer network.
Materials may not be released for use in the laboratory until they have been inspected, verified as suitable for use, and the inspection/verification has been documented.

Safety Data Sheets (SDSs) are available online through the Company's intranet website. Anyone may review these for relevant information on the safe handling and emergency precautions of on-site chemicals.

11.3.3 Specifications

Methods used in the laboratory specify the grade of reagent that must be used in the procedure. If the quality of the reagent is not specified, analytical reagent grade will be used. It is the responsibility of the analyst to check the procedure carefully for the suitability of grade of reagent.

Chemicals must not be used past the manufacturer's expiration date and must not be used past the expiration time noted in a method SOP. If expiration dates are not provided, the laboratory may contact the manufacturer to determine an expiration date.

The laboratory assumes a five year expiration date on inorganic dry chemicals and solvents unless noted otherwise by the manufacturer or by the reference source method.

Chemicals/solvents should not be used past the manufacturer's or SOP expiration date unless verified as outlined below.

- An expiration date cannot be extended if the dry chemical/solvent is discolored or appears otherwise physically degraded. In this case, the dry chemical/solvent must be discarded.
- Expiration dates can be extended if the dry chemical/solvent is found to be satisfactory based on acceptable performance of quality control samples (Continuing Calibration Verification (CCV), Blanks, Laboratory Control Sample (LCS), etc.).
- If the dry chemical/solvent is used for the preparation of standards, the expiration dates can be extended 6 months if the dry chemical/solvent is compared to an unexpired independent source in performing the method and the performance of the dry chemical/solvent is found to be satisfactory. The comparison must show that the dry chemical/solvent meets CCV limits. The comparison studies are maintained on-file and available for review.

Wherever possible, standards must be traceable to national or international standards of measurement or to national or international reference materials. Records to that effect are available to the user.

Compressed gases in use are checked for pressure and secure positioning daily. To prevent a tank from going to dryness, or introducing potential impurities, the pressure should be closely watched as it decreases to approximately 15% of the original reading, at which point it should be replaced. For example, a standard sized laboratory gas cylinder containing 3,000 psig of gas should be replaced when it drops to approximately 500 psig. The quality of the gases must meet method or manufacturer specification or be of a grade that does not cause any analytical interference.

Water used in the preparation of samples, standards or reagents must have a specific conductivity of less than 1-µmho/cm (or specific resistivity of greater than 1.0 megohm-cm) at 25ºC. The specific conductivity is checked and recorded daily. If the water's specific conductivity is greater than the specified limit, the Facility Manager and appropriate Technical Managers must be notified immediately in order to notify all departments, decide on cessation (based on intended use) of activities, and make arrangements for correction.

The laboratory may purchase reagent grade (or other similar quality) water for use in the laboratory. This water must be certified clean by the supplier for all target analytes or otherwise verified by the laboratory prior to use. This verification is documented.

Standard lots are verified before first time use if the laboratory switches manufacturers or has historically had a problem with the type of standard.

Purchased bottleware used for sampling must be certified clean and the certificates must be maintained. If uncertified sampling bottleware is purchased, all lots must be verified clean prior to use. This verification must be maintained.

Records of manufacturer's certification and traceability statements are maintained in files or binders in each laboratory section. These records include date of receipt, lot number (when applicable), and expiration date (when applicable). Incorporation of the item into the record indicates that the analyst has reviewed the certificate.

11.3.4 Storage

Reagent and chemical storage is important from the aspects of both integrity and safety. Light-sensitive reagents may be stored in brown-glass containers. Storage conditions are per the NDSC Environmental Health & Safety Manual, Document No. CW-E-M-001, the local laboratory EHSM addendum and method SOPs or manufacturer instructions.

11.4 Purchase of Equipment / Instruments / Software

When a new piece of equipment is needed, either for additional capacity or for replacing inoperable equipment, the analyst or supervisor makes a supply request to the Technical Manager and/or the Laboratory Director. If they agree with the request, the procedures outlined in NDSC Document No. CA-T-P-001, Qualified Products List, are followed. A decision is made as to which piece of equipment can best satisfy the requirements. The appropriate written requests are completed and purchasing places the order.
Upon receipt of a new or used piece of equipment, an identification name is assigned and added to the equipment list. IT must also be notified so that they can synchronize the instrument for back-ups. Its capability is assessed to determine if it is adequate or not for the specific application. For instruments, a calibration curve is generated, followed by MDLs, Demonstration of Capabilities (DOCs), and other relevant criteria (refer to Section 20). For software, its operation must be deemed reliable and evidence of instrument verification must be retained by the IT Department. Software certificates supplied by the vendors are filed with the LIMS Administrator. The manufacturer's operation manual is retained electronically.

11.5 Services

Service to analytical instruments (except analytical balances) is performed on an as needed basis. Routine preventative maintenance is discussed in Section 22. The need for service is determined by analysts and/or Technical Managers. The service providers that perform the services are approved by the Technical Manager.

Analytical balances are serviced and calibrated annually in accordance with SOP SA-AN-100: *Laboratory Support Equipment.* The calibration and maintenance services are performed on-site, and the balances are returned to use immediately following successful calibration. Calibration certificates are filed for reference. If the calibration was unsuccessful, the balance is immediately removed from service and segregated pending either further maintenance or disposal.

Calibration services for support equipment such as thermometers, weight sets, autopipettors, etc., are obtained from vendors with current and valid ISO 17025 accreditation for calibration of the specific piece of equipment. Prior to utilizing the vendor's services, the vendor's accreditation status is verified. Once the equipment has been calibrated, the calibration certificates are reviewed by the QA Department, and documentation of the review is filed with the calibration certificates. The equipment is then returned to service within the laboratory

11.6 Suppliers

The laboratory selects vendors through a competitive proposal / bid process, strategic business alliances or negotiated vendor partnerships (contracts). This process is defined in the NDSC Document No. CW-F-P-004, Procurement & Contracts Policy. The level of control used in the selection process is dependent on the anticipated spending amount and the potential impact on the laboratory's business. Vendors that provide test and measuring equipment, solvents, standards, certified containers, instrument related service contracts or subcontract laboratory services shall be subject to more rigorous controls than vendors that provide off-the-shelf items

of defined quality that meet the end use requirements. The purchasing system includes all suppliers/vendors that have been approved for use.

Evaluation of suppliers is accomplished by ensuring the supplier ships the product or material ordered and that the material is of the appropriate quality. This is documented by signing off on packing slips or other supply receipt documents. The purchasing documents contain the data that adequately describe the services and supplies ordered.

Any issues of vendor performance are to be reported immediately by the laboratory staff to the Purchasing Group by completing a Vendor Performance Report.
The Purchasing Group will work through the appropriate channels to gather the information required to clearly identify the problem and will contact the vendor to report the problem and to make any necessary arrangements for exchange, return authorization, credit, etc.

Suppliers are subject to re-evaluation, as deemed appropriate, through the use of Vendor Performance Reports used to summarize and review to determine corrective action necessary, or service improvements required by vendors

The laboratory has access to a listing of all approved suppliers of critical consumables, supplies and services. This information is provided through the purchasing system.

11.6.1 New Vendor Procedure

Laboratory employees who wish to request the addition of a new vendor must complete a Vendor Add Request Form.

New vendors are evaluated based upon criteria appropriate to the products or services provided as well as their ability to provide those products and services at a competitive cost. Vendors are also evaluated to determine if there are ethical reasons or potential conflicts of interest with laboratory employees that would make it prohibitive to do business with them as well as their financial stability. The QA Department and/or the Technical Management are consulted with vendor and product selection that have an impact on quality.

12.0 COMPLAINTS

12.1 Overview

The laboratory considers an effective client complaint handling processes to be of significant business and strategic value. Listening to and documenting client concerns captures client knowledge that enables our operations to continually improve processes and client satisfaction. An effective client complaint handling process also provides assurance to the data user that the laboratory will stand behind its data, service obligations and products.

A client complaint is any expression of dissatisfaction with any aspect of our business services (e.g., communications, responsiveness, data, reports, invoicing and other functions) expressed by any party, whether received verbally or in written form. Client inquiries, complaints or noted discrepancies are documented, communicated to management, and addressed promptly and thoroughly.

The laboratory has procedures for addressing both external and internal complaints with the goal of providing satisfactory resolution to complaints in a timely and professional manner.
The nature of the complaint is identified, documented and investigated, and an appropriate action is determined and taken. In cases where a client complaint indicates that an established policy or procedure was not followed, the QA Department must evaluate whether a special audit must be conducted to assist in resolving the issue. A written confirmation or letter to the client, outlining the issue and response taken is recommended as part of the overall action taken.
The process of complaint resolution and documentation utilizes the procedures outlined in Section 14 (Corrective Actions) and is documented following SOP SA-QA-005: *Preventive and Corrective Action.* A copy of this procedure will be made available to any interested party on request.

12.2 External Complaints

An employee that receives a complaint initiates the complaint resolution process by first documenting the complaint according to SOP SA-CA-005.
Complaints fall into two categories: correctable and non-correctable. An example of a correctable complaint would be one where a report re-issue would resolve the complaint. An example of a non-correctable complaint would be one where a client complains that their data was repeatedly late. Non-correctable complaints should be reviewed for preventive action measures to reduce the likelihood of future occurrence and mitigation of client impact.

The general steps in the complaint handling process are:
- Receiving and documenting complaints
- Acknowledging receipt of complaint, whenever possible
- Complaint investigation and service recovery
- Process improvement

The laboratory shall inform the initiator of the complaint of the results of the investigation and the corrective action taken, if any.

12.3 Internal Complaints

Internal complaints include, but are not limited to: errors and non-conformances, training issues, internal audit findings, and deviations from methods. Corrective actions may be initiated by any staff member who observes a nonconformance and shall follow the procedures outlined in Section 14. In addition, Executive Management, Sales and Marketing, and IT may initiate a complaint by contacting the laboratory or through the corrective action system described in Section 14.

12.4 Management Review

The number and nature of client complaints is reported by the QA Manager, Laboratory Director, and Quality Director in the QA Monthly report. Monitoring and addressing the overall level and nature of client complaints and the effectiveness of the solutions is part of the Annual Management Systems Review (Section 18).

13.0 CONTROL OF NON-CONFORMING WORK

13.1 Overview

When data discrepancies are discovered or deviations and departures from laboratory SOPs, policies and/or client requests have occurred, corrective action is taken immediately. First, the laboratory evaluates the significance of the nonconforming work. Then, a corrective action plan is initiated based on the outcome of the evaluation. If it is determined that the nonconforming work is an isolated incident, the plan could be as simple as adding a qualifier to the final results and/or making a notation in the case narrative. If it is determined that the nonconforming work is a systematic or improper practices issue, the corrective action plan could include a more in depth investigation and a possible suspension of an analytical method. In all cases, the actions taken are documented using the laboratory's corrective action system (refer to Section 14).

Due to the frequently unique nature of environmental samples, sometimes departures from documented policies and procedures are needed. When an analyst encounters such a situation, the problem is presented to the Department Manager for resolution. The Department Manager may elect to discuss it with the Technical Manager or have a representative contact the client to decide on a logical course of action. Once an approach is agreed upon, the analyst documents it using the laboratory's corrective action system described in Section 12. This information can then be supplied to the client in the form of a footnote or a case narrative with the report.

Project Management may encounter situations where a client requests that a special procedure be applied to a sample that is not standard laboratory practice. Based on a technical evaluation, the laboratory may accept or reject the request based on technical or ethical merit. Such a request would need to be approved by laboratory management and documented in the project files. Deviations to standard operating procedures must be noted in the final report.

13.2 Responsibilities and Authorities

Under certain circumstances, the Laboratory Director, a Technical Manager, or a member of the QA team may authorize departures from documented procedures or policies. The departures may be a result of procedural changes due to the nature of the sample; a one-time procedure for a client; QC failures with insufficient sample to reanalyze, etc. In most cases, the client will be informed of the departure prior to the reporting of the data. Any departures must be well documented using the laboratory's corrective action procedures. This information may also be documented in logbooks and/or data review checklists as appropriate. Any impacted data must be referenced in a case narrative and/or flagged with an appropriate data qualifier.

Any misrepresentation or possible misrepresentation of analytical data discovered by any laboratory staff member must be reported to facility Senior Management within 24 hours. The Senior Management staff is comprised of the Laboratory Director, the QA Manager, and the Technical Managers. The reporting of issues involving alleged violations of the company's Data Integrity or Manual Integration procedures must be conveyed to an ECO (e.g., the VP-QA/EHS) and the laboratory's Quality Director within 24 hours of discovery.

Whether an inaccurate result was reported due to calculation or quantitation errors, data entry errors, improper practices, or failure to follow SOPs, the data must be evaluated to determine the possible effect.
The Laboratory Director, QA Manager, ECOs, VP of Operations and the Quality Directors have the authority and responsibility to halt work, withhold final reports, or suspend an analysis for due cause as well as authorize the resumption of work.

13.3 Evaluation of Significance and Actions Taken

For each nonconforming issue reported, an evaluation of its significance and the level of management involvement needed is made. This includes reviewing its impact on the final data, whether or not it is an isolated or systematic issue, and how it relates to any special client requirements.

NDSC Document No. CW-Q-S-005 is the procedure to be followed when it is discovered that erroneous or biased data may have been reported to clients or regulatory agencies.

The NDSC Document entitled Internal Investigations (CW-L-S-002) is the procedure to be followed for investigation and correction of situations involved alleged incidents of misconduct or violation of the company's ethics policy.

Laboratory level decisions are documented and approved using the laboratory's standard nonconformance/corrective action reporting in lieu of the data recall determination form contained in NDSC Document No.CW-Q-S-005.

13.4 Prevention of Nonconforming Work

If it is determined that the nonconforming work could recur, further corrective actions must be made following the laboratory's corrective action system. Periodically as defined by the laboratory's preventive action schedule, the QA Department evaluates non-conformances to determine if any nonconforming work has been repeated multiple times. If so, the laboratory's corrective action process may be followed.

13.5 Method Suspension / Restriction (Stop Work Procedures)

In some cases, it may be necessary to suspend/restrict the use of a method or target analyte which constitutes significant risk and/or liability to the laboratory. Suspension/restriction procedures can be initiated by any of the persons noted in Section 13.2, Paragraph 5.
Prior to suspension/restriction, confidentiality will be respected, and the problem with the required corrective and preventive action will be stated in writing and presented to the Laboratory Director.

The Laboratory Director shall arrange for the appropriate personnel to meet with the QA Manager as needed. This meeting shall be held to confirm that there is a problem, that suspension/restriction of the method is required and will be concluded with a discussion of the steps necessary to bring the method/target or test fully back on line. In some cases, that may not be necessary if all appropriate personnel have already agreed there is a problem and there

is agreement on the steps needed to bring the method, target or test fully back on line. The QA Manager will also initiate a corrective action report as described in Section 14 if one has not already been started. A copy of any meeting notes and agreed upon steps should be e-mailed by the laboratory to their Quality Director. This e-mail acts as notification of the incident.

After suspension/restriction, the lab will hold all reports to clients pending review. No faxing, mailing or distributing through electronic means may occur. The report must not be posted for viewing on the internet. It is the responsibility of the Laboratory Director to hold all reporting and to notify all relevant laboratory personnel regarding the suspension/restriction (e.g., Project Management, Log-in, etc.). Clients will NOT generally be notified at this time. Analysis may proceed in some instances depending on the non-conformance issue.

Within 72 hours, the QA Manager will determine if compliance is now met and reports can be released, or determine the plan of action to bring work into compliance, and release work. A team, with all principals involved (e.g., Laboratory Director, Technical Manager, QA Manager) can devise a start-up plan to cover all steps from client notification through compliance and release of reports. Project Management and the Directors of Client Services and Sales and Marketing must be notified if clients must be notified or if the suspension/restriction affects the laboratory's ability to accept work. The QA Manager must approve start-up or elimination of any restrictions after all corrective action is complete.

14.0 CORRECTIVE ACTION

14.1 Overview

A major component of the laboratory's (QA) Program is the problem investigation and feedback mechanism designed to keep the laboratory staff informed on quality related issues and to provide insight to problem resolution. When nonconforming work or departures from policies and procedures in the quality system or technical operations are identified, the corrective action procedure provides a systematic approach to assess the issues, restore the laboratory's system integrity, and prevent reoccurrence. The laboratory employs two systems to manage non-conformances. Issues suspected of being systematic in nature and for which root cause analysis and a formal Corrective Action Report (CAR) are documented in the Incident Corrective Action Tracking (ICAT) database. Routine batch non-conformances, events that are understood to be isolated in nature, are documented in the LIMS non-conformance memo (NCM) system.

14.2 General

Problems within the quality system or within analytical operations may be discovered in a variety of ways, such as QC sample failures, internal or external audits, proficiency testing (PT) performance, client complaints, staff observation, etc.

The purpose of a corrective action system is to:

- Identify non-conformance events and assign responsibility for investigating.
- Resolve non-conformance events and assign responsibility for any required corrective action.
- Identify systematic problems before they become serious.
- Identify and track client complaints and provide resolution.

14.2.1 Non-Conformance Memo (NCM)

NCMs are used to document the following types of corrective actions:

- Deviations from an established procedure or SOP
- QC outside of limits
- Isolated reporting / calculation errors
- Client complaints
- Discrepancies in materials / goods received vs. manufacturer packing slips (Forms of documentation other than NCMs in LIMS are also acceptable)

14.2.2 Corrective Actions Documented In the ICAT Database

The ICAT database is used to document background information, track the results of corrective action investigations and root cause analysis, and to provide reports of corrective action plans. The following types of issues are documented in ICAT:

- Internal and external audit findings
- Failed or unacceptable PT results
- Identified poor process or method performance trends
- Systematic reporting / calculation errors

- Data recall investigations
- Questionable trends that are found in the review of NCMs.
- Client complaints
- Excessive revised reports

14.3 Closed Loop Corrective Action Process

Any employee in the company can initiate a corrective action. There are four main components to a closed-loop corrective action process once an issue has been identified: Cause Analysis, Selection and Implementation of Corrective Actions (both short and long term), Monitoring of the Corrective Actions, and Follow-up.

14.3.1 Cause Analysis

Upon discovery of a non-conformance event, the event must be defined and documented. An entry into the ICAT system must be initiated, someone is assigned to investigate the issue and the event is investigated for cause. Table 12-1 provides some general guidelines on determining responsibility for assessment.

The cause analysis step is the key to the process as a long term corrective action cannot be determined until the cause is determined.

If the cause is not readily obvious, the Technical Manager, Laboratory Director, or QA Manager (or QA designee) is consulted.

14.3.2 Selection and Implementation of Corrective Actions

Where corrective action is needed, the laboratory shall identify potential corrective actions. The action(s) most likely to eliminate the problem and prevent recurrence are selected and implemented. Responsibility for implementation is assigned.

Corrective actions shall be to a degree appropriate to the magnitude of the problem identified through the cause analysis.

Whatever corrective action is determined to be appropriate, the laboratory shall document and implement the changes. The ICAT record is used for this documentation.

14.3.3 Root Cause Analysis

Root Cause Analysis is a class of problem solving (investigative) methods aimed at identifying the basic or causal factor(s) that underlie variation in performance or the occurrence of a significant failure. The root cause may be buried under seemingly innocuous events, many steps preceding the perceived failure. At first glance, the immediate response is typically directed at a symptom and not the cause. Typically, root cause analysis would be best with three or more incidents to triangulate a weakness. NDSC Document No. CA-Q-S-009: Root Cause Analysis provides guidance on this procedure.

Systematically analyze and document the root causes of the more significant problems that are reported. Identify, track, and implement the corrective actions required to reduce the likelihood of recurrence of significant incidents. Trend the root cause data from these incidents to identify root causes that, when corrected, can lead to dramatic improvements in performance by eliminating entire classes of problems.
Identify the one event associated with problem and ask why this event occurred. Brainstorm the root causes of failures; for example, by asking why events occurred or conditions existed; and then why the cause occurred consecutive times until you get to the root cause. For each of these sub events or causes, ask why it occurred. Repeat the process for the other events associated with the incident.

Root cause analysis does not mean the investigation is over. Look at technique or other systems outside the normal indicators. Often creative thinking will find root causes that ordinarily would be missed and continue to plague the laboratory or operation.

14.3.4 Monitoring of the Corrective Actions

The Technical Manager and QA Manager are responsible to ensure that the corrective action taken was effective.

Ineffective actions are documented and re-evaluated until acceptable resolution is achieved. Technical Managers are accountable to the Laboratory Director to ensure final acceptable resolution is achieved and documented appropriately.

The QA Manager reviews monthly NCM and ICAT records for trends. Highlights are included in the QA monthly report (refer to Section 18). If a significant trend develops that adversely affects quality, an audit of the area is performed and corrective action implemented.

Any out-of-control situations that are not addressed acceptably at the laboratory level may be reported to the NDSC Quality Director by the QA Manager, indicating the nature of the out-of-control situation and problems encountered in solving the situation.

14.3.5 Follow-up Audits

Follow-up audits may be initiated by the QA Manager and shall be performed as soon as possible when the identification of a nonconformance casts doubt on the laboratory's compliance with its own policies and procedures, or on its compliance with state or federal requirements.

These audits often follow the implementation of the corrective actions to verify effectiveness. An additional audit would only be necessary when a critical issue or risk to business is discovered. (Also refer to Section 17.1.4, Special Audits.)

14.4 Technical Corrective Actions

In addition to providing acceptance criteria and specific protocols for technical corrective actions in the method SOPs, the laboratory has general procedures to be followed to determine when departures from the documented policies and procedures and quality control have occurred (refer to Section 13). The documentation of these procedures is through the use of an NCM or record in the ICAT system.

Table 14-1 includes examples of general technical corrective actions. For specific criteria and corrective actions, refer to SOP SA-QA-017: *Evaluation of Batch QC Data* and the analytical SOPs.

Table 14-1 provides some general guidelines for identifying the individual(s) responsible for assessing each QC type and initiating corrective action. The table also provides general guidance on how a data set should be treated if associated QC measurements are unacceptable. Specific procedures are included in method SOPs, Work Instructions, QA Manual Sections 19 and 20. All corrective actions are reviewed monthly, at a minimum, by the QA Manager and highlights are included in the QA monthly report.

To the extent possible, samples shall be reported only if all quality control measures are acceptable. If the deficiency does not impair the usability of the results, data will be reported with an appropriate data qualifier and/or the deficiency will be noted in the case narrative. Where sample results may be impaired, the PM is notified by an NCM and appropriate corrective action (e.g., reanalysis) is taken and documented.

14.5 Basic Corrections

When mistakes occur in records, each mistake shall be crossed-out, [not obliterated (e.g. no white-out)], and the correct value entered alongside. All such corrections shall be initialed (or signed) and dated by the person making the correction. In the case of records stored electronically, the original uncorrected file must be maintained intact and a second corrected file is created. This same process applies to adding additional information to a record. All additions made later than the initial must also be initialed (or signed) and dated. When corrections are due to reasons other than obvious transcription errors, the reason for the corrections (or additions) shall also be documented.

Table 14-1. General Corrective Action Procedures

QC Activity ***(Individual Responsible for Initiation/Assessment)***	**Acceptance Criteria**	**Recommended Corrective Action**
Instrument Blank *(Analyst)*	- Criteria in analytical SOP	- Prepare and analyze another blank. - If same response, determine cause of contamination: reagents, environment, instrument equipment failure, etc.
Initial Calibration Standards *(Analyst)*	- Criteria in analytical SOP	- Reanalyze standards. - If still unacceptable, remake standards and recalibrate instrument.
Initial Calibration Verification (Second Source ICV) *(Analyst)*	- Criteria within analytical SOP	- Remake and reanalyze standard. - If still unacceptable, then remake calibration standards or use new primary standards and recalibrate instrument.
Continuing Calibration Verification (CCV) *(Analyst)*	- Criteria within analytical SOP	- Reanalyze standard. - If still unacceptable, then recalibrate and rerun affected samples.
Matrix Spike / Matrix Spike Duplicate (MS/MSD) *(Analyst)*	- Criteria in LIMS MLGs	- If matrix interferences are present, evaluate the LCS. - If the LCS is within acceptable limits the batch is acceptable.
Laboratory Control Sample (LCS) *(Analyst)*	- Criteria in LIMS MLGs and SOP SA-QA-017	- Reanalyze LCS. - Batch must be re-prepared and/or re-analyzed.
Surrogates *(Analyst)*	- Criteria in LIMS MLGs	- Individual sample must be repeated, unless obvious matrix interference is noted.
Method Blank *(Analyst)*	<1/2RL	- Reanalyze blank. - Determine source of contamination. - Re-prepare/re-analyze batch.

15.0 PREVENTIVE ACTION / IMPROVEMENT

15.1 Overview

The laboratory's preventive action programs improve or eliminate potential causes of nonconforming product and/or nonconformance to the quality system. This preventive action process is a proactive and continuous process of improvement activities that can be initiated through feedback from clients, employees, business providers, and affiliates. The QA Department has the overall responsibility to ensure that the preventive action process is in place, and that relevant information on actions is submitted for management review.

Dedicating resources to an effective preventive action system emphasizes the laboratory's commitment to its QA Program. It is beneficial to identify and address negative trends before they develop into complaints, problems and corrective actions. Additionally, the laboratory continually strives to improve customer service and client satisfaction through continuous improvements to laboratory systems.

Opportunities for improvement may be discovered through any of the following:

- review of the monthly QA Metrics Report,
- trending NCMs,
- review of control charts and QC results,
- trending proficiency testing (PT) results,
- performance of management system reviews,
- trending client complaints,
- review of processing operations, or
- staff observations.

The monthly Management Systems Metrics Report shows performance indicators in all areas of the laboratory and quality system. These areas include revised reports, corrective actions, audit findings, internal auditing and data authenticity audits, client complaints, PT samples, holding time violations, SOPs, ethics training, etc. The metrics report is reviewed monthly by the laboratory management, the NDSC QA Team, and Executive Management. These metrics are used in evaluating the management and quality system performance on an ongoing basis and provide a tool for identifying areas for improvement.

Items identified as continuous improvement opportunities to the management system may be issued as goals from the annual management systems review, recommendations from internal audits, white papers, Lessons Learned, Technical Services audit report, Technical Best Practices, or as Executive or management initiatives.

The laboratory's corrective action process is integral to implementation of preventive actions. A critical piece of the corrective action process is the implementation of actions to prevent further occurrence of a non-compliance event. Historical review of corrective action and non-conformances provides a valuable mechanism for identifying preventive action opportunities.

15.1.1 The following elements are part of a preventive action/process improvement system:

- Identification of an opportunity for preventive action or process improvement.
- Process for the preventive action or improvement.
- Define the measurements of the effectiveness of the process once undertaken.
- Execution of the preventive action or improvement.
- Evaluation of the plan using the defined measurements.
- Verification of the effectiveness of the preventive action or improvement.
- Close-Out by documenting any permanent changes to the Quality System as a result of the Preventive Action or Process Improvement. Documentation of Preventive Action/process Improvement is incorporated into the monthly QA reports, corrective action process and management review.

15.1.2 Any preventive actions/process improvement undertaken or attempted shall be taken into account during the annual Management Systems Review (Section 16). A highly detailed report is not required; however, a summary of successes and failures within the preventive action program is sufficient to provide management with a measurement for evaluation.

15.2 Management of Change

The Management of Change process is designed to manage significant events and changes that occur within the laboratory. Through these procedures, the potential risks inherent with a new event or change are identified and evaluated. The risks are minimized or eliminated through pre-planning and the development of preventive measures. The types of changes covered under this system include: facility changes, major accreditation changes, addition or deletion to capabilities or instrumentation, key personnel changes, and laboratory information management system (LIMS) changes, etc. This process is discussed in further detail within the laboratory SOPs.

16.0 CONTROL OF RECORDS

The laboratory maintains a records management system appropriate to its needs and that complies with applicable standards or regulations as required. The system produces unequivocal, accurate records that document all laboratory activities. The laboratory retains all original observations, calculations and derived data, calibration records and a copy of the analytical report for a minimum of five years after it has been issued. Exceptions for programs with longer retention requirements are discussed in Section 14.1.2.

16.1 Overview

The laboratory has established procedures for identification, collection, indexing, access, filing, storage, maintenance and disposal of quality and technical records. A record index is listed in Table 16-1. More detailed information on retention of specific records is provided in NDSC Document Nos. CW-L-P-001, Records Retention Policy and CW-L-WI-001, Records Retention/Storage Schedule. Quality records are maintained by the QA Department on the Q-Drive, which is backed up as part of the regular laboratory backup. Technical records are maintained in the Data Archival folder on the Public_QA Drive and are backed up as part of the regular network backup. Records are of two types; either electronic or hard copy paper formats depending on whether the record is computer or hand generated (some records may be in both formats).

Table 16-1. Record Index

	Record Types [1]:	Retention Time:
Technical Records	- Raw Data - Logbooks[2] - Standards - Certificates - Analytical Records - MDLs/IDLs/DOCs - Lab Reports	- 5 Years from analytical report issue*
Official Documents	- Quality Assurance Manual (QAM) - Work Instructions - Policies - SOPs - Published Methods	- Indefinitely
QA Records	- Certifications - Method & Software Validation/Verification Data	- Indefinitely
QA Records	- Internal & External Audits/Responses - Corrective/Preventive Actions - Management Reviews - Data Investigation	- 5 Years from archival* - **Data Investigation:** 5 years or the life of the affected raw data storage whichever is greater (beyond 5 years if ongoing project or pending investigation)
Project Records	- Sample Receipt & COC Documentation - Contracts and Amendments - Correspondence - QAPP & SAP - Lab Reports	- 5 Years from analytical report issue*
Administrative Records	Financial and Business Operations	Refer to CW-L-WI-001
	EH&S Manual and Permits	Indefinitely
	Disposal Records	Indefinitely
	Employee Handbook	Indefinitely
	Personnel files, Employee Signature & Initials, Administrative Training Records (e.g., Ethics)	Refer to HR Manual
	Administrative Policies	Indefinitely
	Technical Training Records	7 years
	Legal Records	Indefinitely
	HR Records	Refer to CW-L-WI-001
	IT Records	Refer to CW-L-WI-001
	Corporate Governance Records	Refer to CW-L-WI-001
	Sales & Marketing	5 years
	Real Estate	Indefinitely

[1] Record Types encompass hardcopy and electronic records.
[2] Examples of Logbook types: Maintenance, Instrument Run, Preparation (standard and samples), Standard and Reagent Receipt, Archiving, Balance Calibration, Temperature (hardcopy or electronic records).
* Exceptions listed in Table 16-2.

16.1.1 All records are stored and retained in such a way that they are secure and readily retrievable at the laboratory facility that provides a suitable environment to prevent damage or deterioration and to prevent loss**.** All records shall be protected against fire, theft, loss, environmental deterioration, and vermin. In the case of electronic records, electronic or magnetic sources, storage media are protected from deterioration caused by magnetic fields and/or electronic deterioration.

Access to the data is limited to laboratory and company employees and shall be documented with an access log**.** Records are maintained for a minimum of five years unless otherwise specified by a client or regulatory requirement.

For raw data and project records, record retention shall be calculated from the date the project report is issued. For other records, such as NDSC and/or KGD documents, QA, or administrative records, the retention time is calculated from the date the record is formally retired. Records related to the programs listed in Table 16-2 have lengthier retention requirements and are subject to the requirements in Section 16.1.3.

16.2 Programs with Longer Retention Requirements

Some regulatory programs have longer record retention requirements than the standard record retention time. These are detailed in Table 16-2 with their retention requirements. In these cases, the longer retention requirement is enacted. If special instructions exist such that client data cannot be destroyed prior to notification of the client, the container or box containing that data is marked as to who to contact for authorization prior to destroying the data.

Table 16-2. Special Record Retention Requirements

Program	[1]Retention Requirement
Drinking Water – All States	10 years (lab reports and raw data) 10 years - Radiochemistry (project records)
Drinking Water Lead and Copper Rule	12 years (project records)
Commonwealth of MA – All environmental data 310 CMR 42.14	10 years
FIFRA – 40 CFR Part 160	Retain for life of research or marketing permit for pesticides regulated by EPA
Housing and Urban Development (HUD) Environmental Lead Testing	10 years
Alaska	10 years
Louisiana – All	10 years
Michigan Department of Environmental Quality – all environmental data	10 years
Navy Facilities Engineering Service Center (NFESC)	10 years
Ohio VAP	10 years and State contacted prior to disposal
OSHA	30 years

[1]Note: Extended retention requirements must be noted with the archive documents or addressed in facility-specific records retention procedures.

16.2.1 The laboratory has procedures to protect and back-up records stored electronically and to prevent unauthorized access to or amendment of these records. All analytical data is maintained as hard copy or in a secure readable electronic format. For analytical reports that are maintained as copies in PDF format, refer to Section 19.15.1 for more information.

Electronic records are maintained in the Data Archival Folder on the Public_QA drive, or in another applicable drive (such as Q-drive). Refer to SOP SA-QA-001: Document Control Program for specific information on the archival, storage, and back-up of records.

16.2.2 The record keeping system allows for historical reconstruction of all laboratory activities that produced the analytical data, as well as rapid recovery of historical data. The history of the sample from when the laboratory took possession of the samples must be readily understood through the documentation. This shall include inter-laboratory transfers of samples and/or extracts.

- The records include the identity of personnel involved in sampling, sample receipt, preparation, or testing. All analytical work contains the initials (at least) of the personnel involved. The chain of custody would indicate the name of the sampler.
- All information relating to the laboratory facilities' equipment, analytical test methods, and related laboratory activities, such as sample receipt, sample preparation, or data verification are documented.
- The recordkeeping system facilitates the retrieval of all working files and archived records for inspection and verification purposes (e.g., set format for naming electronic files, set format for what is included with a given analytical data set, etc. as per SOP SA-QA-001:

Document Control Program). Instrument data is stored sequentially by instrument. A given day's analyses are maintained in the order of the analysis. Where an analysis is performed without an instrument, LIMS sheets, bound logbooks, bench sheets, or spreadsheets are used to record and file data. Standard and reagent information is recorded in LIMS for each method.

- Changes to hardcopy records shall follow the procedures outlined in Section 12 and 19. Changes to electronic records in LIMS or instrument data are recorded in audit trails.
- The reason for a signature or initials on a document is clearly indicated in the records such as "sampled by," "prepared by," "reviewed by", or "analyzed by".
- All generated data except those that are generated by automated data collection systems, are recorded directly, promptly and legibly in permanent dark ink.
- Hard copy data may be scanned into PDF format for record storage as long as the scanning process can be verified in order to ensure that no data is lost and the data files and storage media must be tested to verify the laboratory's ability to retrieve the information prior to the destruction of the hard copy that was scanned.
- Also refer to Section 19.15.1 'Computer and Electronic Data Related Requirements'.

16.3 Technical and Analytical Records

16.3.1 The laboratory retains records of original observations, derived data and sufficient information to establish an audit trail, calibration records, staff records and a copy of each analytical report issued, for a minimum of five years unless otherwise specified by a client or regulatory requirement. The records for each analysis shall contain sufficient information to enable the analysis to be repeated under conditions as close as possible to the original. The records shall include the identity of laboratory personnel responsible for performance of each analysis and reviewing results.

16.3.2 Observations, data and calculations are recorded real-time and are identifiable to the specific task.

16.3.3 Changes to hardcopy records shall follow the procedures outlined in Section 12 and 19. Changes to electronic records in LIMS or instrument data are recorded in audit trails.

The essential information to be associated with analysis, such as strip charts, tabular printouts, computer data files, analytical notebooks, and run logs, include:

- Laboratory sample ID code;
- Date of analysis; time of analysis is also required if the holding time is seventy-two (72) hours or less, or when time critical steps are included in the analysis (e.g., drying times, incubations, etc.); instrumental analyses have the date and time of analysis recorded as part of their general operations. Where a time critical step exists in an analysis, location for such a time is included as part of the documentation in a specific logbook or on a benchsheet.
- Instrumentation identification and instrument operating conditions/parameters. Operating conditions/parameters are typically recorded in instrument maintenance logs where available.
- analysis type;
- all manual calculations and manual integrations;
- analyst's or operator's initials/signature;
- sample preparation including cleanup, separation protocols, incubation periods, ID codes,

volumes, weights, instrument printouts, meter readings, calculations, reagents;
- test results;
- standard and reagent origin, receipt, preparation, and use;
- calibration criteria, frequency and acceptance criteria;
- data and statistical calculations, review, confirmation, interpretation, assessment and reporting conventions;
- quality control protocols and assessment;
- electronic data security, software documentation and verification, software and hardware audits, backups, and records of any changes to automated data entries; and
- Method performance criteria including expected quality control requirements. These are indicated both in LIMS and on specific analytical report formats.

16.3.4 All logbooks used during receipt, preparation, storage, analysis, and reporting of samples or monitoring of support equipment shall undergo a periodic, documented supervisory or peer review.

16.4 Laboratory Support Activities

In addition to documenting all the above-mentioned activities, the following are retained QA records and project records (previous discussions in this section relate where and how these data are stored):
- all original raw data, whether hard copy or electronic, for calibrations, samples and quality control measures, including analysts' work sheets and data output records (chromatograms, strip charts, and other instrument response readout records);
- a written description or reference to the specific test method used which includes a description of the specific computational steps used to translate parametric observations into a reportable analytical value;
- copies of final reports;
- archived SOPs;
- correspondence relating to laboratory activities for a specific project;
- all corrective action reports, audits and audit responses;
- proficiency test results and raw data; and
- results of data review, verification, and crosschecking procedures

16.4.1 Sample Handling Records

Records of all procedures to which a sample is subjected while in the possession of the laboratory are maintained. These include but are not limited to records pertaining to:
- sample preservation including appropriateness of sample container and compliance with holding time requirement;
- sample identification, receipt, acceptance or rejection and login;
- sample storage and tracking including shipping receipts, sample transmittal / COC forms; and
- procedures for the receipt and retention of samples, including all provisions necessary to protect the integrity of samples.

16.5 Administrative Records

The laboratory also maintains the administrative records in either electronic or hard copy form. Refer to Table 16-1.

16.6 Records Management, Storage and Disposal

All records (including those pertaining to test equipment), certificates and reports are safely stored, held secure and in confidence to the client. Certification related records are available upon request.

All information necessary for the historical reconstruction of data is maintained by the laboratory. Records that are stored only on electronic media must be supported by the hardware and software necessary for their retrieval.

Records that are stored or generated by computers or personal computers have hard copy, write-protected backup copies, or an electronic audit trail controlling access.

The laboratory has a record management system (a.k.a., document control) for control of laboratory notebooks, instrument logbooks, standards logbooks, and records for data reduction, validation, storage and reporting. Laboratory notebooks are issued on a per analysis basis, and are numbered sequentially. All data are recorded sequentially within a series of sequential notebooks. Bench sheets are filed sequentially. Standards are maintained in the LIMS. Records are considered archived when noted as such in the records management system.

16.6.1 Transfer of Ownership

In the event that the laboratory transfers ownership or goes out of business, the laboratory shall ensure that the records are maintained or transferred according to client's instructions. Upon ownership transfer, record retention requirements shall be addressed in the ownership transfer agreement and the responsibility for maintaining archives is clearly established. In addition, in cases of bankruptcy, appropriate regulatory and state legal requirements concerning laboratory records must be followed. In the event of the closure of the laboratory, all records will revert to the control of NDSC. Should the entire company cease to exist, as much notice as possible will be given to clients and the accrediting bodies who have worked with the laboratory during the previous 5 years of such action.

16.6.2 Records Disposal

Records are removed from the archive and destroyed after 5 years unless otherwise specified by a client or regulatory requirement. On a project specific or program basis, clients may need to be notified prior to record destruction. Records are destroyed in a manner that ensures their confidentiality such as shredding, mutilation or incineration. (Refer to Tables 14-1 and 14-2).

Electronic copies of records must be destroyed by erasure or physically damaging off-line storage media so no records can be read.

If a third party records management company is hired to dispose of records, a “Certificate of Destruction” is required.

17.0 AUDITS

17.1 Internal Audits

Internal audits are performed to verify that laboratory operations comply with the requirements of the lab's quality system and with the external quality programs under which the laboratory operates. Audits are planned and organized by the QA staff. Personnel conducting the audits should be independent of the area being evaluated. Auditors will have sufficient authority, access to work areas, and organizational freedom necessary to observe all activities affecting quality and to report the assessments to laboratory management and, when requested, to Executive Management.

Audits are conducted and documented as described in the NDSC document on performing Internal Auditing, SOP No. CW-Q-S-003. The types and frequency of routine internal audits are described in Table 17-1. Special or ad hoc assessments may be conducted as needed under the direction of the QA staff.

Table 17-1. Types of Internal Audits and Frequency

Description	Performed by	Frequency
Quality Systems Audits	QA Department, QA approved designee, or NDSC QA	All areas of the laboratory annually
Method Audits / QA Technical Audits	Joint Responsibility: a) QA Manager or designee, b) Technical Manager or designee (Refer to SOP CW-Q-S-003)	QA Technical Audits Frequency: 50% of methods annually
SOP Method Compliance	Joint Responsibility: a) QA Manager or designee, b) Technical Manager or designee (Refer to SOP CW-Q-S-003)	SOP Compliance Review Frequency: - Every 2 years (non-DoD SOPs) Every year (Drinking Water SOPs) - 100% of SOPs annually (DoD/DOE SOPs)
Special	QA Department or Designee	Surveillance or spot checks performed as needed, e.g., to confirm corrective actions from other audits.
Performance Testing	Analysts with QA oversight	Two successful per year for each TNI field of testing or as dictated by regulatory requirements

17.1.1 Annual Quality Systems Audit

An annual quality systems audit is required to ensure compliance to analytical methods and SOPs, Eurofins Data Integrity and Ethics Policies (see Sec. 7.2), TNI quality systems, client and state requirements, and the effectiveness of the internal controls of the analytical process, including but not limited to data review, quality controls, preventive action and corrective action. The completeness of earlier corrective actions is assessed for effectiveness & sustainability. The audit is divided into sections for each operating or support area of the lab, and each section is comprehensive for a given area. The area audits may be performed on a rotating schedule throughout the year to ensure adequate coverage of all areas. This schedule may change as situations in the laboratory warrant.

17.1.2 QA Technical Audits

QA technical audits assess data authenticity and analyst integrity. These audits are based on client projects, associated sample delivery groups, and the methods performed. Reported results are compared to raw data to verify the authenticity of results. The validity of calibrations and QC results are compared to data qualifiers, footnotes, and case narratives. Documentation is assessed by examining run logs and records of manual integrations. Manual calculations are checked. Where possible, electronic audit miner programs (e.g., Chrom AuditMiner) are used to identify unusual manipulations of the data deserving closer scrutiny. QA technical audits will include all methods within a two-year period.

17.1.3 SOP Method Compliance

Compliance of all SOPs with the source methods and compliance of the operational groups with the SOPs will be assessed by the Technical Manager or qualified designee at least every year. It is also recommended that the work of each newly hired analyst is assessed within 3 months of working independently, (e.g., completion of method IDOC). In addition, as analysts add methods to their capabilities, (new IDOC) reviews of the analyst work products will be performed.

17.1.4 Special Audits

Special audits are conducted on an as needed basis, generally as a follow up to specific issues such as client complaints, corrective actions, PT results, data audits, system audits, validation comments, regulatory audits or suspected ethical improprieties. Special audits are focused on a specific issue, and report format, distribution, and timeframes are designed to address the nature of the issue.

17.1.5 Performance Testing

Single blind performance audits are employed for several reasons. One purpose is to provide corrective action for parameters judged to be unacceptable on external or internal performance audits. Periodic internal performance audits are also used to test parameters that are not routinely tested by external performance audits. Finally, single blind performance audits are employed to satisfy certain certification requirements, to satisfy auditors' specific requests for

performance audit samples, or to provide additional evidence of data quality to clients with specific questions regarding laboratory performance.

The laboratory participates semi-annually in performance audits conducted through the analysis of PT samples provided by a third party. The laboratory generally participates in the following types of PT studies: Drinking Water, Non-Potable Water, and Soil.

These PT studies are performed approximately six months apart. The first study of the year is usually performed in January, and the second study is usually performed in July. The PT results are submitted to certification agencies directly from the PT Provider. Remedial PT studies can be performed, as required, for any analytes scored as unacceptable. Root cause investigation into any unacceptable results must be initiated. Written responses to unacceptable PT results are required. In some cases it may be necessary for blind QC samples to be submitted to the laboratory to show a return to control.

It is Eurofins policy that PT samples be treated as typical samples in the production process. Furthermore, where PT samples present special or unique problems, in the regular production process they may need to be treated differently, as would any special or unique request submitted by any client. The QA Manager must be consulted and in agreement with any decisions made to treat a PT sample differently due to some special circumstance.
Written investigations for unacceptable PT results are required. In some cases it may be necessary for blind QC samples to be submitted to the laboratory to show a return to control.

17.2 External Audits

External audits are performed when certifying agencies or clients conduct on-site inspections or submit performance testing samples for analysis. It is Eurofins policy to cooperate fully with regulatory authorities and clients. The laboratory makes every effort to provide the auditors with access to personnel, documentation, and assistance. Laboratory supervisors are responsible for providing corrective actions to the QA Manager who coordinates the response. Audit responses are due in the time allotted by the client or agency performing the audit.

The laboratory cooperates with clients and their representatives to monitor the laboratory's performance in relation to work performed for the client. The client may only view data and systems related directly to the client's work. All efforts are made to keep other client information confidential.

17.2.1 Confidential Business Information (CBI) Considerations

During on-site audits, auditors may come into possession of information claimed as business confidential. A business confidentiality claim is defined as "a claim or allegation that business information is entitled to confidential treatment for reasons of business confidentiality or a request for a determination that such information is entitled to such treatment." When information is claimed as business confidential, the laboratory must place on (or attach to) the information at the time it is submitted to the auditor, a cover sheet, stamped or typed legend or other suitable form of notice, employing language such as "trade secret", "proprietary" or "company confidential". Confidential portions of documents otherwise non-confidential must be

clearly identified. CBI may be purged of references to client identity by the responsible laboratory official at the time of removal from the laboratory. However, sample identifiers may not be obscured from the information. Additional information regarding CBI can be found in within the 2009 and 2016 TNI standards.

17.3 Audit Findings

Audit findings are documented using the corrective action process and database (see Section 14). The laboratory's corrective action responses may include action plans that could not be completed within a predefined timeframe. In these instances, a completion date must be set and agreed to by operations management and the QA Manager.

Developing and implementing corrective actions to findings is the responsibility of the Department Manager where the finding originated. Findings that are not corrected by specified due dates are reported monthly to management in the QA monthly report.

If any audit finding casts doubt on the effectiveness of the operations or on the correctness or validity of the laboratory's test results, the laboratory shall take timely corrective action, and shall notify clients in writing if the investigations show that the laboratory results have been affected. Once corrective action is implemented, a follow-up audit is scheduled to ensure that the problem has been corrected.

Clients must be notified promptly in writing of any event such as the identification of defective measuring or test equipment that casts doubt on the validity of results given in any test report or amendment to a test report. The investigation must begin within 24 hours of discovery of the problem and all efforts are made to notify the client within two weeks after the completion of the investigation.

18.0 MANAGEMENT REVIEWS

18.1 Quality Assurance Report

The QA Department is responsible for preparing a comprehensive monthly metrics report to Management to keep them apprised of current quality issues. This report fosters communication, review, and refinement of the QA system to evaluate the suitability of policies and procedures to meet both regulatory and laboratory quality objectives.

The NDSC QA team compiles information from all of the Environment Testing laboratories monthly metrics reports for the Executive Management team. This report includes notable information and concerns regarding the laboratories QA program and a listing of new regulations that may potentially impact the laboratories.

18.2 Annual Management Review

The senior management team conducts a review annually of its quality systems to ensure its continuing suitability and effectiveness in meeting client and regulatory requirements and to introduce any necessary changes or improvements. It will also provide a platform for defining goals, objectives and action items that feed into the laboratory planning system. N DSC personnel is be included in this meeting at the discretion of the Laboratory Director. The LIMS review consists of examining any audits, complaints or concerns that have been raised through the year that are related to LIMS. The laboratory will summarize any critical findings that cannot be solved by the lab and report them to Corporate IT.

This management systems review (NDSC Document No. CW-Q-S-004 and Work Instruction No. CW-Q-WI-003) uses information generated during the preceding year to assess the “big picture” by ensuring that routine actions taken and reviewed on a monthly basis are not components of larger systematic concerns. The monthly review should keep the quality systems current and effective, therefore, the annual review is a formal senior management process to review specific existing documentation. Significant issues from the following documentation are compiled or summarized by the QA Manager prior to the review meeting:

- Matters arising from the previous annual review.
- Prior monthly QA Reports issues.
- Laboratory QA Metrics.
- Review of report reissue requests.
- Review of client feedback and complaints.
- Issues arising from any prior management or staff meetings.
- Minutes from prior senior lab management meetings. Issues that may be raised from these meetings include:
  - Adequacy of staff, equipment and facility resources.
  - Adequacy of policies and procedures.
  - Future plans for resources and testing capability and capacity.
- The annual internal double blind PT program sample performance (if performed),
- Compliance to the Ethics Policy and Data Integrity Plan. Including any evidence/incidents of inappropriate actions or vulnerabilities related to data Integrity.

- Evaluation of overall risk, including risks to impartiality, confidentiality, reporting statements of conformity, and nonconforming work.

A report is generated by the QA Manager and management. The report is distributed to the Laboratory Manager, BUMa, and the Quality Director. The report includes, but is not limited to:

- The date of the review and the names and titles of participants.
- A reference to the existing data quality related documents and topics that were reviewed.
- Quality system or operational changes or improvements that will be made as a result of the review [e.g., an implementation schedule including assigned responsibilities for the changes (Action Table)].

Changes to the quality systems requiring update to the laboratory QA Manual shall be included in the next revision of the QA Manual.

18.3 Potential Integrity Related Managerial Reviews

Potential integrity issues (data or business related) must be handled and reviewed in a confidential manner until such time as a follow-up evaluation, full investigation, or other appropriate actions have been completed and issues clarified. The NDSC Document No. CW-L-S-002: *Internal Investigations* shall be followed. All investigations that result in finding of inappropriate activity are documented and include any disciplinary actions involved, corrective actions taken, and all appropriate notifications of clients.

The Eurofins Environment Testing America Presidents, Business Unit Managers, Laboratory Directors, and NDSC Team are informed of any current data integrity or data recall investigations via the monthly metrics report.

19.0 TEST METHODS AND METHOD VALIDATION

19.1 Overview

The laboratory uses methods that are appropriate to meet our clients' requirements and that are within the scope of the laboratory's capabilities. These include sampling, handling, transport, storage and preparation of samples, and, where appropriate, an estimation of the measurement of uncertainty as well as statistical techniques for analysis of environmental data.

Instructions are available in the laboratory for the operation of equipment as well as for the handling and preparation of samples. All instructions, Standard Operating Procedures (SOPs), reference methods and manuals relevant to the working of the laboratory are readily available to all staff. Deviations from published methods are documented (with justification) in the laboratory's approved SOPs. SOPs are submitted to clients for review at their request. Significant deviations from published methods require client approval and regulatory approval where applicable.

19.2 Standard Operating Procedures (SOPs)

The laboratory maintains SOPs that accurately reflect all phases of the laboratory such as assessing data integrity, corrective actions, handling customer complaints as well as all analytical methods and sampling procedures. The method SOPs are derived from the most recently promulgated/approved, published methods and are specifically adapted to the laboratory facility. Modifications or clarifications to published methods are clearly noted in the SOPs. All SOPs are controlled in the laboratory.

- All SOPs contain a revision number, effective date, and appropriate approval signatures. Controlled copies are available to all staff.
- Procedures for writing an SOP are incorporated by reference to Eurofins TestAmerica's Corporate SOP entitled 'Writing a Standard Operating Procedure', No. CW-Q-S-002 or the laboratory's SOP SA-QA-001: *Document Control*.
- SOPs are reviewed at a minimum annually and, where necessary, revised to ensure continuing suitability and compliance with applicable requirements.

19.3 Laboratory Methods Manual

For each test method, the laboratory shall have available the published referenced method as well as the laboratory developed SOP.

Note: If more stringent standards or requirements are included in a mandated test method or regulation than those specified in this manual, the laboratory shall demonstrate that such requirements are met. If it is not clear which requirements are more stringent, the standard from the method or regulation is to be followed. Any exceptions or deviations from the referenced methods or regulations are noted in the specific analytical SOP.

The laboratory maintains an SOP Index for both technical and non-technical SOPs. Technical SOPs are maintained to describe a specific test method. Non-technical SOPs are maintained to describe functions and processes not related to a specific test method.

19.4 Selection of Methods

Since numerous methods and analytical techniques are available, continued communication between the client and laboratory is imperative to assure the correct methods are utilized. Once client methodology requirements are established, this and other pertinent information is summarized by the PM. These mechanisms ensure that the proper analytical methods are applied when the samples arrive for log-in. For non-routine analytical services (e.g., special matrices, non-routine compound lists), the method of choice is selected based on client needs and available technology. The methods selected should be capable of measuring the specific parameter of interest, in the concentration range of interest, and with the required precision and accuracy.

19.4.1 Sources of Methods

Routine analytical services are performed using standard EPA-approved methodology. In some cases, modification of standard approved methods may be necessary to provide accurate analyses of particularly complex matrices. When the use of specific methods for sample analysis is mandated through project or regulatory requirements, only those methods shall be used.

When clients do not specify the method to be used or methods are not required, the methods used will be clearly validated and documented in an SOP and available to clients and/or the end user of the data. Refer to Appendix 6 for a list of the currently accepted U.S. EPA analytical method references used by the laboratory.

The laboratory reviews updated versions to all the aforementioned references for adaptation based upon capabilities, instrumentation, etc., and implements them as appropriate. As such, the laboratory strives to perform only the latest versions of each approved method as regulations allow or require.

Other reference procedures for non-routine analyses may include methods established by specific states (e.g., Underground Storage Tank methods), ASTM or equipment manufacturers. Sample type, source, and the governing regulatory agency requiring the analysis will determine the method utilized.

The laboratory shall inform the client when a method proposed by the client may be inappropriate or out of date. After the client has been informed, and they wish to proceed contrary to the laboratory's recommendation, it will be documented.

19.4.1.1 Client Supplied Methods

Most of the client-supplied method requirements presented to us involve achieving specific quality control criteria, limits of quantitation (LOQ), and/or method detection limits (MDL) using standard EPA methods. These requirements are communicated to the appropriate technical groups prior to the project start up. Each technical group evaluates the scope of work and the requirements to ensure the criteria can be met using the standard EPA method. The data is

monitored to ensure the criteria are met throughout the project. The PM notifies the client if there is a more appropriate method available or if the client's criteria cannot be achieved on a certain sample matrix (i.e., due to matrix or dilutions).

Occasionally, we are asked to transfer a non-standardized method from a client into our lab or to develop a new method, when one is not available. In the case of a method transfer, we set up the client's method and perform some initial evaluation. After the initial evaluation, we may make recommendations on how to improve method performance. If the method appears to be adequate, we determine linearity, specificity, precision, accuracy, MDL, and LOQ by performing calibrations, analyzing method blanks, and carrying out method detection limit and IDOC studies.

In the case of method development, we work with the client and/or data user to determine the level of validation required ensuring that the method meets its intended purpose. In addition to the elements above, we also determine standard and sample stability and robustness depending on the scope of the project. Typically, a standard operating procedure is written and submitted to the client with the results of the validation. These steps are completed prior to analysis of field samples. Data related to the setup of the method are archived.

19.4.1.2 Procedural Deviations

Analysts are required to follow a documented method for all tests performed; and any deviations from analytical methods must be documented, approved, and justified in an appropriate and consistent manner. We classify method deviations as either being a planned deviation or an unplanned deviation. In general, the following information is captured to document both types of situations:

- Description of the situation
- Reason or justification for the deviation
- Impact the deviation had on the testing
- Signature/date of analyst performing the test
- Signature/date of QA and Laboratory management approving the deviation
- Signature/date of client approval, if necessary

Deviations to written procedures are documented in raw data records or through ICAT system. Both types of documentation require management and QA review and approval.

19.4.2 Demonstration of Capability

Before the laboratory may institute a new method and begin reporting results, the laboratory shall confirm that it can properly operate the method. In general, this demonstration does not test the performance of the method in real world samples, but in an applicable and available clean matrix sample. If the method is for the testing of analytes that are not conducive to spiking, demonstration of capability may be performed on quality control samples.

A demonstration of capability (DOC) is performed whenever there is a change in instrument type (e.g., new instrumentation), matrix, method or personnel (e.g., analyst has not performed the test within the last 12 months).

Note: The laboratory shall have a DOC for all analytes included in the methods that the laboratory performs, and proficiency DOCs for each analyst shall include all analytes that the laboratory routinely performs. Addition of non-routine analytes does not require new DOCs for all analysts if those analysts are already qualified for routine analytes tested using identical chemistry and instrument conditions.

The initial demonstration of capability must be thoroughly documented and approved by the Technical Manager and QA Manager prior to independently analyzing client samples. All associated documentation must be retained in accordance with the laboratory's archiving procedures.

The laboratory must have an approved SOP, demonstrate satisfactory performance, and conduct an MDL study (when applicable). There may be other requirements as stated within the published method or regulations (e.g., retention time window study).

Note: In some instances, a situation may arise where a client requests that an unusual analyte be reported using a method where this analyte is not normally reported. If the analyte is being reported for regulatory purposes, the method must meet all procedures outlined within this QA Manual (SOP, MDL, and Demonstration of Capability). If the client states that the information is not for regulatory purposes, the result may be reported as long as the following criteria are met:

- The instrument is calibrated for the analyte to be reported using the criteria for the method and ICV/CCV criteria are met (unless an ICV/CCV is not required by the method or criteria are per project DQOs).
- The laboratory's nominal or default reporting limit (RL) is equal to the quantitation limit (QL), must be at or above the lowest non-zero standard in the calibration curve and must be reliably determined. Project RLs are client specified reporting levels which may be higher than the QL. Results reported below the QL must be qualified as estimated values. Also see Section 19.6.1.3, Relationship of Limit of Detection (LOD) to Quantitation Limit (QL).
- The client request is documented and the lab informs the client of its procedure for working with unusual compounds. The final report must be footnoted: *Reporting Limit based on the low standard of the calibration curve.*

19.4.3 Initial Demonstration of Capability (IDOC) Procedures

Refer to SOP SA-QA-006: *Training Procedures* for information on performing Initial Demonstrations of Capability (IDOC).

A certification statement (refer to Figure 19-1) can be used to document the completion of each initial demonstration of capability. A copy of the certification is archived in the analyst's training folder.

Note: Results of successive LCS analyses can be used to fulfill the DOC requirement.

19.5 Laboratory Developed Methods and Non-Standard Methods

Any new method developed by the laboratory must be fully defined in an SOP and validated by qualified personnel with adequate resources to perform the method. Method specifications and

the relation to client requirements must be clearly conveyed to the client if the method is a non-standard method (not a published or routinely accepted method). The client must also be in agreement to the use of the non-standard method.

19.6 Validation of Methods

Validation is the confirmation by examination and the provision of objective evidence that the particular requirements for a specific intended use are fulfilled.

All non-standard methods, laboratory designed/developed methods, standard methods used outside of their scope, and major modifications to published methods must be validated to confirm they are fit for their intended use. The validation will be as extensive as necessary to meet the needs of the given application. The results are documented with the validation procedure used and contain a statement as to the fitness for use.

19.6.1 Method Validation and Verification Activities for All New Methods

While method validation can take various courses, the following activities can be required as part of method validation. Method validation records are designated QC records and are archived accordingly.
When changes are made to any validated methods, the influence of such changes shall be documented and, if appropriate, a new validation shall be performed.

19.6.1.1 Determination of Method Selectivity – Method selectivity is the demonstrated ability to discriminate the analyte(s) of interest from other compounds in the specific matrix or matrices from other analytes or interference. In some cases to achieve the required selectivity for an analyte, a confirmation analysis is required as part of the method.

19.6.1.2 Determination of Method Sensitivity – Sensitivity can be both estimated and demonstrated. Whether a study is required to estimate sensitivity depends on the level of method development required when applying a particular measurement system to a specific set of samples. Detection limit studies are conducted as described in Section 19.7. Where other protocols for estimations and/or demonstrations of sensitivity are required by regulation or client agreement, these shall be followed.

19.6.1.3 Relationship of Limit of Detection (LOD) to the Limit of Quantitation (LOQ) – An important characteristic of expression of sensitivity is the distinction between the LOD and the LOQ. The LOD is the minimum level at which the presence of an analyte can be reliably concluded. The LOQ is the minimum concentration of analyte that can be quantitatively determined with acceptable precision and bias, equivalent to the laboratory's routine reporting limit (RL). For most instrumental measurement systems, there is a region where semi-quantitative data is generated around the LOD (both above and below the estimated MDL or LOD) and below the LOQ. In this region, detection of an analyte may be confirmed but quantification of the analyte is unreliable within the accuracy and precision guidelines of the measurement system. When an analyte is detected below the LOQ, and the presence of the analyte is confirmed by meeting the qualitative identification criteria for the analyte, the analyte can be reliably reported, but the amount of the analyte can only be estimated. If data is to be

reported in this region, it must be done so with a qualification that denotes the semi-quantitative nature of the result.

19.6.1.4 Determination of Interferences – A determination that the method is free from interferences in a blank matrix is performed.

19.6.1.5 Determination of Range – Where appropriate to the method, the quantitation range is determined by comparison of the response of an analyte in a curve to established or targeted criteria. Generally the upper quantitation limit is defined by highest acceptable calibration concentration. The lower quantitation limit or QL cannot be lower than the lowest non-zero calibration level, and can be constrained by required levels of bias and precision.

19.6.1.6 Determination of Accuracy and Precision – Accuracy and precision studies are generally performed using replicate analyses, with a resulting percent recovery and measure of reproducibility (standard deviation, relative standard deviation) calculated and measured against a set of target criteria.

19.6.1.7 Documentation of Method – The method is formally documented in an SOP. If the method is a minor modification of a standard laboratory method that is already documented in an SOP, an SOP Attachment describing the specific differences in the new method is acceptable in place of a separate SOP.

19.6.1.8 Continued Demonstration of Method Performance – Continued demonstration of method performance is addressed in the SOP. Continued demonstration of method performance is generally accomplished by batch specific QC samples such as LCS, method blanks or PT samples.

19.7 Method Detection Limit (MDL) / Limits of Detection (LOD)

The MDL is the minimum measured quantity of a substance that can be reported with 99% confidence that the concentration is distinguishable from method blank results, consistent with 40CFR Part 136 Appendix B, August, 2017. The MDL is equivalent to the TNI LOD or DL, and is also equivalent to the DoD/DOE Quality Systems Manual (QSM) DL. The working or final MDL is the higher of the MDL value determined from spikes (MDLs) and the MDL value determined from blanks (MDLb). An initial MDL study shall be performed during the method validation process and when the method is altered in a way that can reasonably be expected to change its sensitivity. On-going data are collected during each quarter in which samples are being analyzed. At least once every 13 months the MDLs and MDLb are re-calculated and re-evaluated using data collected during the preceding period. Details of the laboratory's procedure for conducting MDL studies are given in NDSC Document No.CA-Q-S-006).

19.8 Verification of Detection Limits

If it is found during the re-evaluation of detection limit results that more than 5% of the spiked samples do not return positive numeric results that meet all method qualitative identification criteria, then then spiking level shall be increased and the initial MDL study pre-performed at the

new spiking concentration. For DoD labs, additional guidance provided in NDSC Document No. No. CA-Q-S-006 - Attachment 2.

19.9 Instrument Detection Limits (IDL)

The IDL is sometimes used to assess the reasonableness of the MDL or in some cases required by the analytical method or program requirements. IDLs are most commonly used in metals analyses but may be useful in demonstration of instrument performance in other areas. IDLs are calculated to determine an instrument's sensitivity independent of any preparation method. IDLs are calculated either using 7 replicate spike analyses, like MDL but without sample preparation, or by the analysis of 10 instrument blanks and calculating 3 x the absolute value of the standard deviation.

19.10 Limit of Quantitation

The LOQ shall be at a concentration equivalent to the lowest calibration standard concentration, with the exception of methods using a single-point calibration, and shall be greater than the MDL. The LOQ is verified by preparing and analyzing spikes at concentrations 1-2X the selected LOQ, employing the complete analytical process. For DoD labs, additional requirements provided in NDSC Document No. CA-Q-S-006.

When the laboratory establishes a quantitation limit, it must be initially verified by the analysis of a low level standard or QC sample at 1-2 times the reporting limit or by a DL check samples at or below the LOQ. The LOQ is verified annually thereafter. The annual requirement is waived for methods that have an annually verified MDL. The laboratory will comply with any regulatory requirements.

19.11 Retention Time Windows

Most organic analyses and some inorganic analyses use chromatography techniques for qualitative and quantitative determinations. For every chromatography analysis or as specified in the reference method, each analyte will have a specific time of elution from the column to the detector. This is known as the analyte's retention time. The variance in the expected time of elution is defined as the retention time window. As the key to analyte identification in chromatography, retention time windows must be established on every column for every analyte used for that method. These records are kept on-file and available for review. Complete details are available in the laboratory SOPs.

19.12 Evaluation of Selectivity

The laboratory evaluates selectivity by following the checks within the applicable analytical methods, which include mass spectral tuning, second column confirmation, ICP interelement interference checks, and chromatography retention time windows.

19.13 Estimation of Uncertainty of Measurement

19.13.1 Uncertainty is "a parameter associated with the result of a measurement, that characterizes the dispersion of the values that could reasonably be attributed to the measurand" (as defined by the International Vocabulary of Basic and General Terms in Metrology, ISO Geneva, 1993, ISBN 92-67-10175-1). Knowledge of the uncertainty of a measurement provides additional confidence in a result's validity. Its value accounts for all the factors which could possibly affect the result, such as adequacy of analyte definition, sampling, matrix effects and interferences, climatic conditions, variances in weights, volumes, and standards, analytical procedure, and random variation. Some national accreditation organizations require the use of an "expanded uncertainty" defined as the range within which the value of the measurand is believed to lie within at least a 95% confidence level with the coverage factor k=2.

19.13.2 Uncertainty is not error. Error is a single value (i.e., the difference between the true result and the measured result). On environmental samples, the true result is never known. The measurement is the sum of the unknown true value and the unknown error. Unknown error is a combination of systematic error, or bias, and random error. Bias varies predictably, constantly, and independently from the number of measurements. Random error is unpredictable, assumed to be Gaussian in distribution, and reducible by increasing the number of measurements.

19.13.3 The minimum uncertainty associated with results generated by the laboratory can be determined by using the Laboratory Control Sample (LCS) accuracy range for a given analyte. The LCS limits are used to assess the performance of the measurement system since they take into consideration all of the laboratory variables associated with a given test over time (except for variability associated with the sampling and the variability due to matrix effects). The percent recovery of the LCS is compared either to the method-required LCS accuracy limits or to the statistical, historical, in-house LCS accuracy limits.

19.13.4 To calculate the uncertainty for the specific result reported, multiply the result by the decimal of the lower end of the LCS range percent value for the lower end of the uncertainty range, and multiply the result by the decimal of the upper end of the LCS range percent value for the upper end of the uncertainty range. These calculated values represent uncertainties at approximately the 99% confidence level with a coverage factor of k = 3. As an example, for a reported result of 1.0 mg/L with an LCS recovery range of 50 to 150%, the estimated uncertainty in the result would be 1.0 +/- 0.5 mg/L.

Refer to SOP SA-QA-017: *Evaluation of Batch QC Data* for more information on this topic.

19.13.5 In the case where a well-recognized test method specifies limits to the values of major sources of uncertainty of measurement (e.g., EPA 524.2, EPA 525, etc.) and specifies the form of presentation of calculated results, no further discussion of uncertainty is required.

19.14 Sample Reanalysis Guidelines

Because there is a certain level of uncertainty with any analytical measurement, a sample re-preparation (where appropriate) and subsequent analysis (hereafter referred to as 'reanalysis') may result in either a higher or lower value from an initial sample analysis. There are also

variables that may be present (e.g., sample homogeneity, analyte precipitation over time, etc.) that may affect the results of a reanalysis. Based on the above comments, the laboratory will reanalyze samples at a client's request with the following caveats. Client specific Contractual Terms & Conditions for reanalysis protocols may supersede the following items.

- Homogenous samples: If a reanalysis agrees with the original result to within the RPD limits for MS/MSD or Duplicate analyses, or within ± 1 reporting limit for samples ≤ 5x the reporting limit, the original analysis will be reported. At the client's request, both results may be reported on the same report but not on two separate reports.
- If the reanalysis does not agree (as defined above) with the original result, then the laboratory will investigate the discrepancy and reanalyze the sample a third time for confirmation if sufficient sample is available.
- Any potential charges related to reanalysis are discussed in the contract terms and conditions or discussed at the time of the request. The client will typically be charged for reanalysis unless it is determined that the lab was in error.
- Due to the potential for increased variability, reanalysis may not be applicable to Non-homogenous, Encore, and Sodium Bisulfate preserved samples. See the Area Supervisor or Laboratory Director if unsure.

19.15 Control of Data

The laboratory has policies and procedures in place to ensure the authenticity, integrity, and accuracy of the analytical data generated by the laboratory.

19.15.1 Computer and Electronic Data Related Requirements

The three basic objectives of our computer security procedures and policies are shown below. The laboratory is currently using the Eurofins LIMS system, which has been highly customized to meet the needs of the laboratory.

19.15.1.1 Maintain the Database Integrity – Assurance that data is reliable and accurate through data verification (review) procedures, password-protecting access, anti-virus protection, data change requirements, as well as an internal LIMS permissions procedure.

- LIMS Database Integrity is achieved through data input validation, internal user controls, documentation of system failures and corrective actions taken, and data change requirements.
- Spreadsheets and other software developed in-house must be verified with documentation through hand calculations prior to use. Cells containing calculations must be lock-protected and controlled.
- Instrument hardware and software adjustments are safeguarded through maintenance logs, audit trails and controlled access.

19.15.1.2 Ensure Information Availability – Protection against loss of information or service is ensured through scheduled back-ups, stable file server network architecture, secure storage of media, line filter, Uninterruptible Power Supply (UPS), and maintaining older versions of software as revisions are implemented.

19.15.1.3 Maintain Confidentiality – Ensure data confidentiality through physical access controls such as password protection or website access approval when electronically transmitting data.

19.15.2 Data Reduction

The complexity of the data reduction depends on the analytical method and the number of discrete operations involved (e.g., extractions, dilutions, instrument readings and concentrations). The analyst calculates the final results from the raw data or uses appropriate computer programs to assist in the calculation of final reportable values.

For manual data entry, e.g., Wet Chemistry, the data is reduced by the analyst and then verified by the Department Manager or alternate analyst prior to approving the data in LIMS.

Manual integration of peaks will be documented and reviewed and the raw data will be flagged using NDSC Document No. CA-Q-S-002, *Acceptable Manual Integration Practices* and SOP SA-QA-008: *Evaluation of Chromatographic Data.*

Analytical results are reduced to appropriate concentration units specified by the analytical method, taking into account factors such as dilution, sample weight or volume, etc. Blank correction will be applied only when required by the method or per manufacturer's indication; otherwise, it should not be performed. Calculations are independently verified by appropriate laboratory staff. Calculations and data reduction steps for various methods are summarized in the respective analytical SOPs or program requirements.

19.15.2.1 All raw data must be retained in the worklist folder, computer file (if appropriate), and/or runlog. All criteria pertinent to the method must be recorded. The documentation is recorded at the time observations or calculations are made and must be signed or initialed/dated (month/day/year). It must be easily identifiable who performed which tasks if multiple people were involved.
19.15.2.2 In general, concentration results are reported in milligrams per liter (mg/l) or micrograms per liter (µg/l) for liquids and milligrams per kilogram (mg/Kg) or micrograms per kilogram (µg/Kg) for solids. For values greater than 10,000 mg/L, results can be reported in percent, i.e., 10,000 mg/L = 1**%.** Units are defined in each lab SOP.

19.15.2.3 If final calculations are performed external to LIMS, the results should be entered in LIMS with at least three significant figures. In general, results are reported to 2 significant figures on the final report.

19.15.2.4 For those methods that do not have an instrument printout or an instrumental output compatible with the LIMS, the raw results and dilution factors are entered directly into LIMS by the analyst, and the software calculates the final result for the analytical report. LIMS has a formatter for significant figure criterion for each analyte.

19.15.2.5 The laboratory strives to import data directly from instruments or calculation spreadsheets to ensure that the reported data are free from transcription and calculation errors. For those analyses with an instrumental output compatible with the LIMS, the raw results and dilution factors are transferred into LIMS electronically. Electronic data from instruments are saved electronically in a daily folder on the system (CHROM or instrument computer). For

instruments that print out calibrations and concentrations, the data are retained with the data file. The data file is stored in the Archival Folder on the Public_QA. These files are transferred to the server daily, and eventually, to a tape file.

19.15.3 Logbook / Worksheet Use Guidelines

Logbooks and worksheets are filled out 'real time' and have enough information on them to trace the events of the applicable analysis/task. (e.g. calibrations, standards, analyst, sample ID, date, time on short holding time tests, temperatures when applicable, calculations are traceable, etc.)

- Corrections are made following the procedures outlined in Section 14.
- Logbooks are controlled by the QA department. A record is maintained of all logbooks in the lab.
- Unused portions of pages must be "Z"'d out, signed and dated.
- Worksheets are created with the approval of the Technical Manager/QA Manager at the facility. The QA Manager controls all worksheets following the procedures in Section 6.

19.15.4 Review / Verification Procedures

Data review procedures are outlined in the analytical SOPs and SOP SA-QA-002: *Data Generation and Review* and ensure that data reported are free from calculation and transcription errors and that QC parameters have been reviewed and evaluated before data is reported. The laboratory also has an SOP discussing manual integrations to ensure the authenticity of the data (SOP SA-QA-008). The general review concepts are discussed below; more specific information can be found in the SOPs.

19.15.4.1 Log-In Review - The data review process starts at the sample receipt stage. Sample control personnel review chain-of-custody forms and project instructions from the project management group. This is the basis of the sample information and analytical instructions entered into the LIMS. The log-in instructions are reviewed by the personnel entering the information, and a second level review is conducted by the project management staff.

19.15.4.2 First Level Data Review - The next level of data review occurs with the analysts. As data are generated, analysts review their work to ensure that the results meet project and SOP requirements. First level reviews include inspection of all raw data (e.g., instrument output for continuous analyzers, chromatograms, spectra, and manual integrations), evaluation of calibration/calibration verification data in the day's analytical run, evaluation of QC data, and reliability of sample results. The analyst transfers data into LIMS, data qualifiers are added as needed. All first level reviews are documented.

19.15.4.3 Second Level Data Review – All analytical data are subject to review by a second qualified analyst or supervisor. Second level reviews include inspection of all raw data (e.g., instrument output, chromatograms, and spectra) including 100% of data associated with any changes made by the primary analyst, such as manual integrations or reassignment of peaks to different analytes, or elimination of false negative analytes. The second review also includes evaluation of initial calibration/calibration verification data in the day's analytical run, evaluation of QC data, reliability of sample results, qualifiers and NCM narratives. Manual calculations are checked in second level review. All second level reviews are documented.

Issues that deem further review include the following:

- QC data are outside the specified control limits for accuracy and precision
- Reviewed sample data does not match with reported results
- Unusual detection limit changes are observed
- Samples having unusually high results
- Samples exceeding a known regulatory limit
- Raw data indicating some type of contamination or poor technique
- Inconsistent peak integration
- Transcription errors
- Results outside of calibration range

19.15.4.4 Unacceptable analytical results may require reanalysis of the samples. Any problems are brought to the attention of the Laboratory Director, Project Manager, Quality Director/Manager, Technical Manager, or Supervisor for further investigation. Corrective action is initiated whenever necessary.

19.15.4.5 The results are then entered or directly transferred into the computer database and a pdf is printed for the client.

19.15.4.6 As a final review prior to the release of the report, the Project Manager reviews the results for appropriateness and completeness. This review and approval ensures that client requirements have been met and that the final report has been properly completed. The process includes, but is not limited to, verifying that the COC is followed, cover letters / narratives are present, flags are appropriate, and project specific requirements are met. The Project Manager may also evaluate the validity of results for different test methods given expected chemical relationships.

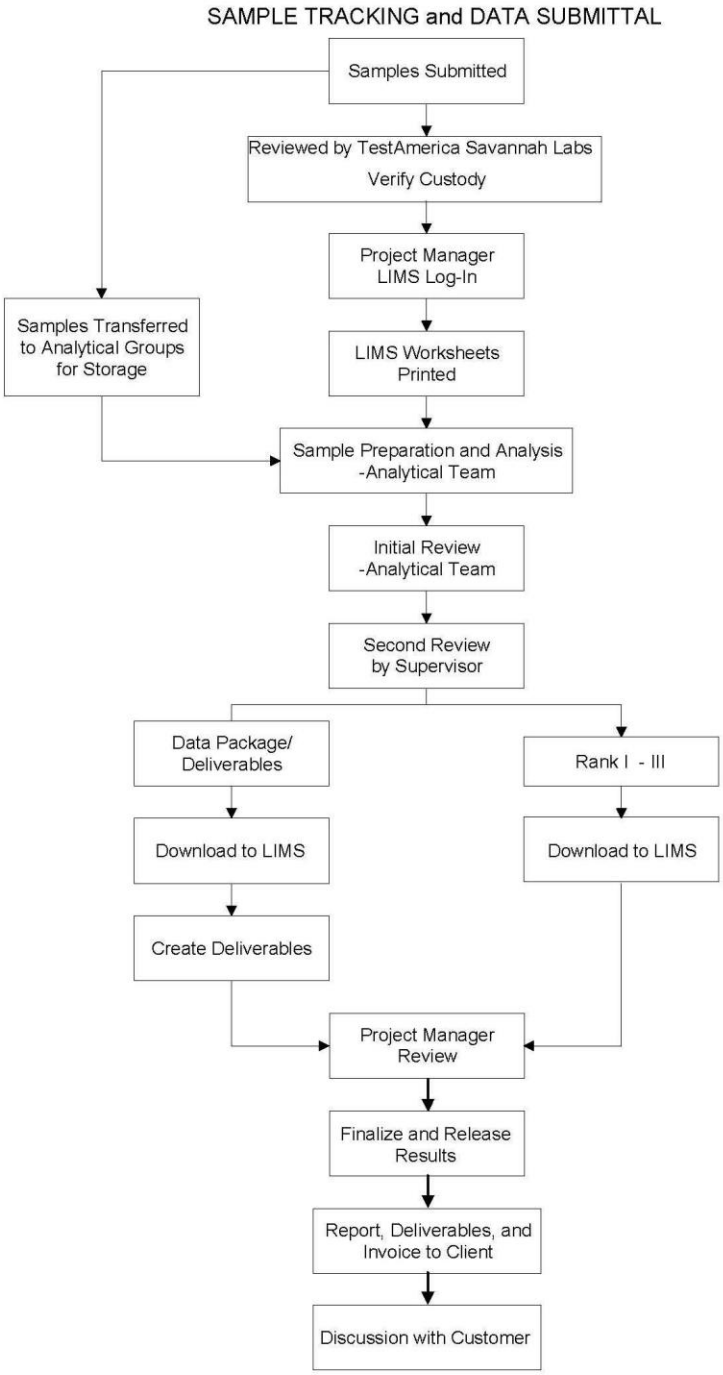
- Total Results are > Dissolved results (e.g. metals)
- Total Solids (TS) > Total Dissolved Solids (TDS) or Total Suspended Solids (TSS)
- TKN > Ammonia
- Total Phosphorus > Orthophosphate
- COD > TOC
- Total Cyanide > Amenable Cyanide
- TDS > individual anions

19.15.4.7 Any project that requires a data package is subject to a tertiary data review for transcription errors and acceptable quality control requirements. The Project Manager then signs the final report.

19.15.4.8 A brief overview of sample flow and information through the laboratory, as well as data review and validation, is presented in Figure 19-1.

19.15.5 Manual Integrations

Computerized data systems provide the analyst with the ability to re-integrate raw instrument data in order to optimize the interpretation of the data. Though manual integration of data is an invaluable tool for resolving variations in instrument performance and some sample matrix problems, when used improperly, this technique would make unacceptable data appear to meet quality control acceptance limits. Improper re-integrations lead to legally indefensible data, a poor reputation, or possible laboratory decertification. Because guidelines for re-integration of data are not provided in the methods and most methods were written prior to widespread implementation of computerized data systems, the laboratory trains all analytical staff on proper manual integration techniques using NDSC Document No. CA-Q-S-002, Acceptable Manual Integration Practices as the guideline for our internal SOP No. SA-QA-008, entitled *Evaluation of Chromatographic Data.*



19.15.5.1 The analyst must adjust baseline or the area of a peak in some situations, for example when two compounds are not adequately resolved or when a peak shoulder needs to be separated from the peak of interest. The analyst must use professional judgment to determine when manual integrating is required. Analysts are encouraged to ask for assistance from a senior analyst or manager when in doubt.

19.15.5.2 Analysts shall not increase or decrease peak areas for the sole purpose of achieving acceptable QC recoveries that would have otherwise been unacceptable. The intentional recording or reporting of incorrect information (or the intentional omission of correct information) is against company principles and policy and is grounds for immediate termination.

19.15.5.3 Client samples, performance evaluation samples, and quality control samples are all treated equally when determining whether or not a peak area or baseline should be manually adjusted.

19.15.5.4 All manual integrations receive a second level review. Manual integrations must be indicated on expanded scale “before” and “after” chromatograms such that the integration performed can be easily evaluated during data review. Expanded scale “before” chromatograms are also required for all manual integrations on QC parameters (calibrations, calibration verifications, laboratory control samples, internal standards, surrogates, etc.) unless the laboratory has another documented NDSC approved procedure in place that can demonstrate an active process for detection and deterrence of improper integration practices.

Figure 19-1. Work Flow

20.0 EQUIPMENT and CALIBRATIONS

20.1 Overview

The laboratory purchases the most technically advanced analytical instrumentation for sample analyses. Instrumentation is purchased on the basis of accuracy, dependability, efficiency and sensitivity. Each laboratory is furnished with all items of sampling, preparation, analytical testing and measurement equipment necessary to correctly perform the tests for which the laboratory has capabilities. Each piece of equipment is capable of achieving the required accuracy and complies with specifications relevant to the method being performed. Before being placed into use, the equipment (including sampling equipment) is calibrated and checked to establish that it meets its intended specification. The calibration routines for analytical instruments establish the range of quantitation. Calibration procedures are specified in laboratory SOPs. A list of available laboratory instrumentation is presented in Table 20-1.

Equipment is only operated by authorized and trained personnel. Manufacturer's instructions for equipment use are readily accessible to all appropriate laboratory personnel.

20.2 Préventive Maintenance

The laboratory follows a well-defined maintenance program to ensure proper equipment operation and to prevent the failure of laboratory equipment or instrumentation during use. This program of preventive maintenance helps to avoid delays due to instrument failure.

Routine preventive maintenance procedures and frequency, such as cleaning and replacements, should be performed according to the procedures outlined in the manufacturer's manual. Qualified personnel must also perform maintenance when there is evidence of degradation of peak resolution, a shift in the calibration curve, loss of sensitivity, or failure to continually meet one of the quality control criteria.

Scheduled routine maintenance is defined in each method SOP. It is the responsibility of each Department Manager to ensure that instrument maintenance logs are kept for all equipment in his/her department. Preventative maintenance procedures are also outlined in analytical SOPs or instrument manuals. (Note: for some equipment, the log used to monitor performance is also the maintenance log. Multiple pieces of equipment may share the same log as long as it is clear as to which instrument is associated with an entry.)

Instrument maintenance logs are controlled and are used to document instrument problems, instrument repair and maintenance activities. Maintenance logs shall be kept for all major pieces of equipment. Instrument maintenance logs may also be used to specify instrument parameters.

- Documentation must include all major maintenance activities such as contracted preventive maintenance and service and in-house activities such as the replacement of electrical components, lamps, tubing, valves, columns, detectors, cleaning and adjustments.
- Each entry in the instrument log includes the analyst's initials, the date, a detailed description of the problem (or maintenance needed/scheduled), a detailed explanation of the solution or maintenance performed, and a verification that the equipment is functioning properly (state what was used to determine a return to control. e.g. CCV run on *'date'* was acceptable, or

instrument recalibrated on 'date' with acceptable verification, etc.) must also be documented in the instrument records.
- When maintenance or repair is performed by an outside agency, service receipts detailing the service performed can be affixed into the logbooks adjacent to pages describing the maintenance performed.

If an instrument requires repair (subjected to overloading or mishandling), gives suspect results, or otherwise has shown to be defective or outside of specified limits it shall be taken out of operation and tagged as out-of-service or otherwise isolated until such a time as the repairs have been made and the instrument can be demonstrated as operational by calibration and/or verification or other test to demonstrate acceptable performance. The laboratory shall examine the effect of this defect on previous analyses.

In the event of equipment malfunction that cannot be resolved, service shall be obtained from the instrument vendor manufacturer, or qualified service technician, if such a service can be tendered. If on-site service is unavailable, arrangements shall be made to have the instrument shipped back to the manufacturer for repair. Back up instruments, which have been approved, for the analysis shall perform the analysis normally carried out by the malfunctioning instrument.

If the back-up is not available and the analysis cannot be carried out within the needed timeframe, the samples shall be subcontracted.

At a minimum, if an instrument is sent out for service or transferred to another facility, it must be recalibrated and the laboratory MDL verified (using an MDLV) prior to return to lab operations.

20.3 Support Equipment

This section applies to all devices that may not be the actual test instrument, but are necessary to support laboratory operations. These include but are not limited to: balances, ovens, refrigerators, freezers, incubators, water baths, temperature measuring devices, and volumetric dispensing devices if quantitative results are dependent on their accuracy, as in standard preparation and dispensing or dilution into a specified volume. All raw data records associated with the support equipment are retained to document instrument performance.

20.3.1 Weights and Balances

The accuracy of the balances used in the laboratory is checked every working day, before use. All balances are placed on stable counter tops.

Each balance is checked prior to initial serviceable use with at least two certified ASTM type 1 weights spanning its range of use (weights that have been calibrated to ASTM type 1 weights may also be used for daily verification). ASTM type 1 weights used only for calibration of other weights (and no other purpose) are inspected for corrosion, damage or nicks at least annually and if no damage is observed, they are calibrated at least every 5 years by an outside calibration laboratory. Any weights (including ASTM Type 1) used for daily balance checks or other purposes are recalibrated/recertified annually to NIST standards (this may be done internally if laboratory maintains "calibration only" ASTM type 1 weights).

All balances are serviced annually by a qualified service representative, who supplies the laboratory with a certificate that identifies traceability of the calibration to the NIST standards.

All of this information is recorded in logs, and the recalibration/recertification certificates are kept on file.

20.3.2 pH, Conductivity, and Turbidity Meters

The pH meters used in the laboratory are accurate to ± 0.1 pH units, and have a scale readability of at least 0.05 pH units. The meters automatically compensate for the temperature, and are calibrated with at least two working range buffer solutions before each use.

Conductivity meters used in the laboratory are capable or measuring conductivity with an error not exceeding 1% or one umhos/cm, whichever is greater. The meters are also calibrated before each use with a known standard.

Turbidity meters are also calibrated before each use. All of this information is documented in logs.

Consult pH, Conductivity, and Turbidity SOPs for further information.

20.3.3 Thermometers

All thermometers are calibrated on an annual basis with a NIST-traceable thermometer.

- If the temperature measuring device is used over a range of 10°C or less, then a single point verification within the range of use is acceptable;
- If the temperature measuring device is used over a range of greater than 10°C, then the verification must bracket the range of use.

IR thermometers, digital probes and thermocouples are calibrated quarterly. IR Thermometers should be calibrated over the full range of use, including ambient, iced (4°C) and frozen (0°C to -5°C), per the Drinking Water Manual.

The mercury NIST thermometer is recalibrated every three years (unless thermometer has been exposed to temperature extremes or apparent separation of internal liquid) by an approved outside service and the provided certificate of traceability is kept on file. The NIST thermometer(s) have increments of 1 degree (0.5 degree or less increments are required for drinking water microbiological laboratories), and have ranges applicable to method and certification requirements. The NIST traceable thermometer is used for no other purpose than to calibrate other thermometers.

All of this information is documented electronically. Monitoring method-specific temperatures, including incubators, heating blocks, water baths, and ovens, is documented in equipment-specific logbooks or LIMS sample batches. More information on this subject can be found in SOP SA-AN-100: *Laboratory Support Equipment (Verification and Use)*.

20.3.4 Refrigerators/Freezer Units, Water baths, Ovens and Incubators

The temperatures of all refrigerator units and freezers used for sample and standard storage are monitored each working day – including holidays and weekends (i.e., 7 days a week).
Ovens, water baths and incubators are monitored on days of use.

All of this equipment has a unique identification number, and is assigned a thermometer for monitoring.

Sample storage refrigerator temperatures are kept between > 0ºC and ≤ 6 ºC.

Specific temperature settings/ranges for other refrigerators, ovens, water baths, and incubators can be found in method specific SOPs.

All of this information is documented in Daily Temperature Logbooks and procedure-specific logbooks.

20.3.5 Autopipettors, Dilutors, and Syringes

Mechanical volumetric dispensing devices including burettes (except Class A Glassware and glass microliter syringes) are given unique identification numbers and the delivery volumes are verified gravimetrically, at a minimum, on a quarterly basis (monthly for DoD).

For those dispensers that are not used for quantitative measurements, a label shall be applied to the device stating that it is not calibrated. Any device not regularly verified cannot be used for any quantitative measurements.

Glass micro-syringes are considered the same as Class A glassware provided they are purchased with a manufacturer's certificate attesting to their accuracy. Micro-syringes are routinely purchased from Hamilton Company. The laboratory keeps on file an "Accuracy and Precision Statement of Conformance" from Hamilton attesting established accuracy.

20.4 Instrument Calibrations

Calibration of analytical instrumentation is essential to the production of quality data. Strict calibration procedures are followed for each method. These procedures are designed to determine and document the method detection limits, the working range of the analytical instrumentation and any fluctuations that may occur from day to day.

Sufficient raw data records are retained to allow an outside party to reconstruct all facets of the initial calibration. Records contain, but are not limited to, the following: calibration date, method, instrument, analyst(s) initials or signatures, analysis date, analytes, concentration, response, and type of calibration (Avg RF, curve, or other calculations that may be used to reduce instrument responses to concentration.)

Sample results must be quantitated from the initial calibration and may not be quantitated from any continuing instrument calibration verification unless otherwise required by regulation, method or program.

If the initial calibration results are outside of the acceptance criteria, corrective action is performed and any affected samples are reanalyzed if possible. If the reanalysis is not possible, any data associated with an unacceptable initial calibration will be reported with appropriate data qualifiers (refer to Section 14).

Note: Instruments are calibrated initially and as needed after that and at least annually.

20.4.1 Calibration Standards

Calibration standards are prepared using the procedures indicated in the Reagents and Standards section of the determinative method SOP. If a reference method does not specify the number of calibration standards, a minimum of 3 calibration points will be used.
Standards for instrument calibration are obtained from a variety of sources. All standards are traceable to national or international standards of measurement, or to national or international standard reference materials.

The lowest concentration calibration standard that is analyzed during an initial calibration must be at or below the stated reporting limit for the method based on the final volume of extract (or sample).

The other concentrations define the working range of the instrument/method or correspond to the expected range of concentrations found in actual samples that are also within the working range of the instrument/method. Results of samples not bracketed by initial instrument calibration standards (within calibration range to at least the same number of significant figures used to report the data) must be reported as having less certainty, e.g., defined qualifiers or flags (additional information may be included in the case narrative). The exception to these rules are standard ICP and ICPMS methods which define the working range with periodic linear dynamic range studies, rather than through the range of concentrations of daily calibration standards.

All initial calibrations are verified with a standard obtained from a second source and traceable to a national standard, when available (or vendor certified different lot if a second source is not available). For unique situations, such as air analysis where no other source or lot is available, a standard made by a different analyst at a different time or a different preparation would be considered a second source. This verification occurs immediately after the calibration curve has been analyzed, and before the analysis of any samples.

20.4.1.1 Calibration Verification

The calibration relationship established during the initial calibration must be verified initially and at least daily as specified in the laboratory method SOPs in accordance with the referenced analytical methods and in the 2009 and 2016 TNI Standard. The process of calibration verification applies to both external standard and internal standard calibration techniques, as well as to linear and non-linear calibration models. Initial calibration verification (ICV) is with a standard source secondary (second source standard) to the calibration standards, but

continuing calibration verifications (CCV) may use the same source standards as the calibration curve.

Note: The process of calibration verification referred to here is fundamentally different from the approach called "calibration" in some methods. As described in those methods, the calibration factors or response factors calculated during calibration are used to update the calibration factors or response factors used for sample quantitation. This approach, while employed in other EPA programs, amounts to a daily single-point calibration.

All target analytes and surrogates, including those reported as non-detects, must be included in periodic calibration verifications for purposes of retention time confirmation and to demonstrate that calibration verification criteria are being met, i.e., RPD, per 2009 and 2016 TNI Std. EL-V1M4 Sec. 1.7.2.

All samples must be bracketed by periodic analyses of standards that meet the QC acceptance criteria (e.g., calibration and retention time). The frequency is found in the determinative methods or SOPs.

Note: If an internal standard calibration is being used then bracketing calibration verification standards may not be are not required, only daily verifications are needed, unless specified by the reference method. The results from these verification standards must meet the calibration verification criteria and the retention time criteria (if applicable).

Generally, the calibrations must be verified by an ICV analyzed immediately following initial calibration and before sample analysis. The ICV may be used as the first bracketing CCV, if criteria for both are met.

A continuing instrument calibration verification (CCV) is generally analyzed at the beginning of each 12-hour analytical shift during which samples are analyzed. The 12-hour analytical shift begins with the injection of the calibration verification standard (or the MS tuning standard in MS methods). The shift ends after the completion of the analysis of the last sample, QC, or standard that can be injected within 12-hours of the beginning of the shift. For methods that have quantitation by external calibration models, a CCV is analyzed at the end of each analytical sequence. Some methods have more or less frequent CCV requirements. See specific SOPs. Most inorganic methods require the CCV to be analyzed after ever 10 samples or injections, including matrix or batch QC samples.

Note: If an internal standard calibration is being used (e.g., GCMS) then bracketing standards are not required, only daily verifications are needed, except as specified by program or method requirements.

If the results of a CCV are outside the established acceptance criteria and analysis of a second consecutive (and immediate) CCV fails to produce results within acceptance criteria, corrective action shall be performed. Once corrective actions have been completed and documented, the laboratory shall demonstrate acceptable instrument / method performance by analyzing two consecutive CCVs, or a new initial instrument calibration shall be performed.

Sample analyses and reporting of data may not occur or continue until the analytical system is calibrated or calibration verified. However, data associated with an unacceptable calibration verification may be fully useable reported based upon discussion and approval of the client under the following special conditions:

a) when the acceptance criteria for the CCV are exceeded high (i.e., high bias) and the associated samples within the batch are non-detects, then those non-detects may be reported case narrative comment explaining the high bias. Otherwise the samples affected by the unacceptable CCV shall be re-analyzed after a new calibration curve has been established, evaluated and accepted; or

b) when the acceptance criteria for the CCV are exceeded low (i.e., low bias), those sample results may be reported if they exceed a maximum regulatory limit/decision level. Otherwise the samples affected by the unacceptable CCV shall be re-analyzed after a new calibration curve has been established, evaluated and accepted.

Samples reported by the 2 conditions identified above will be appropriately flagged.

20.4.1.2 Verification of Linear and Non-Linear Calibrations

Calibration verification for calibrations involves the calculation of the percent drift or the percent difference of the instrument response between the initial calibration and each subsequent analysis of the verification standard. (These calculations are available in the laboratory method SOPs.) Verification standards are evaluated based on the % Difference from the average CF or RF of the initial calibration or based on % Drift or % Recovery if a linear or quadratic curve is used.

Regardless of whether a linear or non-linear calibration model is used, if initial verification criterion is not met, then no sample analyses may take place until the calibration has been verified or a new initial calibration is performed that meets the specifications listed in the method SOPs. If the calibration cannot be verified after the analysis of a single verification standard, then adjust the instrument operating conditions and/or perform instrument maintenance, and analyze another aliquot of the verification standard. If the calibration cannot be verified with the second standard, then a new initial calibration is performed.

- When the acceptance criteria for the calibration verification are exceeded high, i.e., high bias, and there are associated samples that are non-detects, then those non-detects may be reported. Otherwise, the samples affected by the unacceptable calibration verification shall be reanalyzed after a new calibration curve has been established, evaluated and accepted.
- When the acceptance criteria for the calibration verification are exceeded low, i.e., low bias, those sample results may be reported if they exceed a maximum regulatory limit/decision level. Otherwise, the samples affected by the unacceptable verification shall be reanalyzed after a new calibration curve has been established, evaluated and accepted. Alternatively, a reporting limit standard may be analyzed to demonstrate that the laboratory can still support non-detects at their reporting limit.

20.5 Tentatively Identified Compounds (TICs) – GC/MS Analysis

For samples containing components not associated with the calibration standards, a library search may be made for the purpose of tentative identification. The necessity to perform this type of identification will be determined by the purpose of the analyses being conducted. For example, the RCRA permit or waste delisting requirements may require the reporting of non-target analytes. Only after visual comparison of sample spectra with the nearest library searches may the analyst assign a tentative identification. Data system library search routines should not use normalization routines that would misrepresent the library or unknown spectra when compared to each other. Additional details are provided in NDSC Document No. CA-Q-QM-001, Tentatively Identified Compounds (TICS) - GCMS Analysis.

Note: If the TIC compound is not part of the client target analyte list but is calibrated by the laboratory and is both qualitatively and/or quantitatively identifiable, it should not be reported as a TIC. If the compound is reported on the same form as true TICs, it should be qualified and/or narrated that the reported compound is qualitatively and quantitatively (if verification in control) reported compared to a known standard that is in control (where applicable).

20.6 GC/MS Tuning

Prior to any GC/MS analytical sequence, including calibration, the instrument parameters for the tune and subsequent sample analyses within that sequence must be set.

Prior to tuning/auto-tuning the mass spectrometer, the parameters may be adjusted within the specifications set by the manufacturer or the analytical method. These generally do not need any adjustment but it may be required based on the current instrument performance. If the tune verification does not pass it may be necessary to clean the source or perform additional maintenance. Any maintenance is documented in the maintenance log.

Table 20-1. Instrumentation List

eurofins | Environment Testing TestAmerica

Eurofins TestAmerica Savannah Instrument List

Equipment/ Instrument	Manufacturer	Model Number	Serial Number	Year Put into Service	Condition When Received
ICP	Varian (ICP E)	730-ES	IP0712M054	2008	New

Company Confidential & Proprietary

21.0 MEASUREMENT TRACEABILITY

21.1 Overview

Traceability of measurements shall be assured using a system of documentation, calibration, and analysis of reference standards. Laboratory equipment that are peripheral to analysis and whose calibration is not necessarily documented in a test method analysis or by analysis of a reference standard shall be subject to ongoing certifications of accuracy. At a minimum, these must include procedures for checking specifications of ancillary equipment: balances, thermometers, temperature, Deionized (DI) and Reverse Osmosis (RO) water systems, automatic pipettes and other volumetric measuring devices. (Refer to Section 20.3). With the exception of Class A Glassware and glass microliter syringes, quarterly accuracy checks are performed for all mechanical volumetric devices. Wherever possible, subsidiary or peripheral equipment is checked against standard equipment or standards that are traceable to national or international standards. Class A Glassware and glass microliter syringes should be routinely inspected for chips, acid etching or deformity (e.g., bent needle). If the Class A glassware or syringe is suspect, the accuracy of the glassware will be assessed prior to use.

21.2 NIST-Traceable Weights and Thermometers

Reference standards of measurement shall be used for calibration only and for no other purpose, unless it can be shown that their performance as reference standards would not be invalidated.

For NIST-traceable weights and thermometers, the laboratory requires that all calibrations be conducted by a calibration laboratory accredited by A2LA, NVLAP (National Voluntary Laboratory Accreditation Program), or another accreditation organization that is a signatory to a MRA (Mutual Recognition Arrangement) of one or more of the following cooperation – ILAC (International Laboratory Accreditation Cooperation) or APLAC (Asia–Pacific Laboratory Accreditation Cooperation). A calibration certificate and scope of accreditation is kept on file at the laboratory.

Calibration laboratory's policy for achieving measurement traceability is defined and includes the subsequent elements of uncertainty. The calibration report or certificate submitted contains a traceability statement, the conditions under which the calibrations were made in the context of any potential influence, a compliance statement with an identified metrological specification and the pertinent clauses, a clearly identified record of the quantities and functional test results before and after re-calibration, and no recommendation on the calibration interval. Opinions and interpretations of results are presented along with the basis upon which they were made and identified as such. All calibration reports are filed in the QA Department.

An external certified service engineer services laboratory balances on an annual basis. This service is documented on each balance with a signed and dated certification sticker. Balance calibrations are checked each day of use. All mercury thermometers are calibrated annually against a traceable reference thermometer. Digital thermometers are verified quarterly against a traceable reference thermometer. Temperature readings of ovens, refrigerators, and incubators are checked on each day of use.

21.3 Reference Standards / Materials

Reference standards/materials, where commercially available, are traceable to certified reference materials. Commercially prepared reference standards, to the extent available, are purchased from vendors that are accredited to ISO Guide 34 and ISO/IEC Guide 17025. All reference standards from commercial vendors shall be accompanied with a certificate that includes at least the following information:

- Manufacturer
- Analytes or parameters calibrated
- Identification or lot number
- Calibration method
- Concentration with associated uncertainties
- Purity

If a standard cannot be purchased from a vendor that supplies a Certificate of Analysis, the purity of the standard is documented by analysis. The receipt of all reference standards must be documented. Reference standards are labeled with a unique reagent ID and expiration date. All documentation received with the reference standard is retained as a QC record and references the reagent ID.

All reference, primary and working standards/materials, whether commercially purchased or laboratory prepared, must be checked regularly to ensure that the variability of the standard or material from the true value does not exceed method requirements. The accuracy of calibration standards is checked by comparison with a standard from a second source. In cases where a second standard manufacturer is not available, a vendor certified different lot is acceptable for use as a second source. For unique situations, where no other source or lot is available, a standard made by a different analyst would be considered a second source. The appropriate Quality Control (QC) criteria for specific standards are defined in laboratory SOPs. In most cases, the analysis of an Initial Calibration Verification (ICV) or LCS (where there is no sample preparation) is used as the second source confirmation. These checks are generally performed as an integral part of the analysis method (e.g. calibration checks, laboratory control samples).

All standards and materials must be stored and handled according to method or manufacturer's requirements in order to prevent contamination or deterioration. Refer to the Environmental Health & Safety Manual or laboratory SOPs. For safety requirements, please refer to method SOPs and the laboratory's Environmental Health and Safety Manual.

Standards and reference materials shall not be used after their expiration dates unless their reliability is verified by the laboratory and their use is approved by the Quality Assurance Manager. The laboratory must have documented contingency procedures for re-verifying expired standards.

21.4 Documentation and Labeling of Standards, Reagents, and Reference Materials

Reagents must be at a minimum the purity required in the test method. The date of reagent receipt and the expiration date are documented. The lots for most of the common solvents and acids are tested for acceptability prior to company-wide purchase. (Refer to NDSC Document No. CA-Q-S-001, Solvent and Acid Lot Testing and Approval.)

All manufacturer or vendor supplied Certificate of Analysis or Purity must be retained, stored appropriately, and readily available for use and inspection. These records are maintained electronically. Records must be kept of the date of receipt and date of expiration of standards, reagents and reference materials. In addition, records of preparation of laboratory standards, reagents, and reference materials must be retained, stored appropriately, and be readily available for use and inspection. For detailed information on documentation and labeling, please refer to method specific SOPs.

Commercial materials purchased for preparation of calibration solutions, spike solutions, etc.., are usually accompanied with an assay certificate or the purity is noted on the label. If the assay purity is 96% or better, the weight provided by the vendor may be used without correction. If the assay purity is less than 96% a correction will be made to concentrations applied to solutions prepared from the stock commercial material. Blended gas standard cylinders use a nominal concentration if the certified value is within +/-15%, otherwise the certified values is used for the canister concentration.

21.4.1 All standards, reagents, and reference materials must be labeled in an unambiguous manner. Standards are logged into the laboratory's LIMS, and are assigned a unique identification number. The following information is typically recorded in the electronic database within the LIMS.

- Standard ID
- Description of Standard
- Department
- Preparer's name
- Final volume and number of vials prepared
- Solvent type and lot number
- Preparation Date
- Expiration Date
- Standard source type (stock or daughter)
- Standard type (spike, surrogate, other)
- Parent standard ID (if applicable)
- Parent Standard Analyte Concentration (if applicable)
- Parent Standard Amount used (if applicable)
- Component Analytes
- Final concentration of each analyte
- Comment box (text field)

Records are maintained electronically for standard and reference material preparation. These records show the traceability to purchased stocks or neat compounds. These records also include method of preparation, date of preparation, expiration date and preparer's name or initials. Preparation procedures are provided in the Method SOPs.

21.4.2 All standards, reagents, and reference materials must be clearly labeled with a minimum of the following information:

- Expiration Date (include prep date for reagents)
- LIMS Standard ID
- Special Health/Safety warnings if applicable

Records must also be maintained of the date of receipt for commercially purchased items or date of preparation for laboratory prepared items. Special Health/Safety warnings must also be available to the analyst. This information is maintained electronically.

21.4.3 In addition, the following information may be helpful:

- Date opened (for multi-use containers, if applicable)
- Description of standard (if different from manufacturer's label or if standard was prepared in the laboratory)
- Recommended Storage Conditions
- Concentration (if applicable)
- Initials of analyst preparing standard or opening container

All containers of prepared reagents must include an expiration date and an ID number to trace back to preparation.

Procedures for preparation of reagents can be found in the Method SOPs.

Standard ID numbers must be traceable through associated logbooks, worksheets and preparation/analytical batch records.

All reagents and standards must be stored in accordance to the following priority: 1) with the manufacturer's recommendations; 2) with requirements in the specific analytical methods as specified in the laboratory SOP.

22.0 SAMPLING

22.1 Overview

The laboratory does not provide sampling services. The laboratory's responsibility in the sample collection process lies in supplying the sampler with the necessary coolers, reagent water, sample containers, preservatives, sample labels, custody seals, COC forms, ice, and packing materials required to properly preserve, pack, and ship samples to the laboratory.

22.2 Sampling Containers

The laboratory offers clean sampling containers for use by clients. These containers are obtained from reputable container manufacturers and meet EPA specifications as required. Certificates of cleanliness for bottles and preservatives are provided by the supplier and are maintained at the laboratory. Alternatively, the certificates may be maintained by the supplier and available to the laboratory on-line.

22.2.1 Preservatives

Upon request, preservatives are provided to the client in pre-cleaned sampling containers. In some cases containers may be purchased pre-preserved from the container supplier. Whether prepared by the laboratory or bought pre-preserved, the grades of the preservatives are at a minimum:

- Hydrochloric Acid – Reagent ACS (Certified VOA Free) or equivalent
- Methanol – Purge and Trap grade
- Nitric Acid – Instra-Analyzed or equivalent
- Sodium Bisulfate – ACS Grade or equivalent
- Sodium Hydroxide – Instra-Analyzed or equivalent
- Sulfuric Acid – Instra-Analyzed or equivalent
- Sodium Thiosulfate – ACS Grade or equivalent

22.3 Definition of Holding Time

The date and time of sampling documented on the COC form establishes the day and time zero. As a general rule, when the maximum allowable holding time is expressed in days (e.g., 14 days, 28 days), the holding time is based on calendar day measured. Holding times expressed in hours (e.g., 6 hours, 24 hours, etc.) are measured from date and time zero. Holding times for analysis include any necessary reanalysis. However, there are some programs that determine holding time compliance based on the date and specific time of analysis compared to the time of sampling regardless of how long the holding time is.

22.4 Sampling Containers, Preservation Requirements, Holding Times

The preservation and holding time criteria specified in the laboratory SOPs are derived from the source documents for the methods. If method required holding times or preservation requirements are not met, the reports will be qualified using a flag, footnote or case narrative.

As soon as possible or “ASAP” is an EPA designation for tests for which rapid analysis is advised, but for which neither EPA nor the laboratory have a basis for a holding time.

22.5 Sample Aliquots / Subsampling

Taking a representative sub-sample from a container is necessary to ensure that the analytical results are representative of the sample collected in the field. The size of the sample container, the quantity of sample fitted within the container, and the homogeneity of the sample need consideration when sub-sampling for sample preparation. It is the laboratory’s responsibility to take a representative subsample or aliquot of the sample provided for analysis.

Analysts should handle each sample as if it is potentially dangerous. At a minimum, safety glasses, gloves, and lab coats must be worn when preparing aliquots for analysis.

Guidelines on taking sample aliquots and subsampling are located SOP SA-QA-015: *Homogenization, Compositing, and Segregation of Samples.*

23.0 HANDLING OF SAMPLES

It is the responsibility of the client to send us representative and/or homogeneous and properly preserved samples of the system from which they are drawn. The laboratory assumes that all multiple sample containers with the same designator/description and bottle type contain a homogeneous, representative sample.

The laboratory provides the appropriate sample containers, required preservative, chain-of-custody (COC) forms, shipping containers, labels, and custody seals. The laboratory also provides trip blanks and analyte-free water for field blanks. Preparation of methanol containers for field preservation of volatile soil samples is available.

Sample management procedures at the laboratory ensure that sample integrity and custody are maintained and documented from sampling/receipt through disposal.

23.1 Chain of Custody (COC)

The COC form is the written documented history of any sample and is initiated when bottles are sent to the field, or at the time of sampling. This form is completed by the sampling personnel and accompanies the samples to the laboratory where it is received and stored under the laboratory's custody. The purpose of the COC form is to provide a legal written record of the handling of samples from the time of collection until they are received at the laboratory. It also serves as the primary written request for analyses from the client to the laboratory. The COC form acts as a purchase order for analytical services when no other contractual agreement is in effect.

23.1.1 Field Documentation

The information the sampler needs to provide at the time of sampling on the container label is:

- Sample identification
- Date and time
- Preservative

During the sampling process, the COC form is completed and must be legible. This form includes information such as:

- Client name, address, phone number and fax number (if available)
- Project name and/or number
- The sample identification
- Date, time and location of sampling
- Sample collectors name
- The matrix description
- The container description
- The total number of each type of container
- Preservatives used
- Analysis requested
- Requested turnaround time (TAT)
- Any special instructions

- Purchase Order number or billing information (e.g. quote number) if available
- The date and time that each person received or relinquished the sample(s), including their signed name.

When the sampling personnel deliver the samples directly to the laboratory personnel, the samples are stored in a cooler with ice, as applicable, and remain solely in the possession of the client's field technician until the samples are delivered to the laboratory personnel. The sample collector must assure that each container is in his/her physical possession or in his/her view at all times, or stored in such a place and manner to preclude tampering. The field technician relinquishes the samples in writing on the COC form to the sample control personnel at the laboratory or to a laboratory courier. When sampling personnel deliver the samples through a common carrier (Fed-Ex, UPS), the CoC relinquished date/time is completed by the field personnel and samples are released to the carrier. Samples are only considered to be received by the laboratory when personnel at the fixed laboratory facility have physical contact with the samples.

Note: Independent couriers are not required to sign the COC form. The COC is usually kept in the sealed sample cooler. The receipt from the courier is stored in log-in by date; it lists all receipts each date.

23.1.2 Legal / Evidentiary Chain-of-Custody

If samples are identified for legal/evidentiary purposes on the COC, login will complete the custody seal retain the shipping record with the COC, and initiate an internal COC for laboratory use by analysts and a sample disposal record.

23.2 Sample Receipt

Samples are received at the laboratory by designated sample receiving personnel and a unique laboratory project identification number is assigned. Each sample container shall be assigned a unique sample identification number that is cross-referenced to the client identification number such that traceability of test samples is unambiguous and documented. Each sample container is affixed with a durable sample identification label. Sample acceptance, receipt, tracking and storage procedures are detailed in the laboratory's SOP No. SA-CU-001: *Sample Receipt Procedures* and summarized in the following sections.

23.2.1 Laboratory Receipt

When samples arrive at the laboratory, sample receiving personnel inspect the coolers and samples. The integrity of each sample must be determined by comparing sample labels or tags with the COC and by visual checks of the container for possible damage. Any non-conformance, irregularity, or compromised sample receipt must be documented on the Sample Receipt Checklist in LIMS and brought to the immediate attention of the client. The COC, shipping documents, documentation of any non-conformance, irregularity, or compromised sample receipt, record of client contact, and resulting instructions become part of the project record.

Sample Registration personnel check and document preservation of non-volatile liquid samples after the samples have been entered into the LIMS and before they are released to the laboratory for testing or placed into storage. Any checks of volatile samples and samples for oil and grease are performed and documented at the time of analysis.

23.3 Sample Acceptance Policy

The laboratory has a written sample acceptance policy (Figure 23-1) that clearly outlines the circumstances under which samples shall be accepted or rejected. These include:

- a COC filled out completely;
- samples must be properly labeled;
- proper sample containers with adequate volume for the analysis (Sampling Guide) and necessary QC;
- samples must be preserved according to the requirements of the requested analytical method (Sampling Guide);
- sample holding times must be adhered to (Sampling Guide);
- the project manager will be notified if any sample is received in damaged condition.

Data from samples which do not meet these criteria are flagged and the nature of the variation from policy is defined.

23.3.1 After inspecting the samples, the sample receiving personnel sign and date the COC form, make any necessary notes of the samples' conditions and store them in appropriate refrigerators or storage locations.

23.3.2 Any deviations from these checks that question the suitability of the sample for analysis, or incomplete documentation as to the tests required will be resolved by consultation with the client. If the sample acceptance policy criteria are not met, the laboratory shall either:

- Retain all correspondence and/or records of communications with the client regarding the disposition of rejected samples, or
- Fully document any decision to proceed with sample analysis that does not meet sample acceptance criteria.

23.4 Sample Storage

In order to avoid deterioration, contamination or damage to a sample during storage and handling, from the time of receipt until all analyses are complete, samples are stored in refrigerators, freezers, or protected locations suitable for the sample matrix. In addition, samples to be analyzed for volatile organic parameters are stored in separate refrigerators designated for volatile organic parameters only. Samples are never to be stored with reagents, standards or materials that may create contamination.

To ensure the integrity of the samples during storage, refrigerator blanks are maintained in the volatile sample refrigerators and analyzed every two weeks.

Analysts retrieve the sample container allocated for their analysis from the designated storage location, prepare or analyze the sample, and return the remaining sample to the storage

location from which it originally came. All samples are scanned into and out of the storage locations using the LIMS sample custody program. Empty containers are scanned into the LIMS sample custody program as empty and are properly disposed of. All samples are kept for at least 30 days after the report is sent out, which meets or exceeds most sample holding times. After this time, the samples are properly disposed of in accordance with the Environmental Health and Safety Manual.

Access to the laboratory is controlled such that sample storage need not be locked at all times unless a project specifically demands it. Samples are accessible to laboratory personnel only. Visitors to the laboratory are prohibited from entering the refrigerator and laboratory areas unless accompanied by an employee of Eurofins TestAmerica.

23.5 Hazardous Samples and Foreign Soils

Upon receipt, foreign soil samples are marked with a fluorescent green “FOREIGN SOIL” label prior to distributing to the analytical departments. Once the sample is received by the department, it is stored in a “FOREIGN SOIL ONLY” box segregated from other samples. Non-hazardous foreign soil samples are sent out for incineration by a USDA-approved waste disposal facility. RCRA hazardous foreign soil samples are heat treated at the laboratory. After heat treatment, normal disposal procedures are followed. Refer to the Environmental Health and Safety Manual Addendum for additional information on disposal of hazardous samples. If not classified as hazardous, foreign soil samples are sent out for incineration by a USDA-approved waste disposal facility.

23.6 Sample Shipping

In the event that the laboratory needs to ship samples, the samples are placed in a cooler with enough ice to ensure the samples remain just above freezing and at or below 6.0°C during transit. The samples are carefully surrounded by packing material to avoid breakage (yet maintain appropriate temperature). A trip blank is enclosed for those samples requiring water/solid volatile organic analyses (see Note). The chain-of-custody form is signed by the sample control technician and attached to the shipping paperwork. Samples are generally shipped overnight express or hand-delivered by a Eurofins TestAmerica courier to maintain sample integrity. All personnel involved with shipping and receiving samples must be trained to maintain the proper chain-of-custody documentation and to keep the samples intact and on ice. The laboratory’s Environmental Health and Safety Manual contains additional shipping requirements.

Note: If a client does not request trip blank analysis on the COC or other paperwork, the laboratory will not analyze the trip blanks that were supplied. However, in the interest of good client service, the laboratory will advise the client at the time of sample receipt that it was noted that they did not request analysis of the trip blank; and that the laboratory is providing the notification to verify that they are not inadvertently omitting a key part of regulatory compliance testing.

23.7 Sample Disposal

Samples should be retained for a minimum of 30 days after the project report is sent, however, provisions may be made for earlier disposal of samples once the holding time is exceeded. Some samples are required to be held for longer periods based on regulatory or client requirements (e.g., 60 days after project report is sent). The laboratory must follow the longer sample retention requirements where required by regulation or client agreement. Several possibilities for sample disposal exist: the sample may be consumed completely during analysis, the sample may be returned to the customer or location of sampling for disposal, or the sample may be disposed of in accordance with the laboratory's waste disposal procedures in the Savannah Addendum to the Environmental Health and Safety Manual. All procedures in the laboratory's Environmental Health and Safety Manual are followed during disposal. Samples are normally maintained in the laboratory no longer than three months from receipt unless otherwise requested. Unused portions of samples found or suspected to be hazardous according to state or federal guidelines may be returned to the client upon completion of the analytical work.
If a sample is part of a known litigation, the affected legal authority, sample data user, and/or submitter of the sample must participate in the decision about the sample's disposal. All documentation and correspondence concerning the disposal decision process must be kept on file. Pertinent information includes the date of disposal, nature of disposal (such as sample depletion, hazardous waste facility disposal, return to client), names of individuals who conducted the arrangements and physically completed the task. The laboratory will remove or deface sample labels prior to disposal unless this is accomplished through the disposal method (e.g., samples are incinerated). A Waste Disposal Record should be completed.

Figure 23-1. Sample Acceptance Policy

All incoming work will be evaluated against the criteria listed below. Where applicable, data from any samples that do not meet the criteria listed below will be noted on the laboratory report defining the nature and substance of the variation. In addition the client will be notified either by telephone, fax, or e-mail ASAP after the receipt of the samples.

1) Samples must arrive in good condition with a Chain-of-Custody (COC) filled out completely and legibly. The following information must be captured:
   - Client name, address, and phone number
   - Project name and/or number
   - Sample identification
   - Date, time and location of sampling
   - Sample collector's name
   - Matrix type
   - Container type
   - Total number of each type of container
   - Preservatives used
   - Analysis requested
   - Any special instructions
   - Purchase Order number or billing information (e.g. quote number) if available.
   - Date and time each person received/relinquished the sample(s), including signed name.
   - Date and time of receipt between last person to relinquish samples and person who receives the samples in the lab.

The project manager will be notified if any sample is received in damaged condition. Eurofins TestAmerica will request that a sample be resubmitted for analysis.

2) Samples must be properly labeled and labels must be legible.
   - Use durable labels (labels provided by Eurofins TestAmerica are preferred)
   - Include a unique identification number
   - Include sampling date and time, and sampler ID
   - Include preservative used.
   - Use indelible ink
   - Information must be legible

3) Samples must be in proper containers with adequate volume for the analysis and any necessary sample-specific QC. Aqueous samples submitted for Volatiles analyses must be submitted without headspace. Samples must be dechlorinated, if needed, and submitted with proper chemical preservation (pH) as required by the analytical test method.

4) Most analytical methods require chilling samples to 4°C. These criteria are met if the samples are chilled to below 6°C and above freezing. Note: Samples hand-delivered to the laboratory immediately after collection are only considered acceptable if there is evidence that the chilling process has begun (i.e., arrival on ice). If sample analysis is begun within fifteen (15) minutes of collection, thermal preservation is not required. Thermal preservation is not required in the field if the laboratory receives and refrigerates the sample within fifteen (15) minutes of collection.

5) Samples must be prepared and analyzed with the holding times defined in the analytical test method.

Other Considerations:

- Chemical preservation (pH) will be verified prior to analysis and documented. The Project Manager will be notified immediately if there is a discrepancy. If analyses will still be performed, all affected results will be flagged to indicate improper preservation.

- Eurofins TestAmerica will make every effort to analyze samples within the regulatory holding time. Samples must be received in the laboratory with enough time to perform the sample analysis. Except for short holding time samples (i.e., <48 hours) sample must be received with at least 48 hours (2 working days) remaining on the holding time to ensure analysis. Samples analyzed in the laboratory will be qualified on the final report with an 'H' to indicate holding time exceedance.

- Analyses that are designated as field analyses (e.g., Odor, pH, Dissolved Oxygen, and Residual Chlorine) should be analyzed as soon as possible by the field sampler prior to delivering to the lab (i.e., within 15 minutes of collection).

- All samples submitted for Volatiles analyses must have a Trip Blank submitted at the same time. Eurofins TestAmerica will supply a blank with the bottle order.

- Per State and/or Federal Regulation, the client is responsible to ensure that samples are shipped in accordance with DOT/IATA requirements, and that radioactive materials may only be delivered to licensed facilities. Any samples containing (or suspected to contain) Source, Byproduct, or Special Nuclear Material as defined by 10 CFR should be delivered directly to facilities licensed to handle such radioactive material. Natural material or ores containing naturally occurring radionuclides may be delivered to any Eurofins TestAmerica facility or courier as long as the activity concentration of the material does not exceed 270 pCi/g alpha or 2700 pCi/g beta (49 CFR Part 173).

Recommendations for packing samples for shipment:

- Pack samples in ice rather than "blue" ice packs.
- Soil samples should be placed in plastic zip-lock bags. The containers often have dirt around the top and do not seal very well and are prone to intrusion from the water from melted ice.
- Water samples would be best if wrapped with bubble-wrap or paper (newspaper, or paper towels work) and then placed in plastic zip-lock bags.
- Fill extra cooler space with bubble wrap.

24.0 ASSURING THE QUALITY OF TEST RESULTS

24.1 Overview

In order to assure our clients of the validity of their data, the laboratory continuously evaluates the quality of the analytical process. The analytical process is controlled not only by instrument calibration as discussed in Section 20, but also by routine process quality control measurements (e.g. Blanks, Laboratory Control Samples (LCS), Matrix Spikes (MS), duplicates (DUP), surrogates, Internal Standards (IS)). These quality control checks are performed as required by the method or regulations to assess precision and accuracy. Quality control samples are to be treated in the exact same manner as the associated field samples being tested. In addition to the routine process quality control samples, Proficiency Testing (PT) Samples (concentrations unknown to laboratory) are analyzed to help ensure laboratory performance.

24.2 Controls

Sample preparation or pre-treatment is commonly required before analysis. Typical preparation steps include homogenization, grinding, solvent extraction, sonication, acid digestion, distillation, reflux, evaporation, drying, and ashing. During these pre-treatment steps, samples are arranged into discreet manageable groups referred to as preparation (prep) batches. Prep batches provide a means to control variability in sample treatment. Control samples are added to each prep batch to monitor method performance and are processed through the entire analytical procedure with investigative/field samples.

24.3 Negative Controls

Table 24-1. Negative Controls

Control Type	Details
Method Blank (MB)	Used to assess preparation and analysis for possible contamination during the preparation and processing steps.
	The specific frequency of use for method blanks during the analytical sequence is defined in the specific standard operating procedure for each analysis. Generally it is 1 for each batch of samples; not to exceed 20 environmental samples.
	The method blank is prepared from a clean matrix similar to that of the associated samples that is free from target analytes (e.g., Reagent water, Ottawa sand, glass beads, etc.) and is processed along with and under the same conditions as the associated samples. The method blank goes through all of the steps of the process (including as necessary: filtration, clean-ups, etc.).
	Reanalyze or qualify associated sample results when the concentration of a targeted analyte in the blank is at or above the reporting limit as established by the method or by regulation, AND is greater than 1/10 of the amount measured in the sample.

Table 24-1. Negative Controls

Control Type	Details
Calibration Blanks	Prepared and analyzed along with calibration standards where applicable. They are prepared using the same reagents that are used to prepare the standards. In some analyses the calibration blank may be included in the calibration curve.
Instrument Blanks	Blank reagents or reagent water that may be processed during an analytical sequence in order to assess contamination in the analytical system. In general, instrument blanks are used to differentiate between contamination caused by the analytical system and that caused by the sample handling or sample prep process. Instrument blanks may also be inserted throughout the analytical sequence to minimize the effect of carryover from samples with high analyte content.
Trip Blank [1]	Required to be submitted by the client with each shipment of samples requiring aqueous and solid volatiles analyses (or as specified in the client's project plan). Additionally, trip blanks may be prepared and analyzed for volatile analysis of air samples, when required by the client. A trip blank may be purchased (certified clean) or is prepared by the laboratory by filling a clean container with pure deionized water that has been purged to remove any volatile compounds. Appropriate preservatives are also added to the container. The trip blank is sent with the bottle order and is intended to reflect the environment that the containers are subjected to throughout shipping and handling and help identify possible sources if contamination is found. The field sampler returns the trip blank in the cooler with the field samples.
Field Blanks [1]	Sometimes used for specific projects by the field samplers. A field blank prepared in the field by filling a clean container with pure reagent water and appropriate preservative, if any, for the specific sampling activity being undertaken. (EPA OSWER)
Equipment Blanks [1]	Sometimes created in the field for specific projects. An equipment blank is a sample of analyte-free media which has been used to rinse common sampling equipment to check effectiveness of decontamination procedures.
Holding Blanks	Referred to as refrigerator or freezer blanks, are used to monitor the sample storage units for volatile organic compounds during the storage of VOA samples in the laboratory

[1] When known, these field QC samples should not be selected for matrix QC as it does not provide information on the behavior of the target compounds in the field samples. Usually, the client sample ID will provide information to identify the field blanks with labels such as "FB", "EB", or "TB."

Evaluation criteria and corrective action for these controls are defined in the specific standard operating procedure for each analysis.

24.4 Positive Control

Control samples (e.g., QC indicators) are analyzed with each batch of samples to evaluate data based upon method performance (e.g., Laboratory Control Sample), which entails both the preparation and measurement steps; and matrix effects (e.g., Matrix Spike or Sample Duplicate), which evaluates field sampling accuracy, precision, representativeness, interferences, and the effect of the matrix on the method performed. Each regulatory program and each method within those programs specify the control samples that are prepared and/or analyzed with a specific batch

Note that frequency of control samples vary with specific regulatory, methodology and project specific criteria. Complete details on method control samples are as listed in each analytical SOP.

24.4.1 Method Performance Control - Laboratory Control Sample (LCS)

The LCS measures the accuracy of the method in a blank matrix and assesses method performance independent of potential field sample matrix affects in a laboratory batch.

The LCS is prepared from a clean matrix similar to that of the associated samples that is free from target analytes (for example: Reagent water, Ottawa sand, glass beads, etc.) and is processed along with and under the same conditions as the associated samples. The LCS is spiked with verified known amounts of analytes or is made of a material containing known and verified amounts of analytes, taken through all preparation and analysis steps along with the field samples. Where there is no preparation taken for an analysis (such as in aqueous volatiles), or when all samples and standards undergo the same preparation and analysis process (such as phosphorus), a calibration verification standard is reported as the LCS.

In some instances where there is no practical clean solid matrix available, aqueous LCS's may be processed for solid matrices; final results may be calculated as mg/kg or ug/kg, assuming 100% solids and a weight equivalent to the aliquot used for the corresponding field samples, to facilitate comparison with the field samples.

Certified pre-made reference material purchased from a NIST/A2LA accredited vendor may also be used for the LCS when the material represents the sample matrix or the analyte is not easily spiked (e.g. solid matrix LCS for metals, TDS, etc.).

The specific frequency of use for LCS during the analytical sequence is defined in the specific standard operating procedure for each analysis. It is generally 1 for each batch of samples; not to exceed 20 environmental samples.

If the mandated or requested test method, or project requirements, do not specify the spiking components, the laboratory shall spike all reportable components to be reported in the Laboratory Control Sample (and Matrix Spike) where applicable (e.g. no spike of pH). However, in cases where the components interfere with accurate assessment (such as simultaneously spiking chlordane, Toxaphene and PCBs in Method 608), the test method has an extremely

long list of components or components are incompatible, at a minimum, a representative number of the listed components (see below) shall be used to control the test method. The selected components of each spiking mix shall represent all chemistries, elution patterns and masses, permit specified analytes and other client requested components. However, the laboratory shall ensure that all reported components are used in the spike mixture within a two-year time period.

- For methods that have 1-10 target analytes, spike all components.
- For methods that include 11-20 target analytes, spike at least 10 or 80%, whichever is greater.
- For methods with more than 20 target analytes, spike at least 16 components.
- Exception: Due to analyte incompatibility in pesticides, Toxaphene and Chlordane are only spiked at client request based on specific project needs.
- Exception: Due to analyte incompatibility between the various PCB aroclors, aroclors 1016 and 1260 are used for spiking as they cover the range of all of the aroclors. Specific aroclors may be used by request on a project specific basis.

24.5 Sample Matrix Controls

Table 24.5. Sample Matrix Controls

Control Type	Details	
Matrix Spikes (MS)	Use	Used to assess the effect sample matrix of the spiked sample has on the precision and accuracy of the results generated by the method used;
	Typical Frequency [1]	At a minimum, with each matrix-specific batch of samples processed, an MS is carried through the complete analytical procedure. Unless specified by the client, samples used for spiking are randomly selected and rotated between different client projects. If the mandated or requested test method does not specify the spiking components, the laboratory shall spike all reportable components to be reported in the Laboratory Control Sample and Matrix Spike. Refer to the method SOP for complete details
	Description	Essentially a sample fortified with a known amount of the test analyte(s).
Surrogate	Use	Measures method performance to sample matrix (organics only).
	Typical Frequency [1]	Added to all samples, standards, and blanks, for all organic chromatography methods except when the matrix precludes its use or when a surrogate is not available. The recovery of the surrogates is compared to the acceptance limits for the specific method. Poor surrogate recovery may indicate a problem with sample composition and shall be reported, with data qualifiers, to the client whose sample produced poor recovery.
	Description	Similar to matrix spikes except the analytes are compounds with properties that mimic the analyte of interest and are unlikely to be found in environment samples.
Duplicates[2]	Use	For a measure of analytical precision, with each matrix-specific batch of samples processed, a matrix duplicate (MD or DUP) sample, matrix spike duplicate (MSD), or LCS duplicate (LCSD) is carried through the complete analytical procedure.

Control Type	Details	
	Typical Frequency [1]	Duplicate samples are usually analyzed with methods that do not require matrix spike analysis.
	Description	Performed by analyzing two aliquots of the same field sample independently or an additional LCS.
Internal Standards	Use	Spiked into all environmental and quality control samples (including the initial calibration standards) to monitor the qualitative aspect of organic and some inorganic analytical measurements.
	Typical Frequency [1]	All organic and ICP methods as required by the analytical method.
	Description	Used to correct for matrix effects and to help troubleshoot variability in analytical response and are assessed after data acquisition. Possible sources of poor internal standard response are sample matrix, poor analytical technique or instrument performance.

[1] See the specific analytical SOP for type and frequency of sample matrix control samples.
[2] LCSDs are normally not performed except when regulatory agencies or client specifications require them. The recoveries for the spiked duplicate samples must meet the same laboratory established recovery limits as the accuracy QC samples. If an LCSD is analyzed both the LCS and LCSD must meet the same recovery criteria and be included in the final report. The precision measurement is reported as "Relative Percent Difference" (RPD). Poor precision between duplicates (except LCS/LCSD) may indicate non-homogeneous matrix or sampling.

24.6 Acceptance Criteria (Control Limits)

As mandated by the test method and regulation, each individual analyte in the LCS, MS, or Surrogate Spike is evaluated against the control limits published in the test method. Where there are no established acceptance criteria, the laboratory calculates in-house control limits with the use of control charts or, in some cases, utilizes client project specific control limits. When this occurs, the regulatory or project limits will supersede the laboratory's in-house limits.

Note: For methods, analytes and matrices with very limited data (e.g., unusual matrices not analyzed often), interim limits are established using available data or by analogy to similar methods or matrices.

Once control limits have been established, they are verified, reviewed, and updated if necessary on an annual basis unless the method requires more frequent updating. Control limits are established per method (as opposed to per instrument) regardless of the number of instruments utilized.

Laboratory generated % Recovery acceptance (control) limits are generally established by taking ± 3 Standard Deviations (99% confidence level) from the average recovery of a minimum of 20-30 data points (more points are preferred).

- Regardless of the calculated limit, the limit should be no tighter than the Calibration Verification (ICV/CCV). (Unless the analytical method specifies a tighter limit).

- In-house limits cannot be any wider than those mandated in a regulated analytical method. Client or contract required control limits are evaluated against the laboratory's statistically derived control limits to determine if the data quality objectives (DQOs) can be achieved. If laboratory control limits are not consistent with DQOs, then alternatives must be considered, such as method improvements or use of an alternate analytical method.
- For routine analytes that are not classified as poor performers, the lowest acceptable recovery limit will be 10% (the analyte must be detectable and identifiable). Exception: The lowest acceptable recovery limit for Benzidine will be 5% and the analyte must be detectable and identifiable.
- If either the high or low end of the control limit changes by $\leq$ 5% from previous, the control chart may be visually inspected and, using professional judgment, they may be left unchanged if there is no effect on laboratory ability to meet the existing limits.

24.6.1 The lab must be able to generate a current listing of their control limits and track when the updates are performed. In addition, the laboratory must be able to recreate historical control limits.

The QA Department generates a Method Limit Group (MLG) in the LIMS that contains tables that summarize the precision and accuracy acceptability limits for analyses performed at Eurofins TestAmerica Savannah. The MLG includes an effective date and is updated each time new limits are generated and entered. Unless otherwise noted, limits within these tables are laboratory generated. The LIMS maintains an archive of all limits used within the laboratory.

24.6.2 A LCS that is within the acceptance criteria establishes that the analytical system is in control and is used to validate the process. Samples that are analyzed with an LCS with recoveries outside of the acceptance limits may be determined as out of control and should be reanalyzed if possible. If reanalysis is not possible, then the results for all affected analytes for samples within the same batch must be qualified when reported. The internal corrective action process (see Section 12) is also initiated if an LCS exceeds the acceptance limits.

Sample results may be qualified and reported without reanalysis if:

- The analyte results are below the reporting limit and the LCS is above the upper control limit.
- If the analytical results are above the relevant regulatory limit and the LCS is below the lower control limit.
- If there are an allowable number of Marginal Exceedances (ME):

<11 analytes	0 marginal exceedances are allowed
11 – 30 Analytes	1 marginal exceedance is allowed
31-50 Analytes	2 marginal exceedances are allowed
51-70 Analytes	3 marginal exceedances are allowed
71-90 Analytes	4 marginal exceedances are allowed
> 90 Analytes	5 marginal exceedances are allowed

Marginal exceedances are recovery exceedances between 3 SD and 4 SD from the mean recovery limit (TNI).

Marginal exceedances should be random. If the same analyte exceeds the LCS control limit repeatedly, it is an indication of a systematic problem. The source of the error must be located and corrective action taken.

Though marginal exceedances may be allowed, the data must still be qualified to indicate it is outside of the normal limits.

24.6.3 If the MS/MSDs do not meet acceptance limits, the MS/MSD and the associated spiked sample is reported with a qualifier for those analytes that do not meet limits. If obvious preparation errors are suspected, or if requested by the client, unacceptable MS/MSDs are reprocessed and reanalyzed to prove matrix interference. A more detailed discussion of acceptance criteria and corrective action can be found in the lab's method SOPs and in Section 12.

24.6.4 If a surrogate standard falls outside the acceptance limits, and if there is not obvious chromatographic matrix interference, reanalyze the sample to confirm a possible matrix effect. If the recoveries confirm or there was obvious chromatographic interference, results are reported from the original analysis and a qualifier is added. If the reanalysis meets surrogate recovery criteria, the second run is reported (or both are reported if requested by the client). Under certain circumstances, where all of the samples are from the same location and share similar chromatography, the reanalysis may be performed on a single sample rather than all of the samples and if the surrogate meets the recovery criteria in the reanalysis, all of the affected samples would require reanalysis.

24.7 Additional Procedures to Assure Quality Control

The laboratory has written and approved method SOPs to assure the accuracy of the test method including calibration (see Section 20), use of certified reference materials (see Section 21) and use of PT samples (see Section 17).

A discussion regarding MDLs, Limit of Detection (LOD) and Limit of Quantitation (LOQ) can be found in Section 19.

- Use of formulae to reduce data is discussed in the method SOPs and in Section 20.
- Selection of appropriate reagents and standards is included in Section 11 and 21.
- A discussion on selectivity of the test is included in Section 7.
- Constant and consistent test conditions are discussed in Section 6.
- The laboratories sample acceptance policy is included in Section 23.

25.0 REPORTING RESULTS

25.1 Overview

The results of each test are reported accurately, clearly, unambiguously, and objectively in accordance with State and Federal regulations as well as client requirements. Analytical results are issued in a format that is intended to satisfy customer and laboratory accreditation requirements as well as provide the end user with the information needed to properly evaluate the results. Where there is conflict between client requests and laboratory ethics or regulatory requirements, the laboratory's ethical and legal requirements are paramount, and the laboratory will work with the client during project set up to develop an acceptable solution. Refer to Section 9.

A variety of report formats are available to meet specific needs.

In cases where a client asks for simplified reports, there must be a written request from the client. There still must be enough information that would show any analyses that were out of conformance (QC out of limits) and there should be a reference to a full report that is made available to the client. Review of reported data is included in Section 19.

25.2 Test Reports

Analytical results are reported in a format that is satisfactory to the client and meets all requirements of applicable accrediting authorities and agencies. A variety of report formats are available to meet specific needs. The report is printed on laboratory letterhead, reviewed, and signed by the appropriate project manager. At a minimum, the standard laboratory report shall contain the following information:

25.2.1 A report title (e.g., Analytical Report)
25.2.2 The cover page shall include the laboratory name, address and telephone number.
25.2.3 A unique identification of the report (e.g., Eurofins TestAmerica Job ID #) and on each page an identification in order to ensure the page is recognized as part of the report and a clear identification of the end.

Note: Page numbers of report are represented as page # of ##. Where the first number is the page number and the second is the total number of pages.

25.2.4 A copy of the chain of custody (COC).
- Any COCs involved with Subcontracting are included.

25.2.5 The name and address of client and a project name/number, if applicable.
25.2.6 Client project manager or other contact
25.2.7 Description and unambiguous identification of the tested sample(s) including the client identification code.
25.2.8 Date of receipt of sample, date and time of collection, and date(s) of test preparation and performance, and time of preparation or analysis if the required holding time for either activity is less than or equal to 72 hours.
25.2.9 Date reported or date of revision, if applicable.

25.2.10 Method of analysis including method code (EPA, Standard Methods, etc.).
25.2.11 Reporting limit.
25.2.12 Method detection limits (if requested)
25.2.13 Definition of Data qualifiers and reporting acronyms (e.g. ND).
25.2.14 Sample results.
25.2.15 QC data consisting of method blank, surrogate, LCS, and MS/MSD recoveries and control limits.
25.2.16 Condition of samples at receipt including temperature. This may be accomplished in a narrative or by attaching sample login sheets (Refer to Sec. 25.2.4 – Item 3 regarding additional addenda).
25.2.17 A statement expressing the validity of the results, that the source methodology was followed, and all results were reviewed for error.
25.2.18 A statement to the effect that the results relate only to the items tested and the sample as received by the laboratory, except when information is provided by the client. When data is provided by the client there shall be a clear identification of it, and a disclaimer shall be put in the report when the client supplied data can affect the validity of the test.
25.2.19 A statement that the report shall not be reproduced except in full, without prior express written approval by the laboratory coordinator.
25.2.20 A signature and title of the person(s) accepting responsibility for the content of the report and date of issue. Authorized signatories are qualified Project Managers appointed by the Manager of Project Managers.
25.2.21 When TNI accreditation is required, the lab shall certify that the test results meet all requirements of TNI or provide reasons and/or justification if they do not.
25.2.22 Where applicable, a narrative to the report that explains the issue(s) and corrective action(s) taken in the event that a specific accreditation or certification requirement was not met.
25.2.23 When soil samples are analyzed, a specific identification as to whether soils are reported on a “wet weight” or “dry weight” basis.
25.2.24 Appropriate laboratory certification number for the state of origin of the sample, if applicable.
25.2.25 If only part of the report is provided to the client (client requests some results before all of it is complete), it must be clearly indicated on the report (e.g., partial report, or how your lab identifies it). A complete report must be sent once all of the work has been completed.
25.2.26 Any non-Eurofins subcontracted analysis results are provided as a separate report on the official letterhead of the subcontractor. All Eurofins subcontracting is clearly identified on the report as to which laboratory performed a specific analysis.
25.2.27 A Certification Summary Report, where required, will document that, unless otherwise noted, all analytes tested and reported by the laboratory were covered by the noted certifications.

Note: Refer to the NDSC Document No. CA-I-P-002, Electronic Reporting and Signature Policy, for details on internally applying electronic signatures of approval.

25.2.28 Where the laboratory is responsible for the sampling stage, in addition to the requirements listed above, reports containing the results of sampling shall include the following, where necessary for the interpretation of test results:

- the date of sampling;
- unambiguous identification of the material sampled;
- the location of sampling plan and procedures, and deviations, addition to or exclusions from the sample procedures;
- a reference to the sampling plan and procedure, and deviations, additions to or exclusions from the sample procedures;
- details of any environmental conditions during sampling that affect the interpretation of test results;
- information required to evaluate measurement uncertainty for subsequent testing

25.3 Reporting Level or Report Type

The laboratory offers four levels of quality control reporting. Each level, in addition to its own specific requirements, contains all the information provided in the preceding level. The packages provide the following information in addition to the information described above:

- Level 1 is a report with all of the elements outlined in Section 25.2 above, excluding 25.2.15 (QC data).
- Level II is a Level I report plus summary information, including results for the method blank reported to the laboratory MDL, percent recovery for laboratory control samples and matrix spike samples, and the RPD values for all MSD and sample duplicate analyses.
- Level III contains all the information supplied in Level II, but presented on the CLP-like summary forms, and relevant calibration information. A Level II report is not included, unless specifically requested. No raw data is provided.
- Level IV is the same as Level III with the addition of all raw supporting data.

In addition to the various levels of QC packaging, the laboratory also provides reports in EDD (see below). Initial reports may be provided to clients by facsimile. Procedures used to ensure client confidentiality are outlined in Section 25.6.

25.4 Electronic Data Deliverables (EDDs)

EDDs are routinely offered as part of Eurofins TestAmerica's services in addition to the test report as described in Section 25.2. When NELAP accreditation is required and both a test report and EDD are provided to the client, the official version of the test report will be the combined information of the report and the EDD. Eurofins TestAmerica Savannah offers a variety of EDD formats including Environmental Resources Program Information Management System (ERPIMS), Automated Data Review (ADR), Locus Focus (EIM), EQUIS ESBasic, Environmental Quality Information Systems (EQUIS), Staged Electronic Data Deliverable (SEDD), EPA Region V EDD (EDMAN), and Terrabase.

EDD specifications are submitted to the IT department by the PM for review and undergo the contract review process. Once the facility has committed to providing data in a specific electronic format, the coding of the format may need to be performed. This coding is documented and validated. The validation of the code is retained by the IT staff coding the EDD.

EDDs shall be subject to a review to ensure their accuracy and completeness. If EDD generation is automated, review may be reduced to periodic screening if the laboratory can demonstrate that it can routinely generate that EDD without errors. Any revisions to the EDD format must be reviewed until it is demonstrated that it can routinely be generated without errors. If the EDD can be reproduced accurately and if all subsequent EDDs can be produced error-free, each EDD does not necessarily require a review.

25.5 Supplemental Information for Test

The laboratory identifies any unacceptable QC analyses or any other unusual circumstances or observations such as environmental conditions and any non-standard conditions that may have affected the quality of a result. This is typically in the form of a footnote or a qualifier and/or a narrative explaining the discrepancy in the front of the report.
Numeric results with values outside of the calibration range, either high or low are qualified as estimated.

Where quality system requirements are not met, a statement of compliance/non-compliance with requirements and/or specifications is required, including identification of test results derived from any sample that did not meet TNI sample acceptance requirements such as improper container, holding time, or temperature.

Where applicable, a statement on the estimated uncertainty of measurements; information on uncertainty is needed when a client's instructions so require.

When, as requested by the client and agreed to by Eurofins TestAmerica, the report includes a statement of conformity to specification or standard (see Special Services, Section 7.4), the report shall clearly identify:

- to which results the statement applies,
- which specifications, standard or parts thereof are met or not, and
- the decision rule that was applied (unless the decision rule is inherent in the requested specification or standard, taking into account the level of risk (such as false accept and false reject and statistical assumptions) associated with the decision rule.

Opinions and Interpretations - The test report contains objective information, and generally does not contain subjective information such as opinions and interpretations. If such information is required by the client, the Laboratory Director will determine if a response can be prepared. If so, the Laboratory Director will designate the appropriate member of the management team to prepare a response. The response will be fully documented, and reviewed by the Laboratory Director, before release to the client. There may be additional fees charged to the client at this time, as this is a non-routine function of the laboratory.

Note: Review of data deliverable packages for submittal to regulatory authorities requires responses to non-conforming data concerning potential impact on data quality. This necessitates a limited scope of interpretation, and this work is performed by the QA Department. This is the only form of "interpretation" of data that is routinely performed by the laboratory.

When opinions or interpretations are included in the report, the laboratory provides an explanation as to the basis upon which the opinions and interpretations have been made. Opinions and interpretations are clearly noted as such and where applicable, a comment should be added suggesting that the client verify the opinion or interpretation with their regulator.

25.6 Environmental Testing Obtained From Subcontractors

If the laboratory is not able to provide the client the requested analysis, the samples would be subcontracted following the procedures outlined in NDSC Document No. CW-L-S-004, Subcontracting.

Data reported from analyses performed by a subcontractor laboratory are clearly identified as such on the analytical report provided to the client. Results from a subcontract laboratory outside of Eurofins are reported to the client on the subcontract laboratory's original report stationary and the report includes any accompanying documentation.

25.7 Client Confidentiality

The laboratory will ensure the highest standards of quality and integrity of the data and services provided to our clients

The laboratory is responsible for maintaining in confidence all client information obtained or created. In situations involving the transmission of environmental test results by telephone, facsimile or other electronic means, client confidentiality must be maintained.

The laboratory will not intentionally divulge to any person (other than the client or any other person designated by the client in writing) any information regarding the services provided by the laboratory or any information disclosed to the laboratory by the client. Furthermore, information known to be potentially endangering to national security or an entity's proprietary rights will not be released.

Information about the client obtained from sources other than the client (e.g., complainant, regulators) shall be confidential between client and the laboratory. The source of this information shall be confidential to the laboratory and shall not be shared with the client, unless agreed by the source.

Note: This shall not apply to the extent that the information is required to be disclosed by the laboratory under the compulsion of legal process. The laboratory will, to the extent feasible, provide reasonable notice to the client before disclosing the information.

Note: Authorized representatives of an accrediting authority are permitted to make copies of any analyses or records relevant to the accreditation process, and copies may be removed from the laboratory for purposes of assessment.

25.7.1 Report deliverable formats are discussed with each new client. If a client requests that reports be e-mailed, the reports are to meet all requirements of this document.

25.8 Format of Reports

The format of reports is designed to accommodate each type of environmental test carried out and to minimize the possibility of misunderstanding or misuse.

25.9 Amendments to Test Reports

Corrections, additions, or deletions to reports are only made when justification arises through supplemental documentation. Justification is documented using the laboratory's corrective action system (refer to Section 12).

The revised report is retained in the LIMS, as is the original report. The revised report is stored in the project files under the sample number followed by "Rev#" where # is the number of the report revision.

When the report is re-issued, the revision number is placed on the cover/signature page of the report or at the top of the narrative page. A brief explanation of reason for the re-issue and a reference back to the last final report generated may be included.

25.10 Policies on Client Requests for Amendments

25.10.1 Policy on Data Omissions or Reporting Limit Increases

Fundamentally, our policy is simply to not omit previously reported results (including data qualifiers) or to not raise reporting limits and report sample results as ND. This policy has few exceptions. Exceptions are:

- Laboratory error.
- Sample identification is indeterminate (confusion between COC and sample labels).
- An incorrect analysis (not analyte) was requested (e.g., COC lists EPA Method 8315 but client wanted EPA Method 8310). A written request for the change is required.
- Incorrect limits reported based on regulatory requirements.
- The requested change has absolutely *no possible* impact on the interpretation of the analytical results and there is *no possibility* of the change being interpreted as misrepresentation by anyone inside or outside of our company.

25.10.2 Multiple Reports

The laboratory does not issue multiple reports for the same work order where there is different information on each report (this does not refer to copies of the same report) unless required to meet regulatory needs and approved by QA.

Appendix 1. List of Governing Documents Applicable to the QA Manual

NDSC Doc. No.	Title
CA-C-S-001	Work Sharing Process
CA-I-P-002	Electronic Reporting and Signature Policy
CA-L-P-002	Contract Compliance Policy
CA-Q-M-002	Quality Management Plan
CA-Q-QM-001	Guidance on Tentatively Identified Compounds (TICs) – GC/MS Analysis
CA-Q-S-001	Acid and Solvent-Lot Testing and Approval Program
CA-Q-S-002	Manual Integrations
CA-Q-S-006	Detection and Quantitation Limits
CA-Q-S-009	Root Cause Analysis
CA-T-P-001	Qualified Products List
CW-E-M-001	Environmental Health & Safety Manual
CW-F-P-002	Company-Wide Authorization Matrix
CW-F-P-004	Procurement and Contracts Policy
CW-F-S-007	Fixed Asset Acquisition, Retention and Safeguarding
CW-I-M-001	IT Change Control Procedure Manual
CW-L-P-001	Records Retention Policy
CW-L-P-004	Ethics Policy

Appendix 2. List of Laboratory Certifications, Accreditations, Validations

Eurofins TestAmerica Savannah performs work from clients located throughout the United States, as well as in some foreign countries. Most states and/or federal agencies maintain a laboratory accreditation program that requires a laboratory to obtain certification with their agency. To obtain certification, a laboratory must maintain an effective quality system that meets the requirements of the agency. Common components of the quality system requirements include maintaining up-to-date standard operating procedures (SOPs) and a Quality Assurance Manual (QAM); participating in a Proficiency Testing (PT) program; performing method detection limit (MDL) studies, initial and continuing demonstrations of capability studies (IDOCs/CDOCs), and internal assessments; and completing an annual renewal application. In addition to the requirements needed for certification, many agencies have specific analytical and/or reporting requirements that laboratories must follow.

Many agencies offer certification via reciprocity. Reciprocity is the acknowledgement of another state and/or agency's certification program. The most common types of reciprocity are homestate reciprocity and TNI (NELAC) reciprocity.

Lab Management, Project Management, Sales & Marketing, and the QA Manager may initiate requests for certification or accreditation. The QA staff completes the administrative tasks associated with the application and maintains the related documents in accordance with SOP SA-QA-001: *Document Control Program.*

Laboratory management has the responsibility and authority to ensure that laboratory operations are in compliance with program and regulatory requirements of the jurisdiction for which laboratory certification/accreditation is sought and maintained.

To perform compliance work in a particular state, the laboratory must maintain certification for the reported analytes. Most accrediting authorities will certify laboratories on a matrix/method/analyte level. For example:

Soil / EPA 8260B / benzene
Water / EPA 624 / toluene

Generally, laboratories must apply and submit supporting documentation (SOPs, MDLs, IDOCs, PTs, etc.) for each individual matrix/method/analyte combination.

1.0 Obtaining Certification

1.1 Certification Application Process

Lab Management, Project Management, Sales and Marketing, and the QA Manager may initiate requests for certification or accreditation. The application is obtained, reviewed, and completed by the QA Manager or designee. Sections of the application may be distributed as appropriate to various staff members to assist in completion.

The certifying agency's regulations should be carefully reviewed at the time of application to ensure any non-routine requirements are communicated to the laboratory.

The QA Manager consults with Lab Management, Project Management, and the Sales and Marketing Staff to determine if additional methods should be added to the current laboratory certification in order to support existing and future work as the laboratory's capabilities change.

1.2 Reciprocity

Reciprocity is a means of acknowledging another agency's certification via mutual agreements between certifying agencies. Many certifying agencies offer some type of reciprocal certification. The most common types of reciprocity are based on either TNI (NELAC) certification or homestate certification.

Homestate reciprocity refers to another state's certifying agency allowing a laboratory to perform work in that state, provided that the laboratory maintains accreditation within the state in which it resides.

TNI refers to The NELAP Institute which governs the NELAP Standard document outlining Quality System and laboratory functions and requirements. NELAP refers to the National Environmental Laboratory Accreditation Program. Many states will acknowledge a laboratory's TNI accreditation from another state.

Note: Reciprocal agreements between states do not afford a "blanket" certification. To obtain reciprocal certification, a laboratory must still apply for accreditation, submit all required application materials, and receive notification of certification – usually in the form of a certificate - from the reciprocal agency.

1.3 Records Maintenance

A copy of the original application, certificate, and related materials are maintained in accordance with SA-QA-001: *Document Control Program.* Copies of current certifications are kept in the Certifications folder on the Public_QA drive, which is accessible to all laboratory staff. In addition, copies of current laboratory certifications from Savannah and other Eurofins TestAmerica facilities are maintained in the TALS Certification Module. These documents may be required to support subcontracting and marketing activities.

1.4 Maintaining Certification

Most states require continued evidence of an effective Quality System in order for a laboratory to maintain certification. In addition to annual renewal applications, laboratories are often required to complete bi-annual PT studies with acceptable results obtained for each certifiable matrix/method/analyte combination. Annual MDL and continued demonstrations of analyst capability are also routinely required, in addition to on-site assessments.

1.5 Certification Tools and Records

There are several tools in place to aid laboratory staff in determining what certifications the laboratory maintains and understanding any state-specific analytical and/or reporting requirements.

1.5.1 TALS Certification Module

The TALS Certification Module is a tool that can aid in determining which certifications the laboratory maintains. This tool is useful in the pre-project planning process.

1.5.2 State and Project Requirement Summaries

Some states and/or projects have specific analytical and/or reporting requirements. A summary of these requirements is kept in the State and Project Requirement Summary on the Public-QA Drive. These requirements must be reviewed by project management and laboratory staff prior to initiating work. The Project Manager must clearly note in the LIMS Worksheet Notes and/or Project Plan if the Project Requirement Summary (PRS) is to be followed.

1.6 Information Resources

1.6.1 Agency Information

The QA staff maintains a controlled access database that lists current contact information for the agency that oversees laboratory certification as well as the regulatory programs that are offered for certification by the agency. This information may be provided as a resource to Lab Management, Project Management, Corporate QA, and the Sales and Marketing staff.

1.6.2 Certification Matrix

The QA Department ensures that the certification matrix maintained in TALS is current.

1.6.3 Certification / Accreditation Maintenance Requirements

Laboratory Management is responsible for ensuring that laboratory operations are in compliance with the regulatory and certification program requirements for the jurisdiction in which certification is maintained.

The QA Department is responsible for maintaining up to date applications and program information including program specific regulations and requirements.

Project Management is responsible for verifying certification of analytes and methods requested by the client prior to accepting work and should be familiar with the state-specific requirements of that state.

1.7 Certifications Listing

At the time of this QA Manual revision, the laboratory has accreditation/certification/ licensing with the following organizations:

Appendix 5. Terms/Glossary and Acronyms (EL-V1M2 Sec. 3.1)

Terms/Glossary:

Acceptance Criteria: Specified limits placed on characteristics of an item, process, or service defined in requirement documents. (ASQC)

Accreditation: The process by which an agency or organization evaluates and recognizes a laboratory as meeting certain predetermined qualifications or standards, thereby accrediting the laboratory.

Accuracy: The degree of agreement between an observed value and an accepted reference value. Accuracy includes a combination of random error (precision) and systematic error (bias) components which are due to sampling and analytical operations; a data quality indicator. (QAMS)

Analyst: The designated individual who performs the "hands-on" analytical methods and associated techniques and who is the one responsible for applying required laboratory practices and other pertinent quality controls to meet the required level of quality.

Analytical Uncertainty: A subset of Measurement Uncertainty that includes all laboratory activities performed as part of the analysis. (TNI)

Anomaly: A condition or event, other than a deficiency, that may affect the quality of the data, whether in the laboratory's control or not.

Assessment: The evaluation process used to measure or establish the performance, effectiveness, and conformance of an organization and/or its systems to defined criteria (to the standards and requirements of laboratory accreditation). (TNI)

Audit: A systematic and independent examination of facilities, equipment, personnel, training, procedures, record-keeping, data validation, data management, and reporting aspects of a system to determine whether QA/QC and technical activities are being conducted as planned and whether these activities will effectively achieve quality objectives. (TNI)

Batch: Environmental samples that are prepared and/or analyzed together with the same process and personnel, using the same lot(s) of reagents. A **preparation batch** is composed of one (1) to twenty (20) environmental samples of the same quality systems matrix, meeting the above mentioned criteria and with a maximum time between the start of processing of the first and last sample in the batch to be twenty-four (24) hours. An **analytical batch** is composed of prepared environmental samples (extracts, digestates or concentrates) which are analyzed together as a group. An analytical batch can include prepared samples originating from various quality system matrices and can exceed twenty (20) samples. (TNI)

Bias: The systematic or persistent distortion of a measurement process, which causes errors in one direction (i.e., the expected sample measurement is different from the sample's true value). (TNI)

Blank: A sample that has not been exposed to the analyzed sample stream in order to monitor contamination during sampling, transport, storage or analysis. The blank is subjected to the usual analytical and measurement process to establish a zero baseline or background value and is sometimes used to adjust or correct routine analytical results. (ASQC)

Calibration: A set of operations that establish, under specified conditions, the relationship between values of quantities indicated by a measuring instrument or measuring system, or values represented by a material measure or a reference material, and the corresponding values realized by standards. (TNI)

1) In calibration of support equipment the values realized by standards are established through the use of reference standards that are traceable to the International System of Units (SI).
2) In calibration according to methods, the values realized by standards are typically established through the use of Reference Materials that are either purchased by the laboratory with a certificate of analysis or purity, or prepared by the laboratory using support equipment that has been calibrated or verified to meet specifications.

Calibration Curve: The mathematical relationship between the known values, such as concentrations, of a series of calibration standards and their instrument response. (TNI)

Calibration Standard: A substance or reference material used to calibrate an instrument (QAMS)

Certified Reference Material (CRM): A reference material accompanied by a certificate, having a value, measurement uncertainty, and stated metrological traceability chain to a national metrology institute. (TNI)

Chain of Custody (COC) Form: Record that documents the possession of the samples from the time of collection to receipt in the laboratory. This record generally includes: the number and types of containers; the mode of collection; the collector; time of collection; preservation; and requested analyses. (TNI)

Compromised Samples: Those samples which are improperly sampled, insufficiently documented (chain of custody and other sample records and/or labels), improperly preserved, collected in improper containers, or exceeding holding times when delivered to a laboratory. Under normal conditions, compromised samples are not analyzed. If emergency situation require analysis, the results must be appropriately qualified.

Confidential Business Information (CBI): Information that an organization designates as having the potential of providing a competitor with inappropriate insight into its management, operation or products. TNI and its representatives agree to safeguard identified CBI and to maintain all information identified as such in full confidentiality.

Confirmation: Verification of the identity of a component through the use of an approach with a different scientific principle from the original method. These may include, but are not limited to Second Column Confirmation; Alternate wavelength; Derivatization; Mass spectral interpretation; Alternative detectors or Additional Cleanup procedures. (TNI)

Conformance: An affirmative indication or judgment that a product or service has met the requirements of the relevant specifications, contract, or regulation; also the state of meeting the requirements. (ANSI/ASQC E4-1994)

Correction: Actions necessary to correct or repair analysis specific non-conformances. The acceptance criteria for method specific QC and protocols as well as the associated corrective actions. The analyst will most frequently be the one to identify the need for this action as a result of calibration checks and QC sample analysis**.** No significant action is taken to change behavior, process or procedure.

Corrective Action: The action taken to eliminate the causes of an existing nonconformity, defect or other undesirable situation in order to prevent recurrence. (ISO 8402)

Data Integrity: The condition that exists when data are sound, correct, and complete, and accurately reflect activities and requirements. (TNI)

Data Audit: A qualitative and quantitative evaluation of the documentation and procedures associated with environmental measurements to verify that the resulting data re of acceptable quality (i.e., that they meet specified acceptance criteria).

Data Reduction: The process of transforming the number of data items by arithmetic or statistical calculations, standard curves, and concentration factors, and collation into a more useable form. (TNI)

Deficiency: An unauthorized deviation from acceptable procedures or practices, or a defect in an item (ASQC), whether in the laboratory's control or not.

Demonstration of Capability: A procedure to establish the ability of the analyst to generate analytical results of acceptable accuracy and precision. (TNI)

Document Control: The act of ensuring that documents (and revisions thereto) are proposed, reviewed for accuracy, approved for release by authorized personnel, distributed properly, and controlled to ensure use of the correct version at the location where the prescribed activity if performed. (ASQC)

Duplicate Analyses: The analyses or measurements of the variable of interest performed identically on two subsamples of the same sample. The results from duplicate analyses are used to evaluate analytical or measurement precision but not the precision of sampling, preservation or storage internal to the laboratory. (EPA-QAD)

Equipment Blank: Sample of analyte-free media which has been used to rinse common sampling equipment to check effectiveness of decontamination procedures.

External Standard Calibration: Calibrations for methods that do not utilize internal standards to compensate for changes in instrument conditions.

Field Blank: Blank prepared in the field by filing a clean container with pure de-ionized water and appropriate preservative, if any, for the specific sampling activity being undertaken (EPA OSWER)

Field of Accreditation: Those matrix, technology/method, and analyte combinations for which the accreditation body offers accreditation.

Holding Times: The maximum time that samples may be held prior to analyses and still be considered valid or not compromised. (40 CFR Part 136)

Internal Standard: A known amount of standard added to a test portion of a sample as a reference for evaluating and controlling the precision and bias of the applied analytical test method. (TNI)

Internal Standard Calibration: Calibrations for methods that utilize internal standards to compensate for changes in instrument conditions.

Instrument Blank: A clean sample (e.g., distilled water) processed through the instrumental steps of the measurement process; used to determine instrument contamination. (EPA-QAD)

Instrument Detection Limit (IDL): The minimum amount of a substance that can be measured with a specified degree of confidence that the amount is greater than zero using a specific instrument. The IDL is associated with the instrumental portion of a specific method only, and sample preparation steps are not considered in its derivation. The IDL is a statistical estimation at a specified confidence interval of the concentration at which the relative uncertainty is ± 100%. The IDL represents a range where qualitative detection occurs on a specific instrument. Quantitative results are not produced in this range.

Laboratory Control Sample (however named, such as laboratory fortified blank, spiked blank, or QC check sample): A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes, taken through all preparation and analysis steps of the procedure unless otherwise noted in a reference method. It is generally used to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system. An LCS shall be prepared at a minimum of 1 per batch of 20 or less samples per matrix type per sample extraction or preparation method except for analytes for which spiking solutions are not available such as total suspended solids, total dissolved solids, total volatile solids, total solids, pH, color, odor, temperature, dissolved oxygen or turbidity. The results of these samples shall be used to determine batch acceptance.

Least Squares Regression (1st Order Curve): The least squares regression is a mathematical calculation of a straight line over two axes. The y axis represents the instrument response (or Response ratio) of a standard or sample and the x axis represents the concentration. The regression calculation will generate a correlation coefficient (r) that is a measure of the "goodness of fit" of the regression line to the data. A value of 1.00 indicates a

perfect fit. In order to be used for quantitative purposes, r must be greater than or equal to 0.99 for organics and 0.995 for inorganics.

Limit(s) of Detection (LOD) [a.k.a., Method Detection Limit (MDL)]: The MDL is the minimum measured quantity of a substance that can be reported with 99% confidence that the concentration is distinguishable from method blank results, consistent with 40CFR Part 136 Appendix B, August, 2017.

Limit(s) of Quantitation (LOQ) [a.k.a., Reporting Limit]: The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence.

(QS) Matrix: The component or substrate that contains the analyte of interest. For purposes of batch and QC requirement determinations, the following matrix distinctions shall be used:

Aqueous: Any aqueous sample excluded from the definition of Drinking Water or Saline/Estuarine. Includes surface water, groundwater effluents, and TCLP or other extracts.

Drinking Water: Any aqueous sample that has been designated as a potable or potential potable water source.

Saline/Estuarine: Any aqueous sample from an ocean or estuary, or other salt water source such as the Great Salt Lake.

Non-Aqueous Liquid: Any organic liquid with <15% settleable solids.

Biological Tissue: Any sample of a biological origin such as fish tissue, shellfish, or plant material. Such samples shall be grouped according to origin.

Solids: Includes soils, sediments, sludges, and other matrices with >15% settleable solids.

Chemical Waste: A product or by-product of an industrial process that results in a matrix not previously defined.

Air & Emissions: Whole gas or vapor samples including those contained in flexible or rigid wall containers and the extracted concentrated analytes of interest from a gas or vapor that are collected with a sorbant tube, impinger solution, filter, or other device. (TNI)

Matrix Spike (spiked sample or fortified sample): A sample prepared, taken through all sample preparation and analytical steps of the procedure unless otherwise noted in a referenced method, by adding a known amount of target analyte to a specified amount of sample for which an independent test result of target analyte concentration is available. Matrix spikes are used, for example, to determine the effect of the matrix on a method's recovery efficiency.

Matrix Spike Duplicate (spiked sample or fortified sample duplicate): A replicate matrix spike prepared and analyzed to obtain a measure of the precision of the recovery for each analyte.

Method Blank: A sample of a matrix similar to the batch of associated samples (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences are present at concentrations that impact the analytical results for sample analyses.

Method Detection Limit: See Limit of Detection (LOD)

Negative Control: Measures taken to ensure that a test, its components, or the environment do not cause undesired effects, or produce incorrect test results.

Non-conformance: An indication, judgment, or state of not having met the requirements of the relevant specifications, contract, or regulation.

Observation: A record of phenomena that (1) may assist in evaluation of the sample data; (2) may be of importance to the project manager and/or the client, and yet not at the time of the observation have any known effect on quality.

Performance Audit: The routine comparison of independently obtained qualitative and quantitative measurement system data with routinely obtained data in order to evaluate the proficiency of an analyst or laboratory.

Positive Control: Measures taken to ensure that a test and/or its components are working properly and producing correct or expected results from positive test subjects.

Precision: The degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves; a data quality indicator. Precision is usually expressed as standard deviation, variance or range, in either absolute or relative terms. (TNI)

Preservation: Any conditions under which a sample must be kept in order to maintain chemical and/or biological integrity prior to analysis. (TNI)

Proficiency Testing: A means of evaluating a laboratory's performance under controlled conditions relative to a given set of criteria through analysis of unknown samples provided by an external source. (TNI)

Proficiency Testing Program: The aggregate of providing rigorously controlled and standardized environmental samples to a laboratory for analysis, reporting of results, statistical evaluation of the results and the collective demographics and results summary of all participating laboratories. (TNI)

Proficiency Test Sample (PT): A sample, the composition of which is unknown to the laboratory and is provided to test whether the laboratory can produce analytical results within specified acceptance criteria. (TNI)

Quality Assurance: An integrated system of management activities involving planning, implementation, assessment, reporting and quality improvement to ensure that a process, item or service is of the type of quality needed and expected by the client. (TNI)

Quality Assurance [Project] Plan (QAPP): A formal document describing the detailed quality control procedures by which the quality requirements defined for the data and decisions pertaining to a specific project are to be achieved. (EAP-QAD)

Quality Control: The overall system of technical activities that measures the attributes and performance of a process, item, or service against defined standards to verify that they meet the stated requirements established by the customer; operational techniques and activities that are used to fulfill requirements for quality; also the system of activities and checks used to ensure that measurement systems are maintained within prescribed limits, providing protection against "out of control" conditions and ensuring that the results are of acceptable quality. (TNI)

Quality Control Sample: A sample used to assess the performance of all or a portion of the measurement system. One of any number of samples, such as Certified Reference Materials, a quality system matrix fortified by spiking, or actual samples fortified by spiking, intended to demonstrate that a measurement system or activity is in control. (TNI)

Quality Manual: A document stating the management policies, objectives, principles, organizational structure and authority, responsibilities, accountability, and implementation of an agency, organization, or laboratory, to ensure the quality of its product and the utility of its product to its users. (TNI)

Quality System: A structured and documented management system describing the policies, objectives, principles, organizational authority, responsibilities, accountability, and implementation plan of an organization for ensuring quality in its work processes, products (items), and services. The quality system provides the framework for planning, implementing, and assessing work performed by the organization and for carrying out required QA and QC activities. (TNI)

Raw Data: The documentation generated during sampling and analysis. This documentation includes, but is not limited to, field notes, electronic data, magnetic tapes, untabulated sample results, QC sample results, print outs of chromatograms, instrument outputs, and handwritten records. (TNI)

Record Retention: The systematic collection, indexing and storing of documented information under secure conditions.

Reference Material: Material or substance one or more properties of which are sufficiently homogeneous and well established to be used for the calibration of an apparatus, the assessment of a measurement method, or for assigning values to materials. (TNI)

Reference Standard: Standard used for the calibration of working measurement standards in a given organization or a given location. (TNI)

Sampling: Activity related to obtaining a representative sample of the object of conformity assessment, according to a procedure.

Second Order Polynomial Curve (Quadratic): The 2nd order curves are a mathematical calculation of a slightly curved line over two axis. The y axis represents the instrument response (or Response ratio) of a standard or sample and the x axis represents the concentration. The 2nd order regression will generate a coefficient of determination (COD or r^2) that is a measure of the "goodness of fit" of the quadratic curvature the data. A value of 1.00 indicates a perfect fit. In order to be used for quantitative purposes, r^2 must be greater than or equal to 0.99.

Selectivity: The ability to analyze, distinguish, and determine a specific analyte or parameter from another component that may be a potential interferent or that may behave similarly to the target analyte or parameter within the measurement system. (TNI)

Sensitivity: The capability of a method or instrument to discriminate between measurement responses representing different levels (e.g., concentrations) of a variable of interest. (TNI)

Spike: A known mass of target analyte added to a blank, sample or sub-sample; used to determine recovery efficiency or for other quality control purposes.

Standard: The document describing the elements of laboratory accreditation that has been developed and established within the consensus principles of standard setting and meets the approval requirements of standard adoption organizations procedures and policies. (TNI)

Standard Operating Procedures (SOPs): A written document which details the method for an operation, analysis, or action, with thoroughly prescribed techniques and steps. SOPs are officially approved as the methods for performing certain routine or repetitive tasks. (TNI)

Storage Blank: A blank matrix stored with field samples of a similar matrix (volatiles only) that measures storage contribution to any source of contamination.

Surrogate: A substance with properties that mimic the analyte of interest. It is unlikely to be found in environment samples and is added to them for quality control purposes.
Surrogate compounds must be added to all samples, standards, and blanks, for all organic chromatography methods except when the matrix precludes its use or when a surrogate is not available. Poor surrogate recovery may indicate a problem with sample composition and shall be reported to the client whose sample produced poor recovery. (QAMS)

Systems Audit (also Technical Systems Audit): A thorough, systematic, qualitative on-site assessment of the facilities, equipment, personnel, training, procedures, record keeping, data validation, data management, and reporting aspects of a total measurement system. (EPA-QAD)

Technical Manager: A member of the staff of an environmental laboratory who exercises actual day-to-day supervision of laboratory operations for the appropriate fields of accreditation and reporting of results

Technology: A specific arrangement of analytical instruments, detection systems, and/or preparation techniques.

Traceability: The ability to trace the history, application, or location of an entity by means of recorded identifications. In a calibration sense, traceability relates measuring equipment to national or international standards, primary standards, basic physical constants or properties, or reference materials. In a data collection sense, it relates calculations and data generated throughout the project back to the requirements for the quality of the project. (TNI)

Trip Blank: A blank matrix placed in a sealed container at the laboratory that is shipped, held unopened in the field, and returned to the laboratory in the shipping container with the field samples.

Uncertainty: A parameter associated with the result of a measurement that characterizes the dispersion of the value that could reasonably be attributed to the measured value.

Acronyms:

CAR – Corrective Action Report
CCV – Continuing Calibration Verification

Revision History

Summary of Changes for Revision 9:

- This QAM revision reflects a re-work of the local manual to comply with the 2020 QA Manual Template. Most changes are administrative in nature and deal with incorporation of text to accommodate non-TestAmerica Business Units. Titles, roles, and responsibilities have been updated to reflect current Eurofins nomenclature.
  - Updated Quality Policy statement to reflect current Eurofins statement. Section 7.1
  - Clarified NDSC document control nomenclature and included reference to KGDs. Section 7.3
  - Added section on Use of NELAP and A2LA logo. Section 7.5
  - Removed example COC, CAR, and IDOC Form and routine instrument maintenance schedule. Removed sections on sample identifier info and floor plans.
  - Updated Org Chart, Instrument Listing, Certification Listing, and SOP Listing to reflect the current status.
  - Updated Training schedule to reflect current practice. Section 5.3.
  - Added text on Client Supplied Methods. Section 19.4.1.1
  - Added listing of Analytical Method References.

1. INTRODUCTION

This groundwater treatability study work plan (Groundwater TSWP), prepared on behalf of Pharmacia LLC/Solutia Inc. (P/S), presents the approach to conduct bench-scale treatability testing and data analysis to support the design of the groundwater remedy component for the Operable Unit 1/Operable Unit 2 (OU-1/OU-2) portion of the Anniston Polychlorinated Biphenyl (PCB) Site (the Site). It is a supporting document to the predesign investigation work plan (PDIWP) for OU-1/OU-2 (OU-1/OU-2 PDIWP) and a deliverable under the OU-1/OU-2 *Remedial Design/Remedial Action Consent Decree* (United States Environmental Protection Agency [USEPA] 2021).

This Groundwater TSWP provides the objectives and technical approach for the planned treatability study (TS) that will be conducted to support the development of the remedial design for groundwater at the T-11 area. The TS is based on the current conceptual approach to the groundwater remedy with specific focus on performance of the carbon adsorption aspect of the planned treatment. The treatability testing outlined in this Groundwater TSWP may be modified in the future, and additional treatability testing may be identified based on the results of the predesign investigation (PDI) or as the remedial design is advanced. If necessary, modifications to the TS program will be documented in an addendum to this work plan.

1.1 Background Information

As described in the Record of Decision (ROD), the groundwater remedy for the T-11 area includes installing and operating a groundwater extraction and treatment (i.e., pump-and-treat) system to capture PCB-impacted groundwater (USEPA 2017). The long-term goal of this system is to restore groundwater to the remedial goal for PCBs (0.5 micrograms per liter [µg/L]). The pump-and-treat system described in the OU-1/OU-2 ROD includes the following elements:

- Two groundwater extraction wells equipped with submersible pumps and controls
- Liquid-phase granular activated carbon (LGAC) filters equipped with pretreatment particulate filters, as needed
- Discharge of treated groundwater to Snow Creek via the permit equivalency process for National Pollutant Discharge Elimination System

Groundwater samples collected from monitoring well T-11 as part of the OU-1/OU-2 remedial investigation exhibited total PCB concentrations in unfiltered samples ranging from 3.3 µg/L (Aroclors) to 17.3 µg/L (homologs), with a concentration of 10.4 µg/L (homologs) reported following redevelopment of the monitoring well that was completed due to high turbidity noted in the initial samples (Environ 2015). As noted in the ROD, the distribution of PCBs in the floodplain area surrounding T-11 appeared to be unique for the Site, characterized by the presence of the lesser-chlorinated PCB compounds (e.g., Aroclor 1221 and homologs monochlorobiphenyl and dichlorobiphenyl). The presence of these lesser-chlorinated PCBs, along with the potential for carbon adsorption demand from naturally occurring organic matter and other geochemical species in this floodplain area form the primary basis for the TS proposed herein.

The groundwater extraction system is anticipated to consist of two extraction wells, each equipped with a submersible pump rated for producing an instantaneous flow rate of approximately 4 to 5 gallons per minute (gpm). The anticipated maximum flow rate for the system during pumping is approximately 8 to 10 gpm. However, the long-term well yields for extraction wells at the OU-3 portion of the Site average approximately 0.1 to 0.5 gpm per well (totaling 0.2 to 1 gpm for a 2 well extraction system). As such, the long-term average flow rate for the system could be less than the maximum capacity. Conveyance piping (including fittings, valves, and pressure gauges) is anticipated to be installed between pump discharge ports and the climate-controlled treatment system enclosure. The treatment system is anticipated to consist of a prefiltration unit (i.e., a 10-micron [µm] bag filter) and two LGAC vessels arranged in series with lead-lag configuration. Each carbon vessel is anticipated to have a maximum carbon capacity of approximately 250 pounds, for a combined system capacity of 500 pounds. The treatment system is anticipated to include pressure gauges, valves, sampling ports, a flow meter, a fan, a heater, lighting, and all other equipment necessary for system operations. Discharge piping for the treated groundwater is anticipated to be routed from the effluent of the lag carbon vessel to Snow Creek.

1.2 Existing Data to Support Treatability Studies

Data generated during previous investigations in OU-1/OU-2 and data collected as part of the planned PDI will provide information regarding groundwater conditions within the T-11 area. The existing information and data will be supplemented with the TS data to support the remedial design.

As discussed in the OU-1/OU-2 feasibility study, the use of GAC filtration for treatment of PCB-impacted groundwater is well proven (Ramboll Environ 2016), and such treatment is being used effectively within the OU-3 portion of the Site (USEPA 2020). Nevertheless, as discussed above, a TS of GAC performance for the T-11 area is recommended because lesser-chlorinated PCBs are present and naturally occurring species in the floodplain area have the potential for carbon adsorption demand.

1.3 Work Plan Organization

The remainder of this Groundwater TSWP is organized as follows:

- Section 2 details the data quality objectives (DQOs) for the groundwater treatability study.
- Section 3 describes the field sampling and treatability testing.
- Section 4 presents the treatability testing reporting and schedule.
- Section 5 lists the references cited in this document.

2. TREATABILITY STUDY DATA QUALITY OBJECTIVES

The overall objective and purpose of the TS is to generate data to use in the design and evaluation of groundwater treatment using GAC filtration. Accordingly, the following TS DQOs have been established as discussed in the PDIWP:

- GW-DQO 3: Determine an efficient and cost-effective GAC media for PCB treatment.
- GW-DQO 4: Determine the estimated time to PCB breakthrough in a full-scale GAC system.

Groundwater samples for the bench-scale treatability tests will be collected from monitoring well T-11 as part of the PDI sampling (Section 3.2). Bench-scale treatability tests will include an isotherm batch test to address GW-DQO 3 and a rapid small-scale column test to address GW-DQO 4. Details of these tests are provided in Section 3 below. In addition, PCB and geochemical analyses will be conducted on groundwater samples from T-11 to establish current groundwater conditions and determine the volume of groundwater needed for the treatability tests.

3. FIELD SAMPLING AND TREATABILITY TESTING

This section describes the roles and responsibilities for the TS, the field sampling, and the treatability testing and analytical program.

3.1 Roles and Responsibilities

P/S is the primary responsible party and, therefore, has overall responsibility for managing the TS. Agency communications will be through P/S unless P/S directs this to other members of the team. USEPA is the lead regulatory agency on the Anniston PCB Site. P/S has retained a technical team to support the design efforts. As part of the technical team, GSI Environmental, Inc., will have the technical responsibility for completing the groundwater TS described herein.

3.2 Field Sampling Plan

Groundwater samples for treatability testing will be collected from monitoring well T-11 in conjunction with the PDI field program. As described in the OU-1/OU-2 PDIWP, the groundwater PDI program at the T-11 area will follow a phased approach.

- Phase 1 will include redeveloping the well, sampling groundwater for laboratory analysis of PCBs and geochemical parameters to supplement existing characterization data, and confirming the hydraulic conductivity of the transmissive zone through aquifer slug testing.
- Phase 2 will involve installing groundwater observation wells to be used in subsequent aquifer pump testing and collecting soil samples for geotechnical analysis.
- Phase 3 will include conducting aquifer pump testing to assess aquifer response and well yield for designing the extraction wells. It is anticipated that a portion of the groundwater discharge from the aquifer pump tests will be collected for use in the TS.

The groundwater samples for treatability testing will be collected and contained in sealable water containers (e.g., 5-gallon plastic carboys and/or 30-gallon plastic drums). Approximately 120 gallons of groundwater are anticipated to be required by the treatability testing laboratory. The final volume of water required will be determined after reviewing the analytical results from Phase 1 sampling and testing. The sample containers will be shipped under chain-of-custody control to the treatability testing laboratory (SiREM in Knoxville, Tennessee).

3.3 Health and Safety Planning

The groundwater samples for treatability testing will be collected in accordance with the OU-1/OU-2 PDIWP, the Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP), and the project health and safety plan.

3.4 Treatability Testing and Analysis Program

The following bench-scale treatability tests will be conducted using the groundwater samples from T-11:

- A batch isotherm test

- A rapid small-scale column test

A description of each test is provided in the following subsections. Prior to conducting the test, the provided T-11 groundwater will be filtered through a 10-µm polypropylene bag filter in the lab. This filtration will mimic the anticipated full-scale system where a 10-µm bag filter will be installed upstream of the LGAC vessels.

3.4.1 Sorption Isotherm Batch Test

A sorption isotherm batch test will be performed to evaluate how effective two different GAC types are at removing PCBs and to determine the equilibrium partitioning relationship between dissolved and adsorbed PCBs. The two types of GAC to be tested will be coconut-shell-based 8x30 mesh size (the same carbon used in the OU-3 carbon treatment systems) and bituminous-coal-based 8x30 mesh size, which has been reported to outperform coconut-shell-based GAC for removing compounds with a high molecular weight (McNamara et al. 2018).

Five different quantities of both GAC types will be weighed into separate bottles, and 1.5 liters of T-11 groundwater will be distributed into each of the bottles. Two untreated control bottles containing no GAC will also be prepared for sampling at the beginning and end of the reaction period. The bottles will be sealed and tumbled for 20 to 24 hours. The bottles will then be removed from the tumbler, and the GAC will be allowed to settle for approximately 0.5 hours. After the GAC has settled, the pH of each sample will be measured and recorded because GAC adsorption capacity has been shown to increase with decreasing pH in the range of 8.5 to 5 (Hong 1998, Semmens et al. 1986).

Following pH testing, the sample supernatants (i.e., the groundwater within the bottles) from all 12 bottles will be collected and shipped to a third-party laboratory for PCB homologs analysis per the UFP-QAPP. The data will be reviewed to determine which GAC type was most efficient (i.e., adsorbs the highest concentration of PCB with the least amount of GAC) and cost effective for long-term use. The selected GAC material will be used for further testing in the rapid small-scale column test (RSSCT) described below.

3.4.2 Rapid Small-Scale Column Test

The RSSCT is used to determine the volume of groundwater at a specific flow rate that can be treated before the GAC is saturated and PCB breakthrough occurs. The column test is scaled to simulate the performance of a full-scale system thereby replicating mass transfer and hydrodynamic properties, which allows for accurate estimations of full-scale GAC usage and operating time to breakthrough. To simulate the full-scale system performance, the ratio of the anticipated full-scale system GAC vessel diameter to the carbon particle size will be maintained in the laboratory columns by reducing the particle size of the carbon used in the RSSCT. Maintaining this ratio will ensure that the RSSCT recreates similar contact between the groundwater and carbon particles in the anticipated full-scale treatment system.

The column test will be conducted in a small-diameter stainless steel column (approximately 0.5-inches in diameter by 4 inches in height) packed with a measured volume of powdered carbon of a specific mesh size, as indicated by ASTM International (ASTM) D 6586-03, and a size required

to maintain the vessel diameter-to-particle size ratio. For example, the anticipated full-scale 24-inch (610 millimeters [mm]) GAC vessel filled with 12x40-mesh size carbon (with an approximate particle size of 1.7 mm) would have a vessel diameter-to-particle size ratio of 359. The RSSCT conducted in a 0.5-inch (12.7 mm) diameter lab column would thus require a carbon particle size of 0.035 mm to maintain the diameter-to-particle size ratio. The 0.035-mm carbon particle size to be used in the RSSCT column would be achieved by grinding the 12x40-mesh size carbon and sieving through a 400-mesh sieve. Actual RSSCT testing parameters will be determined in part based on the results of the sorption isotherm tests.

The column will be sealed at both ends using threaded fittings connected to stainless steel tubing to allow T-11 groundwater to be delivered to the column. The column will be positioned vertically and connected to a peristaltic pump using flexible vinyl tubing. Deionized water will be pumped into the column in an upflow manner to flood the column and expel air. The deionized water will then be allowed to gravity drain, and the quantity of water collected is the column void volume, or pore volume. Deionized water will be replaced with the prefiltered T-11 groundwater and passed through the column in an upflow manner as further described below.

Based on the carbon vendor's (Evoqua Water Technologies LLC) preliminary modeling estimates of GAC performance, it is anticipated that 30,000 empty bed volumes (EBVs; 1 EBV for the RSSCT equates to approximately 13 milliliters) need to be passed through the lab column to achieve PCB breakthrough. The column will be continuously operated at a flow rate between 30 and 65 milliliters per minute, as dictated by maximum allowable backpressure, 40 pounds per square inch, monitored at column influent. It is anticipated that PCB breakthrough will occur between approximately 4 and 8 days of column operation.

Effluent from the GAC column will be collected and labeled as to the EBV or range of EBVs represented by the sample. The sample volume necessary for analysis of PCBs, total organic carbon, and pH is 1.5 liters, which equates to approximately 115 EBVs. It is anticipated that aliquot effluent samples will be collected as practicable, based on laboratory staff availability, continuously throughout the duration of the experiment. At a minimum, samples will be collected at intervals of 1,000 to 2,000 EBVs, with a maximum of 30 effluent samples collected during the operation of the column test. A total of 15 effluent samples are anticipated to be analyzed to determine PCB breakthrough in the column. An additional 4 samples will be collected from the column influent, at intervals of approximately 7,500 EBVs, to test for groundwater stability throughout the test. In total, 19 samples will be analyzed for PCBs, TOC, and pH during the RSSCT test.

3.5 Residuals Management

A variety of residuals might be generated from the treatability testing. Examples of these residuals are as follows:

- Materials obtained but not used for testing
- Tested materials and treatment residuals
- Used containers, other field disposables, and personal protective equipment

If these materials are generated at the Site, they will be managed using P/S's in-place system to containerize and dispose of PCB-containing wastes and nonhazardous waste. If the materials are generated away from the Site, P/S will work with the laboratory either to use laboratory disposal protocols or to return the materials to the Site for treatment under the P/S system.

3.6 Data Management and Quality

Data management and quality are important components of the TS process and ultimately provide the basis of data usability. Field sampling will be conducted in accordance with this Groundwater TSWP, the OU-1/OU-2 PDIWP, and the standard operating procedures provided in the UFP-QAPP.

During the field sampling and the treatability testing, detailed notes and digital photographs will be collected to document the activities completed. Any variations from the procedures outlined herein will be documented in the TS data summary report.

4. TREATABILITY STUDY REPORTING AND SCHEDULE

This section describes the TS data evaluation and the deliverables to be prepared to support remedial design.

4.1 Data Evaluation and Interpretation

The treatability testing data will be analyzed and evaluated during the development of the remedial design. Data will be specifically evaluated and interpreted considering the DQOs identified in Section 2. Relevant field information and reports, analytical data, data reviews, and other documentation will be reviewed and evaluated. The TS results will be used to support the basis of design and data inputs to evaluate the GAC components of the groundwater remediation design, including the GAC media, the optimum number and size of GAC vessels, and the estimated GAC changeout frequency.

4.2 Reporting

The results of the treatability testing will be presented in a data summary report. That report will summarize the field sampling, treatability testing activities, results, and conclusions. The data summary report will include tabulated data from the treatability testing along with relevant field information and reports, analytical data, photographs, and other related documentation.

4.3 Schedule

The treatability testing discussed in Section 3 will be conducted using samples collected from monitoring well T-11 generated during the aquifer pump testing activities of the PDI, which is planned as the third and final phase of the PDI for this area. Consequently, the schedule for the TS will be tied to the start and duration of PDI field sampling. It is anticipated that the treatability testing and associated analyses will require approximately 3 months to complete once the samples are received at the testing laboratory. Completion of the data summary report is anticipated approximately 2 months following receipt of the final laboratory testing results.

1. INTRODUCTION

This sediment treatability study work plan (Sediment TSWP), prepared on behalf of Pharmacia LLC/Solutia Inc. (P/S), presents the approach to conduct bench-scale treatability testing and data analysis to support the design of the sediment remedy component for the Operable Unit 1/Operable Unit 2 (OU-1/OU-2) portion of the Anniston polychlorinated biphenyl (PCB) Site (the Site). It is a supporting document to the predesign investigation work plan for OU-1/OU-2 (OU-1/OU-2 PDIWP) and a deliverable under the OU-1/OU-2 *Remedial Design/Remedial Action Consent Decree* (United States Environmental Protection Agency [USEPA] 2021).

This Sediment TSWP provides the objectives for the treatability study (TS) and describes the planned TS activities that will be conducted to support the development of the remedial design for Snow Creek sediment. The TS activities described herein are based on the current conceptual approach to the sediment remediation. The treatability testing outlined in this work plan may be modified in the future, and additional treatability testing may be identified based on the results of the predesign investigation (PDI) or as the remedial design is advanced. If necessary, modifications to the TS program will be documented in an addendum to this work plan.

1.1 Background Information

As described in the Record of Decision (ROD), the sediment remedy for OU-1/OU-2 requires excavating contaminated sediment in Snow Creek and disposing of the excavated sediment at an appropriate off-site disposal facility (USEPA 2017). The primary constituent of concern in sediment is PCB, and two previously identified sediment deposits contained one or more metals (i.e., chromium, lead, manganese, and nickel) at concentrations above the remedial goals.

The existing sediment sampling data indicate that the highest total PCB concentrations (60 milligrams per kilogram [mg/kg]) in Snow Creek sediment are generally found in sediment from the upstream portions of the creek between the 11th Street Ditch and Highway 202, including the culverts that convey flow under the highway. The data also indicate that there is a small portion of Snow Creek with a mean sediment PCB concentration of 12 mg/kg for sediment deposits near a railroad bridge just downstream of Highway 202. The sediment in the downstream OU-1/OU-2 portion of Snow Creek between the railroad bridge and Highway 78 had an average PCB concentration of approximately 1.9 mg/kg.

Approximately 2,500 cubic yards of sediment with constituent concentrations above the remedial goals established in the ROD were identified in the OU-1/OU-2 portion of Snow Creek (Ramboll Environ 2016). These estimates do not include any sediment volume in the channelized culvert beneath Quintard Mall. The actual volume of sediment in the OU-1/OU-2 portion of Snow Creek that will be targeted for removal will be determined during the remedial design and will be based on the data from the sediment PDI.

It is anticipated that sediment with PCB concentrations exceeding the remedial criteria will be removed from Snow Creek using mechanical methods and transported to one or more sediment management areas for dewatering (by gravity) or stabilization (by adding an amendment to condition the sediment). Once the sediment has been dewatered or stabilized it will be transported to an approved off-site landfill facility for disposal. Supernatant water (i.e., water removed from

the sediment as part of the dewatering process) will either be transported for off-site treatment or treated at the on-site and discharged.

At this early stage of the remedial design, the specific means and methods for implementing the sediment remedial action have not been finalized. The specific remedial process will be selected and refined during the design phase, which will include reviewing anticipated equipment, performance requirements, and cost effectiveness. The TS results from the testing outlined in this plan will be used to evaluate methods for implementing the sediment remedial action.

1.2 Existing Data to Support Treatability Studies

Data generated during prior investigations in OU-1/OU-2 and data collected as part of the planned PDI will provide data and information on conditions within the OU-1/OU-2 section of Snow Creek. The existing information and data will be supplemented with the TS data to support the remedial design.

Most sediment deposits identified in the OU-1/OU-2 portion of Snow Creek during prior investigations contained fine to coarse sands and gravel. Silts or clays were identified in a smaller subset of the sediment deposits predominately at the upstream and downstream portions of Snow Creek. The abundant sands and gravel present in the sediment deposits are expected to allow for efficient dewatering; however, the presence of fine particles (i.e., silts and clays) in portions of the creek warrants treatability testing to evaluate the potential dewatering characteristics of the sediment that will be targeted for removal.

1.3 Work Plan Organization

The remainder of this Sediment TSWP is organized as follows:

- Section 2 details the data quality objectives (DQOs) for the sediment TS.
- Section 3 describes the field sampling and treatability testing.
- Section 4 presents the treatability testing reporting and schedule.
- Section 5 lists the references cited in this document.

2. TREATABILITY STUDY DATA QUALITY OBJECTIVE

The overall objective and purpose of the TS is to generate data to use in the design and evaluation of sediment removal, transport, processing, and disposal. Accordingly, the following TS DQO has been established as discussed in the PDIWP:

- SED-DQO 3: Determine efficient and cost-effective methods for dewatering and stabilizing sediment excavated from Snow Creek.
- SED-DQO 4: Determine what treatment technologies might be necessary to meet the requirements for discharging the supernatant water that drains from sediment excavated from the creek.

The sediment to be excavated from Snow Creek might require processing, treatment, or conditioning prior to transport to allow it to be loaded into trucks, to meet regulatory requirements for transportation on public roads (i.e., no free liquids permitted), and to strengthen the sediment to the requirements of the selected off-site landfill. During the remediation, it is anticipated that the full extent of sediment deposits that exceed the remedial criteria of 3 mg/kg will be removed. The current thinking is that excavated sediment from a nearby geographic portion of the creek would be managed together within the creek or at a temporary staging area even if the materials contain a mixture of fine- and coarse-grained sediments. Blending coarse-grained sediments (if available) with fine-grained sediments to achieve transport and disposal requirements can also be employed. The remedial action may also include a combination of dewatering methods for the excavated sediment to meet transportation and facility requirements (e.g., gravity dewatering and stabilization/solidification), which is common on sediment remediation projects. The need for combining process options will depend on the nature of the sediment excavated, the results of treatability testing, and the means, methods, and schedule of the remedial contractor.

The data gathered as part of the PDI and the results of the TS will provide information on the nature of the sediment that will be targeted for removal and will provide information that will be used to evaluate potential processing and dewatering options as part of the design phase. The PDI and treatability testing data will also be provided to the remedial contractor to determine the means and methods for the remediation.

Bulk sediment samples for the bench-scale treatability evaluations will be collected from targeted remedial areas that will be identified based on the results of the PDI sampling (Section 3.2). The physical (geotechnical) properties of the sediment collected will also be tested as part of the TS.

Bench-scale treatability tests will include a drainage study and stabilization/solidification testing. In addition, geotechnical analyses will be conducted on treated material. Bulk sediment samples collected from target remedial areas in conjunction with the PDI sampling will be submitted for laboratory characterization and treatability testing.

Sediment excavated from water bodies contain excess water (referred to as supernatant) that will be removed during dewatering prior to transport for disposal. The supernatant will likely require treatment prior to discharge. The bench-scale treatability testing will provide data on the potential concentrations of parameters within the supernatant for review as part of the remedial design to evaluate potential treatment requirements. During design, data from analytical testing of the

supernatant will be compared to the discharge requirements to determine treatment necessary prior to discharge.

3. FIELD SAMPLING AND TREATABILITY TESTING

This section describes the roles and responsibilities for the TS, the field sampling, and the treatability testing and analytical program.

3.1 Roles and Responsibilities

P/S is the primary responsible party and, therefore, has overall responsibility for managing the TS. Agency communications will be through P/S, unless otherwise directed by P/S to other members of the team. USEPA is the lead agency on the Anniston PCB Site project. P/S has retained a technical team to support the design efforts. As part of the technical team, Anchor QEA, LLC, (Anchor QEA) will have the technical responsibility for completing the TS activities described herein.

3.2 Field Sampling Plan

Bulk sediment samples for treatability testing will be collected from Snow Creek in conjunction with the PDI sampling program.

As described in the OU-1/OU-2 PDIWP, the sediment PDI program will follow a phased approach. Initially, Phase 1, which includes probing, survey, and visual observations, will be conducted along the OU-1/OU-2 portion of Snow Creek to map the current sediment deposit locations, estimate sediment volumes, and determine where sediment sampling will be performed to supplement existing sediment characterization data. Phase 2 of the sediment PDI will involve collecting sediment samples for analytical testing to evaluate and refine the extent of sediment in the OU-1/OU-2 portion of Snow Creek that has PCB concentrations above the remedial criteria. The locations where bulk sediment samples will be collected for the TS will be determined after the data collected from the Phase 1 sediment mapping program and the Phase 2 sediment sampling have been reviewed.

Three bulk sediment samples will be collected for treatability testing from areas within Snow Creek that will be targeted for removal. The bulk sediment sampling locations will be selected based upon the following criteria:

- To provide a range in sediment types (i.e., fine material vs. coarse material) based on historical data and data collected during Phase 1 and Phase 2 of the sediment PDI
- To focus on areas with the largest expected volume of sediment to be removed
- To be spatially representative of the sediment removal areas within Snow Creek

The bulk sediment samples will be composited from sediment samples collected in the target remedial areas. It is anticipated that the full extent of sediment deposits that exceed the remedial criteria of 3 mg/kg will be removed and that the sediments removed from deposits located in a nearby geographic portion of the creek would be managed together. As such, the bulk material samples collected for the treatability testing will be collected from the full-depth samples of the sediment deposits at up to five locations and then composited together. It is anticipated that the TS bulk sampling will target a range of sediment types from coarse-grained sediment deposits to fine-

grained sediment deposits, to the extent the materials represent a significant volume of sediment targeted for removal.

It is anticipated that, at a minimum, one bulk sediment sample will be composited from samples collected upstream, within, and immediately downstream of the Highway 202 culverts, which are anticipated to be handled together as part of the remediation. Other sampling locations will be determined after the PDI survey and sampling data has been reviewed. Due to the specific hazards represented by the permit-required confined spaces, bulk sediment samples will be collected from the Highway 202 culverts and the Quintard Mall culvert in conjunction with the confined space entry at those locations during the Phase 2 sediment sampling. The bulk sediment samples will be held for potential treatability testing.

The bulk sediment samples will be collected and contained in sealable 5-gallon buckets. At least 15 gallons of sediment will be collected for each bulk sample collected at each location. In addition, 10 gallons of water from Snow Creek will be collected to mix with the sediment to obtain sediment/water mixes whose properties are representative of the material properties that may occur during sediment removal.

The bulk sediment samples will be sent to Anchor QEA's environmental geochemistry laboratory (EGL) in Portland, Oregon, for treatability testing. Subsamples of sediment from each bulk sample will also be submitted to Excel Geotechnical Testing, Inc., (EGT) in Roswell, Georgia, for the following analyses:

- Moisture Content (ASTM International [ASTM] D2216)
- Particle Size (ASTM D6913/D7928)
- Atterberg (Liquid and Plastic) Limits (ASTM D4318)
- Dry Density (ASTM D2937)
- Organic Content (ASTM D2974)
- Unconfined Compressive Strength (ASTM D2166)
- Paint Filter Test (USEPA Method 9095B)

Following these initial analyses, treatability testing will be performed by Anchor QEA's Portland laboratory as described in Section 3.4.

In addition, Snow Creek bulk sediment samples will be shipped to EGT for post-testing geotechnical analysis as described in Section 3.4.2.

3.3 Health and Safety Planning

The sediment samples for treatability testing will be collected in accordance with the OU-1/OU-2 PDIWP, the Unified Federal Policy Quality Assurance Project Plan (UFP-QAPP; Appendix A of the PDIWP), the OU-1/OU-2 Remedial Design/Remedial Action Health and Safety Plan, and the confined space entry plans (Appendices D and E of the PDIWP), as applicable.

3.4 Testing and Analysis Program

The following bench-scale treatability tests will be performed for each bulk sediment sample collected:

- A drainage study
- Stabilization/solidification testing

A description of each test is provided in the following subsections.

3.4.1 Drainage Study

A drainage study will be performed by the Anchor QEA EGL to evaluate the ability of dredged sediment to passively dewater via gravity drainage. The purpose of this study will be to estimate the water content before and after gravity drainage to evaluate whether the dredged material will need additional treatment to meet transportation and disposal facility requirements. The drainage study will be performed on one homogenized sample from each of the bulk sediment sampling locations.

The drainage study will involve placing sediment samples within a screen and allowing the sample to gravity drain for 72 hours. Samples will be collected at multiple time intervals throughout the drainage study for moisture content and paint filter testing. Water that drains from the samples during the drainage study will be collected, measured, and tested for total suspended solids, PCBs, metals (barium, chromium, cobalt, lead, manganese, mercury, nickel, and vanadium), and oil and grease.

The drainage study will be conducted in accordance with the standard operating procedure (SOP) provided in Attachment 1.

3.4.2 Stabilization/Solidification Testing

Stabilization of samples will be investigated using commercially available reagents at various dosages with the goal of determining effective and cost-efficient reagent doses to meet transportation and disposal facility requirements for paint filter testing and minimum structural strength. The stabilization/solidification testing will be performed regardless of the results for the drainage study results.

Three reagents will be evaluated at a minimum of three mix ratios per reagent by the EGL (Table 3-1). Mix ratios will be evaluated through paint filter testing and visual observations of physical characteristics at cure periods of 12, 24, 48, and 72 hours. Mix ratios will also be monitored for weight change.

The following solidification agents will be used in the testing:

- Type I Portland cement
- Cement kiln dust
- Calciment
- Lime

The treatability testing will be performed using these commercially available amendments at mix ratios of 2.5%, 5%, and 7.5% by weight. If adequate testing results are not obtained using the initial ratios, additional mix ratios will be evaluated. The goal of the testing is to determine effective and cost-efficient combinations of reagent, mix ratio, and cure time to allow the solidified end-product to pass the paint filter test and achieve the minimum structural strength required by the disposal facility. The amendments will be provided by the manufacturer, and the vendor-provided specification sheets for each amendment will be included in the data summary report.

The stabilization and solidification testing will be performed in accordance with the SOP provided in Attachment 2.

For the initial screening phase, mix ratios will be evaluated through paint filter testing, percent solids analysis, moisture content, weight change, and visual observations at the previously specified cure periods. A pocket penetrometer will also be used to evaluate the strength of the admixtures. A second round of solidification testing may be employed using a smaller range of reagent blend to determine the optimum dose and cure time for solidification, as appropriate.

After optimal reagents, mix ratios, and cure times are established through testing at the Anchor QEA EGL, geotechnical testing will be performed by EGT on treated sediment. The geotechnical laboratory will prepare a single sample using the selected amendment and optimum dosage based on the results of the treatability testing. Following the proper cure time, the geotechnical tests detailed in Table 3-2 will be performed to determine the strength and physical properties of the sediment and amendment mixture.

3.5 Residuals Management

A variety of residuals may be generated as a result of the treatability testing. Examples of these residuals are as follows:

- Materials obtained but not used for testing
- Tested materials and treatment residuals
- Used containers, other field disposables, and personal protective equipment

If these materials are generated at the Site, they will be managed using P/S's in-place system to containerize and dispose of PCB-containing wastes and nonhazardous waste. If the materials are generated away from the Site, P/S will work with the laboratory either to use laboratory disposal protocols or to return the materials to the Site for treatment under the P/S system.

3.6 Data Management and Quality

Data management and quality is an important component of the TS process and ultimately provides the basis of data usability. The field sampling activities will be conducted in accordance with this work plan, the OU-1/OU-2 PDIWP, and the SOPs provided in the UFP-QAPP.

During the field sampling and the treatability testing, the field crew will take detailed notes and digital photographs to document the activities completed. Any variations from the procedures outlined herein will be documented in the TS data summary report.

4. TREATABILITY STUDY REPORTING AND SCHEDULE

This section describes the TS data evaluation and the deliverables to be prepared to support the remedial design.

4.1 Data Evaluation and Interpretation

The treatability testing data will be analyzed and evaluated during the development of the remedial design. Data will be specifically evaluated and interpreted considering the DQOs identified in Section 2. Relevant field information and reports, analytical data, data reviews, and other documentation will be reviewed and evaluated. The TS results will be used to support the basis of design and data inputs to evaluate the primary components of the sediment remediation design, including removal, transport, dewatering, processing, and disposal.

4.2 Reporting

The results of the treatability testing will be presented in a data summary report. That report will summarize the field sampling and the treatability testing activities, results, and conclusions. The data summary report will include tabulated data from the treatability testing along with relevant field information and reports, analytical data, photographs, and other related documentation.

4.3 Schedule

The treatability testing will be conducted using samples collected from areas within Snow Creek that will be targeted for removal. Consequently, the treatability testing will be performed after data from Phase 1 and Phase 2 of the sediment PDI program are reviewed.

The schedule for the TS will be tied to the start and duration of the PDI field sampling activities. It is anticipated that the treatability testing and associated geotechnical analytical activities will require approximately 3 months to complete once the samples are received at the testing laboratory.

Drainage Study

1. Scope and Application

This standard operating procedure (SOP) describes the procedures for conducting a bench-scale Drainage Study as part of the treatability study program. The purpose of this study is to determine the water content of a composite sample at different time points of gravity drainage.

2. Health and Safety

All laboratory work will be performed in accordance with the Anchor QEA Environmental Geochemistry Laboratory (EGL) Chemical Hygiene Plan (CHP) by approved staff. Approval to work in the EGL requires orientation to laboratory safety procedures and potential hazards under the guidance of the Laboratory Manager, as specified in the CHP.

3. Equipment List

The following materials, as required, will be available during this procedure:

- Personal protective equipment (PPE)
- Laboratory fume hood
- Analytical balance
- No. 200 standard sieve
- Conical paint filters (60 x 60 mesh or 60 x 48 standard mesh)
- Sampling spoon
- Laboratory stands
- Funnels
- Graduated cylinders
- Graduated beaker
- Laboratory notebook

4. Drainage Study Procedure

In this test, samples representative of sediment proposed for dredging are placed atop a screen and allowed to gravity drain for 72 hours. For each bulk sediment sample, the procedures are as follows:

1. Don appropriate PPE.
2. Homogenize the samples (ensure that water content is representative of anticipated site conditions).
3. Collect a subsample for determination of total solids.

4. Collect a subsample for paint filter testing in accordance with Method 9095B, hold until the final sampling point.
5. Collect a 1-liter subsample of each sample.
6. Place the sediment material in a conical configuration in the center of a No. 200 standard sieve. Set up the apparatus to collect any water that drains from the sample during the testing in a graduated beaker.
7. Place each screen and sample in a non-drafty location or place a non-airtight cover over the sieve.
8. After drainage durations of 6, 24, 48, and 72 hours, remove a 25-gram sample from the center of the cone and determine the total solids. Measure the amount of water that drains from the sample at each time intervals.
9. Homogenize the remaining material.
10. Conduct paint filter testing on time 0- and 72-hour drainage samples.
11. Collect the water that drains from the sample for potential laboratory analytical testing for chemical parameters in accordance with the project work plan.
12. For each sample, plot the solids concentration vs time

ATTACHMENT 2
STANDARD OPERATING PROCEDURE: STABILIZATION/SOLIDIFICATION TESTS

ANCHOR QEA

Standard Operating Procedure

Stabilization/Solidification Tests

1. Scope and Application

This standard operating procedure (SOP) describes the procedures for conducting bench-scale Stabilization/Solidification (S/S) Tests. These tests will evaluate effective and cost-efficient reagent doses to meet transportation and disposal landfill facility requirements for sediment to be dredged from the water body.

2. Health and Safety

All laboratory work will be performed in accordance with the EGL Chemical Hygiene Plan (CHP) by approved staff. Approval to work in the EGL requires orientation to laboratory safety procedures and potential hazards under the guidance of the Laboratory Manager, as specified in the CHP.

3. Equipment List

The following materials, as required, will be available during this procedure:

- Personal protective equipment (PPE)
- Stainless Steel mixing bowl
- Soil mixing apparatus
- Sample containers
- Paint Filter testing equipment described in Method 9095B
- Laboratory notebook

4. Test Procedure for Stabilization/Solidification

The S/S test method described below will be conducted in a laboratory bench-scale setup using sediment collected from potential dredging locations. Samples used in the test will be approximately 1 kg in weight. The tests will be conducted under three different S/S reagent percentages as described in the project work plan.

Upon receipt of the Site sediments, conduct the sediment stabilization bench test study using the following laboratory procedure:

1. Don appropriate PPE.
2. Homogenize the sediment in each container.
3. Determine percent moisture and total solids for each sample.
4. Divide each composite sample into 9 subsamples.
5. Weigh each subsample and record the mass.
6. Record any visual observations.

7. Photograph the samples.
8. Label each of the 9 subsamples as follows to indicate that amendment type and dose:
    a. Three subsamples subject to the addition of Portland cement (PC) are to be labeled with the suffixes "-PC (2.5%)", "-PC (5%)", and "-PC (7.5%)".
    b. Three subsamples subject to the addition of Cement Kiln Dust (CKD) are to be labeled with the suffixes "-CKD (2.5%)", "-CKD (5%)", and "-CKD (7.5%)".
    c. Three subsamples subject to the addition of Calciment (Calc) are to be labeled with the suffixes "-Calc (2.5%)", "-Calc (5%)", and "-Calc (7.5%)".
    d. Three subsamples subject to the addition of lime (CaO) are to be labeled with the suffixes "-CaO (2.5%)", "-CaO (5%)", and "-CaO (7.5%)".
9. Add the stabilization agents (by weight) listed in Step 8 to correspond to the sample labels specified in Step 8. Thoroughly mix the stabilization agent into the sample. For example, add 5% PC by weight to the sample labeled PC (5%).
10. Let the samples cure for a period of 12 hours, weigh each sample and then analyze each of the subsamples for percent solids (Standard Method 2540G), moisture content (ASTM - D2216), paint-filter test (USEPA Method 9095B), and strength using a pocket penetrometer.
11. Repeat the procedure listed in Step 10 after letting the samples cure for 24, 48, and 72 hours.

Attachment 1: Permit-Required Confined Space Entry Permit Form

Attachment 2: Confined Space Hazard Assessment Form

Attachment 3: JSA: Working in Confined Spaces

1. INTRODUCTION

This confined space entry plan and its accompanying job safety analysis (JSA) describe potential hazards and safety procedures associated with accessing the culverts through which Snow Creek flows under Highway 202 in Anniston, Alabama. Requirements and procedures for working in confined spaces are discussed below and in the project-specific health and safety plan (HASP). This confined space entry plan for the Highway 202 culverts must be followed in conjunction with the project-specific HASP and the associated JSAs when entering any of the culverts.

Five separate concrete box culverts, each approximately 10 feet wide by 10 feet tall, pass beneath the width of Highway 202. The culverts are open at both ends and contain varying amounts of accumulated sediment. Considerable amounts of sediment have also been deposited at both the upstream and downstream ends outside the culverts. The Highway 202 culverts are considered a permit-required confined space and are not entered regularly. The activities anticipated to be conducted within this confined space include surveying, visual observation, sediment probing, and sediment sampling.

2. CONFINED SPACE DEFINITION AND REQUIREMENTS

A confined space is defined as a space that is large enough and configured so that a person can enter the space and perform assigned work, has limited means for entry or exit, and is not designed for continuous employee occupancy. A confined space is considered to have been entered as soon as any part of the entrant's body breaks the plane of an opening into the space. Confined space entry may pose the possibility of engulfment. Potentially contaminated confined spaces may pose additional hazards such as air contamination, flammable or explosive atmosphere, and oxygen deficiency.

The Site Safety Officer is responsible for identifying confined spaces into which personnel will enter. All confined spaces will be initially considered to require a permit.

Personnel must be properly trained to supervise and participate in confined space entry procedures or to serve as standby attendants. Personnel entering confined spaces or conducting activities near confined spaces must meet the regulatory requirements outlined in the Code of Federal Regulations (CFR) at 29 CFR 1910.146: Permit-required confined spaces. Each contractor participating in the confined space entry will provide qualified, competent, and trained personnel as defined in 29 CFR 1910.146, who will be responsible and have authority to perform confined space entry activities.

3. SPECIFIC MEASURES: HIGHWAY 202 CULVERTS CONFINED SPACE ENTRY

Entry into the Highway 202 culverts requires a confined space entry permit. At least two entrants and one trained attendant will be involved in the confined space entry. All entrants shall wear (in the breathing zone) a properly calibrated and bump-tested MicroRAE gas monitor (or equivalent). In addition, the attendant will monitor the air at the entry location with a MultiRAE (or equivalent) monitor. The entrants and the attendant will be equipped with radios for communication during the entry. All personnel shall wear personal protective equipment (PPE) in accordance with the project-specific HASP and anticipated hazards. At a minimum, Level D PPE shall be worn, including a hard hat, safety glasses, reflective vests, and steel-toed shoes.

Confined space entry into the Highway 202 culverts will require the following specific measures:

- Confined space entry permit (Attachment 1)
- Hazard assessment form (Attachment 2)
- JSA review (Attachment 3)
- Pre-entry briefing
- Continuous air monitoring by attendant and entrants
- Lifelines attached to a body harness on each entrant
- Radio communications, with back up air horns
- Minimal creek flow and no significant rain in the daily forecast
- Prior notification of the Anniston Fire Department and agreement that they will respond in the event of an emergency, that they are able to meet the response requirements described in 29 CFR 1926.1211, and that they are familiar with the exact location and hazards

4. AIR MONITORING REQUIREMENTS

Air monitoring prior to entry and continuous monitoring of the space during entry are required. Entrants will wear (in the breathing zone) a properly calibrated and bump-tested MicroRAE gas monitor (or equivalent), and the attendant will perform air monitoring at the entry location with a MultiRAE (or equivalent). All air monitoring instruments shall be equipped with a photoionization detector (PID), oxygen, lower explosive limit (LEL), carbon monoxide, and hydrogen sulfide sensors. The air monitoring results will be compared with the action levels and response actions listed in Table 4-1.

Table 4-1. Action Levels for Air

Parameter	Reading	Action
Volatile Organics	0 to 5 ppm	Normal operations with continuous monitoring. If getting consistent detectable readings, try to identify the source. Consider adjusting the action levels depending on possible source materials.
	5 to 20 ppm	Must investigate cause of readings to determine source
	> 20 ppm	Stop work, and contact Site Safety Officer
Hydrogen Sulfide	0 to < 5 ppm	Normal operations
	> 5 ppm	Stop work, evacuate confined spaces/work area, investigate cause of reading, and ventilate area
Oxygen	< 19.5%	Stop work, evacuate confined spaces/work area, investigate cause of reading, and ventilate area
	> 19.5% to < 23.5%	Normal operations
	> 23.5%	Stop work, evacuate confined spaces/work area, investigate cause of reading, and ventilate area
Flammable Vapors (lower explosive limit [LEL])	< 10% LEL	Normal operations
	> 10% LEL	Stop work, ventilate area, investigate source of vapors
Carbon Monoxide	0 to 20 ppm	Normal operations
	> 20 ppm	Stop work, evacuate confined spaces/work area, investigate cause of reading, and ventilate area

ppm: parts per million

5. ROLES AND RESPONSIBILITIES

The roles and responsibilities for personnel involved in the confined space entry are specified in the following subsections.

5.1 Entry Supervisor

The role and responsibilities of the entry supervisor are as follows:

- Know the hazards that may be faced during entry and the mode, signs or symptoms, and consequences of exposure to those hazards.
- Check that the entry permit has been properly prepared, all tests specified by the permit have been conducted, and all procedures and equipment specified by the permit are in place before endorsing the permit and allowing entry to begin.
- Terminate the entry and cancel the permit as required.
- Remove unauthorized individuals who enter or attempt to enter the confined space during entry operations.
- Determine that entry operations remain consistent with the terms of the entry permit and that acceptable entry conditions are maintained.
- Document on the entry permit any incidents or circumstances requiring review of the confined space entry program, including the following:
  - Unauthorized entry
  - The detection of a condition or hazard not authorized by the permit
  - The occurrence of an injury or near miss during entry
  - A change in the use or configuration of the space
  - Personnel complaints about the program
- Prescribe procedures for coordinating entry when personnel from multiple employers are working simultaneously in or around the confined space.

5.2 Authorized Entrants

The role and responsibilities of the authorized entrants include the following:

- Know the hazards that may be faced during entry and the mode, signs or symptoms, and consequences of exposure to those hazards.
- Communicate with the attendant as necessary to enable the attendant to monitor entrant status and to alert entrants of the need to evacuate the space.
- Alert the attendant whenever either of the following situations occurs:
  - The entrant recognizes warning signs or symptoms of exposure to a dangerous situation.
  - The entrant detects a prohibited condition.

- Exit the permit-required confined space as quickly as possible whenever one of the following situations occurs:
    - An order to evacuate is given by the attendant or the entry supervisor.
    - The entrant recognizes warning signs or symptoms of exposure to a dangerous situation.
    - The entrant detects a prohibited condition.
    - An evacuation alarm is activated.

5.3 Attendant(s)

The role and responsibilities of the attendants include the following:

- Know the hazards that may be faced during entry and the mode, signs or symptoms, and consequences of exposure to those hazards.
- Be aware of possible behavioral effects of hazard exposure in authorized entrants.
- Maintain an accurate count of authorized entrants in the confined space.
- Accurately identify who is in the permit space by tagging each individual's lifeline with the entrant's name and recording the names of the entrants.
- Remain outside the confined space during entry operations until relieved by another attendant.
- Communicate with the authorized entrants as necessary to monitor entrant status and to alert entrants of any important information (e.g., the need to evacuate the space).
- Monitor activities inside and outside the space to determine whether it is safe for entrants to remain in the space.
- Order the authorized entrants to evacuate the confined space immediately under any of the following conditions:
    - The attendant detects a prohibited condition.
    - The attendant detects the behavioral effects of hazard exposure in an authorized entrant.
    - The attendant detects a situation outside the space that could endanger the authorized entrants.
    - The attendant cannot effectively and safely perform all their duties.
- Summon rescue and other emergency services as soon as the attendant determines that authorized entrants may need assistance to escape from confined space hazards. Must have a positive verified means of communication to alert the Anniston Fire Department in the event of an emergency.
- Take the following actions when unauthorized persons approach or enter a confined space while entry is underway:
    - Warn the unauthorized persons that they must stay away from the confined space.

    - Advise the unauthorized persons that they must exit immediately if they have entered the permit space.
    - Inform the authorized entrants and the entry supervisor if unauthorized persons have entered the permit space.
- Perform non-entry rescues.
- Do nothing that might interfere with the attendant's primary duty to monitor and protect the authorized entrants.

6. ENTRY PROCEDURES

The following procedures are to be followed when entering the Highway 202 culverts:

1. Verify whether entry into the confined space is necessary to perform work.
2. Review creek flow conditions and schedule confined space entry for when there is no significant rain in the daily forecast.
3. Have the following minimum-required equipment on hand:
    - Ventilation (if determined necessary based on air monitoring results)
    - Barrier (tape or hard barricade) and warning signs
    - Air monitor(s) capable of measuring, at a minimum, concentrations of oxygen, flammable gases, hydrogen sulfide, and carbon monoxide
4. Inspect the confined space from the access location and eliminate any unsafe conditions prior to setting up for entry.
5. Install a barricade or tape and signs to prevent unauthorized persons from accidentally entering the space.
6. Conduct a hazard assessment that includes the following activities:
    - Test the real or potential atmospheric hazards, as follows:
        - Oxygen content: less than 19.5% or greater than 23.5%
        - Flammable gases and vapors: greater than 10% of the LEL
        - Hydrogen sulfide concentrations: 5 parts per million (ppm) or greater
        - Carbon monoxide concentrations: greater than 20 ppm
        - Volatile organic compound concentrations greater than 20 ppm.
    - Review the space for other observable serious safety and health hazards, including the following:
        - Mechanical
        - Electrical
        - Burn
        - Engulfment
        - Entrapment hazards
    - Consider the following environmental hazards:
        - Heat stress
        - Cold stress
        - Inclement weather
        - Insects and spiders

- Bees and wasps
- Ticks
- Mosquitoes
- Poisonous snakes
- Alligators
- Water-borne pathogens
- Feral dogs
- Bears
- Wolves and coyotes
- Other wildlife
- Poisonous plants
- Public at large

7. If any hazardous atmosphere exists, take the following actions:
    - If possible, determine and eliminate the source of the atmospheric hazards (e.g., carbon monoxide from a nearby truck or gas-powered generator).
    - If the atmosphere contains toxins or flammables, ventilate the space by drawing air out until the air has been changed over several times.
    - If oxygen is deficient, ventilate by pushing air into the space until the air has been changed over several times followed by monitoring to verify acceptable oxygen levels.
    - Verify the hazardous atmosphere has been eliminated by testing the air. Air monitoring results must be within acceptable limits without the use of ventilation equipment prior to entry.

8. Take the following pre-entry precautions:
    - Determine start and stop times for authorized entry.
    - Assign roles and responsibilities to entrant(s), attendant(s), and field lead(s).
    - Notify the Anniston Fire Department prior to entry and after work in the confined space is concluded. The entry must not begin and it must be terminated if the Anniston Fire Department is unable to respond at any time.
    - Notify anyone who could be affected by the entry.
    - Do not allow entry to occur or continue until any sources of energy (e.g., steam, electric, mechanical) that pose a risk to entry workers are controlled.
    - Wear appropriate PPE.
    - Provide entrants and attendants with two-way radios of the appropriate National Electrical Code rating for continuous communications.

- Provide portable air horns for use by all entrants and attendants. Horn signals will be developed and documented on the entry permit.
- Check communication devices to confirm they are functioning properly.
- Have lights available that meet the following criteria:
  - Lighting and electrical are of the appropriate National Electrical Code rating.
  - Rating should be Class I, Division I unless the space specifically meets other rating requirements at the time of entry.
- Set up non-entry rescue equipment consisting of independent lifelines attached to a harness on each entrant.
  - Lifelines must be attached to a mechanical device outside the space so that a rescue can begin as soon as the rescuer becomes aware that a rescue is necessary.
  - Lifelines at least 0.5 inches in diameter and 2,000 pounds test must be attached to a harness worn by the entrant. Wristlets may be used only when a harness presents a greater hazard to the worker and wristlets are the safest, most-effective alternative.
  - All lifelines will be secured to a fixed point outside the confined space.
- Coordinate with other contractors, as applicable.
- Have appropriate safety data sheets.
- Conduct continuous air monitoring.

9. Conduct pre-entry briefings with all personnel involved in the confined space entry. Do the following at each briefing:
   - Review the planned work scope.
   - Review confined space entry hazards, procedures, and precautions.
   - Review the confined space entry permit.
   - Review the hazard assessment.
   - Review this plan and the applicable JSAs.
   - Ensure the attendant and all entrants have signed the acknowledgement.
10. Before entry is authorized, the entry supervisor will verify and make any necessary updates to the Hazard Assessment Form.
11. Use protective barriers to protect entrants from external pedestrian, vehicle, or equipment hazards.
12. Before entry is authorized, the entry supervisor will complete and sign the entry permit according to the written confined space program and document that all pre-entry requirements have been met and that acceptable entry conditions exist. Each entry permit must be completely executed and include all required information.
13. The completed permit will be posted at the primary entrance to the permit space.

14. Entry permits are valid for a maximum of one work shift and will be canceled by the entry supervisor when the shift ends, when confined space operations are complete, or whenever a prohibited condition arises in or near the space.
15. Under the following conditions, personnel must exit the space, reevaluate hazards, and modify entry procedures:
    - Any hazardous atmosphere is detected after entry.
    - Any unanticipated health or safety hazard develops.
    - An attendant cannot effectively perform their duties.
    - Personnel in the confined space are experiencing symptoms of heat stress or overexposure to atmospheric hazards.
16. When work is completed, exit the space and close out the permit.

Confined Space Hazard Assessment Form

Attachment 2

Confined Space Hazard Assessment Form

Part 1: Confined Space Identification

Confined space name: Highway 202 Culverts

Dimensions: Openings are approximately 10 ft x 10 ft

Description of space: The space consists of 5 separate culverts that have openings approximately 10 ft X 10 ft and traverse the width of Highway 202. The separate culverts are open on both sides. There are varying amounts of sediment buildup in each of the separate culverts.
This Hazard Assessment needs to be verified and updated as necessary in the field prior to entry.

Is this space entered on a routine basis? ☐ Yes ☒ No

Describe tasks and frequency: This is anticipated to be a one time task for sediment sampling

Part II: Nature of the Hazards Assumptions. Tanks are empty and clean, all energy sources identified and isolated, and no other hazards are introduced into the spaces. A more formal hazard assessment must be done at the time of entry.

Potential Atmospheric Hazards

- ☒ O_2 Deficient/Enriched
- ☒ Combustibles/Flammables
- ☒ CO
- ☒ H_2S
- ☒ Other Toxics

Potential Nonatmospheric Hazards

- ☐ Contains Material That Could Engulf Entrant? _____
- ☐ Internal Config. Could Trap Entrant? _____
- ☐ Electrical (live circuits)? _____
- ☐ Mechanical (pipes, linkages)? _____
- ☒ Slick/Residue Covered Surfaces? _____

Job Safety Analysis

Working in Confined Spaces

Work Activity	Potential Hazards	Preventive or Corrective Measures	Inspection Requirements
Working in confined spaces	• Lack of Oxygen • Flammable or toxic atmosphere • Animals • Insects • Slipping and tripping • Temperature extremes • Flowing water	• Personnel entering the confined space will be required to complete an approved confined space training class prior to entry. • Coordinate with the site owner prior to entry. • Follow procedures to test the atmosphere for lack of oxygen, or flammable or toxic atmosphere. • Personnel should be aware of animals and pests lurking in and around the confined space. • Inspect entrances for signs of animal habitation prior to entry. • Personnel should note all areas where there is a potential for falls and take proper measures to prevent. • Personnel should take appropriate actions in areas where debris or slick surfaces are present to prevent tripping and slipping accidents. • Temperatures may vary dramatically from the outside atmosphere as there could be limited air movement. Personnel must dress accordingly for these extremes, including both cold and hot, and take other appropriate actions as necessary. • Only perform entry when water levels are low, and it has been several days since the last rain event.	• A complete understanding of all hazards • Review of entry procedures, entry plan, permit, and hazard assessment • Bump test and calibration of monitoring equipment • Verify stream flow and water depth

Job Safety Analysis

Working in Confined Spaces

Training Requirements:

- All staff entering confined spaces must complete approved confined space training.
- All personnel working on hazardous waste sites must receive appropriate training as required by 29 Code of Federal Regulations (CFR) 1910.120(e), including but not limited to initial 40-hour, 8-hour supervisor, and annual 8-hour refresher trainings.
- Medical clearance must be received on an annual basis as required by 29 CFR 1910.120(f).
- All assigned employees are required to familiarize themselves with the contents of this JSA, the confined space entry plan, hazard assessment, and project specific HASP before starting a work activity and review it with their supervisor during their daily safety meeting.

1. INTRODUCTION

This confined space entry plan and its accompanying job safety analysis (JSA) describe potential hazards and safety procedures associated with accessing the culvert through which Snow Creek flows under the Quintard Mall in Oxford, Alabama. Requirements and procedures for working in confined spaces are discussed below and in the project-specific health and safety plan (HASP). This confined space entry plan must be followed in conjunction with the project-specific HASP and associated JSAs when entering the culvert.

The Quintard Mall culvert conveys Snow Creek stream flow for approximately 0.3 miles beneath a portion of the parking lot and mall structure. The culvert is considered a permit-required confined space with unique hazards. There are only two entry points to the culvert, at the upstream and downstream ends. This confined space is not entered regularly. The activities anticipated to be conducted within this confined space include surveying, sediment probing, and sediment sampling.

The Quintard Mall culvert is accessible during periods of low or normal stream flow. At a minimum, access to the culvert can be made by walking into the culvert from the downstream end. Details for access from the upstream end of the culvert will be confirmed during predesign investigation (PDI) preparation tasks. Based on culvert foundation plan design drawings, the Quintard Mall culvert is trapezoidal with an upper width of approximately 100 feet. The height of the culvert varies and is estimated to be between 9 and 11 feet tall. Dimensions of the culvert will be confirmed during the PDI.

2. CONFINED SPACE DEFINITION AND REQUIREMENTS

A confined space is defined as a space large enough and configured so that a person can enter the space and perform assigned work, has limited means for entry or exit, and is not designed for continuous employee occupancy. A confined space is considered to have been entered as soon as any part of the entrant's body breaks the plane of an opening into the space. Confined space entry may pose the possibility of engulfment. Potentially contaminated confined spaces may pose additional hazards such as air contamination, flammable or explosive atmosphere, and oxygen deficiency.

The Site Safety Officer is responsible for identifying confined spaces into which personnel will enter. All confined spaces will be initially considered to require a permit.

Personnel must be properly trained to supervise and participate in confined space entry procedures or to serve as standby attendants. Personnel entering confined spaces or conducting activities near confined spaces must meet the regulatory requirements outlined in the Code of Federal Regulations (CFR) at 29 CFR 1910.146: Permit-required confined spaces. Each contractor participating in the confined space entry will provide qualified, competent, and trained personnel as defined in 29 CFR 1910.146, who will be responsible and have authority to perform confined space entry activities.

3. SPECIFIC MEASURES: QUINTARD MALL CONFINED SPACE ENTRY

Due to the potentially unique hazards of this confined space, a sewer inspection contractor, or the equivalent, with remotely operated video surveying equipment is to be used. The confined space will initially be surveyed remotely prior to allowing entrants into the space. Depending on the results of the remote survey, the Site Safety Officer, Entry Supervisor, and a Structural Engineer will jointly determine whether it is acceptable for entry to be made. To the extent possible, work in the space should be limited or performed remotely.

Entry into this confined space will require a confined space entry permit, at least two entrants, and at least two trained attendants (one at the upstream end of the culvert and one at the downstream end). All entrants shall wear (in the breathing zone) a properly calibrated and bump-tested MicroRAE gas monitor (or equivalent). In addition, the attendants will monitor air at the entry location with a MultiRAE (or equivalent) monitor. The entrants and attendants will be equipped with radios for communication during the entry. All personnel shall wear personal protective equipment (PPE) in accordance with the project-specific HASP and anticipated hazards. At a minimum, Level D PPE shall be worn, including a hard hat, safety glasses, steel-toed shoes, reflective vests, and a minimum of a 10-minute Immediately Dangerous to Life or Health (IDLH) emergency escape respirator. Entrants are to travel only halfway into the space, then return to the entry point. The other half of the confined space will be entered from the opposite side, again not traveling more than halfway into the culvert.

Confined space entry into the Quintard Mall culvert will require the following specific measures:

- Confined-space entry permit (Attachment 1)
- Hazard assessment form (Attachment 2)
- JSA review (Attachment 3)
- Culvert design drawings (Attachment 4)
- Pre-entry briefing
- Continuous air monitoring by attendants and entrants
- Emergency escape respirator
- Lifelines attached to a body harness on each entrant
    - Minimum of 1,800 feet in length and marked every 10 feet for the first 100 feet, then every 50 feet for the remaining length, so the attendant can track and call out how far the entrants are into the space
- Radio communications with back-up air horns
- Minimal creek flow and no significant rain in the daily forecast
- Prior notification of the Oxford Fire Department and agreement that they will respond in the event of an emergency, that they are able to meet the response requirements described in 29 CFR 1926.1211, and that they are familiar with the exact location and hazards.

4. AIR MONITORING REQUIREMENTS

Air monitoring prior to entry and continuous monitoring of the space during entry are required. Entrants will wear (in the breathing zone) a properly calibrated and bump-tested MicroRAE gas monitor (or equivalent), and the attendant will monitor air at the entry location with a MultiRAE (or equivalent) monitor. Air monitoring instruments shall be equipped with a photoionization detector (PID), oxygen, lower explosive limit (LEL), carbon monoxide, and hydrogen sulfide sensors. The air monitoring results will be compared with the action levels and response actions listed in Table 4-1. If at any time air monitoring results trigger an action to stop work, the entrants will don their escape respirator and exit the space.

Table 4-1. Action Levels for Air

Parameter	Reading	Action
Volatile Organics	0 to 5 ppm	Normal operations with continuous monitoring. If getting consistent detectable readings, try to identify the source. Consider adjusting the action levels depending on possible source materials.
	5 to 20 ppm	Must investigate cause of readings to determine source
	> 20 ppm	Stop work, and contact the Site Safety Officer
Hydrogen Sulfide	0 to < 5 ppm	Normal operations
	> 5 ppm	Stop work, evacuate confined spaces/work area, investigate cause of reading, and ventilate area
Oxygen	< 19.5%	Stop work, evacuate confined spaces/work area, investigate cause of reading, and ventilate area
	> 19.5% to < 23.5%	Normal operations
	> 23.5%	Stop work, evacuate confined spaces/work area, investigate cause of reading, and ventilate area
Flammable Vapors (LEL)	< 10% LEL	Normal operations
	> 10% LEL	Stop work, ventilate area, investigate source of vapors

Table 4-1. Action Levels for Air

Parameter	Reading	Action
Carbon Monoxide	0 to ≤ 20 ppm	Normal operations
	> 20 ppm	Stop work, evacuate confined spaces/work area, investigate cause of reading, and ventilate area

LEL: lower explosive limit
ppm: parts per million

5. ROLES AND RESPONSIBILITIES

The roles and responsibilities for personnel involved in the confined space entry are specified in the following subsections.

5.1 Entry Supervisor

The role and responsibilities of the entry supervisor are as follows:

- Know the hazards that may be faced during entry and the mode, signs or symptoms, and consequences of exposure to those hazards.
- Check that the entry permit has been properly prepared, all tests specified by the permit have been conducted, and all procedures and equipment specified by the permit are in place before endorsing the permit and allowing entry to begin.
- Terminate the entry and cancel the permit as required.
- Remove unauthorized individuals who enter or attempt to enter the confined space during entry operations.
- Determine that entry operations remain consistent with the terms of the entry permit and that acceptable entry conditions are maintained.
- Document on the entry permit any incidents or circumstances requiring review of the confined space entry program, which include the following:
  - Unauthorized entry
  - The detection of a condition of hazard not authorized by the permit
  - The occurrence of an injury or near miss during entry
  - A change in the use or configuration of the space
  - Personnel complaints about the program
- Prescribe procedures for coordinating entry when personnel from multiple employers are working simultaneously in or around the confined space.

5.2 Authorized Entrants

The role and responsibilities of the authorized entrants include the following:

- Know the hazards that may be faced during entry and the mode, signs or symptoms, and consequences of exposure to those hazards.
- Communicate with the attendant as necessary to enable the attendant to monitor entrant status and to alert entrants of the need to evacuate the space.
- Alert the attendant whenever either of the following situations occurs:
  - The entrant recognizes warning signs or symptoms of exposure to a dangerous situation.
  - The entrant detects a prohibited condition.

- Exit from the permit-required confined space as quickly as possible whenever one of the following situations occurs:
  - An order to evacuate is given by the attendant or the entry supervisor.
  - The entrant recognizes warning signs or symptoms of exposure to a dangerous situation.
  - The entrant detects a prohibited condition.
  - An evacuation alarm is activated.

5.3 Attendant(s)

The role and responsibilities of the attendants include the following:

- Know the hazards that may be faced during entry and the mode, signs or symptoms, and consequences of exposure to those hazards.
- Be aware of possible behavioral effects of hazard exposure in authorized entrants.
- Maintain an accurate count of authorized entrants in the confined space.
- Accurately identify who is in the permit space by tagging each individual's lifeline with the entrant's name and recording the names of the entrants.
- Remain outside the permit space during entry operations until relieved by another attendant.
- Communicate with authorized entrants as necessary to monitor entrant status and to alert entrants of any important information (e.g., the need to evacuate the space).
- Monitor activities inside and outside the space to determine whether it is safe for entrants to remain in the space.
- Order the authorized entrants to evacuate the permit space immediately under any of the following conditions:
  - The attendant detects a prohibited condition.
  - The attendant detects the behavioral effects of hazard exposure in an authorized entrant.
  - The attendant detects a situation outside the space that could endanger the authorized entrants.
  - The attendant cannot effectively and safely perform all their duties.
- Summon rescue and other emergency services as soon as the attendant determines that authorized entrants may need assistance to escape from confined space hazards. Must have a positive verified means of communication to alert the Oxford Fire Department in the event of an emergency
- Take the following actions when unauthorized persons approach or enter a confined space while entry is underway:
  - Warn the unauthorized persons that they must stay away from the confined space.

    - Advise the unauthorized persons that they must exit immediately if they have entered the permit space.
    - Inform the authorized entrants and the entry supervisor if unauthorized persons have entered the permit space.

- Perform non-entry rescues.
- Do nothing that might interfere with the attendant's primary duty to monitor and protect the authorized entrants.

6. ENTRY PROCEDURES

The following procedures are to be followed when entering the Quintard Mall culvert:

1. Verify whether entry into the confined space is necessary to perform work.
2. Review creek flow conditions and schedule confined space entry for when there is no significant rain in the daily forecast.
3. Have the following minimum-required equipment on hand:
    - 10-minute IDLH emergency escape respirators
    - Ventilation (if determined necessary based on air monitoring results)
    - Barrier (tape or hard barricade) and warning signs
    - Air monitor(s) capable of measuring, at a minimum, concentrations of oxygen, flammable gases, hydrogen sulfide and carbon monoxide.
4. Inspect the confined space and eliminate any unsafe conditions prior to setting up for entry.
5. Install a barricade or tape and signs to prevent people from accidentally entering the space.
6. Conduct a hazard assessment that includes the following activities:
    - Test the real or potential atmospheric hazards, as follows:
        - Oxygen content: less than 19.5% or greater than 23.5%
        - Flammable gases and vapors: greater than 10% of the LEL
        - Hydrogen sulfide concentrations: 5 parts per million (ppm) or greater
        - Carbon monoxide concentrations: greater than 20 ppm
        - Volatile organic compound concentrations greater than 20 ppm.
    - Review the space for other observable serious safety and health hazards, including the following:
        - Mechanical
        - Electrical
        - Burn
        - Engulfment
        - Entrapment hazards

- Consider the following environmental hazards:
    - Heat stress
    - Cold stress
    - Inclement weather
    - Insects and spiders

- Bees and wasps
- Ticks
- Mosquitoes
- Poisonous snakes
- Alligators
- Water-borne pathogens
- Feral dogs
- Bears
- Wolves and coyotes
- Other wildlife
- Poisonous plants
- Public at large

7. If any hazardous atmosphere exists, take the following actions:
   - If possible, determine and eliminate the source of the atmospheric hazards (e.g., carbon monoxide from a nearby truck or gas-powered generator).
   - If the atmosphere contains toxins or flammables, ventilate the space by drawing air out until the air has been changed over several times.
   - If oxygen deficient, ventilate by pushing air into the space until the air has been changed over several times followed by monitoring to verify acceptable oxygen levels.
   - Verify the hazardous atmosphere has been eliminated by testing the air. Air monitoring results must be within acceptable limits without the use of ventilation equipment prior to entry.

8. Take the following pre-entry precautions:
   - Determine start and end times for authorized entry.
   - Assign roles and responsibilities as entrant(s), attendant(s), field lead(s).
   - Notify the Oxford Fire Department prior to entry and when work in the confined space is concluded. The entry must not begin and it must be terminated if the Oxford Fire Department is unable to respond at any time.
   - Notify anyone who could be affected by the entry.
   - Do not allow entry to occur or continue until any sources of energy (e.g., steam, electric, mechanical) that pose a risk to entry workers are controlled.
   - Wear appropriate PPE.
   - Provide entrants and attendants with two-way radios of the appropriate National Electrical Code rating for continuous communications.

- Provide portable air horns for use by all entrants and attendants. Horn signals will be developed and documented on the entry permit.
- Check communication devices to confirm they are functioning properly.
- Have hand and head lights required for entry into the confined space that meet the following criteria:
  - Lighting and electrical are of the appropriate National Electrical Code rating.
  - Rating should be Class I, Division I unless the space specifically meets other rating requirements at the time of entry.
- Set up non-entry rescue equipment consisting of independent lifelines attached to a harness on each entrant.
  - Lifelines must be attached to a mechanical device outside the space such that a rescue can begin as soon as the rescuer becomes aware that a rescue is necessary.
  - Lifelines at least 0.5 inches in diameter and 2,000 pounds test must be attached to a harness worn by the entrant. Wristlets may be used only when a harness presents a greater hazard to the worker and wristlets are the safest, most-effective alternative.
  - All lifelines will be secured to a fixed point outside the confined space.
- Coordinate with other contractors, as applicable.
- Have appropriate safety data sheets.
- Continuous air monitoring will be conducted.

9. Conduct pre-entry briefing with all personnel involved in the confined space entry. Do the following at each briefing:
   - Review the planned work scope.
   - Review confined space entry hazards, procedures, and precautions.
   - Review the confined space entry permit.
   - Review the hazard assessment.
   - Review this plan and applicable JSAs.
   - Ensure the attendant and all entrants have signed the acknowledgement.
10. Before entry is authorized, the entry supervisor will verify and make any necessary updates to the Hazard Assessment Form.
11. Use protective barriers to protect entrants from external pedestrian, vehicle, or equipment hazards.
12. Before entry is authorized, the entry supervisor will complete and sign the entry permit according to the written confined space program and document that all pre-entry requirements have been met and that acceptable entry conditions exist. Each entry permit must be completely executed and include all required information.

13. The completed permit will be posted at the primary entrance to the permit space.
14. Entry permits are valid for a maximum of one work shift and will be canceled by the entry supervisor when the shift ends, when confined space operations are complete, or whenever a prohibited condition arises in or near the space.
15. Under the following conditions, personnel must exit the space, reevaluate hazards, and modify entry procedures:
    - Any hazardous atmosphere is detected after entry.
    - Any unanticipated health or safety hazard develops.
    - An attendant cannot effectively perform their duties.
    - Personnel in confined space are experiencing symptoms of heat stress or overexposure to atmospheric hazards.
16. When work is completed, exit the space and close out the permit.

SPECIFIC CONFINED SPACE ENTRY PLAN ACKNOWLEDGEMENT

My signature below certifies that I have read and understand the policies and procedures specified in this Plan.

Attachment 2
Confined Space Hazard Assessment Form

Attachment 2

Confined Space Hazard Assessment Form

Part 1: Confined Space Identification

Confined space name: Quintard Mall Culvert

Dimensions: The bridge traverses approximately 0.3 miles

Description of space: The space is under a bridge that traverses approximately 0.3 miles under portions of the Quintard Mall structure and parking area. Conditions under most of the bridge are unknown. This Hazard Assessment needs to be verified and updated as necessary in the field prior to entry.

Is this space entered on a routine basis? ☐ Yes ☒ No

Describe tasks and frequency: This is anticipated to be a one time task for sediment sampling

Part II: Nature of the Hazards Assumptions. Tanks are empty and clean, all energy sources identified and isolated, and no other hazards are introduced into the spaces. A more formal hazard assessment must be done at the time of entry.

Potential Atmospheric Hazards

- ☒ O_2 Deficient/Enriched
- ☒ Combustibles/Flammables
- ☒ CO
- ☒ H_2S
- ☒ Other Toxics

Potential Nonatmospheric Hazards

- ☒ Contains Material That Could Engulf Entrant? Unknown
- ☒ Internal Config. Could Trap Entrant? Unknown
- ☐ Electrical (live circuits)? _____
- ☐ Mechanical (pipes, linkages)? _____
- ☒ Slick/Residue Covered Surfaces? _____
- ☐ Equipment Preventing Safe Exit? _____
- ☒ Low/Inadequate Lighting? Only natural light at entry locations
- ☐ Hazardous Chemicals Present? _____
- ☒ Fall Potential? Unknown
- ☒ Potential for Dropped Objects? Unknown
- ☒ Multiple Work Groups/Nature of Work Inspection contractor
- ☒ Other potential for insects and wildlife

Job Safety Analysis

Working in Confined Spaces

Project Name: Quintard Mall Bridge	**Project Number:** 171718-01.33	**JSA Number:** 001	**Issue Date:** 10/7/2021
Location: Oxford, Alabama	**Contractor:** Anchor QEA, LLC	**Analysis by:** Tim Shaner	**Analysis Date:** 10/7/2021
Work Operation: Working in Confined Spaces	**Superintendent/Competent Person:** TBD	**Revised by:**	**Revised Date:**
Required Personal Protective Equipment (PPE): • Modified Level D—Safety glasses, hard hat, safety glasses, long pants, long sleeves, and/or Tyvek coveralls if handling potentially contaminated media, steel-toed footwear conforming to ASTM International (ASTM) F2412-05/ASTM F2413-05, at a 10-minute IDLH emergency escape respirator (at a minimum). • Depending on activity, the following PPE may also be required: splash goggles, nitrile outer gloves and latex inner gloves		**Reviewed by:** Christopher Yates	**Reviewed Date:** 10/12/2021
		Approved by: Charles Guest	**Approved Date:** 10/12/2021

PLAYING IT SAFE

Job Safety Analysis

Working in Confined Spaces

Work Activity	Potential Hazards	Preventive or Corrective Measures	Inspection Requirements
Working in confined spaces	• Lack of Oxygen • Flammable or toxic atmosphere • Animals • Insects • Slipping and tripping • Temperature extremes • Flowing water	• Personnel entering the confined space will be required to complete an approved confined space training class prior to entry. • Coordinate with the site owner prior to entry. • Follow procedures to test the atmosphere for lack of oxygen, or flammable or toxic atmosphere. • Personnel should be aware of animals and pests lurking in and around the confined space. • Inspect entrances for signs of animal habitation prior to entry. • Personnel should note all areas where there is a potential for falls and take proper measures to prevent. • Personnel should take appropriate actions in areas where debris or slick surfaces are present to prevent tripping and slipping accidents. • Temperatures may vary dramatically from the outside atmosphere as there could be limited air movement. Personnel must dress accordingly for these extremes, including both cold and hot, and take other appropriate actions as necessary. • Only perform entry when water levels are low, and it has been several days since the last rain event.	• A complete understanding of all hazards • Review of entry procedures, entry plan, permit, and hazard assessment • Bump test and calibration of monitoring equipment • Verify stream flow and water depth

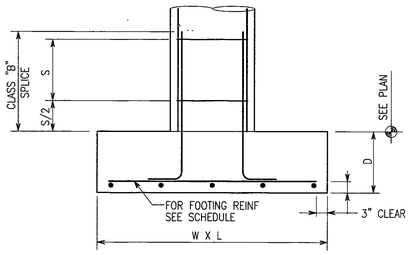
Job Safety Analysis

Working in Confined Spaces



Training Requirements:

- All staff entering confined spaces must complete approved confined space training.
- All personnel must be trained on how to properly use the IDLH emergency escape respirator.
- All personnel working on hazardous waste sites must receive appropriate training as required by 29 Code of Federal Regulations (CFR) 1910.120(e), including but not limited to initial 40-hour, 8-hour supervisor, and annual 8-hour refresher trainings.
- Medical clearance must be received on an annual basis as required by 29 CFR 1910.120(f).
- All assigned employees are required to familiarize themselves with the contents of this JSA, the confined space entry plan, hazard assessment, and project specific HASP before starting a work activity and review it with their supervisor during their daily safety meeting.

CONTROL JOINT NOTES:
1. JOINT IS TOOLED IN TOPPING WITH A GOLDBLATT GROOVER 06-314-M7 IN THE PLANE WHERE TEES ABUT, OVER THE END OF EVERY TEE AND OVER THE ENDS OF BEAMS.
2. ALL JOINTS ARE TO BE DRESSED WITH THE ISO-FLEX VEE ABRASIVE BLADE TO REMOVE LAITANCE, CURING COMPOUNDS AND DRESS THE JOINT PRIOR TO SEALING.
3. JOINTS ARE TO BE PRIMED IN ACCORDANCE WITH MANUFACTURERS INSTRUCTIONS AND SEALED WITH ISO-FLEX 880 G.B. URETHANE SEALANT OR APPROVED EQUAL.
4. JOINTS PROVIDED BY SAWING ARE AN UNACCEPTABLE ALTERNATIVE DUE TO PROBLEMS RELATED TO: A) EDGE SPALLING, B) LACK OF CONTROL WHEN SAWING IS DONE, C) LOCATION DIFFICULTIES, D) CUTTING OF STEEL MESH.

GENERAL NOTES

1. GENERAL

1.1 DESIGN CRITERIA:

A. CODES AND SPECIFICATIONS:

1. BRIDGE SPECIFICATION FOR EXTERIOR AREAS: AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS STANDARD SPECIFICATIONS FOR HIGHWAY BRIDGES, 1989.
2. GENERAL BUILDING CODE FOR COVERED MALL: STANDARD BUILDING CODE, 1991.
3. CONCRETE: BUILDING CODE REQUIREMENTS FOR REINFORCED CONCRETE (ACI 318-89 REVISED 1992).
4. STRUCTURAL STEEL: SPECIFICATION FOR STRUCTURAL STEEL BUILDINGS, ALLOWABLE STRESS DESIGN AND PLASTIC DESIGN, JUNE 1, 1989, AMERICAN INSTITUTE OF STEEL CONSTRUCTION.

B. DESIGN LOADS (PSF):

1. DEAD LOADS: SELF WEIGHT OF PRECAST CONCRETE FRAMING PLUS TOPPING SLAB. ANY CHANGES IN CONSTRUCTION MATERIALS FROM THOSE SHOWN ON THE STRUCTURAL DRAWINGS SHALL BE REPORTED BY THE GENERAL CONTRACTOR TO THE STRUCTURAL ENGINEER FOR VERIFICATION OF LOAD CARRYING CAPACITY OF THE STRUCTURE.
2. SUPERIMPOSED DEAD AND LIVE LOADS: SUPERIMPOSED LOADS VARY ALONG LENGTH OF THE BRIDGE. FOR LOADING TYPE, LOCATION, AND EXTENT, SEE SHEET S1.2.

1.2 SUBMIT ALL SHOP DRAWINGS ON ONE REPRODUCIBLE PRINT (SEPIA) AND ONE BLUE LINE PRINT ONLY. THE REPRODUCIBLE PRINT WILL BE RETURNED. ALL BLUE LINE PRINTS REQUIRED BY THE CONTRACTOR ARE THE RESPONSIBILITY OF THE CONTRACTOR AND SHOULD BE MADE AFTER THE REPRODUCIBLE PRINT IS RETURNED. IF ADDITIONAL BLUE LINES ARE SUBMITTED, THEY WILL BE RETURNED UNMARKED.

1.3 ALL DETAILS SHOWN ARE TYPICAL. SIMILAR DETAILS APPLY TO SIMILAR CONDITIONS, UNLESS NOTED.

1.4 CONTRACTOR SHALL VERIFY ALL DIMENSIONS AND SITE CONDITIONS PRIOR TO FABRICATION/CONSTRUCTION. NOTIFY STRUCTURAL ENGINEER OF ANY DISCREPANCIES PRIOR TO FABRICATION/CONSTRUCTION.

2. FOUNDATION

2.1 GEOTECHNICAL REPORT: FOUNDATION DESIGN IS BASED ON THE GEOTECHNICAL REPORT BY GALLET & ASSOCIATES, INC., ENTITLED "GEOTECHNICAL INVESTIGATION, QUINTARD MALL EXPANSION, OXFORD, ALABAMA DATED OCTOBER 4, 1994 PROJECT NO. 94-G-07750.A, AND ADDENDA LETTERS DATED DECEMBER 21, 1994, APRIL 5, 1995, AND MAY 2, 1995". THE GENERAL CONTRACTOR SHALL OBTAIN A COPY OF THE GEOTECHNICAL REPORT AND ADDENDA LETTERS FROM THE OWNER AND FOLLOW ALL REQUIREMENTS WITHIN THE RECOMMENDATION SECTIONS.

2.2 MAXIMUM ROCK BEARING PRESSURE: 5000 PSF.

2.3 ALL FOUNDATION BEARING SURFACES SHALL BE REVIEWED BY THE GEOTECHNICAL ENGINEER PRIOR TO PLACING CONCRETE TO INSURE THEIR COMPLIANCE WITH PRESSURES NOTED. ALL BOTTOM ELEVATIONS ARE ESTIMATED AND MAY BE ADJUSTED IN THE FIELD BY THE GEOTECHNICAL ENGINEER.

3. CONCRETE

3.1 CONCRETE COMPRESSIVE STRENGTH AT 28 DAYS:
3000 PSI ----- NORMAL WT. ----- FOOTINGS.
4000 PSI ----- NORMAL WT. ----- COLUMNS, TOPPING SLAB.
4000 PSI ----- NORMAL WT. ----- SLAB AND BEAM AT TRANSITION.

3.2 REINFORCING BARS: ASTM A615 GRADE 60.

3.3 WELDED WIRE FABRIC (WWF): ASTM A185. MINIMUM LAP AND EMBEDMENT TO BE THE GREATER OF ONE CROSS WIRE SPACING PLUS 2 INCHES OR 6 INCHES.

3.4 REINFORCING STEEL SHOWN IN SECTIONS OF BEAMS AND COLUMNS IS A SCHEMATIC INDICATION THAT REINFORCING EXISTS. SEE SCHEDULES, SECTION NOTES AND GENERAL NOTES FOR ACTUAL REINFORCING REQUIRED.

3.5 REINFORCING BAR PLACING ACCESSORIES IN ACCORDANCE WITH AASHTO AND ACI MANUAL OF STANDARD PRACTICE.

3.6 DETAIL REINFORCEMENT IN ACCORDANCE WITH AASHTO AND ACI 315. REINFORCEMENT SHALL NOT BE WELDED UNLESS NOTED OR APPROVED BY THE ENGINEER.

3.7 ALL SPLICES SHALL BE CLASS "B" TENSION LAP SPLICE, UNLESS NOTED.

3.8 ALL REINFORCING MARKED CONTINUOUS SHALL BE SPLICED WITH CLASS "B" TENSION LAP SPLICE, UNLESS NOTED.

3.9 CONCRETE COVERAGE OF REINFORCEMENT:

FOOTINGS----------3" BOTTOM & SIDES
COLUMNS----------2" CLEAR OF TIES
BEAMS----------2" CLEAR OF STIRRUPS
TOPPING SLABS----------1 1/2"

3.10 COLUMN REINFORCING: DOWEL TO FOUNDATION WITH HOOKED BARS OF SAME SIZE AND SPACING AS VERTICAL REINFORCING.

3.12 CONCRETING OPERATIONS SHALL COMPLY WITH ACI STANDARDS.

4. PRECAST CONCRETE

4.1 PRECAST MANUFACTURER IS TO BE RESPONSIBLE FOR THE DESIGN OF ALL PRECAST MEMBERS AND THEIR CONNECTIONS TO THE STRUCTURE. CALCULATIONS AND SHOP DRAWINGS SHALL BE SUBMITTED BEARING THE SEAL OF A PROFESSIONAL ENGINEER REGISTERED IN THE STATE OF ALABAMA.

4.2 ANY CONNECTIONS SHOWN ON CONTRACT DRAWINGS ARE SHOWN FOR GENERAL ARRANGEMENT ONLY. THE CONTRACTOR SHALL COORDINATE ALL PRECAST CONNECTIONS AND EMBEDDED ITEMS WITH THE PRECAST MANUFACTURER.

4.3 ERECTOR SHALL BE RESPONSIBLE FOR PROVIDING ALL TEMPORARY BRACING UNTIL ALL CONNECTIONS HAVE BEEN MADE AND TOPPING HAS BEEN CAST.

4.4 PRECAST MANUFACTURER SHALL PROVIDE STABILIZING ANGLES, AS REQUIRED, IN ALL PRECAST WORK.

4.5 PRECAST MANUFACTURER TO VERIFY THAT THE DOUBLE TEE CAMBER DOES NOT INTERFERE WITH THE 3" MINIMUM TOPPING AND SHALL MAKE ALLOWANCES FOR ADDITIONAL WEIGHT WHERE TOPPING EXCEEDS 3".

4.6 ALL EXPOSED STEEL CONNECTIONS AND SUPPORT ANGLES, PLATES, BARS AND BOLTS IN CONJUNCTION WITH ALL PRECAST CONCRETE SHALL BE HOT-DIP GALVANIZED AFTER FABRICATION AND FIELD TOUCHED UP WITH ZINC RICH PAINT.

4.7 TOPPING SLAB: 3" THICK UNLESS NOTED, REINFORCE WITH 6X6 W1.9XW2.9 WWF IN FLAT SHEETS AT MID-DEPTH OF TOPPING.

4.8 TOOLED JOINTS IN CONCRETE TOPPING OVER PRESTRESSED TEES ARE TO BE LOCATED WHERE EVERY TEE ABUTS, ABOVE THE END OF EVERY TEE AND AT THE ENDS OF BEAMS. BEAMS AND TEES MAY NOT ALIGN.

5. STRUCTURAL STEEL

5.1 STRUCTURAL STEEL: ASTM A36.

5.2 WELDED CONNECTIONS: E70XX ELECTRODES. MINIMUM FILLET WELD 3/16".

5.3 HEADED STUDS: ASTM A108, GRADE 1015 OR 1020, COLD FINISHED CARBON STEEL WITH DIMENSIONS COMPLYING WITH THE AMERICAN INSTITUTE OF STEEL CONSTRUCTION.

5.4 GALVANIZING: ALL STRUCTURAL STEEL SHALL BE HOT DIP GALVANIZED IN ACCORDANCE WITH ASTM A123.
